NESTORIANS, followers of Nestorius (*q.v.*), who tended to make Christ two persons. Nestorianism soon became extinct in the Rom. Empire, but it had a great career in the Middle Ages, extending at one time over nearly the whole of Asia. From VII. to XIV. cent. it was very strong in Persia, but was overthrown by Mongolian invasion. Nestorian Christians evangelised India and probably founded the Syrian Church of Malabar (traditionally ascribed to St. Thomas). Churches existed in China, and the discovery of a MS. in a hitherto unknown Aryan language, Sogdianese, witnesses activity in Siberia. Various and partially successful attempts have been made by the R.C. Church to win the Syrian Churches. Nestorians still survive in Kurdistan, and are helped by the 'Archbishop of Canterbury Mission to the Assyrian Christians.'

NESTORIUS (d. *c.* 450), patriarch of Constantinople, 428–31; was earnest in defence of orthodoxy against Arians, Novatians, and Quartodecimans; refused to give the title 'Mother of God' to the Virgin Mary. N. represented the more practical Antiochene school as against the more mystical Alexandrian, Cyril, the bp. of Alexandria, being his enemy. N. was excommunicated, but replied with counter-anathemas. At the Council of Ephesus, in 431, he was deposed; his friends pronounced depositions against the Alexandrian party, but the Ephesian decision was confirmed at Chalcedon. The discovery of N.'s own 'Bazaar of Heraclides' shows that he was not Nestorian in the later sense. He lived some years in exile.

Bethune Baker, *Nestorius and his Teaching*.

NET, meshwork of knotted cord made of flax, hemp, cotton, etc.; used from earliest times in fishing industry and for snaring animals; lace and silk net as ornamentation; hand-made, with wooden needle and oval stick to make mesh; generally machine-made. Fishing nets are tarred to withstand action of water. Fragments of nets have been found among prehistoric remains in Switzerland.

NETHERLANDS, see HOLLAND.

NETHINIM, 'those given to the sanctuary,' mentioned in *Ezra* and *Nehemiah* as a distinct but inferior class of Temple ministers; said to have been first app. by David.

NETLEY (50° 53′ N., 1° 22′ W.), village, Hampshire, England; military hospital; ruined abbey.

NETTING, see FISHES: *Fisheries*.

NETTIUM, TEAL, see under DUCK FAMILY.

NETTLE, herbaceous plant of order *Urticaceæ*; two varieties in Britain, *Urtica dioica* and *U. urens*. Former large with heart-like foliage and clustered green flowers, latter small with elliptical flowers. The usual remedy for a n. sting is to apply to the part affected a crushed dock-leaf, which is usually to be found in the vicinity. Dead Nettle (*Lamium*) has white or purple flower and square stem.

NETTLERASH, URTICARIA, skin disease characterised by the appearance of wheals, accompanied by stinging sensation; may be due to external irritation, to certain articles of food, *e.g.* shellfish, or certain drugs, *e.g.* copaiba, to digestive or genito-urinary disturbances, or other causes; the treatment is first a purge to clear away any irritation in alimentary canal; a light diet, bismuth, strychnine, and ichthyol are beneficial, and a change of air and tonics in chronic cases; an application of a weak solution of carbolic acid, and alkaline baths, relieve itching.

NETTUNO (41° 27′ N., 12° 40′ E.), fishing village, Rome, Italy. Pop. 5600.

NETZE (53° 5′ N., 16° 56′ E.), river, Posen and Brandenburg, Prussia; joins Warthe.

NEU MECKLENBURG (3° S., 152° E.), island, Bismarck Archipelago, W. Pacific.

NEU-BRANDENBURG (53° 32′ N., 13° 15′ E.), town, on Lake Tolensesee, Mecklenburg-Strelitz, Germany, iron foundries. Pop. (1910) 12,344.

NEUBREISACH (48° 3′ N., 7° 28′ E.), fortified town, Alsace, Germany, near Rhine. Pop. 3500.

NEUBURG (48° 43′ N., 11° 11′ E.), town, on Danube, Swabia, Bavaria; capital of former principality of N. Pop. (1910) 9056.

NEUCHÂTEL (47° N., 6° 45′ E.), western canton of Switzerland, bounded by France, cantons of Vaud and Berne and Lake Neuchâtel; area, *c.* 312 sq. miles. Surface is chiefly mountainous, Jura range crossing canton from S.W. to N.E.; highest peak Mont Racine (*c.* 4730 ft.); chief rivers, Doubs and Thièle; leading towns, Neuchâtel (capital), La-Chaux-de-Fonds, and Le Locle. Neuchâtel was for long connected with Prussia,

but in 1857 became canton of Swiss Confederation. Manufactures include watches, wine, and chocolate. Pop. (1910) 133,061.

NEUCHÂTEL (47° N., 6° 55′ E.), capital of Neuchâtel Canton, Switzerland; ancient castle and cathedral; watches, jewellery. Pop. (1910) 23,505; (canton) 132,184.

NEUCHÂTEL, LAKE OF, ancient *Lacus Eburonensis* (46° 55′ N., 6° 50′ E.), lake, Switzerland; outlet by Thièle into Aar.

NEUENAHR (50° 32′ N., 7° 5′ E.), watering-place on Ahr, Rhine province, Prussia; mineral springs.

NEUENDORF (52° 24′ N., 13° 4′ E.), village, Brandenburg, Prussia; textiles.

NEUFCHÂTEAU (48° 20′ N., 5° 40′ E.), town, Vosges, France, at junction of Mouzon and Meuse; woollen industry. Pop. (comm.) 4000.

NEUHALDENSLEBEN (52° 15′ N., 11° 25′ E.), town, on Ohr, Prussian Saxony; pottery. Pop. (1910) 10,774.

NEUILLY-SUR-SEINE, W. suburb, Paris; favourite residence of Orleans family. Pop. (1911) 44,616.

NEUMÜNSTER (54° 4′ N., 9° 59′ E.), town, on Schwale, Schleswig-Holstein, Prussia; cloth. Pop. (1910) 3467.

NEUNKIRCHEN, Ober-Neunkirchen (49° 20′ N., 7° 9′ E.), town, Rhine province, Prussia; ironworks and collieries. Pop. (1910) 34,532.

NEU-POMMERN, formerly New Britain (6° S., 150° E.), island, Bismarck archipelago, W. Pacific.

NEUQUEN (39° S., 69° W.), territory, Western Argentina, S. America; mountainous; capital, Chosmalal. Pop. 30,000.

NEURALGIA, term applied to pain in a nerve unaccounted for by any organic affection, predisposed to by a tendency to nervous affections, by anæmia and other debilitated states, by gout, rheumatism, and other conditions in which the state of the blood is affected. The chief symptoms are paroxysmal, sharp pains, with a dull aching between the paroxysms, or the pain may be continuous, boring, or aching; tender spots can usually be found along the course of the nerve; the skin may be flushed, pale, or perspiring. The local causes of n. may include pressure on the nerve by a tumour, or through disease of bone or other tissue; exposure of the nerve is an important cause; the cause may be reflex, such as irritation of the teeth, or of the stomach by certain foods.

The treatment consists of removing, if possible, any exciting cause, and of treating anæmia, rheumatism, and similar predisposing causes; internally, quinine with perchloride of iron is valuable, as are phenacetin or antipyrin with caffein, also nitroglycerine and arsenic; warmth should be applied to the affected part by poultices or hot-water fomentations, and irritant liniments or even the actual cautery have proved beneficial. Electricity is also valuable, while in extremely obstinate cases the nerve may be cut down upon and stretched. Rest, change of air, and a nutritious diet are important in the treatment of the condition.

See Sciatica, Neuritis.

NEURASTHENIA is a general term applied to weakness or exhaustion of the nervous system, and may be due to overwork, anxiety, and other mental disturbances, a neurotic tendency, over-indulgence in alcohol or other stimulants, and in tobacco, and mistakes in dietary. It is more common in men than in women, and the symptoms may include general malaise, with depression or excitement, headache, insomnia or disturbed sleep, noises in the ears, disturbances of vision, of sensibility, and of the stomach and other organs, while there is usually muscular weakness and wasting. The condition is easily amenable to treatment, which consists of complete rest, change of air, attention to diet, with plenty of nourishing food, and tonics. *Traumatic n.*, or 'railway spine,' is the neurasthenic condition due to injury following railway accidents; the subjective symptoms may be many and various, while objective signs may be few or absent, as in other conditions of n., and it is usually found that when the patient's claim for damages has been settled, either favourably or adversely, the condition improves.

NEURITIS, inflammation of one or more nerves, affecting either the sheath of the nerve, its interstitial tissue, or the nerve fibres themselves. Acute n. affecting a single nerve may be due to prolonged pressure, to extension of inflammation from a neighbouring part, or to an unhealthy condition of the blood, *e.g.* in gout. The nerve is usually red and swollen, there is severe pain in the nerve and around it, and when the nerve is stretched the pain is increased. The skin is very tender, and the muscles supplied become flabby and wasted. A slight attack may pass off in a few days, but a more acute attack may last several weeks. The treatment is, first, a mercurial purge (*e.g.* calomel) followed by a dose of salts; the affected part must have complete rest and fomentations applied to it, while, if pain is intense, cocaine may be injected over the nerve; in chronic cases, counter-irritants and electricity are valuable.

In multiple n. the nerve fibres are generally affected, the causes of the condition including poisons, such as lead and arsenic, alcohol and carbon monoxide, the toxins of such diseases as diphtheria, influenza, measles, and unhealthy conditions of the blood, as in diabetes or general debility. The onset of an attack is usually gradual, there are pains in the legs, a high-stepping gait may be present, and walking gradually becomes impossible through loss of co-ordination and tenderness of the nerves of the legs and feet. The skin of the lower limbs is flushed and tender, reflexes are diminished, and the muscles become wasted. The upper limbs are similarly affected, and there may be mental symptoms, delirium, loss of memory, hallucinations. The treatment includes careful dieting (no alcohol being allowed), rest, and nutritious food. Fomentations and injections of cocaine are employed to relieve the pain, electricity to prevent the wasting of the muscles, and in the more convalescent stages strychnine, iron, and other tonics.

NEUROGLIA, see Nervous System.

NEUROPTERA (Gk. *neuron*, nerve; *pteron*, wing), an order of Insects which used to include termites, dragon-flies, caddis-flies, may-flies, bird-lice, scorpion-flies, alder-flies, snake-flies, mantis-flies, and lace-wing flies, but which has recently been restricted to the last four and a few less-known groups. These possess as common characters four almost similar glassy membraneous wings which, in early development, are tucked in the body, and which bear a close network of nervures. They are carnivorous insects with biting jaws and large antennæ, and there is complete metamorphosis—the larva being entirely different from the adult. N. are widely distributed, especially in tropical and subtropical countries. Most are terrestrial, but a few spend their larval stages in fresh-water ponds or streams. They do little harm, and occasionally do much good by the destruction of injurious insects. See Insecta.

NEUSALZ (51° 48′ N., 15° 42′ E.), town, on Oder, Silesia, Prussia; flax-mills. Pop. (1910) 13,485.

NEUSS (51° 12′ N., 6° 41′ E.), town, ancient *Novesium*, Rhine province, Prussia, near Rhine; textiles. Pop. (1910) 37,224.

NEUSTADT, Polish Prudnik (50° 20′ N., 17° 34′ E.), town, on Prudnik, Silesia, Prussia; tanneries. Pop. (1910) 18,857.

NEUSTADT-AN-DER-HAARDT (49° 20′ N., 8° 10′ E.), town, Bavarian Palatinate, Germany; wine. Pop. (1910) 19,288.

NEU-STETTIN (53° 42′ N., 16° 43′ E.), town, Pomerania, Prussia; iron foundries. Pop. (1910) 11,833.

NEU-STRELITZ (53° 20′ N., 13° 3′ E.), town, capital, Mecklenburg-Strelitz, Germany; iron manufactures. Pop. (1910) 11,978.

NEUTITSCHEIN (49° 40′ N., 18′ E.), town, Moravia, Austria; woollens. Pop. (1911) 13,756.

NEUTRALITY is the attitude of impartiality adopted towards a state at war with another by states not involved in the war. This attitude has its rights and duties. A neutral state must refrain officially, and must compel its subjects to refrain, from giving any help to either of the belligerent states. It should grant impartially to the belligerents any rights, advantages, or privileges which, according to international usage, are not regarded as an intervention in the war. In particular, strict neutrality requires that there must be no supplying either belligerent with troops, arms, ships, munitions of war, money, or anything which may assist materially in the conduct of the war. The question of the justice or injustice of the war does not affect the fulfilment of this neutrality. Matters which do not directly assist the prosecution of war, as, for instance, the drawing up of commercial treaties, may be carried out between neutral states and states at war without any violation of neutrality.

The neutrality of several states has been guaranteed by the principal European powers, and certain international waterways have also been neutralised by the powers. Switzerland was thus permanently neutralised in 1815, when Great Britain, Austria, France, Portugal, Prussia, Spain, and Russia jointly recognised and guaranteed that Switzerland must neither be invaded nor take any part in European hostilities except for the sole purpose of self-defence. The permanent neutrality of Belgium was guaranteed in similar fashion by Great Britain, Austria, France, Prussia, and Russia by the Treaty of London, 1831.

The Suez Canal was permanently neutralised in 1888 by the Convention between Great Britain, Germany, Austria-Hungary, Spain, France, Italy, the Netherlands, Russia, and Turkey. Under the terms of that Convention the Suez Canal shall always be free and open in war and peace alike to every vessel of commerce or of war, without distinction of flag, and shall never be subjected to the exercise of the rights of blockade. And at the same time, under the Convention no act of war must take place within the Suez Canal, or within a radius of three miles from the ports of access to the canal, even though the Ottoman Empire itself should be at war.

The neutralisation of the Panama Canal was guaranteed on the basis of the Suez Canal Convention by the Treaty of 1901 between Great Britain and the United States.

The Hague Convention of 1907 drew up a long list of 'Rights and Duties of Neutral Powers.' By the articles of this Convention—the territory of neutral powers was declared inviolable, and belligerents were forbidden to move troops or convoys of either munitions of war or supplies across neutral territories, or to erect wireless telegraphy stations on such territories; troops of the belligerent armies received on the territory of a neutral power were to be taken inland as far as possible from the seat of war, and supplied with 'the food, clothing, and relief required by humanity.' The recognition of neutrality has slowly grown up, and, as it is known to-day, is comparatively modern. But the beginnings of the principle may be seen in the treaty between Henry VIII. and Francis I. of France, 1515, and the treaty (of Münster) between France and the emperor, 1648. See INTERNATIONAL LAW.

NEUWIED (50° 26′ N., 7° 29′ E.), town, Rhine province, Prussia, on Rhine; tobacco, sugar. Pop. (1910) 19,107.

NEUWEILER (48° 50′ N., 7° 5′ E.), town, Alsace-Lorraine, Germany; wine.

NEVA (59° 48′ N., 30° 45′ E.), river, N. Russia, flows from Lake Ladogo into Gulf of Finland.

NEVADA (40° N., 118° W.), western state of U.S.A., bounded N. by Idaho, Oregon, W. and S. by California, E. by Arizona and Utah; area, c. 110,700 sq. miles. Except portions in N.E. and S.E., state lies wholly in Great Basin, which consists of elevated plateau, broken by rugged and lofty mountains, and intersected by ravines and wild valleys; principal ranges are E. Humboldt Mts., in E. (containing some of highest peaks), Washoe Mts. (branch from Sierra Nevada), Toyabe Mts., Humboldt Mts., and White Pine Mts.; highest point is Wheeler Peak (over 13,000 ft.), near E. boundary. Lakes are numerous and generally salt; largest, Pyramid Lake, near W. boundary; other notable lakes are Winnemucca, Carson, and Walker; hot and cold springs are frequent; sometimes valleys are watered by streams, but more often they are wide deserts with no vegetation. In S.E. are Virgin and Colorado Rivers, and in extreme N. are several streams which reach ocean; rivers belonging to Great Basin never reach sea, but lose themselves in lakes or sink occasionally, to reappear farther on; longest and most important river is Humboldt, flowing into Humboldt Lake; Carson and Walker Rivers enter lakes of same name. Truckee River is connected with Carson by canal.

Region was explored by Fremont 1843–45; passed into hands of U.S.A. at Guadalupe-Hidalgo Purchase; Nevada formed part of Utah under name of Washoe Country until 1861, when organised as a territory; in 1864, admitted as a state. Chief feature in history of state is development of mines.

On account of dryness of climate and aridity of soil, agriculture depends largely on irrigation; grain, hay, butter, vegetables, and fruits produced; stock-raising is a rising industry. Nevada is, above all, a mining state, being one of richest states in mineral wealth; gold and silver principal productions, but copper, lead, zinc, iron, graphite, sulphur, gypsum, borax, and other minerals, also worked; manufactures almost all in connection with mines. Nevada is one of most thinly populated states; chief towns, Carson City (capital), Reno, and Sparks. State is represented in Congress by two Senators and one Representative. Pop. (1910) 81,875.

NEVADA (37° 50′ N., 94° 20′ W.), city, Missouri, U.S.A.; lumber-mills. Pop. (1910) 7176.

NEVADA CITY (39° 20′ N., 121° W.), town, health-resort, California, U.S.A.; fruit-growing and gold-mining. Pop. (1910) 2689.

NEVERS (47° N., 3° 9′ E.), town, Nièvre, France; gave name to counts of N. from X. cent. onwards; episcopal see, has cathedral dating in part from XI. cent.; manufactures iron goods, china, and earthenware. Pop. 28,000.

NEVILLE, NEVILL, Eng. noble house; descended on female side from Saxon Dolfin, s. of Uchtred; branches settled in Yorkshire at Hornby and Middleham; Middleham was centre of large honour of N's of Raby, who acquired earldom of Westmorland, 1397; Warwick, the 'king-maker,' was of this line. Other families, some of them branches, were N's of Bergavenny, Birling, Essex, Fauconberg, Hallamshire, Montagu. See WARWICK, EARLDOM OF.

NEVILLE, GEORGE (1432–76), bro. of Warwick the 'king-maker'; bp. of Exeter, 1458; abp. of York, 1464; alternately supported Henry VI. and Edward IV.

NEVILLE, RALPH (d. 1244), bp. of Chichester, 1224; Chancellor, 1226.

NEVIN, JOHN WILLIAMSON (1803–86), Amer. divine; Presbyterian, then joined Ger. Reformed Church—aroused opposition by showing sympathy with Catholicism.

NEVIS (17° 8′ N., 62° 35′ W.), island, Leeward group, Brit. W. Indies; mountainous; exports sugar. Pop. 15,500. Capital, Charlestown.

NEVIS, BEN, see BEN NEVIS.

NEVYANSKIY ZAVOD (57° 30′ N., 60° 31′ E.), town, Perm, Russia; iron- and steel-works. Pop. 16,500.

NEW ABBEY (54° 59′ N., 3° 37′ W.), village, Kirkcudbrightshire, Scotland; ruins of Sweetheart Abbey.

NEW ALBANY (38° 18′ N., 85° 46′ W.), city, on Ohio, Indiana, U.S.A.; cottons, machinery. Pop. (1910) 20,629.

NEW AMSTERDAM (6° 8′ N., 57° 24′ W.), town, near mouth of Berbice, Brit. Guiana, S. America. Pop. 9300.

NEW BEDFORD (41° 38′ N., 70° 59′ W.), city, port of entry, Massachusetts, U.S.A., on Acushnet estuary. Among public buildings are city-hall, custom-house, county court-house, public library, and post-office. Chartered as city 1847. N. B. was attacked and almost destroyed during War of Independence. City is of considerable commercial importance, and has extensive trade, formerly chief port of whale-fisheries; manufactures include cotton, lubricating oils, cordage, shoes, glass, paints. Pop. (1910) 96,652.

NEW BRIGHTON.—(1) (40° 40′ N., 80° 16′ W.) town, at confluence of Beaver and Ohio, Pennsylvania, U.S.A.; bricks and machinery. Pop. (1910) 8320. (2) (40° 34′ N., 74° 10′ W.) town in Richmond Borough, New York City, on Staten Island; has institution for sailors, named 'Sailors' Snug Harbor'; paper.

NEW BRITAIN (41° 40′ N., 72° 46′ W.), city, Connecticut, U.S.A.; hardware, hosiery. Pop. (1910) 43,916.

NEW BRITAIN, see NEU-POMMERN.

NEW BRUNSWICK (46° 20′ N., 66° W.), maritime province of Dominion of Canada; bounded by Quebec, Gulf of St. Lawrence (N.), Maine and Quebec (W.), Bay of Fundy (S.), Nova Scotia, Gulf of St. Lawrence (E.); area, 27,985 sq. miles. N. B. is connected with Nova Scotia by narrow isthmus; seaboard (about 600 miles); has excellent harbours; extensive forests; St. John and other navigable rivers; numerous lakes; principal towns, Fredericton (capital), St. John, Moncton. French settlement began, 1604; first Brit. settlement, 1764; region ceded to Britain as part of Acadia, 1713; became separate colony, 1784; great influx of Amer. Loyalists; joined Dominion, 1867.

N. B. has a lieut.-gov., executive council, and legislative chamber; Provincial Univ. at Fredericton; R.C's predominate, then Baptists Methodists, Anglicans, Presbyterians. Coal is mined; limestone and gypsum quarried; rich in minerals and natural gas; valuable fisheries; timber exported. Pop. (1911) 351,889.

NEW BRUNSWICK (40° 32′ N., 74° 57′ W.), town, New Jersey, U.S.A.; contains Rutgers Coll.; has R.C. cathedral; manufactures rubber goods, hardware, hosiery. Pop. (1910) 23,388.

NEW CALEDONIA, LA NOUVELLE CALÉDONIE (21° S., 165° E.), island belonging to France, in South Pacific; length, 250 miles; breadth about 25 miles; area, 7650 sq. miles; surface mountainous; Nouméa, capital. N. C. was discovered by Cook, 1774; annexed by France, 1853; used as penal settlement. Dependencies of N. C. are Isle of Pines, Wallis Archipelago, Loyalty Islands, Huon Islands; Futuna and Alafi annexed by France, 1888. Chief products and exports are coffee, sugar, nickel, and chrome ores, tobacco, vanilla, cotton, fruits; rich in other minerals. Pop. (1911) 50,680, including some 29,000 blacks, several thousand convict settlers.

NEW CASTLE (39° 54′ N., 85° 20′ W.), town, Indiana, U.S.A.; iron, pianos. Pop. (1910) 9446.

NEW ENGLAND, name given to six states in N.E. of U.S.A., consisting of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; area, *c.* 66,000 sq. miles; region mountainous in parts—White Mts. in New Hampshire, Green Mts. in Vermont, and Berkshire Hills in Massachusetts, all forming part of Appalachian mountain system. Soil is fertile in valleys, chief productions being hemp, jute, and flax; climate healthy. Region was named New England by Captain Smith, *c.* 1607; first successful settlement made at Plymouth, 1620; colonised by Puritans from England; supported Federal cause during Amer. Civil War. See UNITED STATES.

James, *Colonization of New England* (1904).

NEW FOREST (*c.* 50° 50′ N., 1° 38′ W.), district, Hampshire, England, W. of Southampton Water; well wooded, beautiful scenery; greater part is Crown property; chief village is Lyndhurst, near the centre.

NEW GLARUS (42° 50′ N., 89° 40′ W.), town, Wisconsin, U.S.A.

NEW GLASGOW (45° 36′ N., 62° 40′ W.), seaport, on East River, Nova Scotia, Canada; iron- and steel-works, collieries. Pop. 5500.

NEW GRANADA, see COLOMBIA.

NEW GUINEA (6° S., 141° E.), second largest island in world, north of Australia in West Pacific; separated from Queensland by Torres Strait; Arafura Sea in S.W.; length about 1500 miles; breadth, 480 miles: area, *c.* 312,000 sq. miles. West part belongs to Holland, N.E. to Germany, S.E. to Britain. Northern part is almost separated from mainland by MacClure Inlet; western half and interior still mostly unexplored. N. G. is traversed by high mountain ranges (Owen Stanley, with Mt. Victoria, 13,000 ft., in S.E.; Charles-Louis, in central region, over 14,000 ft.; Finisterre, 11,000 ft., in N.); extensive forests. Climate is unhealthy. There are numerous beautiful birds (*e.g.* Bird of Paradise); mammals scanty. Chief rivers are Amberno, Fly, Kaiserin Augusta, Mambare. Island is inhabited by Papuans mixed with Malays and Polynesians; notorious for head-hunting and savage tribes. N. G. was sighted by d'Abreu, 1511; name given by Retez, 1546; settlement made by East India Co., 1793; Dutch annexed western half, 1828; remainder divided between Britain and Germany, 1884; explored by Wallace, Meyer, De Clercq, Blackwood, Stanley, Staniforth Smith, Wollaston, and many others in recent years. Pop. *c.* 750,000.

British New Guinea, named TERRITORY OF PAPUA, 1906; includes D'Entrecasteaux, Louisade, and other small islands; area, *c.* 90,500 sq. miles; Commonwealth of Australia assumed control, 1901; administered by lieut.-gov. and legislative council; capital, Port Moresby; chief exports—timber, gold, pearls, rubber, bêche-de-mer, copra, and various tropical products. Pop. 350,000.

German New Guinea includes KAISER WILHELM'S LAND (area, 70,000 sq. miles), Bismarck Archipelago, Marshall, Solomon, and other islands; capital, Herbertshöhe; administered by imperial gov.; chief products—copra, gold, timber, mother-of-pearl, coffee, sandal-wood, tortoise-shell. Pop. 360,000.

Dutch New Guinea.—Area, 151,789 sq. miles; with a few trading and mission stations. Pop. 220,000.

Grimshaw, *The New New Guinea* (1911); Pratt, *Two Years among New Guinea Cannibals* (1903); Krieger, *New Guinea* (Berlin, 1899).

NEW HAMPSHIRE (44° N., 72° W.), north Atlantic state of U.S.A.; one of the New England States; bounded N. by Quebec, W. by Vermont, S. by Massachusetts, E. by Maine and Atlantic Ocean; length, 178 miles; breadth, 88 miles; area of land surface, 9040 sq. miles; water surface, 275 sq. miles.

Surface is mountainous, except in S.E.; White Mts. in N. consist of several ranges, viz. Presidential, with Mount Washington (6293 ft.), Adams (5805 ft.), Jefferson (5725 ft.), Clay (5554 ft.), Madison (5380 ft.), etc.; Franconia range, with Mt. Lafayette (5028 ft.); Carter Moriah range, with Carter Dome (4860 ft.), etc.; country is flat in S.E. Principal rivers are Connecticut, Piscataqua, Merrimac, Androscoggin, Ossipee, Mascoma, Pemigewasset; many fine waterfalls; numerous lakes with fine scenery (Winnepesaukee, New Found, Sunapee, Umbagog, Squam, Massabesic, etc.). Climate is healthy, with severe winters; coldest in N.; mean annual temperature from *c.* 42° to 47° F.; average January temperature is *c.* 20° to 25° F.; mean annual rainfall, *c.* 40 in. Fauna includes wolf, lynx, raccoon, squirrel, deer, fox, sable, mink, porcupine, numerous song-birds (wren, hermit-thrush, bunting, etc.). There are extensive forests of beech, oak, yellow birch, sugar-maple, etc.

History.—N. H. was visited by Martin Pring, 1603; Samuel de Champlain, 1605; Captain John Smith, 1614. All the territory between 40° and 48° N. lat. was

granted to Council for New England by James I., 1620; first settlement made by John Mason, 1623, followed by various others up to 1635. N. H. was annexed by Massachusetts, *c.* 1641; constituted a separate province, 1679; formed part of the Dominion of New England from 1686 to 1689; again united to Massachusetts, 1689; royal government established, *c.* 1692; boundaries definitely fixed, 1737, 1741, 1764. N. H. took an active part in the War of Independence; one of original 13 states of the Union. See UNITED STATES.

N. H. has a gov., Senate (24 members, elected for 2 years), and House of Representatives (390–400 members); 2 Senators and 2 Representatives in Federal Congress. The state is divided into 10 counties. Principal towns are Manchester, Nashua, Concord (capital), Dover, Portsmouth, Berlin, Keene. Roman Catholics predominate; then Baptists, Methodists, and Prot. Episcopalians. Elementary education is compulsory; St. Anselm's College (Manchester), Dartmouth College (Hanover), New Hampshire College of Agriculture and Mechanic Arts (Durham), besides other colleges. Total railway mileage exceeds 1300 miles. Principal products are hay, corn, potatoes, oats, fruit (especially apples), tobacco, timber; important industries are cotton and woollen goods, boots and shoes, lumber, machinery, flour, malt liquors, paper; granite and mica are quarried. Pop. (1910) 430,572.

M'Clintock, *History of New Hampshire*; Fry, *New Hampshire as Royal Province* (1908).

NEW HARMONY (38° 30′ N., 87° 45′ W.), small town, Indiana, U.S.A.; founded by Ger. Socialists called Harmonists, 1805; afterwards settled by Owen's followers. Pop. (1910) 1229.

NEW HAVEN (41° 18′ N., 72° 57′ W.), city, seaport, capital of N. H. County, Connecticut, U.S.A.; situated on N. H. Bay; founded by Puritans in XVII. cent.; one of finest cities in America, with wide streets and avenues, spacious parks and squares and handsome buildings; seat of Yale Univ. (*q.v.*), which was removed here from Saybrook, *c.* 1716; has many other educational establishments, libraries, churches, hospitals, etc. N. H. has extensive trade and important manufactures, including firearms, tools, clocks, carriages, and paper; meat-packing an important industry. Pop. (1910) 133,605.

NEW HEBRIDES, chain of islands in Western Pacific Ocean, largest being Espiritu Santo, Mallicolo, Erromango, Efaté or Sandwich, Ambrym, Tanna, and Aneiteum; islands are mostly lofty and volcanic, with luxuriant vegetation; jointly administered (since 1906) by Brit. and Fr. High Commissioners; seat of government at Port Vila in Efaté Island; inhabited by native Melanesians, British, and French; sighted *c.* 1606; explored and named by Cook in 1774. Leading exports are coffee, copra, maize, bananas, and timber. Pop. *c.* 50,000.

NEW HOLLAND, former name of AUSTRALIA.

NEW IBERIA (30° N., 91° 50′ W.), city, Louisiana, U.S.A.; foundries, mills. Pop. (1910) 7499.

NEW JERSEY (40° N., 74° 30′ W.), north-eastern state of U.S.A.; bounded N. by New York, W. by Pennsylvania and Delaware River, S. by Delaware Bay, and E. by Atlantic; length, 166 miles; breadth, 57 miles; area of land surface, 7525 sq. miles; area of water surface, 710 sq. miles. Coast-line is about 120 miles, fringed with sand-bars; numerous large indentations—Wreck Pond, Shark River, Egg Harbor, Manasquan, New Brigantine, etc.

Surface is mountainous in N.; Blue or Kittatinny Mts. (with High Point, 1803 ft., Mount Tammany, 1480 ft.). S.E. of Blue Mts. is large plateau with average elevation, *c.* 1000 ft. Coastal region is marshy; in certain districts large swamps. Among rivers are Hudson, Delaware, Raritan, Passaic, Wallkill, Hackensack, Great and Little Egg Harbor Rivers, Shark, Metedeconk; many navigable; numerous lakes in N. surrounded by fine scenery. Climate generally is healthy, especially in highlands, where there are many summer resorts; average summer temperature, *c.* 67° in N. and 75° in S.; mean annual rainfall, *c.* 40 to 50 in. Fauna is akin to that of other Middle Atlantic states, and includes grey fox, deer, raccoon, opossum, chipmunk; extensive forests (chiefly pine) in S. region; large oak and chestnut forests in N.

History.—N. J. was first visited by Florentine navigator, Giovanni da Verrazano, 1524; Sandy Hook and Raritan Bay explored by Henry Hudson, 1609; Delaware River explored by Cornelis Jacobsen, 1614, and Cornelis Hendrieksen, 1616. First settlement was made by Dutch at Bergen, 1617; followed by Swed. settlement, 1638, which was taken by Dutch, 1655; several attempts made by English to plant colonies were prevented by Dutch. Charles II. granted the territory between Connecticut and Delaware Rivers, and islands between Cape Cod and Hudson River to Duke of York, 1664, which he transferred to Lord John Berkeley and Sir George Carteret; first gov. arrived, 1665. Serious disputes arose between gov. and Quakers, which resulted in the divisions East Jersey (Carteret property) and West Jersey (Quaker property); reunited, 1702, when proprietary government ceased, and N. J. was claimed by the Crown. Until 1738 New York and N. J. had the same gov. The state took a leading part in the War of Independence and Civil War; one of the 13 original states of the Union.

N. J. is administered by gov., Senate (21 members, elected for 3 years), and General Assembly (60 members); the state has 2 Senators and 10 Representatives in the Federal Congress, and is divided into 21 counties. Principal towns are Newark, Jersey City, Paterson, Trenton (capital), Camden, Hoboken, Elizabeth, Bayonne, Passaic; numerous fine seaside resorts. Roman Catholics predominate; then Methodists, Presbyterians, Baptists, Prot. Episcopalians. Primary education is free and compulsory; there are Princeton Univ. (*q.v.*), Stevens Institute of Technology at Hoboken, Rutgers Coll. at New Brunswick. Total mileage of railway exceeds 2400 miles. New Jersey is an important manufacturing and commercial state; chief products—maize, wheat, oats, potatoes, fruit, timber; main industries are textiles, machinery, iron and steel, leather, petroleum-refining, brewing, chemicals, pottery; also bricks, cement, and tiles; iron ore, pig ore, and zinc are mined; valuable fisheries (trout, sturgeon, black bass, oyster, perch, etc.). Pop. (1910) 2,537,167.

Scott, *New Jersey* in 'American Commonwealths' (Boston, 1907).

NEW JERUSALEM CHURCH, that founded by Swedenborgians; John Clowes (d. 1831) and Thomas Hartley (d. 1784) were the two chief workers in England; there are churches in several parts of England, especially in Lancashire, and the Swedenborgians in England have about 7000 members. They have churches on the Continent, America, Australia. See SWEDENBORG, EMMANUEL.

NEW KENSINGTON (40° 35′ N., 79° 45′ W.), town, on Allegheny, Pennsylvania, U.S.A.; aluminium goods. Pop. (1910) 7707.

NEW LONDON (40° 21′ N., 72° 10′ W.), town, on Thames, Connecticut, U.S.A.; has good harbour; manufactures woollens, agricultural machinery, hardware, silk thread; fruit-canning and fishing carried on; has naval arsenal. Pop. (1910) 19,650.

NEW MADRID (36° 34′ N., 89° 26′ W.), town, on Mississippi, Missouri, U.S.A.; exports lumber.

NEW MEXICO (35° 30′ N., 109° W.), S.W. state, U.S.A.; bounded N. by Colorado, W. by Arizona, S. by Mexico and Texas; E. by Texas and Oklahoma; area, *c.* 122,000 sq. miles. Region consists of high tablelands broken by lofty mt. ranges with general southern inclination; highest peaks (some over 12,000 ft.) belong to main chain of Rocky Mt. system in N. central portion of state; other ranges are Zufii Mts. in N.W., Mimbres Mts. in W., and Guadalupe Mts. in S. Characteristic feature of state is flat-topped

mt. or *Mesa*. In E. is vast extent of waste land known as Staked Plains or Llano Estacado. River valleys are generally level; most important rivers are: Rio Grande, which crosses state from N. to S.; Canadian River and Pecos in E.; Puerco, San Juan, Little Colorado, and Gila in W.

After Mexican War, N. M. was included in country ceded to U.S.A. by treaty of Guadalupe-Hidalgo, 1848; portions added by cession from Texas and Gadsden Purchase; organised as territory in 1850, and included parts of Arizona, Nevada, and Colorado; portion annexed to Colorado, 1861, and Arizona disjoined, 1863; N. M. admitted as state in 1911.

Valleys are productive, and other regions rendered fertile by irrigation; chief crops are wheat, Indian corn, oats; cotton, vegetables, and fruits also cultivated; leading industry stock-raising, grasses on hills and plains being particularly fine for grazing purposes; sheep are raised for wool. N. M. is rich in minerals; gold, silver, copper, coal, iron, and zinc worked; marble and sandstone quarried; turquoises and other precious stones found; mineral springs numerous. Other industries are flour and grist milling, printing, publishing, manufacture of cars, lumber and timber products, and blankets. There are *c.* 3000 miles of railway in state. Chief towns are Santa Fé (capital), Albuquerque, Las Vegas, Silver City, and Roswell; there are Pueblo Indian villages at Taos, Zuñi, Acoma, and elsewhere; many ruins of pueblos may be found. Inhabitants are chiefly Mexicans, Americans, and Indians. Gov. is elected for four years. Senate has 24, House of Representatives 49, members. Pop. (1910) 327,301.

NEW MILLS (53° 22′ N., 2° 2′ W.), town, Derbyshire, England; print-works. Pop. (1911) 8999.

NEW MODEL, Eng. parliamentary army as reorganised, 1645, by Cromwell (*q.v.*); commanded by Fairfax.

NEW ORLEANS (30° N., 90° W.), city, port of entry, Louisiana, U.S.A., on Mississippi River, larger portion being built on E. bank. Owing to extreme lowness of situation city is badly drained, and dykes or embankments, wide enough to form promenades, have been constructed along river-banks and round shores of Lake Pontchartrain, to prevent inundation. For miles river is lined with docks and piers; at suburb of Algiers are floating dry-dock, railway terminals, and repair shops. City is connected by rail and steamship with nearly all important centres. In Amer. parts of city are wide and spacious streets and some handsome buildings; principal thoroughfares, Canal Street, St. Charles Avenue, and Prytania Street. Fr. and Span. quarters, with narrow streets, picturesque houses, balconies, and gardens, afford striking contrast to more modern parts of city; most noteworthy street here is Esplanade Avenue. Most important parks and squares in city are: Jackson Square (still known as Place d'Armes), Lafayette Square, and Lee Circle; City Park (between city and Lake Pontchartrain) and Audubon Park. N. O. contains Tulane Univ. of Louisiana, Coll. of Immaculate Conception, N. O. Univ., Southern Univ., Straight Univ., and many other educational establishments; among prominent structures are city hall, Oddfellows' Hall, custom-house, cotton exchange, St. Charles Hotel, St. Patrick's Church, St. Louis Cathedral, Cabilda (old Span. city hall), archiepiscopal palace, and Howard Memorial Library, besides many other libraries, churches, charitable institutions, monuments, and statues.

N. O. was founded by Sieur de Bienville in 1718, and named Orleans in honour of Fr. regent; some years later became capital of colony of Louisiana; passed into hands of U.S.A. at Purchase of Louisiana in 1803; incorporated as city shortly after; British attacked city in 1815 under Pakenham, but were defeated with great loss of life by Americans under Jackson; during Civil War Federal fleet passed Mississippi forts and forced city to surrender in 1862; capital removed from N. O. to Baton Rouge in 1880.

City is one of chief cotton markets in world; extensive export trade in cotton, tobacco, lumber, sugar, rice, grain, and hides; manufactures include molasses, malt liquors, rice, cotton goods, and machinery; has one of largest sugar refineries in America. Pop. (1910) 339,075.

King, *New Orleans* (1896).

NEW PHILADELPHIA (40° 31′ N., 81° 30′ W.), city, on Tuscarawas, Ohio, U.S.A.; iron and steel manufactures. Pop. (1910) 8542.

NEW PLYMOUTH (39° 5′ S., 174° 5′ E.), seaport, W. coast, N. island of New Zealand; exports dairy produce. Pop. 5500.

NEW POMERANIA, see NEU-POMMERN.

NEW ROCHELLE (40° 56′ N., 73° 45′ W.), town, suburb of New York City, U.S.A.; has fine public buildings. Pop. (1910) 28,807.

NEW ROSS (52° 23′ N., 6° 56′ W.), town, river-port, on Barrow, Wexford, Ireland; agricultural produce. Pop. 5800.

NEW SIBERIA ARCHIPELAGO (75° N., 140° E.), group of islands (discovered 1770) in Arctic Ocean, north of Siberian coast; consisting of Kotelnoi, Byelkovskiy, Thaddeus or Fadievskoi, New Siberia, and Lyakhov Islands; area, 9650 sq. miles; highly interesting fossil flora and fauna (mammoth, rhinoceros, etc.); uninhabited.

NEW SOUTH WALES (28° to 37° 30′ S., 141° to 153° E.), oldest state of the Australian Commonwealth in S.E. of the continent; bounded N. by Queensland, W. by South Australia, S. by Victoria, E. by Pacific Ocean; coast-line from Cape Howe to Point Danger *c.* 700 miles; breadth, 800 miles; area, 310,700 sq. miles; many excellent harbours—Port Jackson, Jervis Bay, Broken Bay, Port Stephens, Port Hocking, Wollongong, Shoalhaven, Bateman's Bay, etc. State is traversed from N. to S. by mountain ranges belonging to the Great Dividing Range or Cordillera of Australia; New England and Liverpool ranges in N., 5000 ft.; Blue Mts. W. of Sydney, 4100 ft.; Cullarin, Monaro, and Muniong ranges (with highest peak, Mount Kosciusko, 7308 ft.) in S. Western part consists of extensive plains with fine pasture lands; climate healthy. Northern coastal districts are dry and sub-tropical; interior and western plains hotter than coast; extensive forests; chief tree, eucalyptus; great variety of birds with gorgeous plumage. Chief rivers are Murray, Murrumbidgee, Darling, Lachlan, Hunter, Richmond, Clarence, Hastings, Macleay, etc. (many navigable); some unimportant lakes. Principal towns are Sydney (capital), Newcastle, Bathurst, Goulburn, Broken Hill, Maitland, Parramatta, Lithgow, Grafton, Bourke, Deniliquin; Yass-Canberra is site of Federal capital.

Coast was probably sighted by Span. vessels, XVI. cent.; visited and named N. S. W. by Cook, 1770; founded as a penal settlement, 1788 (see BOTANY BAY); prospered under gov., Lachlan Macquarie; transportation ceased, 1839; south districts severed, 1851, as Victoria, and Moreton Bay district as Queensland, 1859; responsible government granted, 1859; gold discovered near Bathurst, 1851; joined Commonwealth of Australia, 1901. State was explored by Wentworth, Blaxton, and Lawson, 1813, Evan and Oxley, 1815, Hume and Hovell, 1824, Cunningham, 1827, Mitchell, 1831–36, Sturt, 1844, etc.

N. S. W. has a gov. app. by Crown, and state parliament consisting of Legislative Council and Legislative Assembly; women hold franchise. Church of England is predominant. Education is compulsory between ages of six and fourteen; univ. and Technical College at Sydney. There are over 3600 miles of state railways. Irrigation is rapidly extending; enormous herds of sheep and cattle; fish abound; chief exports, frozen and preserved meat, wool, gold, silver, tin, copper, lead, coal, wheat, fruit, timber,

hides and skins, butter, tallow, leather, cocoa-nut oil; manufactures not extensive, but increasing rapidly.

Dependencies of N. S. W. are Norfolk Island situated in 29° S. lat., 163° E. long.; area, 10 sq. miles; and Lord Howe Island, 31° 30′ S., 159° E. Pop. (1911) 648,212.

Official Year-Book of N. S. W.; Coghlan, *Wealth and Progress of N. S. W.* (annual); Hutchinson, *N. S. W.* (1896).

NEW STYLE, see CALENDAR.

NEW ULM (44° 20′ N., 94° 30′ W.), city, Minnesota, U.S.A., on Minnesota. Pop. (1910) 5648.

NEW WASHINGTON, town, on N. coast of Panay, Philippine Islands.

NEW WESTMINSTER (49° 15′ N., 122° 45′ W.), city, on Fraser, Brit. Columbia, Canada; salmon-canneries; sawmills. Pop. (1911) 13,394.

NEW YEAR'S DAY, the first day of the year and, according to their respective reckonings, celebrated by most peoples. The Christian fathers abolished its veneration as a religious festival owing to its pagan associations.

NEW YORK (STATE) (43° N., 75° W.), north-eastern state of U.S.A.; bounded N. by Quebec, N.W. and W. by Ontario, Lake Ontario, Lake Erie, and Pennsylvania, S. by Pennsylvania, New Jersey, and Atlantic, E. by Connecticut, Massachusetts, and Vermont; length from N. to S., *c.* 300 miles; breadth, *c.* 346 miles; area of land surface, 47,620 sq. miles; area of water surface, 1550 sq. miles. New York includes Long Island and Staten Island on Atlantic coast, besides numerous other islands, viz. Manhattan, Randall's, Hart's, Faulkner's, The Thimbles, Plum, Fire, Fisher's, etc. The state has a coast-line of *c.* 275 miles on Lakes Erie and Ontario, with several good harbours—Buffalo, Dunkirk, Fairhaven, Oswego, etc.; the ocean seaboard is small, but important, containing the harbour of New York City.

Surface is mountainous in N.E., E., and S.E.; Adirondack Mts. in N.E., with highest peaks, Mt. Marcy (5344 ft.), M'Intyre (5112 ft.), Skylight (4920 ft.), etc.; Catskill Mountains in S.E., with Slide Mt. (4205 ft.), Hunter Mt. (4025 ft.); Shawangunk Mts. (with Sam's Point, *c.* 2000 ft.) also in S.E.; extensive tableland in central and western regions; coastal districts level. Geologically N. Y. belongs mainly to the Archæan and Palæozoic periods; almost the whole surface is covered with glacial drifts. Principal rivers are Hudson, St. Lawrence, Oswego, Delaware, Susquehanna, Niagara, Mohawk, Allegheny, Genesee, Charlotte, Chenango, Raquette, Wallkill, Grass; there are many fine falls and rapids—Niagara, Trenton, Taughannock, Genesee, etc. N. Y. has hundreds of lakes throughout the country, parts of Lakes Ontario, Erie, and Champlain, Lakes George, Keuka, Seneca, Cross, Canandaigua, Cayuga, Skaneateles, Owasco, Otisco, Oneida, Otsego, Hemlock, Upper and Lower Ausable, Honeoye, Chautauqua, etc.; many rivers and lakes are navigable. Climate generally is healthy, with hot summers and severe winters; mean annual temperature, 46° F.; coldest in Adirondack region; average rainfall from 40–45 in.; greatest in Adirondack Mts. Fauna includes deer, beaver, elk, moose, red fox, black bear, skunk, porcupine, raccoon, mink, weasel; birds include plover, snipe, tern, grouse, woodcock, thrush, warbler, wren, chikadee, orioles. Immense forests stretch in Adirondack region (mainly spruce, hemlock, pine, maple, beech, yellow birch) and in Catstail region (mainly oak, hickory, chestnut); large pasture and arable land in plateau regions.

History.—Territory was first occupied by Iroquois Indians. New York Bay and Hudson River were discovered by Giovanni de Verrazano, 1524; explored by Henry Hudson (who was in service of Dutch East India Co.), and named New Netherland, 1609; Champlain Lake was discovered by Samuel de Champlain, 1609; Block Island discovered by Adriaen Block, 1614; Dutch trading posts established 1614 onwards. First permanent settlement was made, 1624, under gov. Cornelis Jacobsen Mey; New Netherland declared a province, 1643. Charles II. granted the territory to Duke of York, and in 1664 the English took possession of it and named it N. Y.; retaken by Dutch, 1673; finally taken by English, 1674; became a royal province, 1686; severe conflicts with Indians ensued, also various boundary disputes. N. Y. took a prominent part in the War of Independence and the Civil War, and in the latter was loyal to the Unionists. N. Y. is one of the original 13 states of the Union.

Government.—The state is administered by gov., Senate (51 members, elected for 2 years), and an Assembly (150 members, elected for 1 year). N. Y. has 2 Senators and 43 Representatives in Congress, and is divided into 61 counties. Principal cities are New York, Buffalo, Rochester, Syracuse, Albany (capital), Troy, Yonkers, Utica, Schenectady, Binghamton, Elmira, Auburn, Jamestown.

Roman Catholics predominate, then Methodists, Presbyterians, Prot. Episcopalians. Elementary education is compulsory and maintained chiefly by local taxation. New York has many univ's, colleges, and other institutions, including Columbia Univ. (Manhattan), Cornell Univ. (Ithaca), New York Univ. (New York), Syracuse Univ. (Syracuse), Union Univ. (Schenectady), City of N. Y. College (New York), Barnard College (Manhattan), Polytechnic Institute (Brooklyn), Adelphi College (Brooklyn), U.S. Military Academy (West Point). The Univ. of the State of N. Y. is non-teaching and purely administrative, supervising higher education in the state.

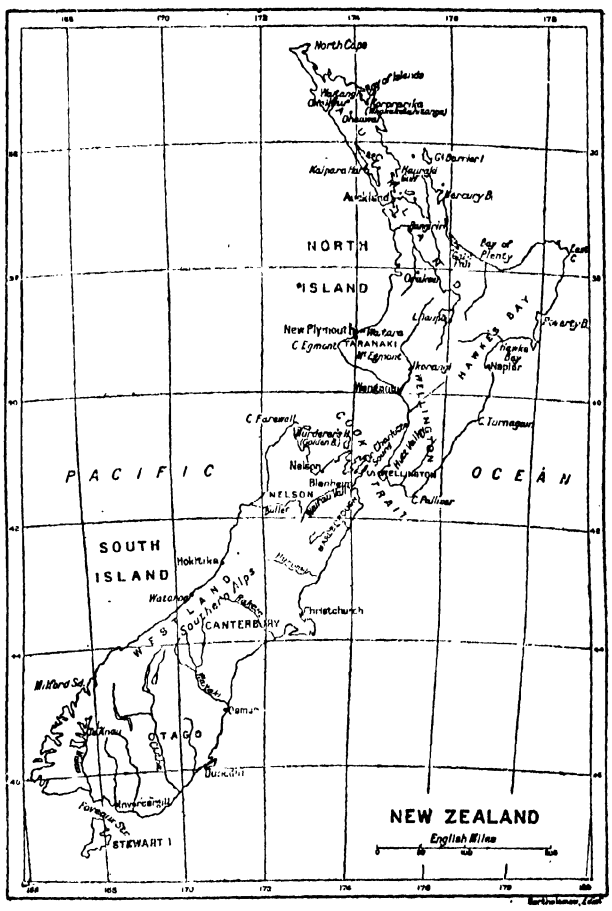
Products and Industries.—Total railway mileage is 8000–9000 miles. Principal products are maize, wheat, oats, potatoes, hay, tobacco, fruit, sugar-beet, timber, live stock, wool. Important industries are manufacturing of clothing, machinery, printing and publishing, sugar- and molasses-refining, dairy produce, liquors, flour, paper, cement, and extensive clay products. N. Y. has numerous mineral springs, viz. Onondaga, Ballston, Saratoga, Avon, New Lebanon, Sharon, etc.; minerals include magnetic iron ore, copper, zinc, lead, talc; salt, petroleum, marble, graphite, limestone, etc., are quarried; valuable fisheries (oysters), etc. Pop. 9,113,614.

Murlin, *New York Red Book* (1910); Wilson, *New York, Old and New* (1907).

NEW YORK (41° 6′ N., 74° W.), largest city of U.S.A., in New York State, and second largest city in world; situated on Hudson (North) River at its confluence with East River. N. Y. comprises Manhattan Island, separated from mainland by Harlem River and Spuyten Duyvil Creek, Long Island, Staten Island, Blackwell's, Randall's, Ward's, Governor's, and other small islands; also some former villages—Washington Heights, Harlem, Port Morris, Inwood, Tremont, Fordham, Riverdale, etc. N. Y. is divided into five boroughs—Manhattan on Manhattan Island, Richmond on Staten Island, Brooklyn on western part, Queens on northern part of Long Island, Bronx on mainland. Length from N. to S. is *c.* 35 miles; breadth (E. to W.), 16 miles; area, *c.* 325 sq. miles.

The harbour, one of the finest in the world, consists of outer harbour or Lower Bay (area, 88 sq. miles), separated from Atlantic Ocean by Sandy Hook bar, and inner harbour or Upper Bay (14 sq. miles), connected with former by the Narrows, a strait, 1 mile wide, between Long and Staten Islands; another channel, Kill van Kull, for smaller vessels runs around Long Island. The approach has several fortifications, viz. Fort-Tompkins, Hamilton, Wadsworth, Totten, Hancock, etc. The Statue of Liberty stands in Upper Bay.

The larger part of the city is laid out very regularly; long wide parallel avenues (First to Eleventh Avenue) run N. and S., crossed at fixed intervals by scores of streets, numbered First, Second, Third, etc. After



59th Street they are broken by Central Park. The so-called lower East Side is one of the tenement districts, consisting of narrow, irregular, densely populated streets. Principal business thoroughfares are Broadway, Wall, 23rd, 34th, 42nd Streets, etc.; handsome residential streets—Fifth Avenue, Madison Avenue, etc. A striking feature are the sky-scrapers, immense buildings of 20 to over 30 storeys, such as the Woolworth Building (750 ft. high, 51 storeys), Metropolitan Life Insurance (693 ft. high), City Investing Buildings (32 storeys), Singer Sewing-Machine Co. (612 ft. high, 41 storeys), Trust Co. of America (23 storeys), Board Exchange, Commercial Buildings, etc. Prominent public edifices are City Hall, in Ital. Renaissance style (1803–12), Appellate Court-House, Tombs (city prison), U.S. Sub-Treasury, Post Office, Metropolitan Museum of Art, Amer. Museum of Natural History, National Academy of Design, Public Library (1911), Metropolitan Opera-House, Manhattan Opera-House, Carnegie Music Hall, Madison Square Garden, Columbia Univ., N. Y. Univ., St. John's College, Academy of Medicine, Trinity Church (1839–46), St. Patrick's R.C. Cathedral (1850–79), St. John's Cathedral, and numerous other churches and synagogues. N. Y. has several fine parks—Central, Battery, Mount Morris, in Manhattan; Van Cortlandt, Pelham, Bronx (with fine botanical and zoological gardens), in Bronx; Prospect Park (Brooklyn), etc.; Statue of *Liberty* (Bartholdi), of *Columbus*, and many other monuments. The 3 suspension bridges, Manhattan, 6855 ft. long (1910), Williamsburg, 7200 ft. long (1904), and Brooklyn, 5990 ft. long (1870–1883), are specially noteworthy (see BRIDGES). Celebrated clubs include Knickerbocker, Manhattan, Union.

Government.—City is governed by Mayor (elected for 4 years), Pres. of the Board of Aldermen (elected by the city), 5 borough pres's (each elected for 4 years), and 73 aldermen (elected for 2 years). The Mayor appoints all heads of departments except finance, which is under a Controller elected by the city. Under Tammany (*q.v.*) numerous scandals arose; Police scandal, 1912. Communication is afforded by electric tramways, elevated railways, ferries, and extensive electric underground trains, connected with Brooklyn by tunnel under East River.

History.—Hudson Bay was discovered by Florentine navigator Verrazano, 1525; Hudson River ascended by Henry Hudson, 1609; first permanent settlement made by Dutch and named *Nieu Amsterdam*, 1623; taken by English and renamed New York, 1664; retaken by Dutch, 1673, but finally annexed by England, 1674; first N. Y. Assembly met, 1683; infested by pirates, *c.* 1700; negro slaves imported, 1725; first newspaper, *New York Gazette*, pub. 1725. During War of Independence N. Y. was in hands of British until 1783; Americans defeated at battles of *Long Island* (1776) and *Harlem Heights*. On establishment of Republic N. Y. was the Federal capital from 1789–90; Erie Canal, opened 1825, was of great commercial importance to N. Y. Great fire destroyed 'East Side,' 1835; Croton Aqueduct completed, 1842; anti-conscription disturbances, 1863. In 1897–98 N. Y., Brooklyn, Long Island City, Staten Island, part of Queens and W. Chester counties, etc., were amalgamated.

New York is the most important seaport and greatest manufacturing centre of U.S.A.; it receives 60 % of the total imports, and sends out over 45 % of total exports of the country. Chief industries are manufacturing of clothing, textiles, printing and publishing, machinery, iron and steel goods, scientific and musical instruments, sugar- and molasses-refining, packing and preserving of meat, distilling and brewing; principal exports—raw cotton, bacon, hams and lard, wheat, maize, oats, copper ore, machinery, agricultural implements, sewing-machines, locomotives, musical and scientific instruments, furniture, carriages, iron and steel goods, cattle and horses, tobacco, leather, paraffin, cotton-seed oil, meat products. N. Y. is perhaps the most cosmopolitan city in the world, and has numerous foreign colonies, such as the German Colony, Greek Colony, Little Italy, Chinatown, Hebrew, Russian, and Negro quarters, etc. Pop. (1900) 3,437,202; (1910) 4,766,883.

Van Dyke, *The New New York* (1909); Martin, *The Wayfarer in N. Y.* (1909).

NEW ZEALAND (34° 30′ to 47° 30′ S., 166° 35′ to 178° 35′ E.), Brit. dominion, S. Pacific Ocean; comprises the three islands known as North, South, and Stewart, and outlying Kermadecs, Chatham, Auckland, Campbell, Bounty, Cook, Savage, and Penrhyn Islands. Area, 104,751 sq. miles. Between North and South Islands is Cook Strait, between South and Stewart is Foveaux Strait. Coast-line is generally broken.

NORTH ISLAND has area 44,468 sq. miles; volcanic mountain ranges run throughout island—highest peaks, Ruapehu (*c.* 9150 ft.), Egmont (*c.* 8350 ft.); drained by Waikato, Thames, Wairoa, North, Wanganui, Hutt, and other streams.

SOUTH ISLAND has area 58,525 sq. miles; traversed

by mountains known as Southern Alps and other ranges; highest peak, Mt. Cook or Aorangi (12,350 ft.); drained by Clutha, Molyneux, Waitaki, Mataura, Grey, and other streams.

STEWART ISLAND has area 665 sq. miles; mountainous, suffers from earthquakes and volcanic eruptions.

Largest towns, Wellington (capital), Christchurch, Dunedin, Auckland. Climate varies, generally much warmer than that of United Kingdom.

History.—Dutch explorer Tasman discovered islands in 1642; they were circumnavigated by Captain Cook, *c.* 1769, who made chart of coast and took formal possession for Britain, which, however, government did not confirm. In 1814 settlements were made by Brit. missionaries, whose efforts at civilising natives met with some success. In 1840 Maoris acknowledged Brit. sovereignty, and islands were once more annexed to Britain by Captain Hobson. N. Z. became autonomous in 1852. Until 1864 seat of government was at Auckland, but in that year it was removed to Wellington. Various wars between colonists and Maoris took place, but these ended by *c.* 1870, since when peace has reigned. Changes in system of government were introduced in 1875. During Boer War N. Z. sent troops to S. Africa in aid of Britain. N. Z. refused to join Commonwealth of Australia in 1900; became Dominion of N. Z. by Order in Council in 1907.

Until now (1913) N. Z. has contributed to the Brit. Navy, and has not attempted to build up a navy for its own defence (cf. its building of the warship *New Zealand* for the Admiralty to use as it thinks fit, 1911).

By Defence Act, 1909, military service is compulsory; after Lord Kitchener's visit the new Defence Act, 1910, greatly improved the organisation.

N. Z. is administered by a governor assisted by nine ministers; there is Parliament of two houses—Legislative Council of 38 members (1911), and House of Representatives of 80 members (including several Maoris); former are appointed, latter elected on adult suffrage. Labour legislation is far advanced; there is a Conciliation and Arbitration Act for settling disputes, and an eight-hours day is universal; most public works are nationalised or municipalised.

Principal wealth lies in vast numbers of sheep and cattle raised; great quantities of wool, frozen meat, and dairy produce exported. Horses and pigs are also bred, and wheat, oats, and other crops widely cultivated. Oranges, lemons, peaches, olives, and other fruits abound. Indigenous products include wild flax, toitoi, raupo, kauri pine, and many valuable timber trees; forest area estimated at 17,000,000 acres. Minerals include gold, silver, copper, antimony; gold to value of over £1,800,000 was exported in 1911. Exports also cereals, hides, gums, fibre, tallow, etc. Imports clothing, machinery, tea, sugar, wines, etc. Railway (state) mileage about 3000.

There is no state religion. Education is free and obligatory. There is a Univ. of N. Z. (Examining), and affiliated Colleges at Dunedin, Auckland, Wellington, and Christchurch. Population consists chiefly of persons of Brit. descent, but there are about 50,000 Maoris and about 2000 Chinese. Pop. excluding aborigines (1901) 772,719; (1911) 1,008,468; total *c.* 1,072,000.

Stout and Stout Logan, *New Zealand* (1911); Loyd, *Newest England* (1901).

NEWARK (40° 4′ N., 82° 23′ W.), city, Ohio, U.S.A.; cars, glassware; iron foundries. Pop. 25,404.

NEWARK (40° 45′ N., 74° 12′ W.), city, port of entry, New Jersey, U.S.A., on Passaic River, *c.* 9 miles from New York; founded 1666 by Company from Connecticut; handsomely built city with fine streets, squares, and parks; chief thoroughfares, Broad Street and Market Street; contains city hall, court-house, public library, and many notable churches. Among educational establishments are Newark Academy, Seminary and Technical School, St. Benedict's Coll., and St. Elizabeth's Academy. N. has many important manufactures, including chemicals, leather, hardware, machinery, paper, trunks, saddlery, boots, shoes, and clothing. Pop. (1910) 347,469.

NEWARK, DAVID LESLIE, LORD (1601–82), Scot. general; commanded for Parliament at *Marston Moor*, 1644; defeated Montrose at *Philiphaugh*, 1645; clung to Presbyterianism, and supported Charles II.; captured at *Worcester*; baron, 1661.

NEWARK-UPON-TRENT (53° 4′ N., 0° 49′ W.), town, Nottinghamshire, England; has ruined castle, which stood three sieges during Civil War; important agricultural centre; manufactures iron and brass goods, beer, flour. Pop. (1911) 16,412.

NEWBERN (35° 4′ N., 77° 13′ W.), town, N. Carolina, U.S.A.; manufactures cotton-seed oil, railway cars; exports lumber, turpentine, vegetables. Pop. (1910) 9961.

NEWBURGH, NEWBURG (41° 29′ N., 74° 3′ W.), town, on Hudson, New York, U.S.A.; manufactures carpets, woollen goods, cottons, leather. Pop. (1910) 27,805.

NEWBURGH (56° 22′ N., 3° 14′ W.), seaport, Fifeshire, Scotland, on Firth of Tay; linens.

NEWBURN (54° 58′ N., 1° 44′ W.), town, Northumberland, England. Pop. (1910) 17,155.

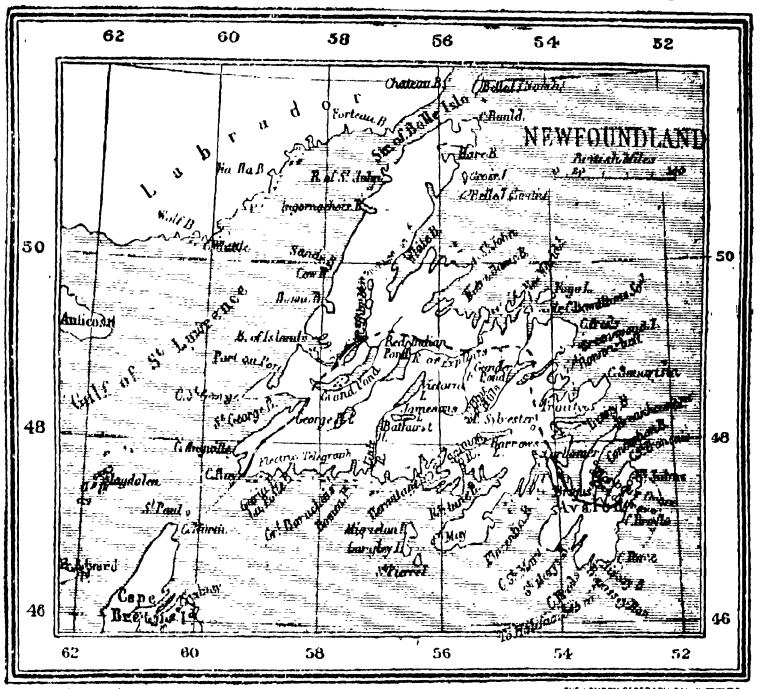
NEWBURY (51° 55′ N., 1° 20′ W.), market town and municipal borough, Berkshire, England, on river Kennet; contains fine Perpendicular church and other interesting buildings; site of two battles during Civil War; large agricultural trade; breweries and flour-mills. Pop. (1911) 12,108.

NEWBURYPORT (42° 46′ N., 70° 58′ W.), city, Massachusetts, U.S.A., on S. bank of Merrimac River; contains city hall, public library, Marine Museum, and some interesting XVII.-cent. houses; manufactures electrical supplies, silverware, combs, shoes, and cottons. Pop. (1910) 14,949.

NEWCASTLE.—(1) (54° 12′ N., 5° 54′ W.) watering-place, on Dundrum Bay, County Down, Ireland. (2) (41° 2′ N., 80° 24′ W.) city, on Shenango, Pennsylvania, U.S.A.; coal and iron region; tinplate works. Pop. (1910) 36,280. (3) (39° 40′ N., 75° 33′ W.) city, Delaware, U.S.A., on Delaware; steel-works, fisheries. Pop. (1910) 3351. (4) (32° 57′ S., 151° 44′ E.) port, N. S. Wales, Australia; great centre of coal trade; shipbuilding, foundries, copper-works, manufacture of boots and shoes; has cathedral. Pop. (1910) 55,630.

NEWCASTLE-UNDER-LYME (53° 2′ N., 2° 14′ W.), town, Staffordshire, England; centre of coal mines and potteries; manufactures paper, army clothing. Pop. (1911) 20,204.

NEWCASTLE-UNDER-LYME, DUKEDOM OF, was cr. for Duke of N.-on-Tyne, 1756; and in 1768 for his nephew, Henry Fiennes-Clinton, whose descendants still hold it.



NEWCASTLE-UPON-TYNE (54° 58′ N., 1° 37′ W.), city, county of a city, municipal and parliamentary borough and port, Northumberland, England, on N. bank of Tyne; ancient and historic town, now one of chief commercial centres in England, owing to mineral products in vicinity and great industrial activity; connected by bridges with Gateshead on opposite bank of river. Among places of interest are: castle erected XII. cent.; many fine churches, including St. Nicholas Cathedral, and some Elizabethan houses; other notable buildings are Guildhall, Corporation Buildings, Wood Memorial Hall, colleges of med. and science, art gallery, and museum. Shipbuilding is main industry; important trade, coal being chief export; manufactures include iron, steel, machinery, glass, earthenware, chemicals, etc. N. was scene of many struggles with Scots. Pop. (1911) 266,671.

NEWCASTLE(-UPON-TYNE), DUKEDOM OF.—Lodovick Stuart, Duke of Lennox, was in 1623 cr. Earl of N. and Duke of Richmond; these honours became extinct on his death, 1624. Sir William Cavendish of Welbeck Abbey was cr. Baron Cavendish and Earl of N., 1628; aided king in Civil War; was cr. Marquess of N., 1643; duke, 1665. On death of his s. Henry, 2nd duke, 1691, titles became extinct. John Holles, Earl of Clare,

was cr. duke, 1694; his grandson, Thomas Pelham-Holles, cr. duke, 1715; d. childless, 1768.

NEWCOMB, SIMON (1835–1909), Amer. astronomer; prof. of Math's for U.S. navy; determined motion of travel of solar system in direction of Vega, chief star in constellation of Lyra, the Harp; he concluded from observations that stars less than 11th magnitude decrease in number, and suggested therefore that the Universe is finite. N. recalculated velocity of light; and observed Zodiacal Light in north, thus connecting it with sun's equatorial plane; wrote several astronomical works.

NEWFOUNDLAND (46° 37′ to 51° 40′ N., 52° 37′ to 59° 25′ W.), island and Brit. colony, N. America, which has so far refused to join Dominion of Canada; lies off mouth of the St. Lawrence, and is separated from Labrador by narrow strait of Belle Isle, while distance to Cape Breton Island on S.W. is little over 50 miles. Its shape is roughly triangular; area, 42,734 sq. miles. Coast-line is much broken and surface is rugged. Chief towns, St. John's, Harbour Grace. There are innumerable lakes, about one-third of surface being water; largest lakes, Grand and Red Indian. Spruce and pine forests are found in various parts; seaboard and river valleys are under cultivation, but over 90 % of adult population are engaged in fishing, fisheries being staple resource of colony. Of these, most important is cod-fishing, season of which is from May till November; seal, lobster, salmon, and herring fishing are also important. There is considerable lumber trade. Minerals include copper, iron, asbestos, lead, coal, silver, gold. Railway mileage, over 700. Climate milder than that of Canada.

History of N. dates from its discovery in 1497 by Cabot; it was subsequently visited by Gaspar Cortereal, a Portuguese explorer, and soon afterwards became known as a great fishing place, expeditions being sent annually by Portugal, France, and Britain in search of fish. In 1583 a colonising expedition to N. was led by Sir Humphrey Gilbert, who definitely annexed the island for England. Other expeditions were undertaken during reign of James I., and a settlement called Avalon was founded by Lord Baltimore in the S.E., which he afterwards withdrew owing to Fr. interference.

For considerable time disputes between French and English for the ownership of N. and its invaluable fisheries were carried on, but eventually these were ended by the Treaty of Utrecht, 1713, whereby Britain obtained exclusive possession of the island, while the French were granted certain fishery rights along the N. and W. coasts. Britain's exclusive sovereignty was confirmed by subsequent treaties in 1763 and 1783. In XIX. cent. further disputes arose, and in 1898 a Royal Commission was appointed to investigate the matter. In 1904 the whole question was finally settled by a convention of both nations, the French keeping the right to fish equally with the British, but renouncing all claim to exclusive rights. A dispute with America on the fishing question was settled in 1910.

N., the smallest of the self-governing Dominions of the Brit. Empire, is administered by a governor, assisted by executive council; legislative power vested in two houses—Assembly of 36 members elected by popular vote, and Legislative Council app. by governor. Rom. Catholicism, Church of England, and Methodism are chief religious denominations. Education is free and compulsory. Pop. (1911) 242,619.

Harvey, *N., England's Oldest Colony* (1897); Prowse, *History of N.* (2nd ed., 1897); Willson, *The Truth about N.*

NEWFOUNDLAND DOGS, see Dog Family.

NEWHAVEN (50° 47′ N., 0° 2′ E.), seaport, Sussex, England, on Eng. Channel; terminus of Newhaven-Dieppe channel route; coasting trade. Pop. (1911) 6665.

NEWLYN (50° 6′ N., 5° 33′ W.), fishing village, Cornwall, England. Pop. 4500.

NEWMAN, FRANCIS WILLIAM (1805–97), Eng. scholar; his religious views were antithetical to his bro's (Cardinal N.), being rationalistic and eclectic. His best-known work is *Phases of Faith.*

NEWMAN, JOHN HENRY (1801–90), Eng. cardinal; s. of a banker; ed. at private school and Trinity Coll., Oxford, 1821; elected fellow of Oriel, 1822, and tutor, 1826, but lost his position owing to ecclesiastical disputes, 1830. He travelled abroad in 1833, visiting Rome, and on his return became the leader of the new Oxford Movement (*q.v.*), writing in *Tracts for the Times*, and having enormous influence in Oxford in the later thirties. But he had doubts about the position of the Anglican Church, and joined the Rom. communion, 1845. He was ordained priest in Rome, and held various positions in England. From 1854–58 he was rector of the Catholic Univ. in Dublin. He engaged in controversy and wrote various works, and was created cardinal, 1879. He described his religious life's work as fighting against 'liberalism in religion.'

Life, by Wilfrid Ward, and by Barry, Waller, Burrow, Hutton, and Meynell.

NEWMARKET (52° 14′ N., 0° 24′ E.), town, Cambridge and Suffolk, England; horse-racing centre. Pop. (1911) 10,483.

NEWMILNS (55° 37′ N., 4° 19′ W.), town, on Irvine, Ayrshire, Scotland; muslins, laces. Pop. (1911) 4806.

NEWPORT.—(1) (51° 35′ N., 3° W.) town, Monmouthshire, England; has important iron and chemical manufactures, and exports large quantities of coal and iron; has ruined castle and fine old church; R.C. episcopal see. Pop. (1911) 83,700. (2) (50° 42′ N., 1° 18′ W.) town, Isle of Wight, England; in neighbourhood are remains of Carisbrooke Castle; XVII.-cent. school. Pop. (1911) 11,155. (3) (52° 47′ N., 2° 23′ W.) town, Shropshire, England; in neighbourhood are remains of Lilleshall Abbey; XVII.-cent. school. Pop. (1911) 3250.

NEWPORT (41° 27′ N., 71° 19′ W.), city and port of entry, Rhode Island, U.S.A., situated on Narragansett Bay; has excellent harbour well protected by forts and torpedo station; founded XVII. cent., and became of considerable importance, but trade was ruined by Amer. War of Independence. Principal buildings are state house, city hall, custom-house, Redwood Library, and Round Tower in Touro Park. Newport is a fashionable watering-place and contains many magnificent estates and houses; fishing chief industry. Pop. (1910) 21,149.

NEWPORT NEWS (36° 57′ N., 76° 30′ W.), city, port of entry, Virginia, U.S.A., on James River; excellent harbour; shipbuilding. Pop. (1910) 20,205.

NEWPORT PAGNELL (52° 6′ N., 0° 43′ W.), market town, on Ouse, Buckinghamshire, England. Pop. (1911) 4239.

NEWQUAY (50° 25′ N., 5° 5′ W.), seaport, watering-place, Cornwall, England. Pop. (1911) 4415.

NEWRY (54° 11′ N., 6° 20′ W.), seaport, on Carlingford Lough, County Down, Ireland; flax-spinning and flour-mills. Pop. (1911) 11,956.

NEWSPAPERS.—The modern newspaper is one of the marvels of civilisation. It is a triumph of organisation, enterprise, and mechanical ingenuity. As indispensable as almost anything of the kind can be, it stands as eyes and ears to its readers, and keeps them in constant touch with all the world's happenings.

History.—Ancient Rome is known to have possessed a kind of official gazette (*Acta Diurna*), while in China, where printing from movable types was practised many years before the system was reinvented in Europe, it is claimed that a n. was in circulation in the early cent's of the Christian era. But the beginning of n's as publications intended for general perusal must be placed at a much later period. The earliest known specimen was printed at Frankfurt in 1615. In England no trace has been preserved of any n. earlier than the *Courant* of 1622. Its subtitle was *The Weekly News from Foreign Parts*, and it professed to do no more than give news that had already been published abroad.

It was soon recognised that the function of a n. could not be confined to the purveying of foreign information. One of the earliest indications of the spread of the n. idea was witnessed in the printing of *Diurnal Occurrences*, which in 1641 included reports of the proceedings in Parliament. This publicity was little to the liking of the members, who then, and for many years afterwards, proved highly sensitive to any unauthorised references to the business of either House. The Long Parliament appointed authorities for the licensing of papers and pamphlets, and forbade the publication of others not so licensed. Similarly, Cromwell declared that no one might print any news or intelligence without the permission of the Sec. of State, and from 1662 to 1695 a vigorous Licensing Act continued in operation. Two papers during that period secured official sanction, but others, representing the dawning independence of the Press, defied the edict, and one printer, as an example to the others, was hung, drawn, and quartered.

In this period was established the still-existing *London Gazette*, which was first issued on November 7, 1665. The first daily n., the *Daily Courant*, began publication in the early years of the XVIII. cent., but its career was short. By 1709 the number of n's in London had increased to eighteen, including Steele's *Tatler*. The *Edinburgh Courant*, founded in 1705, continued publication until 1886, when it was amalgamated with the *Glasgow News*. Among the men of literary eminence who engaged in n. writing in these early days were Defoe, Swift, Addison, Steele, Fielding, Smollett, and Johnson. It was the latter who, referring to his parliamentary reports, declared with satisfaction that he took good care the Whig dogs did not get the best of it. There was in these days no pretence of impartial comment or even impartial reporting, and n. utterances were characterised by venom and ill-feeling.

To this latter aspect of the Press was probably due a renewed effort on the part of the authorities to control the new factor in public life. They, in 1712, imposed a stamp duty of a halfpenny on every half-sheet, and a penny on every whole sheet, with the addition of a tax of a shilling on each advertisement (*q.v.*). These rates were doubled in 1776, and subsequent increases raised the advertisement tax to 3s. 6d. and the stamp duty to 4d. There was also a duty on paper, imposed in the reign of Queen Anne, and remaining in force until 1861. It was not until 1853 that the advertisement tax was abolished, and two years later the stamp duty was also removed. The abolition of the paper duty was the occasion of a strenuous constitutional issue between the House of Lords and the Commons. The latter, on the initiative of W. E. Gladstone, in half-hearted fashion approved, but the Lords rejected, the proposal, and thus asserted a right to refuse assent to the repeal of taxation. On the reintroduction of the measure, the Lords withdrew their opposition.

Apart from the financial hampering of early n. enterprise, the proprietors were subjected to frequent prosecution, fine, and imprisonment. Many of the prosecutions now appear vindictive, but, on the other hand, the n's were scurrilous and vituperative in the highest degree. But with increase of power came a greater sense of responsibility, and while strenuous and combative partisanship are still common, it is marked by more decorum.

Modern Developments.—While the stamp, advertisement, and paper duties were in operation, and before the machinery of production and facilities for distribution were improved, n's were something of a luxury. Sevenpence was the common price for much less value than is now offered for a halfpenny. Working people clubbed together for the purchase of a paper, which was read in turn by the subscribers. After the removal of the financial and other handicaps, there was a vast expansion of n. enterprise. The railways, the invention of the telegraph, and later, the coming of the telephone, facilitated the transmission of news and the distribution of the printed papers. A great concession is that by which a telegraphic message of a hundred words may be sent at night for one shilling, and a message of seventy-five words for the same fee, during the day. The press telegram rates result in a loss to the Post Office, but the deficit is generally regarded as of small moment compared with the advantages of a cheap n. press. Great reductions have also been made in recent years in press cable rates.

N's have within the last generation greatly increased their efforts to obtain news as promptly after the event as possible. While reporting the proceedings of all kinds of public bodies—and sometimes the proceedings of bodies that are not public — from Parliament to parish councils, they attempt to produce a daily or weekly record of every interesting phase of public life. In particular, and in the evening n's specially, there has been a great and not wholly admirable development on the side of sport. But in this respect the n's reflect the public taste. Since Dr. Howard Russell's graphic descriptions of the Crimean campaign in the columns of *The Times*, every important n. has its special correspondent (and

sometimes numbers of them) at every war, and as near every battlefield as he is allowed to penetrate. Of late years, however, the necessity for secrecy in military movements has led to a restriction in the operations of war correspondents.

Staff.—The Editorial Staff of a n. consists of an *Editor-in-Chief* (who directs the policy of the paper, etc.), one or more *Assistant Editors*, including, it may be, a Foreign Editor, Sports Editor, and other Specialists; *Sub-editors* who arrange and prepare for publication the news collected by the n's *reporters* (see REPORTING), sent in by local, foreign, and special *Correspondents*, or received from some *News Agency*. In addition there is the staff engaged in the counting-house, advertisement, and other business departments of the n.; and the compositors, printers, and machine-room hands who turn out the finished n. in accordance with the instructions of the editorial and business staffs.

Printing.—A great advance in n.-printing was made when the steam press was introduced in 1814 by John Walter of *The Times*. This was followed by the rotary printing machine by means of which n's, folded and complete, are produced at the rate of 20,000 or more copies per hour. Before the introduction of the Linotype, a comparatively recent invention, numerous more or less successful attempts were made to improve on the system of hand setting of type by compositors. The *Linotype* has revolutionised methods in the composing room. It is a highly ingenious machine, which, by the manipulation of a keyboard, arranges in proper order matrices from which a complete line of type is cast in one piece. A still later and equally ingenious machine, the *Monotype*, casts each letter separately, and thus enables errors to be corrected without the necessity of setting up the whole line anew. These and other improvements enable n's to meet the enormous demand which has been steadily growing since the Education Act of 1870.

British Newspapers have been greatly influenced by the methods of America. The result is that while the more reputable organs have declined to subordinate facts to picturesque, and often wholly inaccurate, detail, news is now presented in a more popular fashion, and an effort is made to infuse interest into even formal subjects. Although it is sometimes asserted that readers no longer take their opinions from n's, the chief organs retain their leading articles, and there can be little doubt that on many occasions and on many subjects they offer guidance which is willingly accepted. Some of the morning and most of the evening n's supplement the printed text by illustrations, in line drawing or half-tone.

In places where the n's are not specially represented, news is obtained through various **News Agencies**, the chief of which are *Reuter's Telegram Company* (founded 1865), the *Press Association* (1868), the *Central News* (1870), and the *Exchange Telegraph Company* (1870). Dalziel and Laffan are news organisations which deal chiefly in foreign intelligence.

It is estimated that there are 60,000 daily and weekly n's in the world, more than half of which are printed in English.

There are (1913) in Great Britain 2406 newspapers. Of these (including 15 daily papers in London and 135 in the Eng. provinces) there are 464 papers of all kinds published in London, and 1359 in the provinces. Wales has 129 papers, including 8 dailies; Scotland 247 papers, including 18 dailies; and Ireland 191 papers, including 18 dailies.

English Newspapers.—The chief London daily n's are *The Times* (founded in 1788); *The Daily Telegraph* (1855); *The Standard* (1857); *The Morning Post* (1772); *The Daily News and Leader* (founded as *Daily News* in 1846); *The Daily Chronicle* (1876); *The Daily Express* (1900); *The Daily Citizen* (1912), a Labour paper; and the *Daily Mail*. The last, established in 1896, and now having a circulation of almost exactly a million copies—the largest of (at least) British n's—was the first of the successful halfpenny morning n's; others subsequently reduced their prices to a halfpenny also. The evening papers published in London are *The Globe* (founded in 1803), the *Evening Standard* (1827), and *St. James' Gazette* (1880), amalgamated in 1905, the *Pall Mall Gazette* (1865), the *Westminster Gazette* (1893), the *Star* (1888), and the *Evening News* (1881). Illustrated daily papers in London are the *Daily Graphic* (1890), the *Daily Mirror* (1903), and *Daily Sketch* (1909). The *Observer*, *Lloyd's Weekly News*, and other papers are published on Sundays. There are numerous daily and weekly papers devoted to trade, labour, and technical interests, medicine, science, education, the churches, the stage, sport, society, and fashion topics (see PERIODICALS).

Among outstanding n's published in the Eng. provinces are the *Manchester Guardian*, *Birmingham Daily Post*, *Yorkshire Post*, *Sheffield Daily Telegraph*, *Liverpool Daily Post*, and *Mercury*.

The chief **Scottish Newspapers** are *The Scotsman*, founded in 1817 (became a daily n. in 1855); the *Glasgow Herald* (1805); *Dundee Advertiser* (1801); *Dundee Courier* (1816); *Glasgow Daily Mail* (with which was incorporated in 1901 the *Record* and the *North British Daily Mail*, founded in 1847); the *Aberdeen Journal* (1748); the *Aberdeen Free Press* (1853). Evening n's include the Edinburgh *Dispatch* (1886) and *News* (1873), the Glasgow *Citizen* (1864), *Times* (1876), and *News* (1905, founded as *Glasgow Evening News* in 1876).

Irish Newspapers.—The *Dublin News-Letter* was started 1685; the *Dublin Gazette* in 1705. The oldest existing Irish n. is the *Belfast News-Letter*, established 1737. *Freeman's Journal* was founded in Dublin c. 1763 as the *Public Register*. The leading Unionist paper in Ireland is the *Irish Times*.

Colonial Newspapers.—There are about 1200 n's published in Australia, at least 800 in Canada, about 150 in New Zealand, about 160 in South Africa, and 1062 periodicals in India. The oldest existing n. in Australia is the *Sydney Morning Herald* (1831); other leading Australian papers are the *Sydney Daily Telegraph*, the *Melbourne Age* and *Argus*, and the clever Sydney *Bulletin* (weekly). The *New Zealand Times* dates from 1846. The earliest Canadian papers date from the middle of the XVIII. cent. The *Quebec Chronicle* appeared 1764, the *Montreal Gazette*, 1778; the *Montreal Herald* was founded 1808, the *Toronto Globe*, 1844. Many Canadian papers are in French. The leading South African paper is the *Cape Times*, Cape Town (1876); the *Cape Argus* (evening) dates from 1857. The Johannesburg *Star* is the oldest in the Transvaal. The chief Dutch papers are *Ons Land* and the *Volkstem*. Among notable n's in India are the *Pioneer* (Allahabad), *Civil and Military Gazette* (Lahore), *Statesman* (Calcutta), *Times of India* (Bombay), *Madras Times* (Madras).

United States Newspapers.—The total number of n's and periodicals published in U.S.A. is 22,806. The *Boston News-Letter* (1704) was the first Amer. journal. Of the dailies, among the best known are the *New York Herald*, the *New York Tribune*, the *New York Times*; the *Record Herald*, the *Inter-Ocean*, and the *Examiner* (Chicago); the *San Francisco Examiner* and the *San Francisco Bulletin*.

Foreign Newspapers.—In FRANCE the first n. published was the *Gazette de France*, founded in 1631. There is now a large number of journals in the country. Paris alone has about 100. Perhaps the best known to Eng. readers are the *Figaro*, the *Gaulois*, the *Intransigeant*, the *Journal*, the *Journal des Débats*, the *Patrie*, the *Petit Journal*, the *Matin*, the *République Française*, the *Siècle*, the *Soleil*, and the *Temps*.

RUSSIAN dailies include the *St. Petersburgskya Viedomosti*, the *Journal de St. Pétersbourg*, the *Novoya Vremja*, and the *Moscovskya Viedomosti*.

Of the 1050 n's in GERMANY, about 60 are published

in Berlin, including 29 dailies. Among those frequently quoted in Britain are the *Lokal Anzeiger*, *Berliner Tageblatt*, *Vossische Zeitung*, the *Cologne Gazette*, the *Kölnische Volkszeitung*, and the *Vorwärts* (Social-Democratic organ).

The first n. in Italy was the *Diario di Roma* (1716). Celebrated Ital. n's are the *Fanfulla*, the *Tribuna*, *L'Osservatore Romano* (papal), and *Messaggiero* (Rome); *Il Secolo* and *Corrière della Sera* (Milan).

Published lists show that Austria and Hungary have about 100 important n's (notably the Vienna *Neue Freie Presse*), Belgium 70, Denmark about 80, Greece 24, Holland 90, Italy 180, Norway 45, Russia 80, Spain 75, Sweden 70, Switzerland 118, and Turkey about 20.

A feature of many continental countries is 'inspired news,' i.e. official information conveyed by government authorities to certain papers which are regarded as semi-official organs. While Eng. n's favour anonymous leading articles, continental 'leaders' are generally signed or initialed. Most European n's appear on Sundays as on week-days.

Dibblee, *Newspapers* (1913).

NEWTON.—(1) (38° 2′ N., 97° 20′ W.) city, Kansas, U.S.A.; flour-mills. Pop. (1910) 7862. (2) (42° 21′ N., 71° 9′ W.) residential city, on Charles River, Massachusetts, U.S.A. Pop. (1910) 39,806.

NEWTON, ALFRED (1829–1907), Eng. zoologist; eminent student of ornithology and zoogeography.

NEWTON, SIR ISAAC (1642–1727), Eng. natural philosopher; b. Woolsthorpe, Lincolnshire; inventor of the binomial theorem, method of tangents, and fluxional calculus. Tradition has it that the sight of a falling apple in his garden first influenced him towards research concerning the attraction of the earth, which culminated in his discovery of gravity, 1665. In immediate sequence followed a deduction of the law of inverse squares from Kepler's third law, but not until 1685, following on experiments by Picard, which furnished a reliable value for the terrestrial radius, was he able to prove its exactness.

The first volume of his *Philosophiæ Naturalis Principia Mathematica* (1687) was an exposition of the dynamic results of the law of inverse squares; the second, a treatise on motion in resisting mediums, hydrostatics, hydrodynamics, and tides; the third dealt with planetary motion and comets. In 1666 he turned to optical research, and resolved white light into its constituent colours; in 1668 he invented the reflecting telescope, and, lecturing before the Royal Soc. in 1672 and 1675, read papers on prismatic experiments and the phenomena due to interference of light rays known as *Newton's Rings*. Subsequently he published a volume, *Optics*, favouring the emission of light theory, and embodying the results of his papers. In 1669 he was appointed to the chair of Math's at Cambridge Univ., representing the univ. in Parliament in 1689 and in 1701 as a Whig, being defeated at the polls in 1705; app. Warden of the Mint, 1696, Master in 1699, knighted in 1705; he was Pres. of the Royal Soc. from 1703 till his death.

In 1692 he drew up a treatise on the calculus for math's. A controversy with Leibnitz started in 1705, and, lasting 20 years, finally vindicated his own claims of priority in the discovery of the calculus theory. While engaged in the completion of his lunar theory (1694–95) he was embroiled in a protracted dispute with Flamsteed, whose observations were essential for the success of his work. N. was buried in Westminster Abbey.

Sir David Brewster, *Life of N.*

NEWTON, JOHN (1725–1807), Anglican divine; sailor, 1737–55; ordained, 1764; with William Cowper pub. *Olney Hymns*.

NEWTON ABBOT (50° 32′ N., 3° 36′ W.), town, Devonshire, England, on Teign estuary; railway workshops; exports potter's clay. Pop. (1911) 13,712.

NEWTON-IN-MAKERFIELD, NEWTON-LE-WILLOWS (53° 28′ N., 2° 37′ W.), town, Lancashire, England; printing-works and paper-mills. Pop. (1911) 18,462.

NEWTOWN.—(1) (52° 31′ N., 3° 20′ W.) town, on Severn, Montgomeryshire, England; flannel. Pop. (1911) 6068. (2) S.W. suburb, Sydney, New South Wales. Pop. 24,000.

NEWTOWNARDS (54° 36′ N., 5° 41′ W.), seaport, County Down, Ireland, on Lough Strangford; muslin embroidery; linens. Pop. 9200.

NEWTS, EFTS, members of the amphibian genus *Molge*, found in both Old and New Worlds; small, long-tailed, cylindrical animals, some 5 or 6 inches in length. The tail is sometimes surmounted by a crest or fin. Their food consists of worms and aquatic insects, for they are predominantly aquatic creatures; but the Land and Cave Newts of America live almost entirely on land.

NEY, MICHEL (1769–1815), Fr. general; Duke of Elchingen, 1808; prince of the Moskowa, 1812. N. rose from ranks; lieut. in army of North, 1792; general of division, 1799; marshal of France, 1804; won battle of *Elchingen*, which secured capitulation of Ulm, 1805; after *Friedland*, 1808, received from Napoleon description '*brave des braves*'; won battle of *Borodino* and led retreat from Russia, 1812; shot as traitor at Restoration; statue erected on spot, 1853. *Life*, by Bonnal.

NGAMI (20° 28′ S., 22° 50′ E.), formerly a large lake in N. of Kalahari Desert, S. Africa; now almost dry; its principal feeder was the Okavango or Kubango.

NGAN-HUI, NGAN-HWEI (32° N., 117° E.), fertile inland province, China; traversed by Yang-tze-kiang and Hwai-ho; tea; capital, Ngan-king. Pop. 20,500,000.

NIAGARA (43° 15′ N., 79° 8′ W.), river, N. America, forming boundary between Ontario and New York; rises in Lake Erie and flows into Lake Ontario (c. 35 miles). At famous **Falls** river is divided by Goat Island, larger volume of water falling 158 ft. on Canadian side (*Horseshoe Fall*: breadth, 2640 ft.); Amer. Fall, much narrower, is 162 ft. high. Below falls river enters chasm, and farther on are whirlpool and rapids.

Gilbert, *Niagara Falls and their History* (1893).

NIAGARA FALLS.—(1) (43° 6′ N., 79° 4′ W.) town, New York, U.S.A.; seat of R.C. univ.; manufacturing centre; derives water-power from Falls. Pop. (1910) 30,445. (2) (43° 14′ N., 79° 9′ W.) town, port of entry, on Niagara, Ontario; carborundum, paper. Pop. 10,900.

NIAGARA FORT (43° 17′ N., 79° 6′ W.), fortress, near estuary of Niagara R., on Lake Ontario, N. America; occupied by British, 1813–15.

NIALL, see O'NEILL.

NIAM-NIAM, African people of mixed descent, dwelling from the White Nile and the Shari nearly to the equator; estimated at 2,000,000, and including several quite distinct tribes. Courageous, faithful to their wives, skilful in many arts and industries, and intelligent. Earthenware, metal-work, and wood-carving are the chief industries. The men are hunters, the women agriculturists, the soil being fruitful of cereals, yams, and tobacco.

NIAS (1° N., 97° 30′ W.), island, Dutch E. Indies, W. of Sumatra. Pop. 320,000.

NIBELUNGENLIED, High German heroic epic around the following tradition: King Gunter of Burgundy weds Queen Brunhilde with the help of Siegfried; Siegfried in turn weds Kriemhilde, Gunter's sister. The two queens quarrel and Kriemhilde insults her rival. Hagen, a vassal of Gunter, avenges the insult by murdering Siegfried. Kriemhilde marries Etzel, king of the Huns, and with his aid treacherously annihilates the rest of her family (the *Nibelungen*), but is herself killed by Hagen, who in turn succumbs to Hildebrand. Although of popular Ger. origin, the epic was preserved through Scandinavian channels, and has been coloured by them, acquiring a definite form about 1200 under Kaiser Frederic I. It was lost after the XV. cent., but was

rediscovered by Obereit and Bodmer in the XVIII. cent., and reconstituted from later discoveries. It has formed the inspiration of several modern Ger. masterpieces, notably Hebbel's *Die Nibelungen* and Wagner's great series of musical dramas, *Der Ring der Nibelungen*.

NICÆA, modern ISNIK (40° 30′ N., 29° 50′ E.), ancient city on Lake Ascania, Bithynia, Asia Minor.

NICÆA, COUNCIL OF (325 A.D.), the first Œcumenical Council; the persecutions were over and Christianity was now state-established. The immediate object of the Council was to settle the Arian controversy. The bp's were mostly from the Eastern provinces. The Council refused to accept an Arian creed; a creed was brought forward by Eusebius of Cæsarea and in a modified form accepted by the Council. The majority were unwilling to see phrases formulated which were not in Scripture. Athanasius took a leading part and the Emperor Constantine presided.

NICARAGUA (11° to 15° N., 83° to 87° 30′ W.), republic, Central America; is bounded N.W. by Honduras, E. by Caribbean Sea, S. by Costa Rica, S.W. by Pacific; area, *c.* 49,200 sq. miles; Cordillera runs along S.W. side, 15 to 30 miles from coast; between mountains and sea is depression containing Lakes Managua and Nicaragua; to E. between base of hills and sea is extensive plain. Nicaragua is drained by Coco, Sistin, Grande, San Juan. A canal from Atlantic to Pacific, *via* the San Juan Valley and Lake Nicaragua, was early projected and operations actually begun (1889), but the Panama route has prevailed. Chief towns, Managua (capital), Leon, Granada, Matagalpa. Subject to earthquakes; climate varies with elevation, hot and damp near coast.

Nicaragua was sighted by Columbus, 1502; overrun by Gonzalez Davilo, 1522, and annexed by Spain, under whom it became province of Guatemala; rose against mother country and proclaimed independence, 1821; united with Central Amer. Republic from 1823 to 1838, when it became separate state; warred against Britain, 1848, from whom it acquired Mosquito Coast (*q.v.*,), 1860; warred against Honduras, 1907. Dispute with U.S. occurred, 1909.

Administered by pres., aided by council of five ministers; legislature consists of house of 36 members elected by popular vote. Principal religion, Rom. Catholicism. Primary education is free and obligatory. Nicaragua produces mahogany and other valuable timbers, coffee, rubber, sugar-cane, fruit, gold, silver; stock-raising and dairying important. Railway mileage, *c.* 170. Inhabitants include Europeans (very few), Indians, half-breeds. Pop. (1910) 600,000.

Niederlein, *The State of N.* (1898); Walker, *Ocean to Ocean, an Account of N. and its People* (1902).

NICASTRO (39° N., 16° 22′ E.), town, Catanzaro, Calabria, Italy. Pop. 18,500.

NICE, NIZZA (43° 44′ N., 7° 14′ E.), chief town in Alpes-Maritimes, France; beautifully situated on Mediterranean. Built by Phocæans from Marseilles, *Nicæa* was bought by Romans; in Saracen hands, X. cent.; taken by French, 1543, but restored to Savoy; joined to France, 1859, in return for Fr. support against Austria. A fashionable Riviera winter resort, N. is famed for its Promenade des Anglais, Casino, Battles of Flowers, etc.; has cathedral, fort, and harbour; exports flowers, perfumes, fruits, olive oil, pottery, and carved olive-wood. Pop. (1911) 142,949.

NICEPHORUS I., Byzantine emperor, 802–11, after successful revolution against Irene.

NICEPHORUS II., PHOCAS, Byzantine emperor, 963–69; famous conqueror; assassinated by wife in conjunction with his nephew, John Zimisces.

NICEPHORUS III., BOTANIATES, Byzantine emperor, 1078–81; with Turk. help deposed predecessor Michael VII.; deposed by Alexius Comnenus.

NICHOLAS (1841–), king of Montenegro, etc.; succ., 1860, as hereditary prince; developed Montenegro, extended boundaries; fought against Turkey, 1862, 1876, 1877–78, 1912–13; obtained subsidies from Russia; assumed title king, 1910; distinguished general, statesman, and poet. See MONTENEGRO.

NICHOLAS I. (1796–1855), Tsar of Russia; m. Charlotte Louise, dau. of Emperor Frederick William III., 1817; declared heir of his bro., Alexander I., 1823, Constantine being passed over at his own request; succ., 1825, after dangerous revolt in army stirred up by princes, as tyrannical character of N. was deeply feared; at once established iron despotism and elaborate spy system; assisted Greeks against Turkey in their War of Independence from hatred of infidel; western policy to uphold existing governments by armed intervention of powers. N. made Holy Alliance with Austria and Prussia, 1833, of which secret purpose was crusade against revolutions; it became Quadruple Alliance by accession of Britain, 1840, Russia temporarily abandoning Turk. aims; visited England, 1844; aided Austria to suppress Hungarian revolution, 1849, and to maintain preponderance in Germany against Prussia, 1850; refused to acknowledge Napoleon III., and alienated remaining powers by attack on Turkey; as pretext for war demanded recognition of right, claimed by France, to protection of Holy Places at Jerusalem, and to protectorate of all Christian subjects of sultan; sustained crowning disaster in Crimean War (*q.v.*); rigid, narrow, upright character; handsome and striking appearance.

NICHOLAS II. (1868–), Tsar of Russia; succ. his f., Alexander III., 1894; strongly desirous of peace; originated Peace Conference at Hague; made alliance with France; forced to grant Constitution, 1905; unwisely roused Japan by Eastern policy and sustained humiliating defeat. See RUSSIA.

NICHOLAS I., THE GREAT, pope, 858–67; greatly increased prestige of papacy; reduced archbishopric of Ravenna, 861–64; by Lateran Council, 864, ordered Lothair II. of Lorraine to take back his wife, and deposed abp's who had allowed his divorce; victorious over their attempted resistance; recognised False Decretals and used their power in summoning Hincmar and Rothade to Rome, 863, and denying independent action to councils; quarrelled with Gk. Church.

NICHOLAS II., pope, 1058–64; Lateran Council, 1059, settled mode of electing popes; made alliance with Normans of Apulia.

NICHOLAS III., pope, 1277–80; successfully opposed house of Anjou; bull, 1279, settled disputed points in rule of St. Francis.

NICHOLAS IV., pope, 1288–92; pious Franciscan, unequal to secular government.

NICHOLAS V., antipope, 1328–30.

NICHOLAS V., pope, 1447–55; humanist and statesman; pope at time of Turk. capture of Constantinople.

NICHOLAS, HENRY (*c.* 1501–*c.* 1580), founder of the religious sect called the Family of Love; b. in Münster. The sect was Anabaptist, and tended towards rationalism.

NICHOLAS OF BASEL (d. 1397), Ger. heretic; taught Quietism; akin to mystics of Beghard brotherhood; Schmidt's identification of N. with Merswin's 'God's friend in the Oberland' now rejected; burned to death.

NICHOLAS OF CUSA, see CUSA, NICHOLAS OF.

NICHOLAS, ST., famous saint believed to have lived under Constantine; bp. of Myra, Syria; his feast-day is Dec. 6; as *Santa Claus* became identified with Christmas festivities; patron of Russia, of children, and of seafarers; subject of many legends in many lands. See BOY BISHOPS.

Littlewood, *Story of Santa Claus* (1912).

NICHOLAS, SIR EDWARD (1593–1669), Eng. statesman; foremost adviser of Charles I. in Civil War, arranging treaty of Uxbridge, surrender of king to Scots, surrender of Oxford.

NICHOLSON, JOHN (1822–57), Brit. general and administrator; served in Sikh Wars; deputy-commissioner of Bannu on annexation of Punjáb, 1849;

crushed attempted mutiny of Punjab; insisted on, and carried out, attack on Delhi; slain after entry; brilliant ruler, despotic but just; called by Lord Roberts '*beau idéal* of a soldier and a gentleman.'

NICIAS (V. cent. B.C.), Athenian statesman and soldier; succ. Pericles as leader of aristocratic faction; opposed Cleon; helped to arrange *Peace of Nicias*, 421 B.C.; app. general in Syracusan expedition, 415 B.C.; proved himself incompetent, over-cautious, and superstitious; killed, 414; a man of no genius, popularised by minor successes and lavish distribution of wealth.

NICKEL (Ni = 58·68), metallic element in iron group; occurs as kupfernickel (NiAs), n. glance (NiAsS), and frequently with iron and cobalt. Obtained by roasting sulphide to oxide, and reducing with charcoal. Purified by forming n. carbonyl ($Ni(CO)_4$), a volatile, easily decomposable liquid. Silvery white, hard, may be rolled and polished; difficult to oxidise; S.G. 8·9; M.P. 1484°; used for plating (electrolysis of $NiSO_4.(NH_4)_2SO_4.6H_2O$ solution), for alloys (German silver, coinage), and for nickel steel (armour plates, guns). Oxides NiO, Ni_2O_3; salts from NiO only, green hydrated, yellow anhydrous. $Ni(OH)_2$, pale green, does not oxidise in air. $NiSO_4.7H_2O$, and $NiSO_4.(NH_4)_2SO_4.6H_2O$, isomorphous with corresponding iron salts. $Ni(OH)_3$, from $Ni(OH)_2$ and NaOCl, black precipitate.

NICKEL-PLATING, see ELECTRICITY (Electroplating).

NICOBAR ISLANDS (8° N., 93° E.), group of 19 islands in Ind. Ocean, belonging to Great Britain. Chief islands are Great and Little Nicobar, Camorta, Nancowry, and Car Nicobar; total area, 635 sq. miles; large forests; climate unhealthy; administered by the Chief Commissioner of the Andamans; first taken by Danes, 1756; Austrians, 1778; British, 1869; chief exports—cocoa-nuts, edible birds' nests. Natives are of Malay type. Pop. *c.* 7000.

NICOLE, PIERRE (1625–95), Fr. theologian; one of most illustrious prof's at Port Royal; trans. *Provinciales* into Latin, but became estranged from Jansenists; wrote *Essais de morale*.

NICOLL, SIR WILLIAM ROBERTSON (1851–), Brit. journalist, editor, and theologian; knighted, 1909.

NICOLSBURG, Bohemian MIKULOV (48° 49′ N., 16° 38′ E.), town, Moravia, Austria; vineyards.

NICOMEDIA, modern ISMID (40° 45′ N., 30° E.), ancient city, Bithynia, Asia Minor; founded in 264 by Nicodemes I., king of Bithynia; residence of several Rom. emperors; scene of Hannibal's death.

NICOPOLIS, ACTIA NICOPOLIS, ancient city, Epirus, Greece; founded by Octavian in commemoration of his victory at Actium, 31 B.C.

NICOSIA.—(1) (35° 12′ N., 33° 10′ E.) capital of Cyprus, on Pedius; seat of Gk. abp.; manufactures leather, textiles. Pop. 17,000. (2) (37° 42′ N., 14° 25′ E.) town, Catania, Sicily. Pop. 16,500.

NICOTINE ($C_{10}H_{14}N_2$), colourless alkaloid oil in tobacco; B.P. 241° C., pungent smell, soluble in water and alcohol, very poisonous. Diacid base forming crystalline salts, *e.g.* $C_{10}H_{14}N_2.2HCl$.

NICTHEROY, NITEROY (23° 52′ S., 42° 52′ W.), town, Rio de Janeiro, Brazil, S. America; manufactures textiles, soap, tobacco. Pop. 37,000.

NIDIFICATION, see under NEST.

NIEBUHR, BARTHOLD GEORG (1776–1831), Ger. historian; b. Copenhagen; held several public posts, but chiefly important as author of *Roman History* (*Römische Geschichte*); first two vol's pub. 1812, third vol. after death. N. originated new theory of early Rom. history, emphasised laws which control development of civilisation, and founded new hist. school.

NIEBUHR, KARSTEN (1733–1815), Ger. geographer to Dan. Arab. Exploration Soc.; his fellow-travellers died, and N. continued expedition alone; returned, 1767, and wrote valuable accounts of travels; widely read biography by s., Barthold (*q.v.*).

NIEDERBRONN (48° 56′ N., 7° 40′ E.), town, Alsace-Lorraine, Germany; mineral springs. Pop. 3300.

NIEDERLAHNSTEIN (50° 20′ N., 7° 36′ E.), town, Hesse-Nassau, Prussia, at junction of Lahn and Rhine; manufactures machinery. Pop. 4000.

NIEDER-SELTERS (50° 18′ N., 8° 15′ E.), village, Hesse-Nassau, Prussia; 'Seltzer-water' springs.

NIEDERWALD (49° 59′ N., 7° 54′ E.), mountain-ridge, near Rhine, Germany; site of a national monument to commemorate Ger. victory over France in 1870–71.

NIEM, DIETRICH OF (*c.* 1345–1418), Ger. chronicler; abbreviator in papal chancery; advocated general council to end great schism and uphold Empire against Papacy; works important for ecclesiastical history.

NIEMBSCH VON STREHLENAU, Austrian poet, known by pseudonym Nicolaus Lenau (*q.v.*).

NIEMEN, see MEMEL.

NIENBURG-ON-THE-SAALE (51° 50′ N., 11° 45′ E.), town, on Saale, duchy Anhalt, Germany; iron foundries. Pop. (1910) 5573.

NIENBURG-ON-THE-WESER (52° 38′ N., 9° 15′ E.), town, on Weser, Hanover, Prussia; glass-works. Pop. (1910) 10,295.

NIERSTEIN (49° 52′ N., 8° 20′ E.), town, on Rhine, Hesse-Darmstadt, Germany; wines. Pop. (1910) 4600.

NIETZSCHE, FRIEDRICH WILHELM (1844–1900), Ger. philosopher; believer in Darwinism; brute strength, cunning, etc., are exalted as leading to success in the struggle for existence; the Christian virtues should be superseded, as tending to the prolonged existence of less vigorous types; apostle of gospel of Superman. Chief work, *Thus Spake Zarathustra*.

Nietzsche (People's Books, 1912); Orage, *N. in Outline and Aphorism*; Mügge, *N., His Life and Works*.

NIEUPORT, Flemish NIEUWPOORT (51° 8′ N., 2° 44′ E.), small town, on Yser, West Flanders, Belgium. Pop. 3600.

NIÈVRE (47° 10′ N., 3° 30′ E.), central department, France; area, 2658 sq. miles; mountainous in E.; drained by Allier, Loire, Yonne; large forest area; live stock raised; coal, iron and steel manufactures. Pop. (1911) 299,312.

NIGDEH, NIGDE (37° 58′ N., 34° 40′ E.), town, Konieh vilayet, Asia Minor. Pop. 21,000.

NIGEL (d. 1169), bp. of Ely, 1130; prominent for work in Exchequer under Henry II.

NIGER (4° 25′ N., 6° E.), large river of West Africa; rises in plateau of Futa Jallon in Fr. Guinea; flows N. and N.E. through Fr. Sudan, turning S.E. at Barka, flows through Nigeria and enters Gulf of Guinea by numerous mouths, Rio Nun at Akassa being the chief one; total length, 2600 miles, of which over 1050 are navigable; area of basin, 584,000 sq. miles. Swampy delta extends about 120 miles along coast, and covers an area of 14,000 sq. miles. Chief tributaries are Benue, Sokota or Rima, and Kaduna; principal towns, Bammako, Sasandig, Timbuktu, Ansango, Ilo, Gambo, Busa, Lokojo, Asaba, Abo, Rabba, Egga; N. is known under various names (Goliba, Isa, Quorra, etc.); first discovered and explored by Mungo Park, 1795; followed by Clapperton, 1826, R. and J. Lander, 1830, Richardson, Barth, 1851–54, Flegel, 1880–81, Gallieni, Caillié, Boyd Alexander, etc.

Mungo Park, *Travel in the Interior of Africa in the Years 1795, 1796, 1797*; Lenfant, *Le Niger* (1903); Boyd Alexander, *From the Niger to the Nile* (1908).

NIGERIA (10° N., 5° E.), Brit. protectorate, West Africa; consists of **Northern Nigeria** and **Southern Nigeria** (including LAGOS Protectorate). Nigeria is bounded on N. by Fr. Sudan, W. by Dahomey, E. by Lake Chad and Ger. Kamerun, and S. by Gulf of Guinea; total area about 400,000 sq. miles. Boundary between Northern and Southern Nigeria runs from 9° N. in West to 7° N. in East. Coast region is flat and

swampy, with hot and unhealthy climate, malaria being very prevalent; northern part fertile, with healthier climate; interior traversed by mts.; highest ranges, 6000–7000 ft.; immense valuable forests. Chief rivers are Niger, Benue, Sokoto, Kaduna, Waube or Yo, Cross, Katsena, Gongola; principal towns, Lagos (capital and seaport), Kano, Sokoto, Asaba, Onitsha, Benin, Abo, Zungeru (chief town in Northern Nigeria). Maifoni, Abeokuta, Ibadan, Illorin, Gebba, Bussa, Gando; Akassa, Brass, Bonny, Warri, Barutu, Calabar, Sapela, Opobo, Forcados, on or near coast. Fauna consists mainly of elephants, lions, giraffes, hyenas, monkeys, and many species of antelope; rivers infested by crocodiles, hippopotami, and rhinoceri. Native tribes are mostly negroes—Ibo, Idzo, Aros, Efiks, Borgus, Jukos, Garubas, Fulas, Hausas, etc. Muhammadanism is widely spread, especially in north, but cannibalism still prevails in some parts, and human sacrifices are quite common.

Region was discovered by Portuguese, XV. cent.; Brit. traders gradually acquired predominating share of trade; United African Co. established, 1879; acquired rights over Nigeria, and in 1886 obtained royal charter as *Royal Niger Co.*; Benin (*q.v.*) massacre and expedition, 1897. Niger Co. surrendered political administrative rights, 1900, and Protectorate (under High Commissioner) was formed; Lagos (*q.v.*) made Western province of Southern Nigeria, 1906—other provinces, Eastern (headquarters, Calabar) and Central (headquarters, Warri); Sir Frederick Lugard app. High Commissioner of both Northern and Southern Nigeria with a view to their federation, 1912. All children born after April 1, 1901, were declared free. Nigeria was explored by Mungo Park, Major Denham and Clapperton, R. and J. Lander, Richardson, Dr. Barth, etc. Local administration is conducted by Brit. Residents, native kings and chiefs. River is chief means of communication; railway from Lagos to Baro, Rahama, and Kano. Principal products are palm oil, kernels, rubber, timber, ivory, cotton, kolanuts, indigo, coffee, cocoa, tobacco, ostrich feathers, shea-butter, gums, live stock; silver, manganese ore, tin, lignite, iron, lead ore, salt, and soda are found. Pop. *c.* 6,720,000.

Lady Lugard, *A Tropical Dependency* (1905); Mockler-Ferryman, *Brit. Nigeria* (1902); Leanard, *Lower N. and its Tribes* (1906); Morel, *Nigeria: its Peoples and Problems* (1911).

NIGHTHAWK, a Nightjar, see GOATSUCKER.

NIGHTINGALE, see under THRUSH FAMILY.

NIGHTINGALE, FLORENCE (1820–1910), Eng. philanthropist; showed strange power over animals as child; hospital training; took out staff of nurses to Crimea, 1854, and performed heroic services; revolutionised hospital nursing (*q.v.*) at home, founded N. Home, and spread knowledge of hygiene; of good social position and exercised enormous influence. *Life*, by Tooley (1904).

NIGHTJAR, see GOATSUCKER.

NIGHTSHADE, a term comprising two species, included in the *Solanaceæ—Atropa belladonna*, the deadly n., from which belladonna (*q.v.*) is obtained, and *Solanum dulcamara*, the bittersweet, which is only slightly poisonous.

NIHILISM, name of species of revolutionary propaganda in Russia. Word first appears in Turgueniev's *Fathers and Sons* (1862), for spirit which turns critical eye on all human institutions; later appropriated to political destructiveness of physically violent kind. Disappointed by reign of Alexander II., Russ. Liberals began in 1871 to organise revolts against government; the literary movement had been confined to prosperous classes, who now began to preach to people with *Subterranean Russia* for organ; procession at Moscow, 1877; persecuted, imprisoned, or sent to Siberia; 1878–80 were years of Nihilist Terror, and after two vain attempts Alexander II. was slain by bomb, 1881; prominent place taken by women in these attempts; Alexander III. nearly stamped out movement by secret police system and severe punishments.

Stepniak, *Underground Russia* (1883); Stepniak and others, *N. as it was* (1895).

NIIGATA (37° 57′ N., 139° 3′ E.), seaport, Echijo, Japan, on W. coast; lacquer-ware. Pop. 63,000.

NIIHAU, see HAWAIIAN ISLANDS.

NIJAR (36° 54′ N., 2° 15′ W.), town, Almeria, Spain. Pop. 15,500.

NIJMEGEN, NIJMWEGEN, NIMEGUEN (51° 51′ N., 5° 33′ E.), city, on Waal, Gelderland, Netherlands; Roman *Noviomagus*; contains Church of St. Stephen (1272), Renaissance town hall, and ruined Carolingian palace; tobacco, metal-work. Pop. (1911) 57,116.

NIJNI-NOVGOROD, see NIZHNIG-NOVGOROD.

NIJNI-TAGILSK, see NIZHNE-TAGILSK.

NIKAYA, group of Buddhist canonical lit.; *Sutta Pisaka* is composed of four chief N's, mainly dialogues.

NIKKO (*c.* 37° N., 137° 30′ W.), district, Japan; an important religious centre and place of pilgrimage; many Shinto and Buddhist shrines and temples.

NIKOLAYEV (47° 7′ N., 30° 31′ E.), town, Kherson, Russia; important naval station; fortified; has Gk. cathedral, observatory, naval arsenal; manufactures flour, iron goods, etc. Pop. (1910) 95,400.

NIKOLAYEVSK.—(1) (52° N., 48° 40′ E.) town, on Irgiz, Samara, Russia. Pop. 13,600. (2) (52° 53′ N., 140° 22′ E.) fortified town, on Amur, former capital, E. Siberia. Pop. 5500.

NIKOLAYEVSKAYA SLOBODA (50° 5′ N., 45° 30′ E.), town, on Volga, Astrakhan, Russia; trading centre. Pop. 19,000.

NIKOLSBURG, see NICOLSBURG.

NIKON (1605–81), Russ. patriarch, 1653; revised Slavonic service-books.

NIKOPOL (47° 32′ N., 34° 40′ E.), town, Ekaterinoslav, Russia. Pop. 8000.

NIKOPOLI, NICOPOLIS (43° 42′ N., 24° 53′ E.), town, on Danube, Bulgaria; defeat of Sigismund of Hungary by Turks, 1396. Pop. 6200.

NIKOSIA, see NICOSIA.

NIKSHICH, NIKSHITCH, NIKSIC (42° 45′ N., 18° 57′ E.), fortified town, Montenegro; taken from Turks by Montenegrins in 1877. Pop. 5300.

NILE, longest river of Africa; rises between 2° and 3° S. as KAGERA (*Alexandra Nile*), in N.W. of Ger. East Africa; general course from S. to N.; passes through Victoria Nyanza, and enters north part of Albert Nyanza as *Somerset Nile* or *Victoria Nile*; flows through Sudan as *Bahr-el-Gebel*; below Fashoda it takes the name of *Bahr-el-Abiad* or *White Nile*. After Berber the Nile flows northwards for about 1800 miles through north Sudan and Egypt without receiving a single tributary, and enters the Mediterranean by two principal branches, the *Rosetta* and *Damietta*. The delta, 150 miles in length, with numerous canals in every direction, is the most fertile part of North Africa. Chief tributaries are Bahr-el-Ghazal, Sobat, Bahr-el-Azrak, or *Blue Nile*, and Atbara. Principal towns are Cairo, Assiut, Assuan, Kena, Naghamadi, Wadi Halfa, Akasha, Dongolo, Berber, Abu Hamed, Khartum, Fashoda, Lado, Wadela, Fajao. Total length is 3600 miles; navigable throughout (*c.* 3000 miles), except at the six cataracts between Khartum and Assuan, and after leaving Albert Nyanza. Steamers ascend as far as Gondokoro; sudd (floating vegetation) hinders navigation on Upper Nile. Area of drainage basin is estimated from 1,000,000 to 1,500,000 sq. miles. Nile is subject to regular floods, between June and Oct.; maximum elevation is *c.* 41 ft. above the normal level. The fertility of the Nile country depends on these inundations. Irrigation has been improved by the building of the immense Assuan dam (*q.v.*), Assiut dam, Zifta and other barrages.

Nile is intimately associated with ancient and modern history of Egypt (*q.v.*); many famous antiquities on banks. From earliest times the situation of the Nile's sources formed a fascinating geographical problem; source of Blue Nile explored by Bruce,

1770–72; Ismail Pasha expedition ascended White Nile to junction with Blue Nile, and discovered Khartum, 1820–22; explored by three Egyptian expeditions as far as Gondokoro, 1839–42; Speke reached Victoria Nyanza, 1858, and discovered Ripon Falls, 1862; Albert Nyanza discovered by Sir Samuel Baker, 1864; Stanley explored Kagera, and named it Alexandra Nile, 1875; Anglo-Ger. Commission surveyed Kagera from 30° E. to mouth, 1903; other important explorers were Schweinfurth, 1868–71, Colonel Chaillé-Long, 1874, Gordon, 1876, Baumann, Kandt, Lionel Décle, 1891 onwards.

Sir Harry Johnston, *The Nile Quest* (1903); Kandt, *Caput Nile* (Berlin, 1904); Blue Book of Egypt No. 2, 1904 (report by Sir W. Garstein); and works by Bruce, Baker, Speke, etc.

NILE, BATTLE OF THE (1798), fight between Brit. and Fr. fleets in Bay of Aboukir. Hearing of Fr. appearance at Malta, Nelson rightly judged Egypt to be its secret destination, but, arriving at Alexandria before the Fr. fleet, supposed he had made error, and sailed away; returned to find French in possession, but surrounded Fr. fleet in Aboukir Bay at mouth of Nile, and destroyed it. Napoleon for months was thus cut off from France.

NILES (41° 10′ N., 81° 53′ W.), city, on Mahoning, Ohio, U.S.A.; ironworks, coal and iron mines. Pop. (1910) 8361.

NILGHAI (*Bosclaphus tragocamelus*), an Ind. antelope, with maned neck, and fore limbs longer than hind; only the male with horns.

NILGIRIS, THE, NEILGHERRIES (11° 25′ N., 76° 45′ E.), plateau, Deccan, India; highest point, Mt. Dodabetta, 8760 ft. The district has area 956 sq. miles. Pop. 115,000.

NIMACH, see NEEMUCH.

NIMAR (21° 45′ N., 76° 30′ E.), district, Nerbudda, Central Provinces, India. Pop. 335,000.

NIMBUS, in art, a halo (*q.v.*).

NIMEGUEN, see NIJMEGEN.

NÎMES (43° 51′ N., 4° 21′ E.), town, Gard, France; magnificent Rom. remains; *Maison Carrée*, finest extant example of Græco-Rom. architecture; huge amphitheatre, *Tour Magne*, Temple of Diana; Rom. baths once supplied by superb *Pont du Gard* (see AQUEDUCTS). Augustus founded *Nemausus* on site of former Volscian capital; greatly favoured by Agrippa, Antoninus Pius, and other emperors; taken by Vandals, Visigoths, Saracens, and Franks; long under Dukes of Toulouse; restored to France, 1259; Camisard stronghold; birthplace of Guizot, Daudet; silk, cotton, carpets, wine trade. Pop. (1911) 80,400.

NIMROD, in *Genesis* 10 a 'mighty hunter,' and builder of Assyria. The etymology is uncertain, and various unsuccessful attempts at identification have been made.

NINEVEH, celebrated ancient city, capital of Assyrian Empire, situated on Tigris, opposite modern town of Mosul. Practically nothing was known of the city till discoveries made by Layard, Rawlinson, Smith, Rassam, and others in mounds of Kuoyunjik, Nebi Yunus, Khorsabad, and Nineveh. In Kuoyunjik and Nebi Yunus (mounds believed to contain ruins of Nineveh) have been discovered vast palaces with inscriptions, sculptured figures, monuments, etc., which have thrown much light on Assyrian history; exact date of foundation unknown; Sennacherib made many additions to Nineveh, and under him city rose to great power and splendour; ruins of his palace and that of Assur-bani-pal contained in Kuoyunjik; traces of Esar-haddon's palace to be found in Nebi Yunus. Nineveh was captured by Medes and Babylonians, *c.* 606 B.C.

Ferguson, *Palaces of Nineveh and Persepolis Restored.*

NING-PO (29° 42′ N., 121° 21′ E.), walled town, Cheh-kiang, China; one of Treaty ports, opened 1824; exports tea, silks, cotton; many monasteries and temples. Pop. (1910) 400,000.

NINKIGAT, see BABYLONIA (Religion).

NIOBE (classical myth.), dau. of Tantalus and Dione. Her pride in the number and beauty of her children gave offence to Leto, who caused Apollo and Artemis to slay the children.

NIORT (46° 19′ N., 0° 27′ W.), capital, Deux-Sèvres, France, on Sèvre-Niortaise; gloves. Pop. 23,500

NIPIGON, NEPIGON (50° N., 87° 30′ W.), lake, Ontario, Canada; discharges by Nipigon River into Lake Superior.

NIPISSING (46° 16′ N., 80° W.), lake, Ontario, Canada; discharges into Lake Huron by French River.

NIPPON, see JAPAN.

NIPPUR, one of most ancient cities in Babylonia, was situated between Tigris and Euphrates; site identified as Nippur by Layard's excavations in 1851. In 1889 extensive excavations were carried on by Univ. of Pennsylvania, when thousands of tablets and fragments, besides remains of buildings, were unearthed; these inscriptions give excellent account of history of city, and in particular of temple. Nippur was evidently a sacred city, centre of worship of Sumerian god En-lil; temple improved and completely rebuilt often; Arabs name site *Nuffar*.

NIRIS, NIRIZ (29° 10′ N., 54° 15′ E.), town, Fars, Persia. Pop. *c.* 10,000.

NIRVANA, see BUDDHISM.

NISH (43° 27′ N., 21° 59′ E.), town, Servia; Gk. episcopal see; taken in 1456 by Turks, who held it till 1878, when restored to Servia. Pop. (1911) 24,949.

NISHAPUR (36° 8′ N., 58° 40′ E.), town, capital of Nishapur province, Persia; turquoise mines; birthplace of Omar Khayyám (*q.v.*). Pop. *c.* 16,000.

NISIBIS (37° N., 41° 10′ E.), ancient city and fortress, Mesopotamia; scene of repeated conflicts between Romans, Parthians, and Persians; modern Nisibin.

NITEROY, see NICTHEROY.

NITRIC ACID, AQUA FORTIS, HNO_3, colourless fuming liquid; B.P. 86° C.; prepared from Chile saltpetre ($NaNO_3 + H_2SO_4 = NaHSO_4 + HNO_3$); commercial acid (S.G. 1·42) contains about 70 %; corrosive, dissolves metals, powerful oxidising agent, 'nitrates' benzene, etc.; stains skin yellow. Salts are nitrates, soluble in water; KNO_3 is nitre.

Nitro compounds are derived from nitric acid, NO_2OH, by replacement of the OH group by another radicle; their generic formula is therefore $R.NO_2$. They are prepared by 'nitration' thus: $RH + HO.NO_2 = R.NO_2 + H_2O$, and may be reduced by nascent hydrogen thus: $RNO_2 + 6H = RNH_2 + 2H_2O$.

Nitrobenzene ($C_6H_5NO_2$), a pale yellow oil, B.P. 205° C., is prepared by nitrating benzene ($C_6H_6 + NO_2.OH = C_6H_5NO_2 + H_2O$); used for making *aniline*, by reduction with tin and hydrochloric acid: $C_6H_5NO_2 + 6H = C_6H_5NH_2 + 2H_2O$. So-called nitroglycerin ($C_3H_5(NO_3)_3$) and nitrocellulose ($C_{12}H_{16}O_6(NO_3)_4 + C_{12}H_{15}O_5(NO_3)_5$) are nitrates.

NITROGEN (N = 14·01), gaseous element, molecule $= N_2$; occurs chiefly in the air (78 % by volume, 75·5 % by weight), and in combination as ammonia, nitrates, etc.—**Preparation**: (i.) by heating a concentrated solution of sodium nitrite and ammonium chloride, *e.g.* $NaNO_2 + NH_4Cl = NaCl + 2H_2O + N_2$; (ii.) by oxidation of ammonia, *e.g.* $2NH_3 + 3NaOBr = 3NaBr + 3H_2O + N_2$; (iii.) by reduction of an oxide, *e.g.* $N_2O + Cu = CuO + N_2$.

Properties: colourless, tasteless, odourless, does not burn or support combustion; 1 part water dissolves 0·023 part N_2 at N.T.P.; 1 litre at N.T.P. weighs 1·25107 grain; critical temperature, −149° C.; critical pressure, 27·5 atmospheres; B.P. (atm. press.), −195·5° C.; M.P. −210·5° C. Combines with heated lithium, calcium, barium, magnesium, forming nitrides, and with oxygen, by sparking, forming nitric oxide, NO. Hydrides: NH_3, N_2H_4, N_3H; hydroxylamine: NH_2OH; oxides: N_2O, NO, $N_4O_6(N_2O_3)$, $N_2O_4(NO_2)$, N_2O_5; oxyacids: $H_2N_2O_2$, HNO_2, HNO_3.

Organic nitrogen compounds are numerous and complex. Nitrogen is a constituent of proteid matter,

NITROGLYCERIN ($C_3H_5(ONO_2)_3$), glyceryl trinitrate; prepared by slowly adding glycerin to a cold mixture of concentrated sulphuric (4 parts) and nitric (1 part) acids. N. is an oil, Sp. Gr. 1·6; very explosive, especially when impure; mixed with **kieselguhr**, a siliceous earth, to make dynamite; a constituent of cordite (smokeless powder).

NITZSCH, KARL IMMANUEL (1787–1868), Ger. Lutheran theologian; s. of K. L. Nitzsch (*q.v.*); prof. at Wittenberg (1817), Bonn (1822), Berlin (1847).

NITZSCH, KARL LUDWIG (1751–1831), Ger. Prot. theologian; f. of above; prof. at Wittenberg, 1790; opposed rationalism.

NIU-CHWANG (40° 52′ N., 122° 5′ E.), town, Manchuria, China; one of Treaty ports, opened 1858; exports beans, silk, skins, etc. Pop. (1910) 61,000.

NIUÉ (19° 10′ S., 169° 50′ W.), coral island, S. Pacific.

NIVELLES (50° 36′ N., 4° 19′ E.), town, on Thines, Brabant, Belgium; carriages, paper. Pop. 12,500.

NIZAMI, Nizȃ-muddîn Abu Muhammad Ilyȃs bin Yûsuf (1141–1203), Pers. poet; of a very religious temperament, he spent the greater portion of his life in solitude and meditation. His first poem, *Makhzanul Asrâr*, was speculative and didactic, but his poetic genius was best adapted to epic, as the publication of his great poem, *Khosrau and Shirin*, proved. This was followed by the epics *Laila and Majnûn*, and *Iskandarnâma* (an epic on the career of Alexander the Great). His last work, *Hâft Paikar*, or *Seven Beauties*, is a romance.

NIZAM'S DOMINIONS, Hyderabad (*q.v.*).

NIZHNE-TAGILSK (58° N., 60° 20′ E.), town, Perm, Russia; steel- and iron-works. Pop. (1910) 33,000.

NIZHNE-UDINSK (55° 50′ N., 99° 18′ E.), town, Irkutsk, Russia; centre for gold mines. Pop. 6500.

NIZHNIG-NOVGOROD, Nijni-Novgorod (*c.* 56° N., 44° E.), government, European Russia; area, 19,789 sq. miles; large area forested; watered by Volga and other rivers; produces timber, fruits, cereals; manufactures iron goods, etc. Pop. (1910) 1,999,300.

NIZHNIY-NOVGOROD (56° 18′ N., 44° 2′ E.), town, Russia; important commercial centre; capital of government of same name, and seat of celebrated fairs; situated at junction of Oka and Volga Rivers. City consists of Upper Town, with *Kremlin* (begun XIV. cent.), situated on hills; Lower Town, along banks of Oka and Volga; and Fair Town, between two rivers. N.-N. possesses many ecclesiastical buildings and several educational institutions. City owes its importance to growth of manufactures and traffic along rivers, and fairs, which attract merchants from all parts; chief industries — flour-mills, distilleries, potteries, machinery-works, and shipbuilding. Pop. (1910) 103,860.

NOAH, in *Genesis*, patriarch who survived Flood, and from whom, according to Biblical account, the human race descends. (Etymology uncertain.)

NOAILLES, Fr. noble family, drawing title from lordship of N., near Beauvais. With Antoine, noted admiral of XVI. cent., and his bro's François and Gilles, ambassadors, family attained prominence; great generals of XVII. and XVIII. cent's.

NOAKHALI (22° 48′ N., 91° 8′ E.), district, Bengal, India. Pop. 1,155,000. Chief town, Noakhali. Pop. 7200.

NOBEL, ALFRED BERNHARD (1833–96), Swed. chemist; invented dynamite, blasting gelatine, and smokeless powders; established international prizes (value *c.* £8000 each) for those distinguished in science, lit., and peace, awarded annually since 1901 by Swed. Academy of Science, Stockholm Faculty of Medicine, Swed. Academy of Literature, and Committee of Norweg. Storthing.

NOBILITY, see under Classes of Society.

NOBLE, gold coin of value 6s. 8d., issued by Edward III.; rose to value 10s. in Edward IV.'s reign, and was superseded by the *Angel* (*q.v.*).

NOBLE, SIR ANDREW (1832–), Scot. physicist; b. Greenock; ed. Edinburgh and Woolwich; carried out important researches which revolutionised artillery armaments; cr. bart., 1902.

NOBLESVILLE (40° N., 86° W.), city, Indiana, on White River; natural gas region; iron foundries. Pop. (1910) 5073.

NO-BODY CRABS, see under Malacostraca.

NOCERA INFERIORE (40° 45′ N., 14° 38′ E.), town, ancient *Nuceria Alfaterna*, on Sarno, Salerno, Italy; bp.'s see; textiles. Pop. 29,000.

NOCERA UMBRA (43° N., 12° 46′ E.), town, ancient *Nuceria Camellaria*, Perugia, Italy; cathedral. Pop. 8500.

NOCTILUCA, see under Flagellata.

NODDIES, see under Gull Family.

NODIER, CHARLES (1780–1844), Fr. author, writer of novels, tales, history, poetry, criticism, and philology, but more important as influence on the Romantics than for personal output; pioneer in study of Romantic subjects.

NOÉ, AMÉDÉE DE (1819–84), Fr. caricaturist, under pseudonym 'Cham.'

NOETUS (III. cent.), Christian priest of Smyrna; held Patripassian views of person of Christ.

NOGARET, GUILLAUME DE (d. 1313), Fr. statesman; advised, organised, and carried out capture of Pope Boniface VIII., 1303; pope liberated by Romans, but successor forced to absolve N.; active in securing suppression of Templars, 1307, and trial of bp. of Troyes, 1308-13.

NOGENT-LE-ROTROU (48° 19′ N., 0° 48′ E.), town, on Huisne, Eure-et-Loir, France; castle which belonged to Sully. Pop. 8500.

NOGENT-SUR-MARNE (48° 45′ N., 2° 25′ E.), town, on Marne, Seine, France. Pop. 12,100.

NOGENT-SUR-SEINE (48° 29′ N., 3° 30′ E.), town, on Seine, Aube, France. Pop. 4000.

NOIRMOUTIER (47° N., 2° 15′ W.), island, in Bay of Biscay, belonging to Vendée, France. Pop. 6500.

NOLA (40° 54′ N., 14° 32′ E.), town, Caserta, Italy; seat of bishopric, has Gothic cathedral; captured by Romans during Samnite Wars, 313 B.C. Pop. 15,000.

NOLI (44° 13′ N., 8° 20′ E.), small town, Genoa, Italy, on Gulf of Genoa.

NOMARTHRA, sub-order of Edentates (*q.v.*).

NOME (64° 30′ N., 166° W.), town, on Seward Peninsula, Alaska; goldfields. Pop. (1910) 2600.

NOMENTUM, modern Mentana (42° 3′ N., 12° 38′ E.), ancient town, Italy.

NOMINALISM, theory that universal terms such as *man, town, plant* are mere names, and that the things they denote have no real existence; in scholastic philosophy of Middle Ages opposed to Realism (*q.v.*).

NONCONFORMIST, 'one who does not conform'; generally used in England of those Protestants who do not conform to the Church of England. See Free Churches.

NONCONFORMITY, LAW RELATING TO, differs from that of Church of England, *e.g.* the marriage law; Nonconformist ministers share with Anglicans certain exemptions, *e.g.* serving on juries; cannot take Oxford or Cambridge divinity degree.

NON-COMMISSIONED OFFICERS, see Officers.

NON-JURORS, holders of public offices—mostly Church of England clergymen—who declined to take the oath of allegiance to William and Mary in 1688, because they held that James II. was king by lawful and divine right.

Overton, *The Non-Jurors* (1902).

NORA (39° N., 9° E.), ancient town, Sardinia.

NORBA, Norma (41° 40′ N., 13° E.), ancient town, Latium, Italy; modern Norma.

NORBERTINES, see Premonstratensians.

NORCIA (42° 48′ N., 13° 4′ E.), town, Perugia, Italy; ancient *Nursia*; woollens; birthplace of St. Benedict. Pop. 10,000.

NORD (50° 30′ N., 3° 20′ E.), department, northern

France; between Belgium and North Sea; area, 2193 sq. miles; chief rivers, Scheldt, Scarpe, Oise, Sambre, Lys; capital, Lille; soil fertile; extensive coal mines; iron, steel, and other manufactures. Pop. (1911) 1,961,780.

NORDAU, MAX SIMON (1849-), Ger. physician and critic; famous for theory of decadence of modern art.

NORDEN (53° 36′ N., 7° 13′ E.), town, Hanover, Prussia; sugar, tobacco. Pop. (1910) 6891.

NORDEN, JOHN (1548–1625), Eng. topographer; originator of county guides. His first work, *Speculum Britanniæ: Middlesex*, was followed by other parts.

NORDENSKIÖLD, NILS ADOLF ERIK, BARON (1832–1901), Swed. geographer and Arctic explorer; b. at Helsingfors, Finland. In the *Vega* he achieved the navigation of the North-East Passage.

NORDERNEY (53° 43′ N., 7° 11′ E.), small island, North Sea, off coast of E. Friesland; belongs to Hanover, Prussia; sea-bathing resort. Pop. (1910) 4261.

NORDFJORD (61° 58′ N., 6° E.), inlet, western coast, Norway.

NORDHAUSEN (51° 30′ N., 10° 48′ E.), town, Prussian Saxony; has R.C. cathedral; manufactures beer, spirits, tobacco, leather, etc. Pop. (1910) 32,564.

NORDICA, MADAME, LILIAN DÖME (1859-), Amer. soprano operatic singer; notable success in Europe as well as U.S.A.

NORDIN, CARL GUSTAF (1749–1812), Swed. statesman, bp., and historian; principal adviser of Gustavus III.; collection of MSS. nucleus of *Scriptores rerum Suecicarum medii ævi*.

NÖRDLINGEN (48° 51′ N., 10° 29′ E.), town, Germany; here Imperialists defeated Swedes, 1634, and French defeated Imperialists, 1645. Pop. (1910) 8706.

NORE, THE (51° 28′ N., 0° 48′ E.), sandbank, in estuary of Thames, England; marked by lightship; a Brit. fleet mutinied here, May–June 1797.

NORFOLK (52° 12′ N., 1° E.), county, E. England; bounded on N. and E. by North Sea, S. by Suffolk, W. by Cambridge and Lincoln; area, 2044 sq. miles. Coast is mostly low and flat, with few indentations. Inland are undulating plains, valleys, and woods. In W. is Fen district. *Broads*, lying in E. part of county, are series of lakes joining various rivers. Principal streams are Great and Little Ouse, Yare, Bure, Wensum, Waveney. Soil is fertile; good crops raised; cattle-rearing, fruit-growing, malting, brewing, tanning, and brick-making carried on. Manufactures include boots, shoes, silk, wool, flour, mustard, and agricultural implements. Chief towns are Norwich (county town), Yarmouth, Lynn, Cromer, Wells, and Thetford. There are some interesting old town and village churches; a fine cathedral at Norwich; monastic remains at Walsingham, Bromholm, Binham, and Carrow; notable castles at Castle Rising, Castle Acre, and Norwich; some beautiful houses, Sandringham being among the more modern mansions. Pop. (1911) 321,748.

Norfolk, in Victoria County Histories.

NORFOLK (42° N., 97° 10′ W.), city, Nebraska, U.S.A.; flour-mills. Pop. (1910) 6025.

NORFOLK (36° 50′ N., 76° 23′ W.), town, Virginia, U.S.A.; important railway and canal centre; large fortified harbour; fine public buildings; seat of Prot. bp.; flour, cotton, pea-nuts, etc. Pop. (1910) 67,452.

NORFOLK, EARLDOM AND DUKEDOM OF.—The county of N. was granted by the Conqueror to Ralph de Gael, who was in 1071 termed Earl of Norwich; forfeited, 1074. HUGH LE BIGOD was created Earl of N. by Stephen in or before 1141; his descendant ROGER surrendered remainder of his titles and estates to crown, 1302, and died, 1306. Edward II. granted the earldom in 1312 to his bro. THOMAS, whose granddau. Margaret inherited the earldom, 1375, and was created duchess, 1397, when her grandson and heir, THOMAS MOWBRAY, was created duke. The Mowbrays held earldom and dukedom till death of infant Anne, *c.* 1481; her husband, Richard, Duke of York, was created Duke of N., 1477. Dukedom was revived for John, Lord Howard, grandson of 3rd duke, 1483; his descendant forfeited, 1572, but his heir again received earldom, 1644, and the dukedom was restored to the Howards, 1660.

NORFOLK ISLAND (29° S., 167° 56′ E.), Brit. island, S. Pacific; dependency of New South Wales; formerly a penal settlement; colonised by Pitcairn islanders, 1856.

NORICUM, an ancient province of Rome, lying to S. of Danube; now included in Austria, Carinthia, Styria, and Salzburg.

NORMA, see NORBA.

NORMAL SCHOOLS, training colleges for teachers. See EDUCATION.

NORMAN (35° 10′ N., 97° 30′ W.), city, Oklahoma, U.S.A.; seat of state univ.; flour and cotton-seed oil. Pop. (1910) 3724.

NORMAN CONQUEST, see ENGLAND (History).

NORMAN, SIR HENRY WYLIE (1826–1904), Anglo-Indian field-marshal; performed brave rescue in second Sikh War, 1844; distinguished in Mutiny; gov. of Jamaica, 1883; Queensland, 1888; field-marshal, 1902.

NORMANDY (49° N., 0°), old province of France, between Brittany and Fr. Flanders; N. and W. coasts washed by Eng. Channel; now comprises the five departments, Seine-Inférieure, Eure, Calvados, Manche, and Orne; total area, 10,500 sq. miles. Normandy has fine pasture-land and orchards, picturesque and varied coast scenery; chief river, Seine; principal towns, Rouen (capital), Evreux, Caen, Alençon, Le Havre, Dieppe, Honfleur, Harfleur, Cherbourg on coast; numerous bathing resorts. Country was invaded and conquered by Northmen, IX. cent., who definitely settled, 911, when Fr. king, Charles the Simple, granted the land thereafter called N., Rollo the viking chief doing homage as first Duke of N.; united with England after Norman Conquest, 1066; passed to France, 1204; retaken by England, 1346, 1417; English finally defeated, 1450. Normandy has given France many of her greatest men. Chief industries are lace, textiles, carpets, machinery, ship-building, leather goods, hardware, stained glass, cider-making; famous liqueur Benedictine made at Fécamp; agriculture, cattle- and horse-rearing. See NORMANS, VIKINGS.

Palgrave, *History of N.* (4 vols., 1878); Scudamore, *Normandy* (1906); Macquoid, *Through Normandy*.

NORMANS, Scandinavians who emigrated in X. cent. from Norway, etc., to Gaul, and became absorbed in Romano-Gallic population of N.E. France, forming duchy of *Normandy* in Fr. kingdom. This branch of 'Northmen' also colonised Britain, Sicily, and S. Italy in XI. cent. Their first recorded appearance on Fr. coast was in V. cent. Invasions increased in number, but remained mere piratical attacks. Defeated by the Frankish ruler, Théodebert, 530, the Northmen for a time came more rarely. The pirate Adroald marked the coming era of settlement by establishing himself at Saint-Omer. Charlemagne kept them in awe, but after his death they appeared in the Seine and made a settlement in Île de Noirmoutier. Yearly invasions and pillagings followed, Paris being terrorised, 845 and 885, and numerous towns burned and battles fought. Although bribed to depart, they soon returned in larger numbers. Charles the Simple granted part of Neustria, the subsequent NORMANDY, to the viking, Rolf the Ganger, 911, on condition that he became Christian and prevented any further invasions by the Seine. Rouen became capital of the new fief, now a settled colony.

The Normans adopted Fr. tongue and customs, became the foremost people of France and pioneers in all new movements, religious or artistic—witness their famous arch. and *chansons de geste*, and Bec Abbey, the great centre of civilisation. They showed themselves the most energetic people of Europe, and made many conquests outside France. Ralph de Toni assisted the Italians against the Byzantine emperor, 1017, and other Norman nobles began to settle in Italy. Apulia was conquered, 1041–42. Celebrated Robert Guiscard (*q.v.*)

became Duke of Apulia and Calabria, 1059. His bro. Roger conquered Sicily, 1060–1101. Roger's son united Sicily and Apulia in Norman kingdom of Naples or Sicily. England was conquered by William, Duke of Normandy, 1066. See ENGLAND (History), NORMANDY, NAPLES, SICILY, VIKINGS.

Johnson, *The Normans in Europe*; Jewett, *The Normans*.

NORMANTON.—(1) (53° 42′ N., 1° 25′ W.) town, on Calder, Yorkshire, England; coal mines. Pop. (1911) 15,033. (2) (17° 38′ S., 141° 25′ E.) town, river port, on Norman, Queensland, Australia.

NORONHA, FERNANDO DE, see FERNANDO DE NORONHA.

NORRIS, JOHN (1657–1711), Eng. philosopher and divine. Educated at Winchester and Oxford, he was nevertheless closely related to the Cambridge Platonists, especially to Henry More. He was much influenced also by Malebranche.

NORRISTOWN (40° 6′ N., 75° 23′ W.), town, on Schuylkill, Pennsylvania, U.S.A.; cottons, woollens. Pop. (1910) 27,875.

NORRKÖPING (58° 35′ N., 16° 10′ E.), city, on Motala, Östergötland, Sweden; cotton goods; burned by Russians, 1819. Pop. (1911) 46,629.

NORTH ADAMS (42° 41′ N., 73° 8′ W.), city, on Hoosac, Massachusetts, U.S.A.; boots and shoes. Pop. (1910) 22,109.

NORTH AMERICA, see AMERICA, UNITED STATES, CANADA, NEWFOUNDLAND, ALASKA.

NORTH BERWICK (56° 3′ N., 2° 43′ W.), watering-place, Haddingtonshire, Scotland, on Firth of Forth; well-known golf-links; near it are Berwick Law (612 ft.), Tantallon Castle, and Bass Rock. Pop. (1911) 3247.

NORTH BRABANT, see BRABANT.

NORTH CAPE (71° 10′ N., 25° 45′ E.), promontory, Norway, on island of Magerö; most northerly point of Europe.

NORTH CAROLINA, see CAROLINA.

NORTH, CHRISTOPHER, see WILSON, JOHN.

NORTH DAKOTA, see DAKOTA.

NORTH HOLLAND (52° 35′ N., 4° 50′ E.), province of Netherlands between North Sea and Zuider Zee; area, 1070 sq. miles; it includes the islands Texel, Vlieland, Terschelling, Marken, Wieringen, and Urk; chief towns, Amsterdam and Haarlem; cattle-rearing, cheese-making, chief industries. Pop. 1,140,000.

NORTH ISLAND, see NEW ZEALAND.

NORTH, MARIANNE (1830–90), Eng. botanist; travelled all round the world painting flora.

NORTH SEA, GERMAN OCEAN (56° 30′ N., 3° E.), part of Atlantic between Great Britain, Belgium, Holland, Germany, Denmark, and Norway; length, 700 miles; breadth, 420 miles; area, 190,000 sq. miles; greatest depth off Norwegian coast, 440 fathoms; bed crossed by large banks (Dogger, Jutland, etc.); communicates with Baltic through Skager Rack and Cattegat; with Atlantic through Strait of Dover, Eng. Channel, etc.; receives Rhine, Elbe, Thames, Forth, Tay, Tweed, etc.; extensive fisheries. See OCEANOGRAPHY.

NORTH SEA CONVENTION, 1882, agreement between Britain, Belgium, Denmark, France, Germany, and Holland for allocating respective rights of fishery in North Sea, and also for establishing police regulations.

NORTH SHIELDS (55° N., 1° 26′ W.), seaport, on Tyne, Northumberland, England; ironworks; shipbuilding yards; incorporated with TYNEMOUTH (*q.v.*).

NORTH, SIR DUDLEY (1641–91), Eng. financier; made large fortune; commissioner for customs, 1683; removed to treasury and managed finances with great ability till Revolution.

NORTH SYDNEY, residential suburb, Sydney, New South Wales, on N. shore of Port Jackson. Pop. 23,000.

NORTH TONAWANDA (43° N., 78° 50′ W.), city, on Niagara River, New York State, U.S.A.; lumber-mills. Pop. (1910) 11,955.

NORTH WALSHAM (52° 19′ N., 1° 23′ E.), market town, Norfolk, England. Pop. (1911) 4254.

NORTHALLERTON (54° 21′ N., 1° 26′ W.), town, Yorkshire, England; centre of bp. of Durham's liberty in N. Riding from Domesday times; near by was fought *Battle of the Standard*, 1138. Pop. (1911) 4806.

NORTHAMPTON (42° 14′ N., 72° 39′ W.), town, Massachusetts, U.S.A.; manufactures paper, silks, cottons, woollens, sewing machines, cutlery; many educational and philanthropic establishments. Pop. (1910) 19,431.

NORTHAMPTON (52° 15′ N., 0° 54′ W.), municipal, parliamentary, and county borough in Northamptonshire, England, on river Nene; of great historic interest; contains All Saints' and St. Sepulchre's Churches and an Eleanor cross; seat of leather manufactures; other industries—tanning, brewing, and iron-founding. Pop. (1911) 90,076.

NORTHAMPTON, EARLDOM AND MARQUESSATE OF.—Saxon Waltheof was created, or confirmed as, earl, 1072, his son-in-law, Simon Senlis, *c.* 1080. The SENLISES held earldom till 1184, the BOHUNS, 1337–73. WILLIAM PARR, bro. of last queen of Henry VIII., was created Marquess of N., 1547, attainted, 1553, but again created marquess, 1559; d. childless. HENRY HOWARD, cr. earl, 1604; d. childless, 1614. WILLIAM, LORD COMPTON, was created earl, 1618, and title has since descended in that family, together with marquessate granted to Charles, 16th earl, 1812.

NORTHAMPTONSHIRE (52° 15′ N., 1° W.), midland county, England; bounded by Lincoln, Rutland, Leicester, Warwick, Oxford, Bucks, Bedford, Huntingdon, and Cambridge; area, 909 sq. miles. Surface is undulating; highest ground near Daventry; some parts richly wooded and well cultivated, finest scenery being in W. and S.W. N.E. forms part of Fen district. Chief rivers are Nene, Welland, Avon, Cherwell, Leam, and Ouse. Wheat and barley are principal crops raised; good pasturage where stock-raising is carried on. Iron is found; main industry, manufacture of boots and shoes. Chief towns are Northampton (county town), Peterborough, Kettering, and Wellingborough. At Peterborough is fine cathedral; interesting churches to be found at Earls Barton, Brigstock, Brixworth, Irthlingborough, and elsewhere; remains of several castles, including those of Fotheringay and Barnwell; some beautiful mansions and ancient crosses. Pop. (1911) 213,754.

Northamptonshire, in Victoria County Histories.

NORTHBROOK, THOMAS GEORGE BARING, 1ST EARL OF (1826–1904), Brit. statesman; held various offices under Liberal governments, 1857–72; gov.-gen. of India, 1872–76; first lord of Admiralty, 1880–85; commissioner to Egypt, 1884.

NORTHCLIFFE, ALFRED CHARLES WILLIAM HARMSWORTH, 1ST BARON (1865–), newspaper proprietor; founded *Answers* (1888), *Daily Mail* (1906); chief proprietor of numerous daily and weekly newspapers; has encouraged aviation by offering enormous prizes.

NORTHCOTE, SIR STAFFORD, see IDLESLEIGH, EARL OF.

NORTHEIM (51° 45′ N., 10° 4′ E.), town, on Ruhme, Hanover, Prussia: tobacco. Pop. (1910) 8625.

NORTHFIELD.—(1) (44° 28 N., 93° 7′ W.) city, Minnesota, U.S.A., on Cannon: manufactures lumber. Pop. (1910) 3265. (2) (44° 10′ N., 72° 38′ W.) town, Vermont, U.S.A.; seat Norwich Univ.; furniture; woollens. Pop. (1910) 1918.

NORTHFLEET (51° 26′ N., 0° 21′ E.), urban district, Kent, England; chemical works. Pop. (1911) 14,184.

NORTHINGTON, ROBERT HENLEY, 1ST EARL OF (*c.* 1708–72), Lord Keeper (last so designated), 1757–61; Lord Chancellor, 1761–66; cr. earl, 1764; pres. of Council, 1766–67.

NORTHMEN, see VIKINGS.

NORTHUMBERLAND (55° 15′ N., 2° W.), northernmost county, England; bounded on N. by

Berwick and Roxburgh, W. by Cumberland, S. by Durham, and E. by North Sea; area, 2000 sq. miles. Shores are generally low; off coast lie Holy Isle or Lindisfarne, Farne Islands, and Coquet Island. Inland surface is mostly rugged and broken, with undulating hills and moors, rising highest on borders of Scotland and Cumberland; highest point, Choviot (2676 ft.). County is well watered by Tweed, Till, Aln, Coquet, Wansbeck, Blyth, and Tyne; valleys fertile and well wooded. Northumberland is one of chief sheep-rearing counties in England; cattle-raising also carried on; chief crops, barley and wheat; important coast and river fisheries; of great industrial importance, coal being chief product. Tyne is centre of manufactures and has enormous shipping trade; principal industries along its banks are shipbuilding, iron-works, alkali-works, manufacture of machines, tools, glass, and pottery; in other parts of county are brick- and tile-works, potteries, and cloth-mills. Chief towns are Newcastle, Tynemouth, N. Shields, Alnwick, Hexham, and Morpeth.

In VI. cent. Northumberland formed part of Bernicia; later joined with Deira and called *Northumbria*; from Norman Conquest to XVII. cent. scene of many struggles with Scots; contains battlefields of *Otterburn, Homildon Hill,* and *Flodden.* There are imposing castles at Bamborough, Alnwick, Norham, Dunstanburgh, and Warkworth; fine ecclesiastical remains at Lindisfarne, Hexham, Alnwick, and Newminster. Pop. (1911) 371,521.

Northumberland, in Victoria County Histories.

NORTHUMBERLAND, EARLDOM AND DUKEDOM OF.—*Comes Northumbrensis* occurs, 1100, and various people were called earls in XII. cent.; but there seems to have been no earldom in modern sense till 1377. Earldom was held by great house of Percy (*q.v.*), 1377 till (with exception of periods of attainder) 1670, and by descendants on female side since; dukedom created for 2nd house of Percy (Smithson), 1766.

NORTHUMBERLAND, DUKE OF, JOHN DUDLEY, VISCOUNT LISLE, EARL OF WARWICK (*c.* 1502–53), Eng. statesman; member of council of regency for Edward VI.; cr. Earl of Warwick, 1547; overthrew protectorate of Somerset, 1549; became chief power in realm and obtained dukedom of N. 1551; misgoverned; married his son, Lord Guilford Dudley, to Lady Jane Grey and induced king to settle crown on latter; defeated by Mary, and executed.

NORTHUMBRIA, most northerly and one of most important of Old English kingdoms, stretching from Humber on S. to Firth of Forth on N., and bounded on W. by Cumbria and Strathclyde; consisted of former kingdoms of Bernicia and Deira; Bernicia said to have been founded by Ida, *c.* 547; first known king of Deira, Ella; two kingdoms united under Ethelfrith, end of VI. and beginning of VII. cent's; Christianised under Edwin in VII. cent. Northumbria declined through internal troubles and invasions, and in 827 became tributary to Egbert, king of Wessex.

NORTH-WEST FRONTIER PROVINCE (33° N., 72° E.), province in Brit. India, constituted in 1901; consists of districts of Peshawar, Kohat, Bannu, and Dera Ismail Khan, formerly comprised in Punjab; Hazara district; agencies of Malakand (Dir, Swat, Chitral), Khyber, Kurram, Tochi, and Wana; area, *c.* 38,700 sq. miles; capital, Peshawar. Region is mostly mountainous, Hindu Kush forming northern boundary; highest summits are Tirach Mir (25,400 ft.) and Kachan (22,600 ft.). River valleys and district of Peshawar are most fertile and cultivated parts. Principal rivers are Indus, Kabul, Kurram, and Kunhar. Administration is in hands of commissioner and agent to Gov.-Gen. Leading occupation is agriculture; chief crops—maize, rice, wheat, barley, sugar-cane, grain, tobacco, and cotton. Inhabitants, *c.* 2,250,000, are mostly Pathans.

NORTH-WEST PASSAGE, see POLAR REGIONS, GEOGRAPHY.

NORTH-WEST TERRITORIES, division of Canada; area, *c.* 1,200,000 sq. miles; long administered by Hudson's Bay Co. (*q.v.*); bought by Dominion, 1869; out of it were carved provinces of Manitoba (1870), Alberta (1905), Saskatchewan (1905); part of Keewatin district divided between Ontario and Manitoba, and Ungava incorporated in Quebec (1912). N.W. Territories now comprise undeveloped regions of Canada north of 60° N. (except Yukon), viz. Mackenzie, Franklin, and remnant of Keewatin; governed by commissioner and council of four; inhabited by Indians, Eskimos, and a few white fur-traders.

NORTH-WESTERN PROVINCES, see UNITED PROVINCES OF AGRA AND OUDH.

NORTHWICH (53° 16′ N., 2° 31′ W.), market town, Cheshire, England, at junction of Weaver and Dane; salt-mines, chemical works. Pop. (1911) 18,151.

NORTON, THE HON. MRS. CAROLINE SHERIDAN (1808–77), Eng. writer; granddaughter of R. B. Sheridan; prototype of *Diana of the Crossways*; married unhappily to Hon. G. C. Norton (1827), from whom she separated; married Sir W. Stirling-Maxwell, 1877. Her best novels are *Stuart of Dunleath* (1847), *Old Sir Douglas* (1868); poems include *The Sorrows of Rosalie* (1829), *The Child of the Islands* (1845), *The Lady of La Garaye* (1862).

NORWALK.—(1) 41° 6′ N., 73° 26′ W.) city, on Norwalk, Connecticut, U.S.A.; woollen goods. Pop. (1910) 6954. (2) (41° 15′ N., 82° 40′ W.) city, Ohio, U.S.A.; iron and steel manufactures; pianos. Pop. (1910) 7858.

NORWAY (58° to 71° 11′ N., 5° to 31° E.), kingdom situated in extreme N.W. of Europe; bounded N. by Arctic Ocean, N.E. by Russ. Lapland and Sweden, S. by North Sea, Skager Rack, and Cattegat, and N.W. by Arctic and Atlantic Oceans; extreme length, *c.* 1150 miles; width varies from 20 to 260 miles; area, 124,445 miles.

Physical Features.—The seaboard is fringed by chains of islands which render it, in many cases, dangerous of access, though they give continuous lines of smooth-water channel inside. It is everywhere indented by the long, narrow, winding inlets, often with sides rising sheer from the sea, known as *fjords*; this broken character gives the country a long coast-line of over 3000 miles, and the deep fjords furnish many convenient harbours. The islands — Kvalö, Tromsö, the Lofodens, and the Vigtens—contain about 7 % of the total area. The chief fjords, the Varangen, Alten, Trondhjem (80 miles), Molde, Sogne (106), Hardanger (66), Stavanger (50), and Christiania (90), vary in depth from 220 to over 660 fathoms. Except in the S. and S.E., the coast rises steeply from the sea, and the interior plateau slopes up to the mountains that form the boundary all along the S.E., the Kjolens in the N., with a mean height of from 4000 to 6000 ft., and the lower but more widely spread Dovrefjeld in the S., with a mean height of 2000–4000 ft. Several peaks attain to over 7000 ft.; the highest is about 8400. A large number of long, narrow lakes lie in ice-scooped hollows, and there are numerous short, rapid rivers, the longest being the Glommen (350 miles), flowing S. to Christiania Fjord, and the Tanna (175), flowing N. to the Arctic Ocean.

The northerly climate is modified by the Gulf Stream, which washes the whole of the N.W., and the hills afford considerable protection from the N.E. winds; but the cold is severe in the interior, and as the fjords allow the damp winds of the Atlantic to reach the plateau, the snowfall there is greater than it would otherwise be. The rainfall on the coast varies from 40 to 75 in., and in the interior from 12 to 16; the temperature ranges from a winter mean of about 2° in the extreme N. to a summer mean of 63° in the S. Justedal in the S. (4600–5400 ft.) and Svartisen (3600 ft.) in the N. are the largest glaciers; the limit of perpetual snow varies from 3000 to 5000 ft.; nowhere is the coast icebound in winter; the N. part is the 'land of the midnight sun.' Norway is chiefly

composed of Plutonic and Metamorphic rocks, granite being the principal soil; everywhere are marks of the Ice Age. The fauna includes elk, red-deer, wolf, glutton, sheep, grouse of largest varieties, wild-fowl and sea-birds of many kinds, salmon, herring, cod. The fir, oak, ash, birch, elm, hazel, and lime grow in great abundance; hardy fruits, vegetables, and the usual cereals are grown.

History.—Many of the Viking pirates of the VIII. cent. sailed from Norway, which was at that time ruled by many chiefs or kings and divided into several states each with its separate parliament or *Storthing*. HARALD HAARFAGER (860–930) united Norway under his own rule, driving his rivals to carve out new principalities for themselves in the Orkneys, Hebrides, Man, etc. The great OLAF TRYGGVESSON (995–1000) introduced Christianity into Norway, and under OLAF II., 'king and saint' (1016–28), the Norwegians were thoroughly Christianised. Olaf II. was forced to fly before Canute in 1028. His s. MAGNUS was restored in 1035, but reigned only by aid of his uncle HARALD HAARDRAADA (*q.v.*), who succeeded him in 1047 and was slain at *Stamford Bridge* in 1066. His successors were engaged in conflicts with the Church and nobles, until in 1240 HAAKON THE OLD (1217–63) firmly established the power of the Crown. He also conquered Iceland and Greenland. His s. MAGNUS (1263–80), however, surrendered the Hebrides and Isle of Man to Scotland. HAAKON V. (1299–1319), the last male descendant of Harald Haarfager, was succeeded by MAGNUS ERIKSON (1319–43) of Sweden, of the *Folkunger* line, but Norway and Sweden were separated by Magnus's abdication from Norway in favour of his s., HAAKON VI. (1343–80).

The minority of his s., OLAF V. (1380–87), was marked by the rule of Margaret of Denmark, who after Olaf's death made the *Union of Kalmar* (1397), uniting the three kingdoms of Norway, Denmark (*q.v.*), and Sweden. After a vain attempt to throw off the yoke, Norway was forced in 1450 to make a treaty of perpetual union. CHRISTIAN III. (1534–59) made a revolt against his rule the pretext for treating Norway as a subject state, and Dan. language and law gradually superseded Norwegian.

Norway exchanged Denmark for Sweden as a ruler in 1814, when by the Treaty of Kiel Sweden (*q.v.*) received Norway as reward for joining the coalition against Napoleon. A Swed. army terrorised the Storthing into accepting CHARLES XIII. (king, 1814–18), he, however, accepting the new constitution. Throughout the century Norway clamoured for independence, and a strong republican party opposed the autocracy of the king of Sweden. At last the successive efforts of the radical premiers Sverdrup, Steen, and Michelsen resulted in 1905 in the establishing of Norway as a separate kingdom under Prince Charles of Denmark, who became HAAKON VII. In 1907 Britain, Germany, France, and Russia guaranteed the integrity of Norway.

GEORGE PHILIP & SON LTD THE LONDON GEOGRAPHICAL INSTITUTE

Literature.—Norwegian is a Scandanavian tongue closely akin to Danish. From the days of the sagas until the XIX. cent. Norweg. literary men wrote in Danish. Wergeland (1808–45) was inspired by the

new patriotism originating in 1814; Welhaven (1807–73) set up a standard of form; Lunstad (1802–80), Asbjörnsen (1812–85), Moe (1813–82), Aasen (1813–96), Janson (1841–), and Garborg (1851–) have done much for the revival of national lit., and other authors of note are the brothers Vrag, Vogt, and Obstfelder (symbolist poets), Hamsun, Kinck, and Bojer; while of European renown are Ibsen (1828–1906), Kjelland (1849–), and Björnson (1832–1910). Norway has produced some distinguished scientists, and the noted polar explorers Nansen and Amundsen.

Government.—The monarchy is constitutional and hereditary in the male line; if the king has no male heir he may suggest a successor, but the decision rests ultimately with the Storthing. The constitution dates from 1814; by it the Crown has the right to veto a bill twice, an appeal to the country being made on each occasion, and if the third Storthing again passes the bill it becomes law. There is a royal Council. All males of 25 and over elect the members, and since 1907 women with certain qualifications of income may vote. The *Storthing* is composed of two houses, the *Lagthing* (upper) and *Odelsthing* (lower). The 20 local districts or *Amts* are governed by an *Amtmand* and have an *Amtsthing*; the *Amts* consist of towns and rural communes. The *Amts* are Akershus, Bergen (town), Bergenhus Nordre, Bergenhus Söndre, Bratsberg, Buskerud, Christiania (town), Christians, Finmarken, Hedemarken, Jarlsberg and Larvik, Lister and Mandal, Nedenes, Nordland, Romsdal, Smaalenene, Stavanger, Tromsö, Trondhjem Nordre, Trondhjem Söndre. The supreme law-court is the *Höiesteret*; in each legal district (*Herred*), of which there are 104, there is a court of first instance, the *Forligelses-kommission*; criminals whose offences involve serious punishment are tried by jury (*Lagmandsret*). Men between 18 and 25 are liable to serve in the army; sailors between 22 and 41 are liable to service in the navy. Education is compulsory from 6 or 7 to 14 years of age. Christiania has a univ. The Established Church is Lutheran. The capital is Christiania; the other important towns are Bergen, Trondhjem, Stavanger, Drammen, Kristiansand, Fredrikstad, Kristiansund, Fredrikshald, Aalesund, Skien, Arendal, and Larvik. There are some 2000 miles of railway, of which over four-fifths belong to the State.

Products and Industries.—The small proportion of the country (3 %) fit for cultivation is along the coasts, especially the south, and in occasional depressions along the fjords or lakes; 75 % is of no value, the rest is under forest. Timber and fisheries constitute the wealth of Norway; 90 % of the farms are under 50 acres. Cattle number over 1,000,000; sheep nearly 1,500,000. Of the forest trees nearly three-quarters are pines; the annual value of the timber export is about £4,500,000—unwrought and sawn timber, wood-pulp, matches, etc. The fisheries are very valuable, the chief being cod and ling; whales, walrus, seals, and sharks are taken in the N. Cod-liver oil is made and exported in large quantities. The minerals—copper, silver, pyrites, felspar, etc.—are not very important. Norway is one of the great carrying countries of Europe. Exports (1911) were over £18,000,000. Imports (1911) exceeded £27,000,000, the chief being, in order of importance, comestibles (including spirits), coal, minerals, manufactured metals and minerals, textiles, yarn, ropes, hair, skins, tallow, furniture, dye-stuffs, and paper. Pop. (1900) 2,240,032; (1910) 2,391,782.

Bain, *Scandinavia* (1905); Boyesen, *Norway* (Story of the Nations, 1900); Daniels, *Home Life in Norway* (1911); Baedeker, *Norway and Sweden*.

NORWEGIAN SEA, part of North Atlantic Ocean between Norway and Greenland, and between Arctic Ocean and about lat. 61° N.

NORWICH.—(1) (52° 38′ N., 1° 15′ E.) city, county, parliamentary and municipal borough and county of itself, in Norfolk, England; beautifully situated on Wensum River; contains fine Norman cathedral, founded 1096; castle, in centre of city, has Norman keep, now used as museum; other interesting buildings are Ethelbert, Erpingham, and Bp. Salmon's Gateways. N. has over forty churches, finest being St. Peter Mancroft's, St. Andrew's, and St. Giles'; chief industries —engineering-works, breweries, tanneries, and brick-works; manufactures include chemicals, starch, and mustard. Pop. (1911) 121,493. (2) (41° 32′ N., 72° 6′ W.) city, Connecticut, U.S.A., on Thames River, at head of navigation; founded 1659, and chartered as city, 1784. Manufactures machinery, firearms, paper, textiles, and cutlery. Pop. (1910) 20,367. (3) (42° 30′ N., 75° 30′ W.) town, New York, U.S.A., on Chenango; ironworks. Pop. (1910) 7422.

NORWOOD.—(1) (39° 10′ N., 84° 25′ W.) residential city, Ohio, U.S.A. Pop. (1910) 16,185. (2) (42° 11′ N., 71° 12′ W.) town, Massachusetts, U.S.A.; printing-works; tanneries. Pop. (1910) 8014. (3) suburb of London, in Surrey; 5½ miles S. of St. Paul's. Pop. 37,000.

NORZAGARAY (14° 40′ N., 125° E.), town, Luzon, Philippine Islands.

NOSAIRIS, people who preserved their independence in the mountains of N. Syria for 500 years; found also in Antioch, Tarsus, and Adana; estimated at from 120,000 to 150,000. Though under Turk. rule since 1832, they have never accepted Islamism (or Christianity), but retain a mystic and mysterious faith.

NOSARI, NAVSARI (20° 54′ N., 73° E.), town, state of Baroda, Bombay, India; cotton-weaving. Pop. 17,000.

NOSE, see OLFACTORY SYSTEM.

NOSOLOGY, the branch of medicine that treats of the classification of diseases.

NOSSEN (51° 5′ N., 13° 18′ E.), town, on Mulde, Saxony, Germany. Pop. (1910) 5104.

NOSSI-BÉ (13° S., 48° E.), island, off N.W. coast of Madagascar, of which it is a dependency; coffee, sugar-cane; capital, Hellville. Pop. 11,000.

NOSTALGIA, home-sickness, particularly so great as to cause melancholia.

NOTARY, NOTARY PUBLIC, official whose business it is to take notes of matters affecting the public; acts chiefly in commercial transactions, attesting deeds and other documents to make them authentic in foreign countries. In London he must belong to the Scriveners' Co.

NOTO (36° 54′ N., 15° 4′ E.), town, Syracuse, Sicily; trade in oil, wine. Pop. 24,000.

NOTTINGHAM (52° 57′ N., 1° 8′ W.), city, county of city, municipal, parliamentary, county borough, on Trent, Nottinghamshire, England; well-built town with wide streets, large market-place, and some fine buildings, most notable being St. Mary's and St. Peter's Churches, R.C. Cathedral, Univ. Coll., town hall, and exchange; Castle now used as art museum; manufactures hosiery, lace, cotton, wool, machinery, and chemicals. Nottingham played a prominent part in Civil War. Pop. (1911) 259,942.

NOTTINGHAM, EARLDOM OF, first held by Mowbrays and descendants (Berkeley, Howards), 1377–1681; by Finch family, 1681 onwards.

NOTTINGHAMSHIRE, NOTTS (*c.* 53° 5′ N., 1° W.), midland county, in Trent basin, England; area, 843 sq. miles; surface level along Trent, elsewhere undulating, rising to *c.* 600 ft.; drained by Trent and its tributaries; crossed by several canals and by leading northern railways; contains Sherwood Forest, traditionally associated with Robin Hood; county town, Nottingham. N. was part of Mercia in Saxon times, and was frequently overrun by Danes; sided with York in Wars of Roses, and with Charles I. in Civil War, which first broke out in this county. N. produces coal, iron, gypsum, limestone; manufactures lace, hosiery. Pop. (1911) 344,135.

Nottinghamshire (Victoria County Histories).

NOÛMENON, the reality underlying phenomena; the thing-in-itself.

NOVA SCOTIA (45° N., 64° W.), maritime province, Canada; most easterly of dominion; connected with New Brunswick by narrow isthmus at end of Bay of Fundy; consists of Nova Scotia proper and Cape Breton Island, separated by Gut of Canso; length, 300 miles, breadth, about 100 miles; area, 21,068 sq. miles. There are numerous excellent harbours; coasts subject to fogs; many rivers and lakes. Surface is hilly, soil fertile. Principal towns are Halifax (capital), Sydney, Glace Bay, Amherst, Yarmouth, Pictou. N. S. was discovered by John Cabot, 1497; named *Acadia* by first Fr. settlers, 1604; claimed by English and renamed Nova Scotia, 1621; finally ceded to Britain, 1713; Cape Breton annexed, 1763; joined the Dominion of Canada, 1867. N. S. has a lieut.-gov., executive council, legislative assembly, and council; Dalhousie and several sectarian univ's; extensive coal mines; iron mined and smelted; gold found; valuable fisheries; timber, fruit, agricultural produce exported. Pop. (1911) 492,338.

Willson, *Nova Scotia* (1911).

NOVALIS, FRIEDRICH VON HARDENBERG (1772–1801), Ger. poet and dramatist; wrote *Heinrich von Ofterdingen* (prose romance), *Geistliche Lieder* (spiritual poetry), etc.

NOVATIAN (III. cent.), Rom. priest; chosen by minority as bp. of Rome, 250; his followers called *Novatians*.

NOVARA (45° 30′ N., 8° 35′ E.), town, N. Italy; seat of bishopric, has cathedral dating in part from V. cent.; here Austrians defeated Sardinians, 1849. Pop. (1911) *c.* 54,600.

NOVAYA ZEMLYA, NOVA ZEMBLA (71° N., 55° E.), two Russ. islands in Arctic Ocean; divided by the narrow channel Matochkin Shar, and separated from Waigatz Island by Kara Strait; length about 600 miles, breadth, 80 miles; area, 35,000 sq. miles. Surface is mountainous; coast-line broken by fjords; flora and fauna arctic; whale, walrus, and seal fisheries; discovered by Willoughby, 1553; explored by Barents, Borough, Count Lütke, Von Baer, Grinevetskiy, Ekstam, etc.

NOVEL, in its modern signification, is a prose narrative of considerable length, having a well-defined plot and showing intimate observation of character and custom. The history of the novel commences in Greece with the name of Xenophon, whose *Cyropædia* is a fictitious narrative of the boyhood of Cyrus, and of which the true motif is an exposition of the author's own views on education. In this little narrative there is also to be found the earliest prose love-story in Greek—the story of the love of Abradates and Pantheia. The Greek romance writers of the Græco-Roman period show considerable dexterity in plot-construction and variety of incident. Characteristic of the school are *The Marvels beyond Thule* of Antonius Diogenes, which relates how the hero, Deinias, met the heroine, Dercyllis, in Thule; and the *Æthiopica* of Heliodorus, in which the priestess Charicleia flies to Egypt with her lover Theagenes. The Latin romance writers borrowed and transcribed from the Greek school. The best Latin romances are the *Golden Ass* of Apuleius and the *Satyricon* of Petronius Arbiter.

During the Middle Ages the romance writers drew their material chiefly from Eastern sources, e.g. *Kalilah and Dimnah*, the *Seven Wise Masters*, and the *Gesta Romanorum*. Among mediæval story-tellers Boccaccio ranks highest; his *Fiammetta*, *Ameto*, and *Decameron* are admirably told. In the XV. cent. the romance cycles, notably the *Arthurian Legends* and the *Chansons de Geste*, opened new vistas to narrative writers. Sir Thomas Malory's *Morte d'Arthur* drew from these sources and is the forerunner of the English novel. In Spain at this time the chivalric romances achieved widespread popularity, till Cervantes' *Don Quixote* ridiculed them out of the field. The pastoral romance also had numerous devotees in Spain and France. In England this type is represented by the *Arcadia* of Sir Philip Sidney. The Spanish 'picaresque' or 'rogue' n. inspired in France Le Sage's *Gil Blas*, and in England Nash's *Unfortunate Traveller*. The type survived in the works of Defoe and Smollett. The domestic n. owes its origin to the epistolary narratives of Samuel Richardson, whose *Pamela* is the true prototype of modern fiction. Richardson's contemporary, Fielding, also contributed much to establish the English novel.

At the beginning of the XIX. cent. Sir Walter Scott introduced the historical n., which has ever since proved irresistible. Mention must also be made of Jane Austen, whose quiet studies of provincial life are inimitable. George Eliot is the inventor of the psychological n., if not of the problem n. Thackeray, Dickens, Kingsley, Hardy, and Meredith are bright stars in the galaxy of XIX. cent. novelists. To-day fiction is the most fertile department of literature, and in theme its resources seem inexhaustible.

NOVELDA (38° 27′ N., 0° 45′ W.), town, Spain.

NOVELLÆ, see JUSTINIAN I.

NOVEMBER (from Lat. *novem*, 'nine,' because ninth month of Rom. year), eleventh month; contains 30 days, one was temporarily added in the Julian era.

NOVGOROD.—(1) (59° N., 34° 30′ E.) government, European Russia; area, 45,770 sq. miles; drained by upper waters of Volga; crossed by several canals; mountainous in S. Pop. (1910) 1,638,500. (2) capital of above, situated on Volkhov River, near Lake Ilmen. On left bank of river is ancient Kremlin, walls of which at one time enclosed many churches and other buildings. Other interesting features are Cathedral of St. Sophia, and many ecclesiastical buildings. N. was formerly independent and of great importance, but in 1570 almost destroyed by Ivan IV. of Moscow and never recovered. Pop. 28,000.

NOVI LIGURE (44° 45′ N., 8° 46′ E.), town, Piedmont, Italy.

NOVIBAZAR, YENIPAZAR (43° 4′ N., 20° 35′ E.), chief town of Sanjak (district) of Novibazar, strip of Turkish territory between Servia and Montenegro; high strategical importance; under Austrian military occupation, 1879-1908; taken by Montenegrins and Servians, 1912. See TURKO-BALKAN WAR. Pop. 10,000; (Sanjak) 170,000.

NOVO-BAYAZET (40° N., 45° E.), town, Erivan, Russian Transcaucasia. Pop. 9000.

NOVOCHERKASSK (47° 27′ N., 40° E.), town, on Don, Russia; cereals, wine. Pop. (1910) 76,480.

NOVOGEORGIEVSK, KRYLOV (49° N., 33° E.), town, Kherson, Russia. Pop. 12,500.

NOVOGEORGIEVSK, MODLIN (52° 26′ N., 20° 47′ E.), first-class fortress, Russian Poland.

NOVOMOSKOVSK (48° 40′ N., 35° 10′ E.), town, on Samara, Ekaterinoslav, Russia. Pop. 14,000.

NOVO-RADOMSK, RADOMSK (51° N., 19° 20′ E.), town, gov. Piotrkov, Russia. Pop. 13,000.

NOVOROSSIYSK (44° 43′ N., 37° 46′ E.), seaport, capital of Chernomorskiy Territory, Russia, on Black Sea; exports cereals. Pop. (1910) 44,230.

NOWANUGGER, NAWANAGAR (*q.v.*).

NOWELL, ALEXANDER (1507–1602), dean of St. Paul's from 1560.

NOWGONG.—(1) (25° N., 79° 30′ E.) town, cantonment, Bundelkhand, Central India. Pop. 12,600 (2) (26° 16′ N., 92° 42′ E.) town, capital of N. district, Assam, India. Pop. 5500; (dist.) 265,000.

NOWSHERA, NAUSHARA (34° N., 72° E.), town, cantonment, N.W. Frontier Province, India. Pop. 10,000.

NOYON (49° 33′ N., 2° 56′ E.), town, Oise, France; has fine Transitional cathedral, dating from XII. cent.; old episcopal palace; Calvin's birthplace. Pop. 7500.

NUBAR PASHA (1825–99), Egyptian statesman; successively sec. to Boghos, Mehemet Ali, Ibrahim Pasha, Abbas Pasha, and Said; organised railway communication between Cairo and Suez; on Said's death, 1863, sent by Ismail Pasha to obtain permission from sultan for completion of Suez Canal and to settle differences with France; Minister of Foreign Affairs, 1866,

abolished separate courts of foreign nations in Egypt for civil actions.

NUBIA, region in N.E. Africa, stretching roughly from Red Sea to Libyan Desert and southward from Egypt, but has no definite limits. Greater part of surface consists of sandy deserts and steppes; productive districts lie mostly in valley of Nile; chief towns, Khartum, Omdurman, Wadi Halfa, and Dongola. Inhabitants are Hamitic people and Arabs. Nubia is included politically in Egypt or Anglo-Egyptian Sudan.

NUBLE (37° S., 72° W.), inland province, Chile, bordering Argentine Republic. Pop. 175,000. Capital, Chillan.

NUCERIA ALFATERNA, see NOCERA INFERIORE.

NUCIFRAGA, a Nutcracker; see under CROW FAMILY.

NUCLEUS, a small central nodule present in each plant and animal cell, and intimately concerned with the phenomena of growth and reproduction. It is composed of many chromatin elements. In some single-celled animals—Protozoa—there are two nuclei: a larger elongated *macro-* or *mega-nucleus*, which stains deeply, and a smaller *micronucleus*, difficult to stain. The latter is more intimately concerned in sexual reproduction than the former. See OVUM.

NUCULA, see under LAMELLIBRANCHIATA.

NUDDEA, see NADIA.

NUDIBRANCH, see under GASTEROPODA.

NUEVA SAN SALVADOR, SANTA TECLA (13° 40′ N., 89° 20′ W.), town, Salvador. Pop. 20,000.

NUEVO LÉON (25° 30′ N., 99° 40′ W.), state, Mexico, on E. slopes of Sierra Madre; chief product, sugar. Pop. (1910) 368,929. Capital, Monterrey.

NUGGINA, NAGINA (*q.v.*).

NUISANCE, in legal parlance, that which is harmful or discomforting to one's neighbours. The Public Health Act (1875) embraced all measures for the removal of n's, and appointed sanitary inspectors. By-laws are made by local authorities. N. may be private, as the presence of anything which would make a neighbour's house unhygienic; or public, as the presence of anything (insanitary sewers, cellars, etc.) dangerous to the community at large. Immoral houses are in the eyes of the law a n. See DISORDERLY HOUSE.

NUJIBABAD, NAJIBABAD (*q.v.*).

NUKHA (41° 10′ N., 47° 10′ E.), town, Elizavetpol, Russian Transcaucasia; silk industries. Pop. 26,000.

NUMA POMPILIUS (715–672 B.C.), traditional second Rom. king; reputed author of innumerable religious institutions and legal reforms.

NUMANTIA (*c.* 41° 45′ N., 2° 30′ W.), ancient town, on Douro, Spain; taken by Romans, 133 B.C., after long heroic defence.

NUMBER.—Starting with the *natural* numbers 1, 2, 3, etc., we can extend our ideas to other kinds of n's. If the process of subtraction is to have unique significance, *i.e.* if $a-b$ is always to have the same meaning, when b is greater than a it becomes necessary to introduce *negative* n's, which may, if integers, be regarded as a continuation of the natural scale backwards through *zero*. Similarly, division of a by b when b is not a factor of a, leads to *fractional* n's; and the process of finding the root of a number leads to *irrational* n's, such as $\sqrt{7}$ or $\sqrt[3]{5}$, which cannot be expressed exactly, but may be obtained to any required degree of accuracy. Again, since all squares, whether of positive or negative n's, are positive, $\sqrt{-a}$ cannot denote any positive or negative quantity; hence it is called *imaginary*. Expressions of the form $a+b\sqrt{-1}$, where a and b are real, are called *complex* quantities.

Theory of numbers is concerned with positive integers, which may be divided into two classes—*prime numbers* and *composite numbers*. A prime can only be divided (without remainder) by itself and unity. Two numbers not both divisible by any number other than unity are said to be prime to one another. The different primes can be found by the 'Sieve of Eratosthenes.' The natural n's from 1 onwards being written in order, take the first prime, 2, and cross out every second number from 2. Next, leaving 3, cross out every third number from 3. The next number left is 5, and leaving this, cross out every fifth number from 5, and so on. The numbers left will all be primes. The number of such primes is infinite, and it can be proved that no rational integral algebraic expression can represent prime numbers only. Several properties of *factors* depend on the theorem that if a number a divides a product bc and is prime to one factor b, it must divide the other factor c. For since a divides bc, every factor of a is found in bc; but since a is prime to b, no factor of a is found in b; therefore all the factors of a are found in c; *i.e.* a is a factor of c. Every composite number can be resolved into prime factors, and this can only be done in one way.

The product of any r consecutive integers is divisible by $\lfloor r$ (see ALGEBRA). Let n be the first of the r numbers; then we have to show that

$$\frac{n(n+1)(n+2)\ \ldots\ (n+r-1)}{\lfloor r}, \text{ or } \frac{\lfloor n+r-1}{\lfloor r \cdot \lfloor n-1}$$

is an integer. The second of these expressions is the number of combinations of $n+r-1$ things r together, and hence must be integral for all values of n and r. Thus the theorem follows: If n is a prime number, the coefficient of every term in the expansion of $(a+b)^n$, except the first and last terms, is divisible by n. This follows from the form of the coefficient and from the last theorem.

FERMAT'S THEOREM.—If n be a prime number, and m any number prime to n, then $m^{n-1}-1$ is divisible by n. For if n is a prime, the coefficient of every term in the expansion of $(a_1+a_2+\ \ldots\ +a_m)^n$, which contains more than one of the letters, is divisible by n. There are m terms each containing only one letter, and the coefficient of each of these terms is 1. Hence, putting $a_1=a_2=\ \ldots\ =1$, we have, if $\mathrm{M}(n)$ denotes a multiple of n—

$$m^n=m+\mathrm{M}(n);\ \text{and}\ \therefore\ m(m^{n-1}-1)=\mathrm{M}(n).$$

Hence, if m is prime to n, $(m^{n-1}-1)$ is a multiple of n.

The number of positive numbers less than a given number N and prime to it may be shown to equal

$$\mathrm{N}\left(1-\frac{a}{1}\right)\left(1-\frac{1}{b}\right)\left(1-\frac{1}{c}\right)\ \ldots,\ \text{where}\ \mathrm{N}=a^{\alpha}.b^{\beta}.c^{\gamma}\ \ldots,$$

and a, b, c . . . are the different prime factors of N.

If, when two numbers a and b are divided by a third number c, they leave the same remainder, they are said to be *congruent* with respect to the *modulus* c; this is expressed by $a\equiv b\ (\mathrm{mod.}\ c)$, which is called a *congruence*.

Congruences have many properties analogous to equations. Thus, if a congruence of the nth degree in x be satisfied by more than n values of x, which are such that the difference between any two is unity or is prime to the modulus, then the congruence will be satisfied for all integral values of x, and the coefficients of all the different powers of x will be multiples of the modulus. If a and b are prime to one another, the numbers a, $2a$, $3a$, . . . $(b-1)a$ all leave different remainders when divided by b. From this a simple proof of Fermat's theorem follows.

WILSON'S THEOREM.—If n be a prime number, $1+\lfloor n-1$ will be divisible by n. This can be deduced from the previous theorem, and is important, since it expresses a distinctive property of prime numbers. *Lagrange's theorem*, that if p be a prime number, the sum of all the products r together of the numbers 1, 2, 3 . . . $(p-1)$, is divisible by p, r being any integer not greater than $(p-2)$, may be proved by the congruence theorem previously stated.

P. Bachmann, *Zahlentheorie*; H. J. S. Smith, *Brit. Ass. Report on Theory of Numbers*, 1859–63, 1865.

NUMBERS, Book of, in Old Testament, fourth of the Mosaic books; like *Exodus*, is compounded of the combined Jahvistic and Elohistic narrative, JE, with the Priestly Code P, and contains the story of the Israelites from the second to the fortieth years of the Exodus. Chaps. 1–10[28] are all from P, and describe the camp and the functions of the Levites. The dual structure of N. is shown in 13–14, where there is plainly a twofold story of the spies, and again in 16–17—Korah's revolt—the combination is obvious; 26–36 are all from P, except part of 32.

See Gray, in 'International Critical Commentary.'

NUMBERS, PARTITION OF, theory originated by Euler. In it we regard numbers as made up by addition of parts. Thus partitions of 4 are 31, 22, 211, 1111. *Classes of Partitions*: (i) into given number of parts, or (ii.) not more than given number of parts; (iii.) into given parts, with or without repetitions. Partitions are obtained from 'partition functions.'

NUMENIUS, see under Plover Family.

NUMERAL, symbol or figure used to represent number. Earliest n's appear to have been hieroglyphical, as with the Egyptians, but were of little arithmetical value. Chaldeans, Hebrews, and Greeks used letters of alphabet for figures, first 9 letters denoting units, second 9 tens, 4 others with 5 accented ones hundreds, and so on. Greeks continued this notation to tens of thousands, and taking M as 10,000, by combinations with other numerals could reach 100,000,000. Roman numerals (still used) were I, II, III, IIII, V (5), X (10), L (50), C, later C (100), Io later D (500), M or cIo (1000), and so on. Some of these are derived from others; thus V is half of X, L half of C. N's used now are of Indian origin, and it was not until adoption of this decimal system that arithmetic made any great progress.

NUMIDIA, ancient North African state, between Rom. province of Africa and north-west state of Mauretania, where modern Algeria lies; named after its nomad population; divided into tribes of Massyli (Eastern) and Massæsyli (Western); cavalry important in Punic Wars; became Roman province, 46. See Algeria.

NUMISMATICS is the science which deals with coins and medals. The most rudimentary system of exchange is the barter system, by which any kind of property is used for the purchase of the required commodity. At a later stage a fixed metallic weight becomes the unit of exchange. Thus Abraham gave to Ephron four hundred pieces of silver, 'current with the merchant.' The use of metals as weights, however, is to be distinguished carefully from the coinage system, by which the pieces of metal are stamped with an official impress guaranteeing just weight and value. The invention of such a stamp is attributed to the Lydians. The gold used by the Lydians was derived from Mt. Tmolus and the Sands of Pactolus. It was not pure, but an alloy of gold and silver known as *electrum*. The early Lydian coins were bean-shaped ingots; the obverse was plain, while the reverse bore incuse sinkings. The earliest Lydian coins have been attributed to Gyges, who flourished in the VIII. cent. B.C., but probably the coinage was invented at a much earlier date. Later Lydian coins show on the obverse a lion's head, and on the reverse incuse depressions.

Croesus (568–554 B.C.) substituted a currency of pure gold and pure silver for the primitive electrum. His 'stater' bears on the obverse the fore-quarters of a bull and a lion, and on the reverse a double incuse. Darius (522–485 B.C.) founded the Persian coinage. His gold stater, called the Daric, was current in the Ionian states and the Ægean Islands; it shows on the obverse the figure of the king kneeling, and holding in his right hand a spear and in his left hand a bow. Trade between Greece and Asia Minor made the Lydian coinage familiar on the mainland. The introduction of the coinage system into Greece is assigned to Pheidon, tyrant of Argos, who flourished about 750 B.C. His coins bear the impress of a tortoise, an animal sacred to Aphrodite, in whose temple at Ægina the coins were issued. In 590 B.C. Solon first introduced the silver tetradrachm at Athens; on the obverse of the coin is the head of Athena, patron goddess of the city, and on the reverse the owl, a bird associated with the goddess. Towards the close of the Persian wars the Greek coins exhibit great beauty in conception and execution. From 480 B.C. the names of cities and their chief magistrates begin to occur on Greek coins. About this time the Athenian stater was the chief unit of exchange in Greece, but the Corinthian stater, with the figures of Pegasus on the obverse, had a wide circulation.

About 400 B.C. numismatic art in Greece attained its highest excellence. The most general type has the head of a divinity on the obverse, while the reverse has a mythological or agonistic subject. Of this type is the famous Syracusan medallion, which is judged to be the finest example of numismatic art in the world. All the large cities of Greece had at this time independent mints, but the conquests of Philip of Macedon imposed the Macedonian stater on the states of Greece, and the independent mints ceased to coin their individual types. From the time of Alexander the Great the head of the reigning monarch began to take the place of the ideal head of the divinity on the obverse, and the portraiture is distinguished by its uncompromising realism. As historical sidelights, the series of numismatic portraits of the kings of Syria, Macedonia, Egypt, Pontus, Bithynia, and Pergamum are invaluable.

The first Jewish shekel was struck by Simon Maccabæus *c.* 140 B.C. During the Græco-Roman period the Greek states issued bronze coins with representations of various local cults and institutions. Roman coinage never attained to the excellence of the Greek coins issued during the period of the Athenian and Spartan supremacy. About 350 B.C. circular pieces of bronze, a Roman pound in weight, were stamped with the head of Janus on the obverse, and the prow of a ship on the reverse. The Republican silver money bears representations of events connected with the family history of the *Triumviri Monetales*. In the year 2 B.C. Augustus assumed the control of the gold and silver coinage, and during the Empire Roman coins bore on the obverse the head of the emperor or a member of his family, and on the reverse allegorical, historical, or architectural subjects.

Before the coming of the Anglo-Saxons, the Britons had an independent coinage modelled after Phœnician coins introduced by traders. The chief Anglo-Saxon coins are *sceattas*, *styeas*, *heptarchial pennies*, and *ecclesiastical pennies*; but English coins are not characterised by any remarkable artistic merit prior to the currency during the reign of Edward III. The coins of this sovereign first bear the inscription 'Dei Gratia' and the title 'Rex Franciæ.' The gold coins of this period were called *nobles* and *angels*. Henry VII. first coined the sovereign. The coins issued by Cromwell during the Protectorate are exceptionally fine; the obverse bears the laureated bust of the protector, while the reverse bears a crowned shield with the harp and crosses of St. George and St. Andrew. Later British coins exhibit no remarkable artistic merit.

The historical evidence afforded by numismatic research is mainly corroborative, as the information to be derived from the inscriptions is necessarily scant, giving principally the names of cities, sovereigns, and magistrates, and the date of the currency. Greek and Roman coins throw light on obscure mythological problems. From the time of Alexander the Great the numismatic portrait-gallery is of the greatest importance, as there are few extant picture portraits belonging to any period prior to the latter half of the Middle Ages. But it is perhaps to the glyphic art that numis-

matic art is most closely akin, and on which numismatic evidence is most invaluable.

NUMMULITES, a genus of mostly extinct gigantic Foraminifera, found as far back as Carboniferous times; disc-like, and sometimes as large as a half-crown.

NUNCIO, see LEGATE.

NUNCOMAR, see under HASTINGS, WARREN.

NUNDIDROOG, NANDIDRUG (*q.v.*).

NUNEATON (52° 32′ N., 1° 28′ W.), town, Warwickshire, England; ribbons; ironworks. Pop. (1911) 37,083.

NUORO (40° 19′ N., 9° 21′ E.), town, Sassari, Sardinia. Pop. 7300.

NUPE (9° 20′ N., 5° E.), province, Northern Nigeria, formerly a native kingdom. Pop. 155,000. Capital, Bida.

NUREMBERG (49° 27′ N., 11° 5′ E.), city, on Pegnitz, Bavaria (middle Franconia); presents mediæval appearance, with turreted walls, moat, gateways, quaint gabled houses, and narrow streets. Chief features are Lorenzkirche (XIII. cent.), with fine wood-carvings and stained-glass windows, Seebalduskirche (XIV. cent.), Frauenkirche; Kaiserburg (royal palace), Renaissance town-hall, Germanic and other museums; houses of Dürer and Hans Sachs, and numerous artistic fountains. Nuremberg was an imperial free city, XIII. cent.; prominent in lit., art, and commerce in Middle Ages; adopted Protestantism, 1528; annexed to Bavaria, 1806. Chief industries are machinery, chemicals, toys, gold- and silver-leaf, lead pencils, paints, lithography, hardware, motors; important trading centre and large hop-market. Pop. (1910) 333,142.

NURSE, see under SHARKS AND DOG FISHES.

NURSIA, see NORCIA.

NURSING.—In early times, and in the Middle Ages, nursing, like hospitals, was in the hands of the religious orders, and under the management of the clergy; but after the Reformation it became, in Prot. countries, dissociated from religion, and thus declined in esteem, and fell into the hands of menials. The modern development of n. began, again under a religious influence, with the foundation of the *Kaiserwerth Institute* in Prussia in 1836, which was soon followed by similar institutions, not only in Germany, but in England, U.S.A., and other countries, the first in England being the *Institution of Nursing Sisters*, founded in London in 1840 by Mrs. Fry. The organisation of a service of nurses to care for the wounded in the Crimean War by Miss FLORENCE NIGHTINGALE (1820–1910), who was trained at the Kaiserwerth Institute, gave a great impetus to n., and the first training-school for nurses on the lines in vogue to-day was founded with the money subscribed as a national recognition to Miss Nightingale in connection with St. Thomas's Hospital, London, in 1860.

The requisite professional training for n. may be obtained in almost any of the general or special hospitals or the more important poor-law infirmaries, the methods of training being similar in regard to the principles although they differ in detail. *Probationers* entering the hospital must be between 21 (in many hospitals, 23 or 25) and 35 (sometimes 30) years of age, must pass a medical examination, and show that they have reached a sufficient standard of education. The usual salary is £8 to £10 the first year, £15 the second, £20 the third, rising to £30 as *staff* nurse, £40 to £60 as *sister* or head nurse, and from about £100 to £250 as *matron*, in addition, in most cases, to uniform, board, and laundry. There is, however, usually a long waiting list at all the large hospitals of persons desiring to enter as probationers, who may have to wait months or even a year or two to begin their training.

Trained nurses in Britain usually belong to a private society or institution, or to such an association as *Queen Victoria's Jubilee Institute for Nurses*, which provides trained nurses (receiving a salary of £30 to £35 per annum, with uniform, board, and laundry) for the sick poor in their own homes. A nurse in a private institution may receive all the fees she earns, paying a certain sum for the upkeep of the institution, or she may receive a fixed salary of about £20 and a percentage of the fees she earns in addition. The fees charged by private institutions to patients are usually from £2, 2s. to £3, 3s. per week.

NURSINGPUR, NARSINGHPUR (*q.v.*).

NUSHKI (29° 40′ N., 66° E.), chief town, N. district, Baluchistan.

NUT (Bot.), a one-celled fruit with a woody pericarp, the shell, and often partially or wholly enveloped in a cupule formed by the more or less complete fusion of the floral bracts, as in the oak and hazel. Many so-called n's are of considerable commercial importance, but these do not always come within the strict definition given above. Some are the source of oils, *e.g.* palm n. and candle n., whilst others, *e.g.* almond and walnut (both really drupaccous), are edible.

NUTCRACKERS, see under CROW FAMILY.

NUTHATCHES, SITTIDÆ, a family of small tree-climbing passerine birds, with 60 species; found in almost every part of the world, except S. America and the greater part of Africa.

NUTMEG, seed of *Myristica fragrans*, a tree indigenous to Moluccas; fruit, a berry which splits and exposes the central seed, enclosed by a red aril, the 'mace' of commerce. N. is strongly aromatic and used as spice; it yields n. butter and n. oil.

NUTRITION, see PLANTS (PHYSIOLOGY).

NUTTALL, THOMAS (1786–1859), Amer. botanist and ornithologist.

NUWARA ELIYA (6° 59′ N., 80° 47′ E.), town, sanatorium, Ceylon.

NUX VOMICA, drug consisting of the seed of a tree, *Strychnos Nux Vomica*, growing chiefly in India and Farther India; seed is disc-shaped, depressed in centre, grey in colour, and of somewhat silky appearance, and its chief constituents are the alkaloids strychnine (*q.v.*) and brucine; tincture and extracts are used medicinally, chiefly as tonics in dyspepsia and other gastro-intestinal conditions, *e.g.* Nux Vomica Compound.

NYACK (41° 5′ N., 73° 55′ W.), village, on Hudson River, New York State, U.S.A. Pop. (1910) 4619.

NYASA (12° S., 34° 40′ E.), lake, East Central Africa; enclosed by German East Africa, British Central Africa, and Portuguese East Africa; length, 340 miles; breadth, 40 miles; greatest depth, 2315 ft.; area, 10,200 sq. miles; known to Portuguese as *Moravia* in XVII. cent.; first explored by Livingstone, 1859; navigated by steamers and sailing vessels.

NYASALAND, see BRITISH CENTRAL AFRICA.

NYBORG (55° 19′ N., 10° 47′ E.), seaport, island of Fünen, Denmark, on Great Belt; formerly important fortress; Swedes defeated here, 1659. Pop. 8300.

NYCTICEBUS, see LORIS, POTTOS.

NYCTIPITHECUS, see DOUROUCOLIS.

NYEZHIN (51° 8′ N., 32° E.), town, on Oster, Chernigov, Russia. Pop. (1910) 48,500.

NYIREGYHÁZA (47° 58′ N., 21° 40′ E.), town, Hungary; extensive vineyards in vicinity. Pop. (1910) 38,198.

NYKJÖBING (54° 46′ N., 11° 52′ E.), seaport, on island of Falster, Denmark. Pop. 7800.

NYKÖPING (58° 45′ N., 17° 1′ E.), seaport, Södermanland, Sweden, on Baltic; steam-engines, cloth. Pop. 9700.

NYLSTROOM (24° 42′ S., 28° 33′ E.), town, on Nylstroom, Transvaal; gold deposits.

NYMPHÆACEÆ, order of aquatic plants with large floating leaves; examples are Lotus, Water-Lily.

NYMPHS (classical myth.), minor goddesses of nature; associated with streams, mountains, etc.; principal divisions were *Nereïds* (sea n's), *Æseïdes* (grove n's), *Dryades* (forest n's), *Oreades* (mountain n's); frequently confused with ancient Ital. local deities of wood and stream.

O, 15th letter of alphabet; appears in Egyptian hieroglyphics; in classical Greek represented by O (*omicron*=small *o*) and Ω (*omega*=great *o*), which are short and long respectively. In English *o* has several sounds—*ŏ* (as in *not*), *ō* (*note, for*), *ŭ* (*love*), *oo* (*Scone*).

OAHU, see HAWAIIAN ISLANDS.

OAJACA, see OAXACA.

OAK (Quercus), a dicotyledonous genus of trees included in the Cupuliferæ; widely distributed; stem stout and covered with rugged bark; leaves oval, with bluntly sinuate or serrate margins. The male flowers are borne in lax, pendulous inflorescences; female flowers borne in axils of upper leaves, and each surrounded by a cupule, which is usually regarded as having arisen by fusion of the bracteoles. The fruit, or *acorn*, is at first completely enclosed by the cupule, but when mature is only protected by it basally. The Brit. oak, *Quercus robur*, includes two forms: *Quercus sessiliflora*, with stalkless female flowers and growing typically on dry, sandy soils (*e.g.* Sherwood Forest on the bunter sandstone), and *Quercus pedunculata*, with stalked flowers, characterising the clays and loams. Oak wood is still largely used for purposes which require a durable timber, and was formerly extensively used in shipbuilding, whilst the bark is valuable for tanning. Other well-known species of economic value are *Q. suber*, the cork oak, *Q. cerris*, the Turkey oak, *Q. ilex*, the evergreen oak, and *Q. alba*, the Amer. white oak. Oaks attain a great age.

OAKHAM (52° 42′ N., 0° 44′ W.), county town, Rutland, England; remains of ancient castle; boots and shoes. Pop. (1911) 3668.

OAKLAND (37° 50′ N., 122° 15′ W.), city, California, U.S.A., on San Francisco Bay; seat of various collegiate institutions; shipbuilding yards; ironworks; canneries. Pop. (1910) 150,174.

OAMARU (45° 6′ S., 171° 1′ E.), town, S. Island, New Zealand; exports grain, frozen meat. Pop. 5300.

OAR FISHES, see RIBBON FISHES.

OARS differ from paddles in that they are passed through thongs or rowlocks; used as auxiliary to sails or as sole mode of propulsion in classical and mediæval times. Ancient battleships generally possessed three banks of oars or even more; sometimes 40 feet long; replaced by sails, XV. cent., largely owing to introduction of artillery. In the Brit. Navy they vary from 8 to 17 feet, and are made of ash or fir. Wooden thole-pins to secure leverage for oars were replaced by iron rowlocks. Oars are made in various shapes, generally lighter for fresh-water rowing. Tubular oars for racing have been introduced, but are still being experimented with; used by Belgians at Henley, 1906. See ROWING.

OASIS, fertile part in a desert, due to springs, *e.g.* Sahara O.; or artificial artesian wells, *e.g.* in Algeria.

OATES, TITUS (1649-1705), spread abroad tale of Catholic plot to murder Charles II. and massacre Protestants, 1678. O. was pensioned; Catholics executed and queen implicated. On James II.'s accession he was sentenced to flogging and life-imprisonment; released, 1688, and led disreputable life till end.

OATH, solemn declaration invoking the witness of God that the truth shall be spoken. The general legal rule is that evidence in a court of law is not admissible unless it is given on o., or by some form of *affirmation* which the law regards as equivalent to an o. Should a person object to taking the o. on the ground that he has no religious belief, or that the taking of an o. is contrary to his religious belief, he may make a solemn affirmation which has in law the same effect as an o. No particular form of the o. is compulsory. The witness may adopt any form which is binding on his conscience or employ any ceremonies required by his religion. Those professing Christianity usually hold a copy of the New Testament or of the Gospels in the naked right hand, while the following o. is read aloud by the officer of the court: 'The evidence which you shall give between the parties shall be the truth, the whole truth, and nothing but the truth, so help you God.' The old custom of kissing the book has now been abolished. Scot. witnesses usually swear with uplifted hand. Jews are sworn on the Pentateuch with heads covered; Muhammadans on the Koran. Besides the o. of a witness, there is the o. of allegiance to the crown, taken by peers, members of Parliament, soldiers and sailors, and other persons in the service of the crown.

OATS (*Avena sativa*) a gramineous plant much cultivated in Scotland and N. Europe generally for food, being hardier than wheat. The inflorescence is paniculate, with two to six flowered spikelets. O. form an invaluable food for horses, and yield the well-known oatmeal.

OAXACA, OAJACA.—(1) (17° N., 96° 30′ W.) state, S. Mexico; area, 35,382 sq. miles; surface generally mountainous; produces cereals, rubber, coffee, sugar, etc. Pop. (1910) 1,041,035. (2) town, capital of above, on Rio Verde; sugar, cochineal. Pop. (1910) 37,469.

OB, OBI (66° 30′ N., 67° E.), navigable river, W. Siberia, flowing into Gulf of Ob.

OBADIAH, Old Testament book and one of minor prophets. The writer speaks mostly of Edom, and prophesies their destruction at an impending 'day of the Lord,' when they and other nations shall be requited according to their works. The destruction of Jerusalem referred to is that probably of 586 B.C. There are close parallels between O. and *Jeremiah* 49^{7-22}, and probably both drew from a common source.

OBAN (56° 24′ N., 5° 27′ W.), town, Argyllshire, Scotland; noted summer resort and yachting centre; stands on beautiful bay. Pop. (1911) 6567.

OBEID, EL, see EL OBEID.

OBELISK, four-sided tapering stone monument, especially common in Egypt; placed in front of gateways of temples and halls or in isolated positions; sides generally covered with hieroglyphics; good example, Cleopatra's Needle, brought from Alexandria to London, 1878, and set up on Thames Embankment.

OBERAMMERGAU (47° 35′ N., 11° 4′ E.), village, on Ammer, Bavaria; wood and ivory carving. Noted Passion Play has been performed here every ten years, since passing of plague, 1634; next representation, 1920.

OBERHAUSEN (51° 30′ N., 6° 50′ W.), town, Rhine province, Prussia; ironworks. Pop. (1910) 89,897.

OBERLAHNSTEIN (50° 20′ N., 7° 40′ E.), town, Hesse-Nassau, Prussia, at junction of Lahn and Rhine. Pop. (1910) 8925.

OBERLAND, see BERNESE OBERLAND.

OBERLIN (41° 16′ N., 82° 13′ W.), village, Ohio, U.S.A.; head of O. Coll., which includes Academy, Coll., Theological Seminary, and public library; founded, 1833. Pop. (1910) 4365.

OBER-NEUNKIRCHEN, see NEUNKIRCHEN.

OBERON, king of the fairies and husband of Titania; familiar figure in mediæval tales; appears in

A Midsummer Night's Dream and in Weber's opera *Oberon* (1826), words by Wieland.

OBERSALZBRUNN, see SALZBRUNN.

OBERSTEIN (49° 42′ N., 7° 20′ E.), town, Birkenfeld, Oldenburg, Germany; agate-cutting and polishing. Pop. (1910) 9669.

OBESITY, see CORPULENCE.

OBI, see OB.

OBJECT GLASS, large glass at end of a refracting telescope at opposite end to eyepiece. The o. g. receives the rays of light from a star or other object, and collects them to a focus, where is placed the eyepiece, which magnifies the image there formed. A telescope's quality and power depend on its o. g. The modern o. g. consists of two pieces, an outer convex lens of crown glass and an inner concave lens of flint glass, this combination greatly reducing the effects of chromatic aberration. See TELESCOPE.

OBJECTIVE, see SUBJECTIVE.

OBJECTIVISM, theory that we can attain real truth, through objective validity of our ideas.

OBOE, HAUTBOY, important wood-wind instrument played by a double reed; evolved from primitive *schalmei*, now obsolete, and in its present form about 200 years old; has a peculiar nasal tone, piercing, yet expressive. Essentially a lyric instrument, music of a tender, pastoral character suits it best, but in skilful hands it is also useful for the expression of melancholy and gaiety. 'It is less voluptuous than the clarinet,' says an authority; 'in sustained cantilena it assumes a character of *naïveté*, modesty, and for this reason, in operatic and in programme music, it plays an important rôle as representative of maidenliness.' To the o. is assigned the province of 'sounding the A' to which the rest of the orchestra tunes, a practice dating from Händel's time, when it was the principal wind instrument. An imitative o. stop is included in most organs.

OBOK (12° N., 43° 30′ E.), decayed seaport, on Tajura Bay, Fr. Somaliland.

OBRA (52° 25′ N., 15° 50′ E.), small river, Posen, Prussia; joins Warthe.

O'BRIEN, WILLIAM (1852–), Irish politician; founded the paper, *United Ireland*, 1880; the United Irish League, 1898, and its paper, *The Irish People*; has been often imprisoned; now (1913) leader of Independent Nationalists in Parliament.

OBSERVANTISTS, see FRANCISCANS.

OBSERVATORY, a building devoted to the observation of natural phenomena in connection with such sciences as astronomy, meteorology, and for the study of magnetic phenomena. The most interesting o's are generally astronomical, housing instruments for the observation of the heavenly bodies.

Astronomical o's date from early times in China, while the Pyramids of Egypt played a great part in stellar observation (see Lockyer's *Dawn of Modern Astronomy*). An o. was founded at Alexandria in 300 B.C., whilst others were built at Cairo in 1000 A.D. and Maragha (Persia) 1260 A.D. The first European o., however, was built at Nuremberg by Walther in 1472, while Tycho Brahe founded his world-famous o. at Hveen, an island near Copenhagen, in 1580. Other o's were built as follows: Royal Observatory, France (Paris), 1667; Royal Observatory, England (Greenwich), 1675; Vienna, 1756; Dublin, 1785; Cape of Good Hope (Cape Town), 1820; Sydney, Australia, 1820; Royal Observatory, Scotland (Edinburgh), 1825; Pulkova, Russia, 1839; Melbourne (Australia), 1853; Lick, California, 1888; Flagstaff (Arizona), 1894; Yerkes, Wisconsin, U.S.A., 1897; and Carnegie Solar Observatory, Mount Wilson, U.S.A., 1904.

An o. consists chiefly of the dome or cupola for housing the telescope. This dome rests on a substructure, and generally runs on roller bearings. A sliding shutter is so arranged that it gives an opening allowing the telescope to be pointed from horizon to zenith. This opening may be directed to any point of the sky by rotating the cupola. Telescopes are generally mounted equatorially; by clockwork the instrument automatically follows a celestial object from its rising to its setting. In o's where very large instruments are used, rising floors, worked by hydraulic power, are installed to accommodate the observer to the alteration in the instrument's height. A transit instrument and sidereal clock are also necessary for the carrying on of astronomical work. The former is so arranged as to move only up and down, like a cannon. It points due south and is generally accommodated in a separate building or room. The time a star crosses the line of the transit instrument is taken, and compared with the star's known time of transit, and the sidereal clock is regulated thereby. The clock, a very evenly balanced instrument, involving the highest art of clockmaking, is used in connection with the locating of heavenly bodies with the large telescope.

Owing to the impurities of the atmosphere, caused by factory chimneys, etc., it has been found advisable to build o's on the summit of mts. California, U.S.A., is specially noted for its clear atmosphere. Perhaps the most famous observatory of the present day is the Lick. James Lick, an American millionaire, left a sum of money to build an o. and to erect a telescope the object glass of which was to be 36 inches in diameter. The Trustees, in searching for a suitable spot to erect this huge instrument, decided at last on Mount Hamilton, in California, some 4250 feet high, and here in 1888 the Lick Telescope was erected. Numerous double stars and a new satellite to Jupiter have been discovered, while thousands of measurements of double stars have been taken at the Lick O. Observations of nebulæ have been carried on with other instruments.

Stroobant, *Les Observatoires astronomiques* (1907).

OBSIDIAN, volcanic rock (vitreous lava) of acid composition and of glassy appearance; composition resembles granite, and it is classed with felspars; found in Europe, Iceland, Siberia, S. America, Mexico, Peru; hard and brittle; sometimes used for ornamental purposes. Incas and Yucatans of Peru and Mexico used o. for weapons, spear- and arrow-heads, cutting knives, etc.

OBSTETRICS, MIDWIFERY, is the science which deals with the case of a pregnant woman, the bringing of her child into the world, and the care of the woman and the newborn child in the puerperium, or lying-in period immediately following labour, in which the organs of generation of the woman return to their normal, non-pregnant condition. The most distinctive part of the science of o. is the process of labour, which takes place in three stages: first, the dilatation of the uterus to allow the escape of the child; second, the expulsion of the child; and third, the expulsion of the *placenta*, or after-birth. A natural labour is one in which the head of the child is presented, and which begins and ends within the space of twenty-four hours. Pregnancy, labour, and the puerperium must not be regarded as pathological but as perfectly normal and physiological processes which require little or no assistance under natural conditions, but upon which civilisation has had the effect of increasing the difficulties and dangers.

Pregnancy extends for nine calendar months, and the date of confinement may be reckoned as falling within the fortnight which has as its central date the 280th day after the beginning of the last menstrual period. The earliest sign of pregnancy is the cessation of the monthly menstrual flow. During the second, third, and fourth months a certain amount of sickness is experienced, most commonly on rising. From the third month the breasts become enlarged and the superficial veins more prominent: there is a feeling of fulness, associated at times with pain. The pink areola surrounding the nipple becomes darker and wider. The glands surrounding the nipple become enlarged and form prominent papillæ. After the fourth month the abdomen enlarges. Quickening, the first indication of an independent life,

is usually experienced during the fifth month, and varies from a slight fluttering to severe sickness and fainting. Towards the end of pregnancy the discomfort to breathing caused by the enlarged uterus becomes less; walking becomes more difficult, and there is usually an increased tendency to pass water at short intervals.

While a pregnant woman is not an invalid she should take especial care of her health at this time. Walking is the best exercise; dancing, tennis, hockey, golf, cycling, etc., should be avoided. Crowded places of entertainment, where the atmosphere is close and there is excitement, should be shunned. The clothing should be warm, loose, and comfortable. When the abdomen becomes enlarged, an obstetric belt or flannel binder gives adequate support. The ordinary diet should be maintained unless sickness or indigestion supervene. The bowels have a tendency towards constipation, and should be attended to; the daily warm or tepid bath should be strictly adhered to. If the heaviness of the breasts causes discomfort, bandages or binders may be applied; and during the last two months the nipples should be hardened by bathing twice a day with eau-de-Cologne or weak spirits.

While most pregnancies are normal there are complications which may appear. The morning sickness may become excessive; but it yields to treatment. Sleeplessness should be carefully treated. Attention to diet, especially in the evening, may be all that is required. Owing to the pressure of the uterus there is a special tendency to varicose veins and swelling of the legs. Rest in bed, with bandages if necessary to the affected parts, is all that is needed. Jaundice occasionally occurs. There may be a discharge from the vagina which causes itching and is accompanied by pains in the back; antiseptic and astringent douches will remedy it.

Eclampsia (convulsions closely resembling those of epilepsy) is fortunately of comparatively rare occurrence. Even if threatened it can often be prevented. Warning is given in the state of the urine, and every pregnant woman should have her urine examined by her doctor once a month during the first six months, and fortnightly till the end of pregnancy. An impending fit is usually preceded by disturbance of the sight and hearing, and there are severe headaches.

In the time of Hippocrates (400 B.C.), as, indeed, for many hundreds of years later, the conduct of labour was in the hands of skilled women. Although we find accounts of disorders of the generative system of women in his writings, and in the works of his followers the possibility of changing the presentation of the child is spoken of, and the mutilation and extraction of the dead child described, yet the process and conduct of a normal labour is not mentioned. With the advance in the knowledge of anatomy the art of o. became more exact, and Soranus (98–137 A.D.), who wrote a valuable work for the instruction of midwives, Galen (131–201 A.D.), and Moschion (c. IV. cent. A.D.) had by their writings a great share in its development. After this period little advance was made until the XVI. cent., when the influence of the Renaissance and the Reformation began to make itself felt on this as on other arts and sciences, although the practice of o. still remained in the hands of women. Ambroise Paré (*q.v.*), in 1550, revived the operation of turning, which had been known to Soranus and forgotten later, and the method of Paré, by which many children, who must otherwise have died, have been delivered alive, is used at the present day.

In the XVII. cent. surgeons began to conduct labours, Jules Clément, a famous Fr. surgeon, acting as accoucheur to Madame de la Vallière, to the dauphiness of France, and to many other ladies of the Fr. court, since when many eminent surgeons and physicians have refused to consider o. subsidiary to the other branches of med., and have devoted their attention entirely to that subject. At the end of the XVI. cent. the forceps was invented by Peter Chamberlen, son of a Huguenot who had fled to England, and the invention was kept a secret of the Chamberlen family for over a cent., becoming known to the medical profession generally by about 1730. During the XVIII. cent. the science of o. made great strides, chairs in the subject being established in different univ's, the first being the chair of Midwifery in Edinburgh Univ., founded in 1726, while new operations were devised and instruments and methods were improved. Progress continued to be made in the XIX. cent., made memorable in the history of o. by the application of anæsthetics in labour—Sir J. Y. Simpson (*q.v.*), in 1847, first employing ether, and, later in the same year, chloroform to relieve the pains of labour, the latter becoming afterwards very generally employed in surgery; and second, by the abolition of so-called puerperal fever, really a septicæmia, from the maternity wards, by causing the students taking part in the conduct of labour to first disinfect their hands in chloride of lime, a method introduced by J. P. Semmelweiss (*q.v.*) and later amplified and perfected independently by the discoveries and antiseptic applications of Lister (*q.v.*).

OCALA (29° 13′ N., 82° 10′ W.), city, Florida, U.S.A. Pop. (1910) 4370.

OCAÑA (39° 56′ N., 3° 29′ W.), town, Toledo, Spain. Pop. 7200.

OCCAM, WILLIAM OF (d. 1347), Eng. philosopher; b. Ockham; ed. Oxford and Paris under Duns Scotus; revived Nominalism of Roscellin; the same thing cannot exist in several different objects, whence universal a mere sign to designate different things; opposed Pope's claim to political power; fled to Bavaria, and never recanted.

OCCASIONALISM, doctrine that mind and matter do not interact, and that on any change in one, God intervenes to produce a change in the other. See DESCARTES.

OCCLEVE, THOMAS, HOCCLEVE (1368–c. 1450), Eng. minor poet of Chaucerian school. His longest work is *The Regement of Princes*, or *De Regimine Principum*, a metrical homily on conduct. He also wrote *Jeraslaus' Wife*, *Jonathas*, and *Learn to Die*.

OCEAN CITY (39° 18′ N., 74° 35′ W.), city, seaside resort, New Jersey, U.S.A.

OCEAN GROVE (40° 15′ N., 74° W.), seaside resort, New Jersey, U.S.A.

OCEANIA, OCEANICA (35° N. to 55° S., 100° W. to 130′ E.), division of globe comprising islands in Pacific Ocean; divided into various groups, viz. Melanesia (with Australasia), Polynesia, Malaysia (excluded by some geographers), and Micronesia. These islands are divided among Britain, U.S.A., Holland, Germany, France, Japan, and Chile, and are involved in the important problem of the mastery of the Pacific.

Alexander, *The Islands of the Pacific* (1895); Russier, *Le Partage de l'Océanie* (1905); Colquhoun, *The Mastery of the Pacific* (1902).

OCEANOGRAPHY, the comprehensive science which deals with the ocean in all its aspects—its tides and currents, its varying composition and temperatures, its vegetation, and its animal inhabitants. Apart from its purely scientific aspect, o. is of immense importance to navigators and especially to fishermen, for on a knowledge of the habits of fishes, which in turn depend in great part on oceanic conditions, the progressive and scientific advance of fisheries depends.

O. cannot be called a single or pure science, for it includes many branches and takes toll of many sciences. Physics measures and interprets tides and currents, chemistry tells of the composition of sea water and its content, botany and zoology are laid in tribute; but o. has a distinct function in correlating and uniting the isolated items of information into a single compact science of the sea. Owing to the difficulty of observing directly any but the surface layers of the ocean, the progress of o. has been very gradual until recent years, and has kept step only with the perfecting of instruments for making records in the unseen depths.

The early observers were content with measuring the depth of the ocean, from Magellan, who, in 1521, on the first voyage round the world, failed to reach the bottom of the Pacific with a 200-fathom line, to Sir John Ross, who, in 1817–18, touched the bottom of the Arctic Ocean in 1050 fathoms and brought up on his sounding-line a live starfish, a hint that even at great depths living things existed.

Sporadic observations of ocean phenomena have been made since the earliest times, but the main development of knowledge has lain with expeditions specially fitted for the purpose. Thus Edmund, in 1699, and Halley, the Astronomer-Royal, endeavoured to gain information concerning the longitude and the variation of the compass, whilst among many more purely oceanographical expeditions stand out pre-eminently those of Captain James Cook in 1772–73, the Antarctic expeditions of Sir James Clark Ross from 1839 to 1843, the U.S. Exploring Expedition of Captain Wilkes and Professor Dana from 1839 to 1842, the U.S. Coast Survey from 1844, with which Maury, Pourtalés, and Louis Agassiz were associated, and the North Atlantic cruises of the *Lightning* (1868) and *Porcupine* (1869) under the leadership of Sir Wyville Thomson and W. B. Carpenter. But overshadowing all others in the comprehensiveness and scientific value of its work was the great expedition of H.M.S. *Challenger*, under Sir Wyville Thomson, which from 1872 to 1876 circumnavigated the world, crossing and recrossing the great oceans, observing and collecting everywhere. The magnitude of its labours may be judged from the fact that the scientific results were published in 50 quarto vol's, and these form the bed-rock upon which modern o. has been founded.

Since the *Challenger* voyage scarcely a year has passed without the accomplishment of important scientific work by one expedition after another. Researches have concentrated more particularly in the North Atlantic, in the North Sea, and in the Antarctic Ocean. Outstanding efforts have been made in the first by the Prince of Monaco on his yachts, *L'Hirondelle* and *Princesse Alice*, in the second by the International Commission for the Scientific Investigation of the North Sea, participated in by Great Britain, Sweden and Norway, Russia, Germany, Denmark, Holland and Belgium, and in the last by a series of well-equipped expeditions dispatched by Belgium (1897–99); Great Britain (Scott, 1901–3 and 1911–13); Bruce, 1902–4, Shackleton, 1907–9; Germany (1901–3 and 1911); Sweden (1901–3); and France (1903–5 and 1908–10).

It is impossible to describe all the complicated apparatus used in vessels fitted for oceanographical research, but mention may be made of the automatic sounding machines, such as that invented by Lucas, which records mechanically the depth at which bottom has been touched; of reversing thermometers which from the deck can be made to register the temperature at given depths, and with which is associated a water-bottle which brings to the surface a sample of water from the same depth for examination as to salinity, etc.; current-meters, which, lowered and kept as stationary as possible at a definite position, record the direction and speed of tidal and other currents; and the apparatus for collecting the organic content of the sea. This last consists of dredges to be dragged along the bottom, and of many types of net—the otter-trawl, and pelagic trawls for catching the larger animals, the former at the sea-bottom and the latter at any desired depth; vertical nets drawn directly upwards so that the content of a column of sea water of known length and area can be estimated; and tow-nets, several of which, at the surface and known depths, are generally employed at one time.

The result of innumerable sounding observations has been to show that the bottom of the ocean more or less resembles the surface of the land: in places marked by deep depressions, which as in the greatest abysses known —the Aldrich Deep and Challenger Deep, in the west of the South and North Pacific Ocean respectively—may reach a depth of over 5000 fathoms (roughly, 5½ miles); or rising here and there in great elevations which sometimes reach the surface and project as islands, but more frequently form great submarine ridges far underneath the surface, such as the Mid-Atlantic ridge, which runs down the centre of the Atlantic Ocean from the Arctic Ocean to the latitude of Cape Horn. But the sea-bottom is more uniform than the surface of the land. Vegetation, as we know it on the seashore, almost ceases at a depth of 10 to 15 fathoms. Round the continental areas, and exending from the shore to varying distances, down sometimes to 1000 or rarely to 2000 fathoms below sea-level, are deposits formed mainly from the neighbouring land—coral sands and muds, green, red, and blue muds, and volcanic sands and muds. In deeper water the deposits are even more uniform, extending sometimes over many thousands of square miles. There they are formed of the skeletons of minute organisms which have sunk to the bottom, and after which they are named. In the shallower waters far from land, the sea-floor is covered with Pteropod ooze, formed of the empty shells of the pelagic molluscs, Pteropods. Characteristic of depths between 1000 and 2000 fathoms, the commonest deposit, found over hundreds of thousands of square miles, is Globigerina ooze formed of foraminiferal shells; still deeper in colder regions are Diatom oozes of microscopical plant skeletons, and in the tropical Pacific and Indian Oceans Radiolarian oozes, while in the abysses there occurs a red clay derived mainly from volcanic products.

However uniform the sea-floor may be, the ocean itself presents great variety, and its depths, tides, currents, varying temperatures, and varying salinities are more or less reflected in the organisms which live in it. The inhabitants of coastal waters are mainly brightly and variously coloured, and are furnished with comparatively heavy bodies and strongly developed protective devices. In the open sea blue colours are prevalent, and the bodies of many pelagic creatures are delicate, transparent, and almost invisible, with adaptations to a floating habit. With increasing depths, colours become more uniform, dark browns, blues, violet, and black being commonest amongst fishes, and reds amongst invertebrate animals, at and beyond 300–400 fathoms, at which depth most of the sun's rays are absorbed. Other interesting developments appear to be due to phenomena of light, for while all the sun's rays penetrate to 55 fathoms, and light is still strong at 275 fathoms, and can be detected even at 550 fathoms, no trace of sunlight affects photographic plates in 930 fathoms. In those depths many invertebrates and fishes are furnished with luminous organs, eyes become larger, to catch every faint gleam of light, or disappear altogether in the darkness, and tactile organs or feelers take their place or act as subsidiaries. Pressure increases at the rate of one atmosphere for every 5½ fathoms, which represents a pressure of about 2½ tons per square inch at a depth of 2000 fathoms, and to withstand this the bones and flesh of deep-sea animals are soft and porous. Many bottom animals too are furnished with long legs and long stalks to raise them above the suffocating ooze on the sea-floor.

The study of ocean currents and drifts in the Atlantic and North Sea has shown that upon them depends the distribution of the minute organisms which constitute the food of many fishes, and therefore to a great extent the distribution and migration of fishes themselves.

To the investigations of oceanographers mariners owe their invaluable charts of soundings and their knowledge of tides, oceanic currents, and drifts, information which also places in the hands of the meteorologist the key to many of the climatic conditions and fluctuations on sea and land. Further, although as regards fisheries it is only in recent years that efforts have been made to interpret the complicated phenomena in terms of physical o., yet already many problems seem on the verge of solution.

Consult the 'Scientific Results' of Expeditions mentioned; or for comprehensive summaries, Murray

and Hjort, *The Depths of the Ocean* (1912); *Science of the Sea*, edit. by G. Herbert Fowler (1912); Wyville Thomson, *The Depths of the Sea* (1873); or from the biological aspect, Johnstone's *Life in the Sea* (1908).

OCELOT, see under CAT FAMILY.

OCHAKOV, OTCHAKOV (46° 40′ N., 31° 30′ E.), fortified seaport, Kherson, Russia, on Black Sea; taken by Russians, 1737 and 1788; fisheries. Pop. 11,500.

OCHINO, BERNARDINO (1487–1564), Ital. theologian; confessor of Pope Paul III. and general of Capucin order; wonderful powers as preacher; charged with heresy, and fled to Geneva, 1542; subsequent life as fugitive and heretical preacher and writer.

OCHOTONA, Picas (*q.v.*).

OCHRIDA (41° 11′ N., 20° 43′ E.), town, Albania, on Lake Ochrida. Pop. *c.* 17,000.

OCHSENFURT (49° 35′ N., 10° E.), town, on Main, Lower Franconia, Bavaria; trade in wine. Pop. 3200.

O'CONNELL, DANIEL (1775–1847), Irish statesman; famous barrister, nicknamed 'the counsellor'; became head of anti-Union party; formed Catholic Association, 1823, of great power, dissolved, 1825, to anticipate suppression; established society, 'Friends of Ireland,' 1829, and various successors, in their turn suppressed; M.P. for Dublin, 1832, and fought Coercion Act of 1833; introduced subject of Repeal, 1834; founded Repeal Association, 1840, held meetings, and set up huge organisation to agitate; imprisoned for conspiracy to raise sedition, 1844; opposed to militancy, and broke with young Irish party; revered in Ireland as *the Liberator*. See Dunlop, *Life* (1900).

OCONOMOWOC (43° 5′ N., 88° 48′ W.), city, summer resort, Wisconsin, U.S.A. Pop. (1910) 3054.

OCONTO (44° 50′ N., 87° 50′ W.), city, Wisconsin, U.S.A.; lumber and fishing industries. Pop. 5629.

OCRICULUM, ancient town, Umbria, Italy, on Via Flaminia.

OCTAVIA, sister of Rom. emperor, Augustus; on her husband Marcellus' death, m. Mark Antony, only to be forsaken for Cleopatra. See AUGUSTUS CÆSAR.

OCTAVIANUS, afterwards Emperor Augustus. See AUGUSTUS CÆSAR.

OCTOPODA, see under CEPHALOPODA.

OCTOPUS, a genus of Cephalopoda (*q.v.*).

OCTROI (Lat. *auctoritas*), name given in France to duties levied by local authorities on certain articles (wines, foodstuffs, etc.) entering towns or communes; original meaning, royal permission to levy tax on articles of consumption entering a town; abolished, 1791, but restored, 1798; not imposed by all towns or municipal councils (*e.g.* Lyons has no *octroi*, while Paris has). A similar system exists in other Romance countries.

OCULOMOTOR, see NERVOUS SYSTEM.

OCYDROME, a rare, flightless New Zealand bird, of dull plumage, related to the Rallidæ; interesting on account of its affinities with extinct species of Carinatæ.

ODÆNATHUS, ODENATUS (2nd half of III. cent. A.D.), prince of Palmyra; repelled Persians, who were conquering eastern provinces from Roman empire; received title of 'independent lieutenant of the Emperor of the East,' 262.

ODDE, ODDA (60° 8′ N., 6° 35′ E.), tourist centre, Norway.

ODDFELLOWS, ORDER OF, a friendly society. The various lodges of the Independent Order of Oddfellows, Manchester Unity, were formally united in 1813. Present membership, including U.S.A. and Brit. Colonies, exceeds 1,050,000, and the funds in hand are over £15,000,000. The Independent O.O.F. (now affiliated with Manchester Unity), with Sovereign Grand Lodge, U.S.A., and Grand Lodges in several European countries, has membership of over 1,700,000 (over 1½ millions in U.S.A.).

ODE, Gk. word meaning song with musical accompaniment; came to denote lyrical poetry of length and complexity, *e.g.* the *Carmen* of Alcman, the *Horatian Ode* of Sappho, Alcæus, and Anacreon. Pindar perfected the ode. Horace's odes are more regular, and inspired such odes as Spenser's *Epithalamion*, Collins' *To Evening*, Shelley's *To a Skylark* and *To the West Wind*, Keats' *To a Nightingale*. 'Pindaric' odes are Dryden's *Alexander's Feast*, Wordsworth's *Intimations of Immortality*, Tennyson's *Duke of Wellington*.

ODENKIRCHEN (51° 10′ N., 6° 30′ E.), town, on Niers, Rhine province, Prussia; silks, velvets. Pop. (1910) 20,049.

ODENSE (55° 23′ N., 10° 22′ E.), city, island of Fünen, Denmark, on Odense; tanneries; iron foundries; cathedral contains tombs of King Canute and other kings. Pop. (1911) 42,237.

ODENWALD (49° 40′ N., 8° 48′ E.), mountainous region, Hesse, Germany; noted for its legends.

ODER (53° 20′ N., 14° 30′ E.), river, Germany; rises in Odergebirge (Moravia); flows N.W. through Germany and enters Baltic by three arms—Swine, Peene, Dievenow; chief tributaries, Bartsch, Neisse, Warthe; principal towns, Breslau, Stettin, Frankfort; length, 550 miles; navigable for about 470.

ODERBERG (52° 50′ N., 14° 5′ E.), town, on Oder, Brandenburg, Prussia; dépôt for timber from Russia. Pop. 4500.

ODESSA (46° 28′ N., 30° 43′ E.), important seaport, on Black Sea, Southern Russia, near mouth of Dniester; with fine cathedral (XIX. cent.), gov.'s palace, theatre, univ. (1865), Nikolai Boulevard, etc.; originally a Turk. fortress; taken by Russians, 1789; town founded, 1794; free port, 1811–57; serious revolts and riots, 1905–6. Odessa has oil-mills, sugar-refineries, tanneries, ironworks, chemicals, soap, leather, tobacco; principal export is grain. Pop. (1910) 478,900.

ODILIENBERG (48° 20′ N., 7° 10′ E.), mountain, tourist-resort, Alsace, Germany; noted Convent of St. Odile (founded VII. cent.).

ODIN, see WODIN.

ODO (1036–97), half-bro. of William I. of England; bp. of Bayeux, 1049; Earl of Kent, 1067.

ODOACER, FLAVIUS (*c.* 434–93), Ger. king (probably Scyrrian by birth), who overthrew Romulus, last Rom. emperor of West, 476, and became practically sovereign of Italy. O. retained Rom. senate and government of Italy. Attacked and defeated by Theodoric king of Ostrogoths, 489 (on Byzantine emperor's commission), he held out till 493.

ODOBENIDÆ, see WALRUSES.

ODOBENUS, see WALRUSES.

O'DONNELL, Irish family; descended from Conall Gulban, s. of V.-cent. Irish king, Niall; rulers of Tyrconnel and rivals of O'Neills of Tyrone. Chief members: (1) **Manus** (d. 1564), succ. his f. as The O'D., 1537; adopted cause of Gerald Fitzgerald and invaded Pale, 1539–40. (2) His s. and heir, **Calvagh** (d. 1566), deposed him, 1555, but was captured by Shane O'Neill, 1561; restored by England, 1566. (3) His grandson, **Hugh Roe** (1572–1602), is famous in Irish history and legend; became The O'D., 1592, and led opposition to England.

ODONTOCETI, a sub-order of whales (*q.v.*).

ODONTOLCÆ, Fossil Birds, see under ODONTORNITHES.

ODONTORNITHES, sub-class of Fossil Birds having jaws furnished with sharp teeth. Two divisions are distinguished, the *Odontolcæ* represented by N. Amer. *Hesperornis*, with teeth sunk in a groove, somewhat resembling an ostrich, but with legs adapted for swimming, and the ODONTOTORMÆ, containing *Ichthyornis*, with teeth sunk in distinct sockets and well-developed wings.

ODONTOTORMÆ, Fossil Birds, see under ODONTORNITHES.

ODORIC, ST. (*c.* 1286–1331), Ital. missionary; Franciscan friar; set out with Irish minorite, James, *c.* 1316, and was absent about 12 years, passing through Persia and India and across China. O.'s journey added to information acquired by Marco Polo nearly all that was known in Middle Ages. His narrative was freely used in Sir John Mandeville's *Travels*.

ODYLIC FORCE, supposed all-pervading force, at

one time held to explain 'mesmerism' and 'animal magnetism.' See HYPNOTISM.

ODYSSEUS, ULYSSES, in Gk. legend the son of Laërtes. The chief events of his life were his long service in the Trojan War, his protracted homeward voyage so full of adventure, his return to his faithful wife Penelope, and his vengeance on her suitors. See HOMER.

ŒCOLAMPADIUS, JOHN HUSSGEN (1482–1531), Ger. reformer; Gk. and Hebrew scholar; friend of Erasmus; adopted Zwingli's view of Eucharist; organised Reformed Church at Basel, 1529; contributed to *Bible* commentary.

ŒCUMENICAL, ECUMENICAL (Gk. *Oikoumenē*, inhabited world), universal; applied to General Councils of whole Church. See COUNCIL.

ŒDEMIA, COMMON SCOTER, see under DUCK FAMILY.

OEDENBURG, see SOPRON.

ŒDIPUS (classical myth.), Theban king; exposed in infancy because of prophecy; found by shepherd and adopted by king of Corinth; journeyed to Thebes, unwittingly slaying on the road his father Laius; delivered land from Sphinx (*q.v.*), and married his mother Jocasta, ignorant of her identity. A plague consequently fell on the land, and when the incest was discovered, Jocasta committed suicide, and Œ., self-blinded, wandered forth a beggar.

The Œ. myth appears in Homer, but is best read in the *Œdipus Tyrannus* of Sophocles (*q.v.*), one of the most magnificent tragedies ever written. It has several times been attempted on the modern stage, notably by Martin Harvey, under the direction of Prof. Max Reinhardt (1912).

OEHRINGEN (29° 10′ N., 9° 30′ E.), town, Württemberg, Germany. Pop. 3600.

OELAND, see ÖLAND.

OELS, ÖLS (51° 12′ N., 17° 21′ E.), town, on Oels, Silesia, Prussia. Pop. (1910) 11,719.

OELSCHLÄGER, ADAM (1600–71), Ger. traveller; b. at Aschersleben. His greatest works are a narrative of the Russ. and Persian legation, and a history of Holstein.

OELSNITZ (50° 27′ N., 12° 10′ E.), town, on Weisse Elster, Saxony, Germany; carpets. Pop. (1910) 13,952.

OELWEIN (42° 40′ N., 91° 57′ W.), city, Iowa, U.S.A.; machine shops. Pop. (1910) 6028.

OEREBRO, see ÖREBRO.

OESEL, ÖSEL (58° 20′ N., 22° 30′ E.), Russ. island, Baltic Sea. Pop. 61,000. Chief town, Arsenburg.

ŒSOPHAGUS, the gullet; that portion of the food canal which leads from the mouth to the stomach.

ŒSTRIDÆ and **ŒSTRUS**, see BOT FLIES.

OETA (38° 48′ N., 22° 14′ E.), mountain, ancient Greece; modern Katavothra.

OEYNHAUSEN (52° 10′ N., 8° 30′ E.), watering-place, Westphalia, Prussia; saline springs. Pop. 3500.

OFEN, Ger. name for Buda, Hungary. See BUDA-PESTH.

OFFA (d. 796), king of the Mercians (from 757); defeated Wessex at *Bensington*, 779; created Mercian archbishopric at Lichfield, 787; boundary (*Offa's Dyke*) made between Mercia and Wales.

OFFENBACH (50° 7′ N., 8° 45′ E.), town, on Main, Hesse, Germany. Pop. (1910) 75,593.

OFFENBACH, JACQUES (1819–80), operetta composer; b. Cologne; lived in Paris; best works include *Orphée aux Enfers*, *La Belle Hélène*, *Madame Favart*, and *Contes d'Hoffmann* (1881).

OFFENBURG (48° 27′ N., 7° 56′ E.), town, on Kinzig, Baden, Germany; textiles. Pop. (1910) 16,840.

OFFICERS.—Leadership in war is a form of employment not unlike the control of workmen in building a railway or a cathedral; and as late as the XVIII. cent. officers were commissioned as much to raise troops as to lead them. To this day the theory is maintained that the paymaster of a company of Brit. infantry is its captain, and not long since the colonel of a regiment was remunerated by the profit he obtained on clothing the rank and file. These appointments were bought and sold just as commercial partnerships are bought and sold to-day, and the price of an ensign's commission was £400, further sums being paid on promotion; so that ultimately a lieutenant-colonel could dispose of his official position for £3500. In the Guards and the Cavalry these sums were doubled. The purchase system was abolished in 1873 in Britain.

In the Brit. Army at present *commissions* are granted to serve as second-lieutenant, and promotion follows by seniority in the corps to lieutenant, captain, major, and lieutenant-colonel. O's who are not then retired may receive 'extra regimental' employment as colonels, and from the colonels are selected brigadier-generals, who in turn may be chosen for promotion to the rank of major-general, lieutenant-general, general, and field-marshal. In the Brit. Navy the corresponding ranks are Admiral of the Fleet (field-marshal), admiral (general), vice-admiral (lieutenant-general), rear-admiral (major-general), and commodore (brigadier-general). Regimental o's of the army rank as follows with naval officers: Colonel and lieutenant-colonel as captain or commander, majors and captains as lieutenants; a lieutenant in the army is of equal standing with a sub-lieutenant in the navy; the second-lieutenant ranks with a chief gunner or chief boatswain.

British officers are drawn from several sources, viz. State Training Schools at Woolwich and Sandhurst, the Univ's, the Special Reserve, and the Territorial Force. There is also the power to grant commissions to selected non-commissioned o's. The training received by candidates for commissions thus varies considerably. The ex-corporal will have had at least two years' experience of soldiering in the Regular Army, whereas an ex-Territorial o. will possess but a very rudimentary knowledge of military life. The latter would, however, have been instructed in the theory of war so far as to emerge with credit from a competitive examination. The Special Reserve o. would have to pass the competitive examination in addition to serving on probation as an o. with a regular unit for six months (one year in the artillery). The Univ. candidate is expected to have made up for his deficiencies in military knowledge (acquired in the O.T.C.—Officers' Training Corps) by taking a degree in Arts or Science.

The payment of o's, as of the rank and file in the Brit. Army, is relatively high as compared with foreign armies, but it is largely payment in kind. On appointment, an o. in the infantry receives 5s. 3d. per day, in addition to lodging, fuel, and light, and the services of a soldier as his personal attendant; but from the day he joins a sum of money begins to accrue out of which he will eventually after 8 years' service receive a pension for life. The rates of pension are: infantry, £120–200 per annum after 15 years' service, rising in the case of higher officers to £1000; artillery and engineers, £300 after 21 years' service, rising in proportion to rank. In the Navy, retirement at the age of 45 brings with it a pension varying from £200–500. An admiral's maximum retired pay is £850.

United States.—Officers are trained for the army at West Point, and there are also four service schools; engineers and medical service, Washington; about sixty cadets pass out annually, after a severe course of training lasting four years. Commissions from the ranks are not uncommon. The ranks are similar to those of the British Army.

Foreign Countries.—**FRANCE** resembles Britain in its training of officers. The great *écoles militaires* are St. Cyr and L'École Polytechnique; about one-third of French officers rise from the ranks. **GERMANY.**—The German officer is trained to a more implicit obedience of instructions and regulations than either the British or the French, hence the position of the superior officers is correspondingly more responsible. Special attention is bestowed upon artillery-training. In the **ITALIAN** Army horsemanship and training for mountain-warfare are given most prominence.

OFFICINAL, term applied to those drugs kept in stock by chemists and druggists.

OGDEN (41° 13′ N., 111° 59′ W.), city, on Weber, Utah, U.S.A.; woollen mills; canneries. Pop. (1910) 25,580.

OGDENSBURG (44° 39′ N., 75° 30′ W.), city, port of entry, on St. Lawrence, New York State, U.S.A.; lumber manufactures. Pop. (1910) 15,933.

OGIER THE DANE, a hero who, according to the Carolingian romances, had a feud with Charlemagne and was imprisoned by him. The valour he subsequently showed against Charlemagne's enemies, the Saracens, brought about a reconciliation.

OGILVY OF AIRLIE, JAMES, LORD (*c.* 1549–1606), Scot. noble; supporter of Queen of Scots; ancestor of Earls of Airlie (*q.v.*).

OGILVY, DAVID (1725–1803), Scot. claimant of ancestral earldom of Airlie; raised regiment of 300 clansmen for Pretender, 1745.

OGLETHORPE, JAMES EDWARD (1696–1785), Eng. soldier; securing parliamentary grant of £10,000, sailed with a contingent of debtors and founded Georgia (named after George II.); tried for failing to overtake Prince Charles's army in '45 rebellion, but acquitted.

OGOWÉ (3° S., 14° 30′ E.), river, Fr. Equatorial Africa, flowing by delta into Atlantic; length, 700 miles.

O'HIGGINS, BERNARDO (1778-1842), Chilean patriot; fought for revolution and commanded against Spain, 1813; fought under San Martin, 1817–18; administrator of Chile, 1817–23; overthrown by democratic rising.

OHIO (40° N., 83° W.), north-eastern inland state, U.S.A.; bounded on N. by Michigan and Lake Erie, E. by Pennsylvania and (separated by Ohio River) West Virginia, S. by Kentucky and (separated by Ohio River) West Virginia, and W. by Indiana; capital, Columbus; area, *c.* 41,060 sq. miles, 300 being water.

O., lying on the borderland of Alleghany Plateau and Prairie Plains, is, in general, a vast undulating plain, with average elevation of *c.* 850 ft. above sea-level, the extremes being 425 ft. and 1540 ft. (Hogues Hill). The central part is flat; a low ridge stretches S.W. across the state, and N. of this the country slopes gently to Lake Erie, the southern portion being rather hilly. This divide also separates the waters of Lake Erie—with its principal rivers, the Tuscarawas, Cuyahoga, Sandusky, Huron, and (only partly in the state) the Maumee—from the waters of the Ohio, whose chief tributaries are the Muskingum, Scioto, Great Miami, and Little Miami.

O. is part of original New York territory; scene of frequent disputes and struggles between British and French, British and Americans, Americans and Americans, white settlers and Indians. Eng. traders appeared early in XVIII. cent.; colonised by Ohio County; Brit. claim challenged by French till 1763; won for Amer. Republic by War of Independence, 1783; developed as part of North-West Territory by New England settlers; admitted as state of Union, 1803; devastated by floods, March 1913. O. has a Gov., Senate (34 members), and House of Representatives (119). Education is compulsory from 6 to 14. There are from 30 to 40 univ's and colleges, notably State Univ., Columbus; Ohio Univ. (State), Athens; Cincinnati Univ. (city); Western Reserve Univ.; Wesleyan Univ., Delaware; and Oberlin Coll. (non-sectarian). Roman Catholic, Methodist, Presbyterian, and Lutheran are chief religious denominations. Pop. (1910) 4,767,121.

O. is extensively devoted to agriculture, the chief crops being cereals (maize, wheat, oats), hay, potatoes, fruits, and vegetables as well as tobacco. Horse- and cattle-breeding and dairy-farming are important. Other industries include foundries and machine-shops; iron and steel working; manufacture of carriages and wagons; clay products; boots and shoes; clothing; lumber and timber working, planing, etc.; printing and publishing; rubber goods; liquors; flour and grist working; and slaughtering. The mineral resources are considerable, chiefly coal and also petroleum and natural gas; sandstone and limestone are quarried and Portland cement manufactured; salt is produced and mineral waters found. The most important cities are Cleveland on the edge of Lake Erie, Cincinnati, Toledo, Columbus, Dayton, Youngstown, Akron. There are six ports on Lake Erie. O. is divided into 88 counties and has almost 10,000 miles of railways.

Taylor, *O. and its People*; Thomson, *Bibliography of O.*

OHIO RIVER (37° 16′ N., 88° 20′ W.), tributary of Mississippi, formed by junction of Monongahela and Alleghany Rivers at Pittsburgh, Pennsylvania, U.S.A.; *c.* 970 miles long; separates states of Ohio, Indiana, and Illinois from W. Virginia and Kentucky; chief tributaries, Muskingum, Scioto, Wabash, Big Sandy, Great Kanawha, Kentucky, Green, Cumberland, and Tennessee; most important towns on banks, Pittsburgh, Cincinnati, Louisville, and Portsmouth; a great highway of commerce; subject to floods; disastrous inundations, March 1913.

OHLAU (50° 56′ N., 17° 18′ E.), town, on Oder, Silesia, Prussia; tobacco and machinery. Pop. (1910) 9036.

ÖHLENSCHLÄGER, ADAM GOTTLOB (1779-1850), Dan. poet; b. in Copenhagen. The turning-point in his career was the return to Copenhagen of Henrik Steffens, who introduced the Dan. world to Goethe, Schiller, and the new Romantic movement. This event inspired his beautiful poem *Guldhornene*. His three finest works are *Baldur hin Gode*, *Palnatoke*, and *Axel og Valborg*.

OHLIGS (51° 10′ N., 6° 40′ E.), town, Rhine province, Prussia; formerly *Merscheid*; cutlery. Pop. (1910) 27,839.

OHM, GEORG SIMON (1787–1854), Ger. physicist; discovered *Ohm's Law* (see ELECTRICITY).

OHMMETER, instrument for measuring high resistance offered by a circuit to an electric current; essentially consists of two coils placed with their axes at right angles; at intersection of axes is pivoted small iron needle whose deflection is a measure of the resistance.

OHRDRUF (50° 48′ N., 11° 44′ E.), town, on Ohr, Saxe-Coburg-Gotha, Germany; porcelain. Pop. (1910) 6500.

OIL, a combustible, more or less viscous liquid, which does not mix with water. O's may be of mineral, vegetable, or animal origin, and may consist of hydrocarbons, aldehydes, phenols, or—more commonly—ethereal salts or esters, such as glycerides, which are saponifiable. *Fats* are distinguished from oils by their solidity.

Mineral oils are hydocarbons belonging chiefly to the series of *paraffins* (q.v.). They are unsaponifiable, and unacted on by acids and alkalies. They include *petrol* (B.P. 40° to 70° C.), *light petroleum* (B.P. 80° to 120° C.), *kerosene* or *refined petroleum* (B.P. 150° to 300° C.). The residue from their distillation yields vaseline, etc.

Vegetable oils are divided into volatile or essential oils, and fixed or fatty oils, with which the liquid animal fats may be included. ESSENTIAL OILS are found in the leaves, fruits, or seeds of plants. They are used as flavourings or perfumes, and are extracted by distillation with or without water, by expression, or by maceration in solid or liquid fat, followed by alcoholic extraction. The chief essential oils are: Oil of almonds, anise, bergamot, caraway, cedar, chamomile, cinnamon, citron, cloves, dill, eucalyptus, geranium, juniper, lavender, lemon, lime, mustard, nutmeg, orange, orange flowers or Neroli, peppermint, rose (attar of), rosemary, rue, sage, terebene, thyme, turpentine, verbena, wormwood.

FATTY OILS are extracted from the fruits or seeds of

plants or the tissues of animals, by draining (cod-liver oil), boiling with water (blubber), melting (lard, tallow), expression (olive oil), extraction with a solvent (bone oil). They are colourless or pale yellow liquids; unctuous to the touch; leave a permanent grease spot on paper; lighter than water; somewhat soluble in alcohol, and readily soluble in ether, chloroform, benzene, petroleum, and other oils. Chemically they consist chiefly of esters (glycerides) of the triacidic radicle, glyceryl, C_3H_5''', whose hydroxide glycerol or glycerin ($C_3H_5(OH)_3$) results, together with a fatty acid when they are hydrolysed by acids or superheated steam (i.), or its alkali salt, which is a soap, when they are saponified by alkalies (ii.).

(i.) $C_3H_5A_3 + 3HOH = \underset{\text{(glycerol)}}{C_3H_5(OH)_3} + 3\underset{\text{(fatty acid)}}{HA}$.

(ii.) $C_3H_5A_3 + 3NaOH = C_3H_5(OH)_3 + 3NaA$ (soap).

Fatty oils are not directly inflammable, but may be burnt by means of a wick. Some, known as drying oils, thicken into a varnish by atmospheric oxidation. They are purified by light, heat, treatment with water, acids, alkalies, oxidising and reducing agents, and by hydraulic pressure to remove solid constituents.

The chief fatty oils are: *Olive oil*, yellow to olive green in colour; easily turns rancid; used for lubrication, burning, cooking, eating, and soap-making. *Rape-seed* or *Colza oil*, light yellow, and nearly odourless when refined; used for lubrication, burning, and soap-making. *Cotton-seed oil*, straw-coloured or golden yellow when refined; agreeable taste, used for cooking, making margarine, and adulterating other oils and fats. *Linseed oil*, a drying oil; used for making paints and varnishes, soft soap, and oilcloth. *Castor oil*, colourless; very viscous; used medicinally, for making cheap soaps, and for lubrication. *Palm oil*, semi-solid; yellow to brown; used chiefly as railway grease. *Neatsfoot oil*, yellow; odourless; does not become rancid; used for lubricating clocks and machinery, and for leather-dressing. *Bone oil*, yellowish; used for soap-making. *Whale oil*, yellow or brown; fishy odour; used for burning and soap-making. *Cod-liver oil*, nearly colourless; peculiar fishy taste; used medicinally and in leather-dressing.

Oils are tested qualitatively and quantitatively thus: by specific gravity, refractivity, melting or solidifying point, solubility, especially in glacial acetic acid, colour tests with sulphuric and nitric acids, temperature reactions, estimation of saponification value, volatile acids, bromine and iodine absorption.

OIL BIRD, see GUACHARO.

OIL CITY (41° 27′ N., 79° 48′ W.), city, Pennsylvania, U.S.A., at junction of Oil Creek and Allegheny; oil. Pop. (1910) 15,657.

OIL ENGINE, see ENGINE.

OIL-BEETLES, see under HETEROMERA.

OIL-CAKE, see FLAX.

OIRON (47° N., 0° 15′ W.), town, Deux-Sèvres, France; old castle.

OISE (49° 20′ N., 2° 25′ E.), department, north France; formed of old provinces, Île-de-France and Picardy; area, 2261 sq. miles; chief rivers, Oise, Aisne, and Lorain; capital, Beauvais; principal products, vegetables, beetroot, fruits; manufactures iron, textiles, leather, lace, chemicals, cider. Pop. (1911) 411,028.

OISE (49° 54′ N., 3° 50′ E.), river, France; joins Seine; length, 186 miles.

OJIBWAS, see INDIANS, RED.

OKAPI, see GIRAFFE FAMILY.

OKEHAMPTON (50° 45′ N., 3° 59′ W.), town, Devonshire, England; has ruined castle; remains of Rom. road. Pop. (1911) 3175.

OKEN, LORENZ (1779–1851), Ger. philosopher and scientist; b. in Baden, and studied at Würzburg and Göttingen. In 1807 he became prof. at Jena—first of Med. and subsequently of Natural Science. In 1828 he went to Munich, having been obliged to resign his chair at Jena for political reasons. Finally he taught at Zürich, where he died. Oken was less a scientist than a philosopher; his system was a nature-philosophy, which endeavoured to relate scientific facts to a preconceived ideal. In this he resembled many scientists of his time, but his scientific observations were in general more exact, and his philosophical interpretations more consistent than those of the majority of his contemporaries.

OKHOTSK, SEA OF (50° N., 147° E.), arm of North Pacific, with Kamchatka on E., island of Sakhalin and E. Siberia on W.

OKI (36° 16′ N., 133° 10′ E.), group of islands, N. of Izumo province, Japan. Pop. 6300.

OKLAHOMA (36° N., 98° W.), state of U.S.A.; bounded N. by Colorado and Kansas, E. by Missouri and Arkansas, S. by Texas, W. by Texas and New Mexico; area, 70,500 sq. miles. Surface consists chiefly of prairies and rolling plains rising in N.W. corner to elevated tableland, which forms part of Great Plains; Wichita and Arbuckle Mts. in S., Ozark Mts. in E., and Chautaugua Mts. in W. are principal elevations; most important river in state is Arkansas, with tributaries, Salt Fork, Cimarron, and Canadian Rivers; Red River forms southern boundary of state, and has its affluents, N. Fork, Washita, and Kiamichi waters. Plains are treeless, but many of hills well wooded; river valleys and certain upland districts fertile and well cultivated.

O. formerly consisted of W. part of Indian Territory and strip of land N. of Texas Panhandle, known as 'No Man's Land'; Indians ceded portion of Territory to U.S.A., and land opened for public settlement, 1889; organised as territory, 1890; O. and Indian Territory proclaimed one State in 1907. State has Gov., Senate, and House of Representatives. System of Initiative and Referendum prevails. There are some 6000 miles of railway.

Chief crops are Indian corn, wheat, hay, oats, and cotton; barley, flax, tobacco, vegetables, and fruits also produced; stock-raising important industry, particularly in W.; sandstone, gypsum, limestone, granite, and petroleum found, besides smaller quantities of coal, zinc, and lead. Manufacturing industries are unimportant, except flour and grist milling and cotton-seed oil. Chief towns are Guthrie, Oklahoma City (capital), Shawnee, Muskogee, M'Alester, Tulsa, and Enid. Pop. (1910) 1,657,155.

Buck, *The Settlement of O.* (1907).

OKLAHOMA CITY (35° 30′ N., 97° 30′ W.), capital, Oklahoma, U.S.A.; cotton. Pop. (1910) 64,205.

OKUMA, COUNT SHIGENOBU (1837–), Jap. statesman; sought to introduce Western reforms, roused opposition and lost limb from bomb, 1889; revised international treaties; Premier, 1898–99.

OKYO, MARUYAMA (1733–95), Jap. artist; realist of remarkable gifts; painted all subjects, but excelled with birds and flowers. His influence was immense, and is still felt. See JAPAN (Art).

OLAF, OLÄUS, kings of Norway.—**Olaf I.** (969–1000), after piratical youth, introduced Christianity with great cruelty; leapt into sea after defeat by Danes and Swedes.—**Olaf II.**, *the Saint* (995–1030), also attempted to enforce Christianity.

ÖLAND, ŒLAND (57° 3′ N., 9° 34′ E.), Swed. island in Baltic; area, *c.* 520 sq. miles; produces cereals; town, Borgholm. Pop. 230,000.

OLBERS, HEINRICH WILHELM MATTHIAS (1758–1840), Ger. astronomer and physician; discovered minor planets *Pallas* (1802), *Vesta* (1807), and five comets; rediscovered *Uranus* (1781).

OLBIA, ancient port on E. coast of Sardinia; remains survive of Rom. city but not of previous Gk. town; called *Civita* in Middle Ages, and afterwards *Terranova*.

OLBIA (*Borysthenes*), ancient Gk. colony on Euxine, at mouth of Hypanis; established by Milesians, *c.* 655 B.C.; destroyed by Getæ, 50 B.C.; rebuilt by Romans; destroyed by Goths, *c.* 248 A.D.; interesting excavations.

OLD AGE PENSIONS.—Denmark led the way in

granting State pensions to old people (over 60) by Act of 1891. A Ger. Act of same year grants pensions to workmen over 70, who have qualified therefor by weekly contributions for 1200 weeks. The Brit. Statutes of 1908 and 1911 rejected the contributory principle. Qualifications for pension under these Acts are that the recipent shall be—(1) Brit. subject resident for 12 out of past 20 years in U.K.; (2) seventy years of age; (3) possessor of no more than £31, 10s. yearly income. Pensions, which rise to 5s. weekly, vary with pensioner's independent income. Since 1909 old age pensions have been paid throughout Australia by the Commonwealth Government. In New Zealand pensions are granted to male applicants of 65, women of 60. In 1910 an Act was passed in France enabling introduction of contributory system of old age pensions.

Sutherland, *Old Age Pensions*; Booth, *Old Age Pensions and the Aged Poor.*

OLD CATHOLICS.—On promulgation of the doctrine of papal infallibility by Vatican Council of 1870, some Roman Catholics (including renowned scholars like Döllinger) refused to accept the doctrine and were excommunicated. A conference took place at Munich, and others have been held since, with the result that an OLD CATHOLIC CHURCH was formed, and relations were entered into with the Eastern and Anglican Churches. There was further divergence from official Catholic doctrine, and only the Councils up to 787 were accepted. Marriage of the clergy and other departures from Roman tradition were sanctioned. Since its beginning the O. C. movement has not been very successful, its number remaining almost stationary. There are about 125,000 adherents in Germany, Austria, and Switzerland, some in Holland, one church in Paris, and some in America, and a few churches in Italy. The next revolt against the Roman Church from within was Modernism.

Scarth, *Old Catholic and Kindred Movements.*

OLD FORGE (41° 20′ N., 75° 45′ W.), town, on Lackawanna, Pennsylvania, U.S.A.; anthracite coal mines. Pop. (1910) 11,324.

OLD POINT COMFORT (37° 1′ N., 76° 16′ W.), watering-place, Virginia, U.S.A., at mouth of James River.

OLD RED SANDSTONE, see DEVONIAN SYSTEM.

OLD STYLE, see CALENDAR.

OLD TOWN (44° 55′ N., 68° 40′ W.), city, on Penobscot, Maine, U.S.A.; manufactures lumber. Pop. (1910) 6317.

OLD WIFE, or **OLD WENCH**, see TRIGGER FISHES.

OLD WORLD MONKEYS, see CERCOPITHECIDÆ.

OLDBURY (51° 38′ N., 2° 34′ W.), town, Worcestershire, England; iron- and steel-works. Pop. (1911) 30,240.

OLDCASTLE, SIR JOHN (d. 1417), Eng. Lollard; friend and companion of Prince Henry; imprisoned as heretic, 1413; escaped, failed in attempted risings, but remained concealed in Welsh Marches till 1417; hanged and burned.

OLDENBARNEVELDT, JOHAN VAN (1547–1619), Dutch statesman; accepted reformed religion and assisted house of Orange in freeing Holland from Spain; Advocate of Holland, 1586, and became chief authority in state; opposed Maurice of Nassau's foreign policy, 1600–9, and forced him to accept peace, when Spain agreed to recognise Dutch independence, 1609. Backed by States of Holland, O. raised troops to keep order in threatened religious strife of Armenians and Gomarists; arrested and beheaded.

OLDENBURG (53° 5′ N., 8° 10′ E.), grand-duchy of N.W. Germany; composed of (1) duchy of O., bounded N. by North Sea, W., S., and E. by Hanover; (2) principality of Lübeck (*q.v.*) since 1803; (3) principality of Birkenfeld (*q.v.*) since 1815. Total area is 2479 sq. miles; surface flat; coast district marshy, with rich agriculture and pasture land; inland known as Geest, chiefly heath and moorland; principal rivers, Weser, Hunte, Hase; several lakes; Oldenburg, capital. Counts of O. are first mentioned *c.* X. cent.; Christian VIII. became king of Denmark, 1448, Norway, 1450, Sweden, 1457; and gave O. to his bro. Gerhard, 1457; under Dan. rule, 1667–1773; became a duchy, 1777, a grand-duchy, 1815. O. has a Landtag (45 members). Prevailing religion is Prot. Industries include fisheries; extensive agriculture and fine live stock (especially horses). Pop. (1910) 391,246; with Lübeck and Birkenfeld, 483,042.

OLDENBURG (53° 8′ N., 8° 12′ E.), capital of Oldenburg, Germany; has grand-ducal palace, fine library, and art galleries. Pop. (1910) 30,242.

OLDHAM (53° 32′ N., 2° 8′ W.), town, Lancashire, England; one of leading cotton towns; also manufactures silks, machinery, leather. Pop. (1911) 147,495.

OLDHAM, JOHN (1653-83), Eng. poet; wrote *Pindaric Odes*; best known as a writer of satires against the Jesuits.

OLEAN (42° 5′ N., 78° 27′ W.), city, on Allegheny, New York State, U.S.A.; oil refineries. Pop. (1910) 14,734.

OLEANDER (*Nerium*), genus of evergreen plants, order Apocynaceæ; native of Asia, N. Africa, S. Europe; very poisonous.

OLEFINES, hydrocarbons (C_nH_{2n}) resembling the paraffins in physical properties; lower members are gases, higher are liquids or solids. *Ethylene* (C_2H_4), the simplest o., is formed by destructive distillation of coal; therefore present in coal gas. Higher o's exist in tar distilled from bituminous shales. Term 'olefiant' (oil-forming) was originally applied to ethylene, which, being unsaturated, forms an oily liquid ($C_2H_4Cl_2$) with chlorine.

OLEIC ACID ($C_{18}H_{34}O_2$), organic compound occurring in fats and oils, commonly prepared by saponifying an oil (such as olive oil), with the addition of lead acetate; the lead oleate thus formed is finally treated with hydrochloric acid, which extracts o. acid; colourless, solid, without smell; B.P. 223°.

OLÉRON (45° 57′ N., 1° 15′ W.), island, Charente-Inférieure, France, at mouths of Charente and Seudre.

OLFACTORY SYSTEM, THE, embraces the external and internal nose, which form air passages below and the organ of smell above. The upper part of the external nose is formed from the nasal bone and a process of the upper jawbone; the upper end is joined to the frontal bone, and beneath the lower end, the bridge, the upper and lower lateral cartilages and the smaller cartilagines *minores* define its shape. The internal nose consists of the two *nasal fossæ* (opening at the nostrils), separated by the *nasal septum*, which is covered by the mucous membrane of the nose. Each of the fossæ is occupied by three *turbinated* bones, which run horizontally from front to back, each being rolled up like a scroll, forming a space below for the passage of air. It is in the highest passage and turbinated bone that the olfactory nerve, or nerve of smell, terminates, ending in several branches which pass into the mucous membrane. The fossæ terminate at the back end in slits leading into the pharynx, and near the orifices of the Eustachian tube leading to the drum of the ear.

OLGIERD (d. 1377), grand-duke of Lithuania; extended territory at Russia's expense; defeated and drove back Tatar hordes. 1362.

OLHÃO (36° 58′ N., 7° 46′ W.), seaport, Portugal, on Atlantic; fisheries. Pop. 7300.

OLIBANUM, frankincense (*q.v.*).

OLIGOCENE SYSTEM, subdivision of Cainozoic or Tertiary series, resting on Eocene strata and beneath Miocene; divided into Hempstead Beds—freshwater marls and clays; Bembridge Beds—marls and limestones; Osborne Beds—freshwater clays, marls, sandstones, and limestones; Headon Beds—clays, marls, sandstones, and limestones.

In Britain O. strata are found only in Hampshire, Devonshire, and Isle of Wight. In France they overlie the Eocene of the Paris Basin, while in Germany

they form the oldest Tertiary rocks. The life of the O. period includes numerous palms and conifers, cowries, cones and spindle shells, lamellibranchs, paroquets, cranes, pelicans, etc., and among mammals many survivors from Eocene times.

OLIGOCHÆTA, EARTHWORMS, see under CHÆTOPODA.

OLINDA (7° 53′ S., 34° 54′ W.), town, Pernambuco, Brazil; formerly capital. Pop. 8200.

OLIPHANT, LAURENCE (1829–88), Brit. author; s. of Sir Anthony Oliphant, Chief Justice of Ceylon. His first works were books of travels called *A Journey to Khatmandu* and *The Russian Shores of the Black Sea.* These were followed by two important books on China and Japan, *Minnesota and the Far West* and a *Narrative of the Earl of Elgin's Mission to China and Japan in 1857–59.* His later years were devoted to occultism, the influence of which is seen in *Sympneumata, Scientific Religion,* and *Masollam.*

OLIPHANT, MARGARET OLIPHANT (1828–97), Brit. novelist; *née* Wilson; b. at Wallyford, Midlothian. She was a prolific writer of novels and critical sketches, and is most successful in depicting scenes from simple Scot. life.

OLIVARES, GASPAR DE GUZMAN, COUNT OF, DUKE OF S. LUCAR (1587–1645), Span. courtier and statesman; ruled Spain as chief favourite of Philip IV., 1621–43, and was made by nation and king scapegoat of disasters abroad; extravagant, corrupt, and inefficient; driven from office, 1643.

OLIVE (*Olea europœa*), tree, order Oleaceæ, cultivated from early times for its fruit, especially in Mediterranean region, to which it is indigenous. The fruit is plum-like and possesses an oily mesocarp from which o. oil (see OILS) is obtained by pressure. The cultivated form, unlike the wild parental stock, is thornless, and has larger and more oily fruit. The foliage is lanceolate and greyish green in colour, and the flowers have a tetramerous calyx and corolla, with two stamens and a bilocular ovary. The bottled fruits are unripe when gathered, and are preserved in brine mixed with certain aromatic substances. Among allied Eng. plants are privet, ash, and lilac.

OLIVEIRA MARTINS, JOAQUIM PEDRO DE (1845–94), great Portug. writer; b. at Lisbon. His first important work was *O. Socialismo,* which revealed his sympathy with the industrial classes. His *History of Portugal* is the work of a psychologist, sociologist, and moralist rather than of a historian.

OLIVENZA (38° 33′ N., 6° 58′ W.), town, Estremadura, Spain; fortified; tanning, potteries. Pop. 10,500.

OLIVES, MOUNT OF, MOUNT OLIVET (31° 47′ N., 35° 16′ E.), mountain ridge, E. of Jerusalem; favourite resort of Christ and disciples.

OLIVETANS, small mendicant order with Benedictine rule; founded, 1324; still exists.

OLIVINE, olive green mineral, occurring in lavas, basalts, gabbros, and sometimes in meteorites; composed of silicate of iron and magnesium. See CHRYSOLITE.

OLLIVIER, OLIVIER ÉMILE (1825–), Fr. statesman; one of 'The Five' who opposed Napoleon III.'s despotism; chief instrument in obtaining constitution of 1869; committed Princes Pierre Bonaparte and Joachim Murat for trial, 1870; held responsible for Franco-Prussian War, which overthrew his ministry; remained true to ideal of *L'Empire libéral,* whose history he wrote.

OLMÜTZ (49° 36′ N., 17° 16′ E.), town, Austria; archiepiscopal see; has fine Gothic cathedral; formerly an important fortress; besieged by Frederick the Great, 1758. Pop. (1911) 22,257.

OLNEY.—(1) (52° 9′ N., 0° 42′ W.) town, Buckinghamshire, England; residence of Cowper. (2) (38° 45′ N., 88° 10′ W.) city, Illinois, U.S.A.; flour-mills, iron foundries. Pop. (1910) 5011.

OLONETS (62° 30′ N., 37° E.), government, N.W. Russia; area, 49,355 sq. miles; contains Lake Onega; produces timber, cereals; manufactures iron goods, leather, flour. Pop. (1910) 443,400.

OLOPAN (VII. cent.), Nestorian missionary to China; first to introduce Christianity there.

OLORON-SAINTE-MARIE (43° 12′ N., 0° 35′ W.), town, Basses-Pyrénées, France; tanneries.

ÖLS, see OELS.

OLTENITZA (44° 8′ N., 26° 43′ E.), town, Rumania, at junction of Argesh and Danube; here Turks twice defeated Russians, 1853–54.

OLUSTEE (30° 12′ N., 82° 25′ W.), village, Florida, U.S.A.; here Confederates defeated Federals, 1864.

OLYMPIA, plain in Elis, in Peloponnesus, where celebrated Olympic games took place; bounded on W. by Cladeus and S. by Alpheus Rivers, on N. by group of hills, chief of which, Cronion, was sacred to Cronus. Situated on plain was Altis, or sacred Grove of Zeus, surrounded by walls with several gates, and containing temples, public buildings, and countless statues. Name O. was given to buildings in and around Altis. Principal features within Grove were: (1) Temple of Zeus Olympius, containing statue of Zeus by Pheidias and other famous statues; (2) Temple of Hera; (3) Temple of Mother of the Gods; (4) Pelopium, precinct, sacred to Pelops; (5) Philippeium, erected by Philip of Macedon to celebrate battle of *Chæronea*; (6) Treasuries; (7) Zanes, bronze statues of Zeus; (8) Great Altar of Zeus; (9) Prytaneum. Outside Altis were: (1) Stadium, in which foot-races and games were held; (2) Hippodrome, where chariot and horse-races took place; (3) Gymnasium and (4) Palæstra, both used for exercise of competitors; (5) Leonidæum; (6) Boulenterium or Council Halls; (7) Roman Triumphal Arch; (8) Roman house believed to have been occupied by Nero, and many other buildings. Festivals were celebrated every four years, and interval between called *Olympiad*; catalogue of victors began in 776 B.C. and ended *c.* end of IV. cent. A.D. Festivals were controlled by Pisa till its destruction by Eleans and Spartans, *c.* 572 B.C.

OLYMPIA (47° 3′ N., 122° 48′ W.), capital of state of Washington, U.S.A., on Puget Sound; lumber, industries. Pop. (1910) 6996.

OLYMPIAD, see CHRONOLOGY.

OLYMPIC GAMES, see ATHLETICS.

OLYMPIODORUS, name of several Gk. authors, especially (1) the historian of Honorius' reign, b. Thebes (Egypt), V. cent. A.D.; (2) a philosopher of Alexandria in V. cent. A.D., teacher of Proclus; (3) the last Alexandrian Neoplatonist, in VI. cent. A.D.; (4) the Aristotelian commentator, in VI. cent. A.D.

OLYMPUS.—(1) (40° 4′ N., 22° 20′ E.) mountain range, separating Macedonia and Thessaly; legendary home of the gods. (2) (39° 57′ N., 29° 20′ E.) mountain, on borders of Mysia, Bithynia, and Phrygia, Asia Minor.

OLYNTHUS, city of ancient Greece; became chief city of Chalcidice, 432, establishing Chalcidic Confederation, which extended power to Pella; might have been bulwark against Macedonia, but weakened by jealousy of Sparta and Athens; destroyed by Philip, 348.

OMAGH (54° 36′ N., 7° 19′ W.), county town, Tyrone, Ireland. Pop. 4900.

OMAHA (41° 23′ N., 96° 1′ W.), chief city, Nebraska, U.S.A.; capital of Douglas County, on Missouri River; public buildings include courthouse, Federal building, city hall, public library, and many educational establishments; chartered as city, 1857; headquarters of military department of Missouri; railway terminus; chief industries, refining and smelting works, distilleries, breweries, flour and grist mills. Pop. (1910) 124,196.

OMAN (22° 30′ N., 56° 30′ E.), Arab state, Arabia, between Persian Gulf, Gulf of O., and Ind. Ocean; area, 82,000 sq. miles; surface mountainous; capital, Muscat; produces fruits, vegetables, cereals. Pop. (1912) *c.* 500,000.

OMAR, see CALIPH.

OMAR KHAYYÁM, the astronomer-poet of Persia; b. Nishapur, Khorassan, *c.* 1050 A.D. He

co-operated in a wonderful reconstruction of the Persian calendar. As a poet he has great popularity owing to Eng. translations by Fitzgerald (*q.v.*).

OMAR PASHA, MICHAEL LATTAS (1806–71), Turk. general; writing-master to Abdul-Medjid; defeated Russians at Danube, 1853–54; repulsed 40,000 Russians at Eupatoria, Crimea, 1855; crushed rebellion in Bosnia and Herzegovina, 1861; captured Cettinje, 1862.

OMBRE, card game in vogue in England during reign of Queen Anne; mentioned by Pope; three or four may play; object is to win the pool; game is Span. in origin.

OMDURMAN (15° 36′ N., 32° 47′ E.), town, Egyptian Sudan, on Nile; trading centre; scene of Kitchener's victory over Khalifa, 1898. Pop. 45,000 (under 1000 Europeans).

OMEN, the divining of the future, in various religions. A very common method was to examine the entrails, especially the liver, of a sacrificed animal. Owing to the amount of blood it contained, it was natural to regard it as the seat of life. The exact steps by which it came to be believed that by the peculiarities of the liver the will of the gods could be ascertained, are uncertain. A regular system of interpretation came to be followed out, something like that of palmistry or phrenology. A system of divination was practised in Babylon before 2000 B.C., and in Greece and Rome in early times. Another system of taking omens in Rome was from the way the sacred chickens took their food. The flight of birds, especially eagles, was also watched for portents.

OMNIBUS (Lat. *omnibus*, 'for all'), vehicle introduced by Pascal, who obtained patent to run public coaches in Paris, 1662. Shillibeer (1797–1866) ran the first o. in London, 1829; and in 1832 the Stagecoach Act allowed o's to take up or let down passengers on the street. In 1855 the London General O. Co. was formed; roof-seats were first seen in 1857, by which date the G.O.C. had c. 600 'buses. Horse-o's are being rapidly superseded by motor-o's.

OMNIUM, JACOB, see HIGGINS, MATTHEW JAMES.

OMSK (54° 58′ N., 73° 24′ E.), fortified town, at junction of Om and Irtish, Russia; capital of general government of the Steppes and of province Akmolinsk. Pop. (1910) 90,200.

ON, see HELIOPOLIS.

ONAGER, see under HORSE FAMILY.

ONAGRACEÆ, a dicotyledonous natural order consisting chiefly of perennial herbs, though it includes a few shrubs and trees; leaves simple and flowers usually tetramerous, with inferior ovary; among better-known forms are willow herb (*Epilobium*), with plumed seeds, *Fuchsia*, *Œnothera* (evening primrose), and *Circœa* (enchanter's nightshade).

ONEGA (61° 45′ N., 35° 30′ E.), one of largest European lakes, in Russia; drains into Lake Ladoga; area, 3765 sq. miles.

ONEGLIA (43° 53′ N., 8° 2′ E.), town, on Gulf of Genoa, Italy; wine, oil. Pop. 8600.

ONEIDA (43° 7′ N., 75° 40′ W.), city, New York State, U.S.A., on Oneida Creek; wagon-works. Pop. (1910) 8317.

ONEIDA COMMUNITY, famous Amer. settlement, founded by John Humphrey Noyes at Putney, Vermont, 1838, and removed by him to neighbourhood of Oneida (*q.v.*), 1847. Plan is original Christianity, combining communism, trade, and 'the simple life'; communism extended to wives till interference of legislature, 1882, but deeply religious character of settlement prevented 'complex marriage' system degenerating into 'free love'; community prospered, and was formed in 1881 into Oneida Co. Ltd., which has now large capital, and is noted for quality of its manufactures and agricultural produce; model villages are built for employees.

O'NEILL, Irish family; lords of Tyrone; descended from famous Irish king **Niall** (d. 405), s. of King Eochaidh Muighmheadhoin, and called 'of the nine hostages'; frequent figure in Irish legend and history; among his fourteen sons were Laeghaire, ancestor of O'Coindhelbhains; Conall Crimhthainne, ancestor of O'Melaghlins; Fiacha, ancestor of MacGeoghegans and O'Molloys; Maine, ancestor of O'Catharnaighs; Eoghan, ancestor of O'Neills; and Conall Gulban, ancestor of O'Cannanains and O'Donells. Eoghan's descendants were many of them prominent early kings of Ireland, among them being 'NIALL OF THE THREE SHOWERS' (715–78), his grandson, NIALL (791–845), and the latter's grandson, **Niall** (c. 870–919), famous in song, with whom the patronymic *O'Neill* begins. HUGH O'N., lord of Tyrone, led opposition to English under John; The O'N. held one of the four kingships into which Ireland was at that time divided. Con Bacagh O'N., 'the lame,' s. of Con O'N., lord of Tyrone, became The O'N., 1519, but after years of warfare submitted to English, and received title, 'Earl of Tyrone'; Shane O'N. (c. 1530–67) appeared at Eng. court with his followers in wild costumes designed to deceive English. Turlough was elected as The O'N. on Shane's death, but resigned dignity to Earl Hugh, 1593; after repeated rebellions Hugh lost earldom, 1614; his famous nephew, Owen Roe O'N. (d. 1649), General of the Confederates, 1642, was last to claim title.

ONEONTA (42° 25′ N., 75° 5′ W.), town, on Susquehanna, New York State, U.S.A.; railway repair-shops. Pop. (1910) 9491.

ONION (*Allium cepa*), a Liliaceous plant of Asiatic origin, cultivated for culinary purposes; possesses a tunicate bulb, and hollow, centric leaves; flowers white, and arranged in cymose umbels.

ONORE, see HONAWAR.

ONTARIO (43° to 57° N., 79° to 95° W.), province of Dominion of Canada, bounded on N. by Hudson Bay, W. by Manitoba, S. by Great Lakes and Minnesota, E. by Quebec; length from E. to W. about 1000 miles; area, *c.* 370,000 sq. miles; surface undulating; highest point not exceeding 2000 feet, northern part undeveloped and swampy; Laurentian Plateau in E., mostly waste land; large forests; soil fertile; magnificent scenery (Niagara Falls, Great Lakes, Thousand Islands, etc.); rivers include Ottawa (part of boundary between Ontario and Quebec), Albany, Trent, Niagara, St. Lawrence, Severn, Maganetawan, Trench; numerous large lakes—Superior, Huron, Ontario, Erie, Nipigon, Nipissing, Simcoe, Lake of the Woods, etc.; fauna includes wolf, fox, mink, skunk, bear, moose, caribou, otter; principal towns are Toronto (capital of Ontario), Ottawa (capital of Dominion), Kingston, London.

O. was first visited and explored by Champlain, 1613, 1615; mission founded among Indians, 1615; influx of Amer. loyalists took place, 1782–84; became a separate province and called *Upper Canada*, 1791; joined Dominion of Canada as province of Ontario, 1867; part of Keewatin named 'Patricia' (147,000 sq. miles) added, 1912.

O. is administered by lieut.-gov. and executive council, and legislative assembly; entitled (1913) to 24 seats in Federal Senate, 82 in House of Commons. Education is nominally compulsory; Toronto univ., Queen's univ., and military coll. at Kingston, etc.; important agricultural coll. at Guelph. Methodists predominate, then Presbyterians, R.C's, Anglicans, Baptists. There are about 6000 miles of railway; several important canals (Welland between Erie and Ontario, Rideau between Kingston and Ottawa, etc.). Chief products are cereals, hemp, tobacco, sugar-beet, tomatoes, fruits, furs; manufactures, agricultural implements, cotton and woollen goods, leather, iron- and hard-ware, machinery, carriages, furniture, lumber trade; rich in minerals except coal; nickel, copper, iron, silver, gold, lead, gypsum, etc.; numerous petroleum wells. Pop. (1911) 2,523,208. See CANADA.

ONTARIO, LAKE (43° 30′ N., 78° W.), smallest and most easterly of five Great Lakes of N. America; length, 195 miles; extreme breadth, 55; greatest

depth, 738 ft.; area, 7240 sq. miles; shores flat; subject to violent storms; connected with Lake Erie by Welland Canal.

ONTENIENTE (38° 53′ N., 0° 39′ W.), town, Valencia, Spain; textiles. Pop. 12,500.

ONTOLOGY, science of Being as Being (Gk. *on, ontos*, being). See METAPHYSICS.

ONYCHOPHORA, class of Arthropods; see PERIPATUS.

ONYX, variety of agate (*q.v.*), consisting of alternate layers of white and black, or white and brown chalcedony; found in river gravels in Deccan (India) and used for cameos, brooches, etc.

OODEYPORE, UDAIPUR (*q.v.*).

OOLITE (Gk. 'egg-stone'), variety of limestone composed of very small clustered globules resembling fish roe. The Oolite series of strata consist of limestones, calcareous sandstones; they are members of the Mesozoic or Secondary group; underlie the Cretaceous formations, and rest on the Lias; subdivided into Upper, Middle, and Lower groups, and contain numerous interesting fossil remains, including over 200 species of ammonites.

OONALASHKA, UNALASKA, see ALEUTIAN ISLANDS.

OOTACAMUND, UTAKAMAND (11° 24′ N., 76° 44′ E.), town, sanatorium, Nilgiri Hills, Madras, India. Pop. 16,000.

OOZE, see FORAMINIFERA, DIATOMACEÆ.

OPAH, KING-FISH, MOON-FISH, or JERUSALEM HADDOCK (*Lampris luna*), a large, compressed, bright red and green, bony fish, sometimes 6 feet long; found rarely in the Pacific, but chiefly in the North Atlantic and occasionally in British waters.

OPAL, gem-stone, consisting chiefly of silica and water; since ancient times prized on account of its beautiful colours; found in Hungary, Saxony, and S. America; chief varieties—*Precious* or *noble opal* (brilliant reflected colours), *fire opal* (red reflections), *common opal* (white reflections), and *semi-opal* (opaque).

OPALINA, see under INFUSORIA.

OPEN SPACES, see COMMONS.

OPERA, a work for the stage, in which music, words, action, and scenery combine to represent a certain story. The essentials of the form are as old as Grecian art; but it was not until the end of the XVI. cent. that the first specimens of o., as we now understand it, were produced. These tentative efforts—*Daphne* (1594) and *Eurydice* (1600)—were the work of a Florentine, Jacopo Peri, who wrote, as he averred, 'to test the effect of the kind of melody said to be the same as that used by the ancient Greeks and Romans throughout their dramas.' Following him came Claudio Monteverde (1566–1650), a Milanese, who gave o. a fresh complexion, and even foreshadowed Wagner in some of his effects. A new epoch opened with the Neapolitan Alessandro Scarlatti (1659–1725), the real founder of Ital. o. so called—that form in which melody takes the chief place, with the singer as the leading personage. Meanwhile, o. had been establishing itself outside Italy. In 1645 it was transplanted to France by Cardinal Mazarin, and some thirty years later was introduced to Germany. In England, Henry Purcell (1658–95) wrote no fewer than thirty-nine works for the stage; and there Ital. o. received a further fillip when Händel subsequently established himself in London. Gluck (*q.v.*) introduced certain forms also, anticipating Wagner. A host of minor composers essayed the form before Mozart touched it to such splendid purpose in *Don Giovanni*, *Figaro*, and other o's. Later, Rossini raised Ital. o. to further heights, seconded by Bellini and Donizetti. In Germany, Weber and Meyerbeer; in France, Auber, Boieldieu, Gounod, Thomas, and Bizet all wrote valuable works. The part of Wagner (*q.v.*) in the process of development was unique. Later composers like Mascagni, Puccini, Leoncavallo, Strauss, and Debussy have not essentially advanced the form.

Arthur Elson, *A Critical History of Opera* (1905).

OPHICLEIDE, brass-wind instrument of the family of bugle horns with keys; in reality, the bass of the military bugle. O's of various sizes and different keys were formerly used, but only those in B flat and C are now employed in orchestras, and these infrequently. The tone, so powerful that it has been described as a 'chromatic bullock,' prevents its blending satisfactorily with other brass instruments, hence it is often replaced by the tuba.

OPHIDIA, Snakes (*q.v.*).

OPHIOGLOSSALES, see PTERIDOPHYTA.

OPHIR, a region, whose exact locality is disputed, famed for its gold. From Ophir the ships of Solomon brought gold, silver, and jewels. Probably it was the country at the mouth of the Indus.

OPHISTOBRANCHIATA, an order of Gastropod Mollusca. See GASTEROPODA.

OPHITES (Gk. *ophis*, serpent), ancient Gnostic sect; they had a strange and elaborate cosmogony, in which the world is created by Ialdaboth.

OPHIUROIDEA, see ECHINODERMATA.

OPIE, JOHN (1761–1807), Eng. painter; noted pictures are *Murder of Rizzio*, *Arthur and Hubert*, *Juliet in the Garden*.

OPINION, affirmation aiming at truth, but not claiming more than approximate truth; unlike a hypothesis, does not look for future verification.

OPITZ VON BOBERFELD, MARTIN (1597–1639), Ger. poet; b. Bunzlau; wrote *Trostgedichte in Wiederwärtigkeit des Krieges*, *Zlatna* (epics), *Buch von der Deutschen Poeterey* (prose work), besides numerous translations.

OPIUM, dried, milky juice (*latex*) of unripe capsules of the poppy—*Papaver somniferum*. It was known to Theophrastus (III. cent. B.C.). The greatest amount of o. is produced by India, about 80,000 chests, each containing 1 Chin. picul (133⅓ lb.), being exported annually, nearly all to China, while about 5000 chests were consumed annually in India itself, before 1907. In 1907, on the Chin. Government attempting to put down the use of o., the Brit. Government offered to reduce the export of Indian o. to China by one-tenth each year, so that in ten years the export to China would cease altogether, but only on condition that China should reduce her native production at the same time. In 1911 an agreement between Britain and China provided for the complete stoppage of importation from India in seven years, on condition that China should stop producing o. In 1912 China failed to carry out the bargain; she increased the area of production and imposed duties on Ind. o.

A conference of the Powers at The Hague, Jan. 1912, drew up a Convention of 25 Articles by which they agreed to control the supply of and gradually suppress the manufacture of o. Persia exports about 10,000 chests of opium, partly to China and partly to Europe, while Asia Minor exports about 7000 chests, practically all to Europe.

The o. poppy is cultivated from seed sown from Nov. to March, and successive crops are ready from May to July. The flowers are white or purplish; and a few days after the petals have fallen, when the capsules are about 1½ inches in diameter, they are cut round the middle with a knife, and left overnight for the juice to flow out and harden. After further drying on poppy leaves, the dark, plastic masses are made into lumps for sale.

Opium is bitter, and has a characteristic smell. Its properties depend upon the 19 or 20 alkaloids it contains. The chief of these are: *morphine*, $C_{17}H_{17}NO(OH)_2$ (1·6–17 %, average, 9 %); *narcotine*, $C_{19}H_{14}NO_4(OCH_3)_3$ (5 %); *papaverine*, $C_{16}H_9N(OCH_3)_4$ (0·8 %); *thebaine*, $C_{17}H_{15}NO(OCH_3)_2$ (0·4 %); *codeine* or *methylmorphine*, $C_{17}H_{17}NO(OH)(OCH_3)$ (0·3 %); *narceine*, $C_{30}H_{29}NO_9(OCH_3)_2$ (0·2 %). All these bases are combined in o. with meconic acid, $C_3HO_3(OH)(COOH)_2$, lactic or sulphuric acid, and there are present also ammonium salts, mucin, pectin, albumin, caoutchouc, wax, etc. Morphine (*q.v.*), the most important alkaloid, is separated from the others by extracting the opium with hot

water, and boiling the extract with milk of lime. Alcoholic tincture of o. is known as *laudanum* (q.v.). It contains about 0·75 % of morphine.

O. is used medicinally, mainly to relieve pain and to produce sleep, and for this purpose is best given hypodermically as morphine. It is also employed to relieve vomiting, to stop diarrhœa, to lessen distressing coughing, to stop bleeding in the stomach and intestines, while it is valuable in heart disease, diabetes, in cystitis and other inflammatory conditions, for hæmoptysis, and, as Dover's powder, to cause perspiration in, for instance, common cold. Externally the *linamentum opii* and fomentations sprinkled with laudanum are of value in relieving pain.

O. is sometimes eaten; its stimulating effect is followed by depression, which produces a craving for more. Most o. grown is used for smoking, the Chinese being specially addicted thereto. The evil effects of o.-smoking have been disputed; certainly they are not so great as those of eating the drug, and probably the smoke contains no morphine. Nevertheless, the Chinese are overcoming the habit; public burnings of o.-pipes are taking place, and whole districts are being denuded of the poppy. O. is very poisonous; ½ grain has proved fatal to an infant, and 4 grains to an adult. In acute o.-poisoning there may be excitement at first, but drowsiness soon comes on, followed by deep coma. At first the patient can be roused, but later this is impossible. The pupils are contracted, reflexes are abolished, the skin cold, face and lips livid, the pulse slow and weak, and there is, later, profuse perspiration. The breathing becomes slower, more irregular, and more difficult, and, if treatment is unsuccessful, the patient dies of asphyxia. The treatment is to wash out the stomach with dilute permanganate of potash, give emetics (apomorphine hypodermically), keep the patient awake by walking him about, flapping him with a towel, applying electric current. Strong coffee is injected into the rectum and a suboutaneous injection of atropine sulphate, an antidote to morphine, is given, while oxygen and amyl nitrite inhalations are valuable. This treatment is continued for many hours if necessary.

A person addicted to o.-eating or the morphine habit is usually pale, with dull eyes, suffering from nervous irritability, dyspepsia, and circulatory disturbances, with sometimes albuminuria or glycosuria (albumen or sugar in the urine). The treatment of the condition is to isolate the patient, gradually diminish the amount of o. or morphine, until in a fortnight the quantity has been reduced to nothing. Sudden cessation of the drug may cause serious nervous disturbances and collapse. Cure is usually effected at the end of a few weeks, but relapses are unfortunately common.

OPLADEN (51° 5′ N., 7° E.), town, on Wupper, Rhine province, Prussia. Pop. (1910) 9390.

OPON (10° 15′ N., 124° E.), town, Cebu, Philippine Islands; scene of Magellan's death, 1521. Pop. 13,000.

OPORTO (41° 7′ N., 8° 33′ W.), city, on Douro, Portugal; in province of Entre-Douro-e-Minho; prominent seaport and large commercial centre; notable features are cathedral (XII. cent.), São Martinho (founded *c.* 560), São Francisco (XV. cent.); Nossa Senhora da Serra do Pilar (Augustine convent, now barracks), São Pedro (Capuchin convent, now public library, museum, and art academy); Ponte de Dom Luiz (iron bridge with single arch of 560 ft.); fine public parks; originally *Portus Cale* before Roman conquest; taken by Visigoths, 540 A.D.; in Moorish hands, 716–1092; prominent through Portug. history; taken by French, 1809; centre of port wine trade; woollens, silks, hats, cork-cutting, tanning, soap, tobacco, shipbuilding, iron and steel goods, leather, etc. Pop. 170,000.

OPOSSUM SHRIMPS, see under MALACOSTRACA.

OPOSSUMS, see under MARSUPIALS.

OPPELN (50° 40′ N., 17° 54′ E.), town, on Oder, Silesia, Prussia; cement, beer. Pop. (1910) 33,907.

OPPENHEIM (49° 51′ N., 8° 15′ E.), town, on Rhine, Hesse, Germany; wine; destroyed by French, 1689. Pop. (1910) 3739.

OPSONIC INDEX, see BACTERIOLOGY.

OPTIC NERVE, see EYE.

OPTICS, science of Light (*q.v.*).

OPTIMISM, see PESSIMISM.

OPTION, right to demand sale of ('call o.') or right to sell ('put o.') stock on a future day at price fixed on day of granting o. A *straddle o.* is a 'put and call o.' in the same stock.

ORACLE, a sacred spot where a god is supposed to answer questions or make known his will. O's have existed among various peoples and in various religions, but they were a special characteristic of ancient Greece. The most famous was the o. at Delphi (*q.v.*). One chief way of consulting an o. was by omens, thus, if the animal sacrificed showed certain characteristics, various inferences were drawn. The other oracular method was by means of ecstasy. Certain natural gases in a cave threw a priestess into a frenzy, and the cries she uttered were interpreted by priests to those who inquired of the o. The Delphic o. was of some political importance, and by the advice given often helped to determine the foundation of Gk. colonies. The opinion of competent scholars as to the general moral effect of the Delphic o. is, on, the whole, favourable, particularly in insisting on the wrong involved in taking human life, and stressing the moral impurity incurred in murder and not merely the ritual uncleanness in homicide as such. Some sayings of the Pythoness (the priestess of Apollo) have come down to us; many are probably spurious. The Delphic o. waned in influence in the III. cent. B.C., but continued some time longer. Other famous o's were those at Cumæ, Delos, Dodona, Epidaurus (*qq.v.*).

Farnell, *Cults of the Greek States*.

ORAN (35° 40′ N., 0° 38′ W.), fortified seaport, Algeria, on Mediterranean; contains Grand Mosque, Roman Catholic cathedral, Château Neuf (1563), Château Vieux (citadel), Fort de la Moune, museum, etc.; taken by Spaniards from Moors, 1509; flourished in XV. cent.; abandoned after severe earthquake, 1792; taken by French, 1831; chief exports are wool, cereals, wine, grain, esparto grass, cattle, sheep, hides, tomatoes, potatoes. Pop. (1911) 123,086.

ORANG, ORANG-UTÁN (*Simia*), a genus of Simian Apes (see under PRIMATES), found in the forests of Sumatra and Borneo; vegetarian and arboreal; with brain most like that of man.

ORANGE (40° 47′ N., 74° 14′ W.), town, New Jersey, U.S.A.; large manufacture of hats. Pop. (1910) 29,630.

ORANGE (33° 15′ S., 149° 10′ E.), town, health-resort, New South Wales; gold and silver mines. Pop. 7600.

ORANGE (44° 7′ N., 4° 49′ E.), town, on Aigue, France; in department Vaucluse with Notre Dame; has fine Roman remains (triumphal arch, theatre, etc.); capital of independent principality, XI. cent.; passed to house of Nassau, XVI. cent.; acquired by France, 1713; silks, textiles, etc. Pop. 10,600.

ORANGE, largest S. African river; rises in Kathlamba Mts., in E. of Basutoland, and winds *c.* 1000 miles W. to Atlantic; separates Cape Province from Orange Free State, Griqualand West, Bechuanaland, and German Namaqualand. Chief tributaries are Caledon and Vaal; volume varies greatly in dry and wet seasons; mouth obstructed by a bar.

ORANGE, fruit of *Citrus aurantium*, a tree included in the Rutaceæ, to which the lemon and the lime also belong. Among sweet varieties may be mentioned the Jaffa and the Tangierine; the Seville, or bitter o. (*C. vulgaris*, or *C. Bigaradia*), is used for marmalade, and the Bergamot o. (*C. Bergamia*) yields oil of Bergamot, used in perfumery. O. trees are very prolific, and bear glossy, evergreen foliage and masses of white, sweet-scented flowers, which yield oil of neroli on distillation (see OILS). The o. is a native of Asia,

probably of Chino-Jap. origin, and was first introduced into Mediterranean countries by the Portuguese, still prominent among its cultivators and exporters. O's for export, being collected whilst green, lack the delicate flavour which characterises the naturally ripened fruit.

ORANGE FREE STATE, Oranje Vrij Staat (27° 31′ S., 25° 30′ E.), inland province of the Union of South Africa; bounded N. and N.W. by Transvaal, W. and S. by Cape Province, E. by Basutoland and Natal; length from N.E. to S.E., *c.* 350 miles; breadth, 180 miles; area, 50,392 sq. miles. The surface is an immense plateau from 3000 to 5000 ft. above sea-level, generally flat with a few low ridges and numerous isolated hills, known as *kopjes*, not exceeding 7000 or 8000 ft. On the borders of Natal (S.E.) are the Drakensberg Mountains, with part of Mont aux Sources (11,000 ft.), Platberg (8000 ft.), Melanies Kop (7500 ft.), Draken's Berg (5682 ft.) in the O. F. S. Rivers are few: Vaal (boundary between Transvaal and O. F. S.), Orange (boundary between Cape Province and O. F. S.), Modder, Caledon, Klip, etc.; none navigable; no lakes. Climate is very healthy, but dry and hot; annual rainfall, *c.* 20 to 30 in. in northern provinces; average rainfall, *c.* 14 in. in W. and S.W., where droughts are common and severe; hottest in W., where temperatures of 105° F. are not unusual. Flora is scanty; the plains are generally covered with grass after rains, but for many months they are dry and barren; few trees (viz. willow, mimosa, acacia, euphorbia, gum, pepper-trees, aloe, etc.); large tracts of pasture and arable land, though only a small area is under cultivation (mainly N. and E.). Fauna includes hyena, lynx, baboon, monkey, ant-bear, wild-cat, jackals, springbok; numerous snakes, tarantulas, scorpions; destructive locust plagues.

History.—O. F. S. was originally inhabited by Bushmen, Hottentots, and Bantu tribes. Boer settlements were made, 1824; 'Great Trek' by Boers from Cape Colony and agreement with Bantuang chief ceding country between Vet and Vaal Rivers to Boers, 1836, and Republic proclaimed with Piet Retief as first Commandant-General; annexed by Great Britain, 1848; became an independent Dutch Republic, 1854, with President (elected for 5 years), Executive Council, and *Volksraad* (Parliament); enjoyed excellent government under distinguished Pres. (Sir) John Brand, 1864–88; warred with and defeated Moshesh, 1867; 'Conquered Territory' acquired and boundaries fixed, 1870; Kimberley diamond fields (discovered, 1867) annexed by Britain, 1871; compensation of £90,000 paid to O. F. S. Government; Reitz president, 1889–96; Steyn president, 1896–1900; having formed alliance with Transvaal, O. F. S. joined that republic in South African War, 1899–1902; annexed by Britain, 1900, and made Crown Colony as **Orange River Colony**; responsible government granted, 1907; joined Union of South Africa, 1909, its old title, 'Orange Free State,' being restored.

Government.—The province is divided into 24 districts; administered by Administrator, Provincial Council (25 members elected for 3 years), and Executive Committee (4 members); there are 39 municipalities. Principal towns are Bloemfontein (capital), Kroonstadt, Heilbron, Ladybrand, Harrismith. Dutch Reformed Church predominates; majority of population is Dutch-speaking. Education is generally compulsory; elementary and secondary education is under the control of Provincial Council (until 1915); higher (univ.) education in under the Union Government. The province has over 500 government and government-aided schools; Grey Univ. College (Bloemfontein). Principal products are wheat, maize, Kaffir-corn, fruit, tobacco; important stock-rearing (sheep, cattle, horses, ostriches); coal mines in N.; diamond mine at Jagersfontein in W.; salt-pans near Bloemfontein; chief exports are wool, skins, ostrich feathers, hides, mohair, mealies, wheat, meal, and dairy produce. Dairy farming is extending. Pop. (1911) 526,906 (including 175,435 whites). See South Africa.

ORANGEBURG (33° 30′ N., 80° 50′ W.), city, on North Fork of Edisto, S. Carolina, U.S.A.; cotton industries. Pop. (1910) 5906.

ORANGEMEN, association of Protestants who uphold Prot. succession to Brit. throne and Prot. religion in Church and State as laid down in Bill of Rights and Act of Settlement, 1688. Its aims were formulated (1688) by Dr. Burnet, William, Prince of Orange's chaplain. The association still exists, but the term O. is generally used of Ulster Protestants who celebrate anniversaries of the Siege of Londonderry, Battle of the Boyne (July 1), William's landing at Torbay (Nov. 5). It is divided into lodges united in each country in a grand lodge.

ORANIENBAUM (59° 52′ N., 29° 45′ E.), town, summer resort, on Gulf of Finland, Russia. Pop. 6200.

ORATORIO, a sacred musical composition of an extended nature, the words generally taken from Scripture. The term comes from the *Oratory* in which St. Philippo Neri assembled his congregation to listen to tentative experiments of the kind. The first o's dealt almost exclusively with Christ's sufferings, and consisted chiefly of antiphonies and short choruses. Ital. composers, like Scarlatti and Carissimi, subsequently selected other Biblical subjects for treatment; but it was not until the master-mind of Händel (*q.v.*) operated on the form that o. assumed its highest power and interest. Händel's *Messiah* still remains the most popular of all o's, the leader in a splendid series, which includes *Israel in Egypt*, *Samson*, and *Judas Maccabæus*. After Händel, as a master of o., came Mendelssohn (*q.v.*), whose *Elijah* and *St. Paul* occupy a front rank. Haydn's *Creation* stands in a manner by itself, the style being somewhat light and the text a hybrid re-cast of Scripture and *Paradise Lost*. Later o's, such as Gounod's *Redemption* and certain specimens by Brit. composers, do not seem made for permanence.

Patterson, *Story of Oratorio* (1902).

ORBETELLO (42° 27′ N., 11° 13′ E.), town, Grosseto, Italy, near Mediterranean. Pop. 7600.

ORBIT (Lat. *orbis*, 'a ring'), path followed by a celestial body in its revolution round (1) its primary, or (2) a common centre of gravity. The earth's o. round the sun (which it takes 365 days, 6 hours, 9 mins., 9 secs. to complete) is 186 million miles in diameter, whilst that of Neptune, the farthest known planet, has a diameter of 5580 million miles. The o. of the earth around the sun is regarded as the plane of the solar system for convenience.

ORCAGNA, the corrupted nickname (from Arcagnuolo, 'archangel') of Andrea di Cione (*c.* 1308–? 1368), painter, sculptor, and architect; b. Florence. He was architect of the church of Or San Michele there, the marble tabernacle of which is his *chef-d'œuvre*. Orvieto Cathedral was also built from his designs. The majority of his paintings, chiefly frescoes and panel pictures, were done for Florence churches. One is now in the National Gallery, London.

ORCHARDSON, SIR WILLIAM QUILLER (1835–1910), painter; b. Edinburgh and studied there under Scott Lauder. He was elected A.R.A., 1868, and R.A., 1877. He was in the front rank of genre-painters, and many of his pictures, from 'The Challenge' of 1865 onwards, achieved deserved popularity.

ORCHESTRA, a term applied in three distinct senses: (1) to the space occupied by the players in a theatre; or, in a concert room, to both players and chorus; (2) to a body of players collectively; (3) to the united groups of instruments upon which they perform. The latter is the most usual sense of the term. In this case an o. includes three different classes of instruments—stringed instruments, wind instruments (subdivided into wood and brass), and instruments of percussion. The term 'band,' often regarded as synonymous, has a more restricted meaning.

ORCHESTRATION, see Instrumentation.

ORCHHA (25° N., 79° E.), native state, Bundelkhand, Central India. Pop. 325,000. Capital, Tehri.

ORCHIDS (*Orchidaceæ*), family containing the most specialised of monocotyledonous plants; characterised by their herbaceous nature, entire and parallel-veined leaves, and irregular flowers with six petal-like segments, one of which forms a variously modified lip. O. occur all over the world, but are most common in tropical countries. In temperate regions generally terrestrial, thousands of tropical species are epiphytic, growing upon branches of jungle undergrowth and trees, without being parasitic. Almost all are specially modified for insect fertilisation, most interesting being the arrangement of pollen in club-shaped pollen masses or pollinia, which become glued to the head of any insect seeking the flower's nectar, and are so borne to other flowers. O. are extensively cultivated for the variety and beauty of shape and colour; from several species of Orchis salep is prepared, and vanilla from unripe fruit of *Vanilla planifolia*.

ORCHIL, ARCHIL (*q.v.*).

ORCHOMENUS.—(1) ancient Gk. city of Arcadia. Its kings were supreme in Arcadia till VII. cent., when they abandoned Messene to Sparta; site of modern Kalpaki. (2) ancient Gk. city of Bœotia; capital of prehistoric race Minyæ; superseded by Thebes; important excavations.

ORDEAL, the appeal to a supernatural power to settle by some sign a legal decision, has been practised very widely, particularly in the Middle Ages. A favourite method of ordeal was that of making the accused person carry a lump of red-hot iron or walk over red-hot ploughshares. If he escaped unscathed he was innocent. Sometimes he had to plunge his arm into boiling liquid. The guilt of a person could be proved by giving him food, which, if he were guilty, would stick in his throat. This last, in certain circumstances, it is possible to do without injury. If a murderer approached the corpse of the person he had murdered, blood, it was thought, would flow out afresh from the wounds.

ORDERIC VITALIS (*c.* 1075–1142), mediæval chronicler; b. near Shrewsbury; became priest in Abbey of St. Evroul, Normandy, and devoted leisure to historical research. His *Historiæ Ecclesiasticæ* is a history of England and Normandy.

ORDERS, HOLY, the state of those who have entrusted to them the power of exercising certain functions in the Christian Church. Thus the Anglican Church recognises three orders—bp's, priests, and deacons; the R.C. Church calls these (with the subdeaconate) the *major orders*; the *minor orders* are acolytes, exorcists, readers, and doorkeepers, but these are now only preliminaries to the priesthood. The Eastern Churches have the same major orders, but only readers besides; the Armenian hierarchy is the same as the Roman. Most Prot. Churches have not episcopal government, though the Lutheran Churches of Scandinavia and some others retain bp's; but a sacerdotalism, and hence 'holy orders' in the Catholic sense, does not exist. There has been much controversy between Roman and Anglican theologians as to the validity of Anglican orders, but in the bull *Apostolicæ curæ* of 1896 Leo XIII. declared them to be invalid. In the Gk. Church, however, Anglican orders are recognised.

The early history of orders in the Christian Church is much disputed. Some deny the Catholic claim that the threefold ministry existed from the beginning. Presbyterians defend their Church government on historic grounds. It is probable that at first (*e.g.* in the New Testament) bp's and presbyters were not differentiated. In the early II. cent. the monarchical episcopate was evolved. See BISHOP.

Gore, *Church and Ministry, Orders and Unity*; Lindsay, *Church and Ministry in Early Centuries.*

ORDERS OF KNIGHTHOOD, see KNIGHTHOOD.

ORDINANCE, former method of legislation. Act of Parliament requires consent of full Parliament—Crown, Lords, Commons; o's might be issued by any of the three.

ORDINARIES, see HERALDRY.

ORDNANCE.—At the close of the Four Years War in America (1861–65) no fewer than 47 types of o. were in use by the Federal and Confederate armies, and in 1866 the Prussians introduced breech-loading steel guns at Königgrätz. At this time Austria, France, Italy, Prussia, and Russia each had 24 to 37 types—breech-loading and muzzle-loading, rifled and smooth-bored guns, howitzers and mortars—of steel, cast-iron, and bronze. Britain had 10 types of field artillery, from 6-pounder rifled B.L. guns to 32-pr. S.B. howitzers, and 46 types of siege and garrison artillery. The projectiles of the period were 'case' and solid shot; common, segment, and shrapnel shells; carcasses and rockets. The Armstrong 18-pr. had a range of 7550 yards with an elevation of 33°, and the 7-inch rifled gun (or 68-pr. S.B. gun) fired shot which at 1000 yards penetrated nearly 25 feet of earthen parapet. Probably few specimens of all this artillery exist to-day except in museums; and so it is hardly worth while here to attempt more than to show the character and distribution of the guns produced in the XX. cent., so far as the details are made public, and premising that the appearance of a new weapon or a new projectile would render all existing types obsolescent.

Indeed, invention is only checked by economy—for example, the adoption of a pointed shell (which would give a longer range and a flatter trajectory) would render the existing limbers and wagons useless (the pointed shell would be too long for them), while all the stores of shells accumulated would be wasted and all sights on gun mountings would have to be re-graduated. The larger the army the more serious would be the drain on its financial resources if a complete re-armament took place. Germany and Austria both need a new field gun, and both hesitate to embark millions of pounds on a weapon which may soon become obsolete, so busy are inventors of warlike material to-day.

The power of field artillery is limited by the extreme weight which can be drawn by a handy team, say, 6 horses. The weight of field guns in cwts. varies as follows: England 40, Russia 38½, Austria 37½, France 37, Germany 34·4, Spain 34, Italy 33½; but the extra weight of the Austrian gun is due to using bronze instead of steel, while the lightness of Italian and Spanish guns is necessitated by the small size of their horses. Howitzers are no heavier, though they throw a heavier shell, because the tube is shortened for high-angle fire.

In the field, two shells are used: (*a*) Shrapnel, for disabling men; (*b*) High Explosive, for destroying guns, houses, earthworks, etc. Shrapnel are burst in the air by using a time fuse. H.E. shells detonate on impact, and shrapnel may be made to burst on impact by using a percussion fuse.

The proportion of field guns to 1000 bayonets is in Germany 6–4, France 4–8, Russia 4–4, Japan 4–1, Italy 3–4, United States 3–3, Austria 3–25. This calculation is based on the army corps, except as regards Japan, which like Great Britain has no higher organisation than the division.

The range of foreign guns varies from 9000 yards (France) to 6000 yards (Russia and Italy), and no distinction is made between horse and field artillery: the range of heavy guns is about 10,000 yards. France has decided (December 1912) to adopt a new type of gun for horse artillery of the same calibre as the field gun (2·95 inches or 75 mm.), but half a ton lighter; it is made at the Creusot Works. The late General Langlois promoted the new theory that rapidity of fire is more important than mathematical accuracy of aim, and caused the reduction of guns in a field battery from 6 to 4 in order to provide additional vehicles for ammunition. Bulgaria, Greece, Rumania, Servia, Turkey, and the United States have adopted the 4-gun battery. Russia retains the 8-gun battery. Germany is about to convert 20 (horse) batteries of 6 guns into 30 (horse) batteries of 4 guns.

Howitzers enable a heavy shell to be combined with light draught. A Krupp 4·7 weighs only 26 cwt., and throws a 46-lb. shell. The Coventry Ordnance Works make a 4·625 piece to weigh only 24¼ cwt., and to throw a 37½-lb. shell. The Krupp 6-inch weighs 43 cwt. with 90-lb. shell, and the French 6·1 Rimailho is 64 cwt. with 88-lb shell; the Krupp 5·9 (used in Germany) weighs 44 cwt. and throws a 95-lb. shell.

The guns of coast fortresses and defended ports are constructed to encounter naval ordnance. The guns of the 'fixed armament' are of three types: (*a*) heavy and medium guns, to deal with armoured vessels; (*b*) high-angle-fire guns, to attack the decks of vessels which keep beyond the range at which their side armour would be pierced; (c) light Q.F. guns, for use against torpedo-boats and destroyers.

Coast defence batteries in the Brit. service mount 9·2-inch B.L. (heavy), 6-inch B.L., 4·7-inch Q.F. (medium), 4-inch Q.F., 12-pr. Q.F. (light) guns. The charge is always cordite. The shells are high-explosive (filled with lyddite), armour-piercing, and common pointed (filled with 'P' mixture).

Gun Construction.—The earlier types of B.L. guns consisted of a steel tube, rifled inside, with various hoops, or coils, and a jacket carrying the trunnions *shrunk over the tube.* Improvements in steel have enabled wire construction to be used with the more modern guns. Modern guns consist of a tube over which layers of wire or flat steel tape are wound under a tension graduated for each layer, the exterior of the wire being protected by a jacket. In the larger guns the tube is in two parts, the inner part being capable of renewal, and the jacket is supplemented by a forward coil. The wire gives great circumferential strength, combined with accuracy of tension, and certainty as to the soundness of the material. Longitudinal strength, which is absent in the wire itself, is obtained by the support given to the barrel by the jacket, or by jacket and forward tube combined. Guns built on this system are lighter than guns of equal power built *on the all-steel system.*

Method of Attachment to the Mounting.—Until recently guns were attached to their mountings by means of trunnions. These fitted into trunnion holes in the carriage and enabled the gun to be elevated or depressed; both gun and carriage recoiled together.

All modern guns are trunnionless. They fit inside a cradle and recoil through it. A recoil-checking device keeps the gun in the cradle, and feathers on the gun fitting into featherways in the cradle, or some similar arrangement, prevent the gun turning in the cradle. The cradle does not recoil with the gun.

The sights are carried on the cradle instead of on the gun, and this enables continuous laying to be carried out.

B.L. guns are fired by means of tubes (electric, percussion, or friction), Q.F. guns by a primer (electric). Tubes and primers are brass cylinders closed at the head, where the means of firing is placed.

Tubes are placed in the vent and actuated by a lock: a primer is screwed into the base of the metal cartridge case. Electric tubes and primers are fired by means of a current of electricity which, heating a platinum bridge, ignites the powder in the body. Percussion tubes contain a percussion cap, and are fired by the striker of the lock hitting the cap. Friction tubes contain a roughened bar covered with friction composition fixed in the head. When the bar is drawn out (or pushed in), friction causes the composition to ignite and the tube to fire.

The requisites of a modern gun mounting are provided in our garrison artillery by a massive pedestal, bolted to an anchorage embedded in a concrete emplacement, thus affording the stable platform essential to accuracy. Ball bearings give smoothness and rapidity in elevating and traversing. Some form of hydraulic buffer absorbs recoil, and a portion of the energy of recoil is utilised to run the gun up again into the firing position. To provide for continuous laying, the sights and elevating and traversing gears are attached to non-recoiling portions of the mounting; the sights thus form part of the mounting, not of the gun.

An elevation-indicator determines mechanically the elevation of the gun in relation to the mounting, and a gear is provided to either adjust or compensate for want of level in the mounting—so essential in obtaining quadrant elevation or laying with auto-sight. A traversing arc let into the floor of the emplacement or attached to the mounting enables a gun to be laid under cover for direction. A range dial and training dial (electric) attached to the mounting ensures the rapid and accurate passing of ranges and trainings. The combined rammer and sponge, the single-motion breech mechanism, wireless electric tubes, etc., save manual labour and ensure a rapid service of the gun. Protection of gunners and gear from hostile fire is obtained by curved vertical shields which keep out splinters of shell, so that it is no longer necessary to raise earthen parapets, or fire through port-holes, which limited the arc of fire and often the elevation of the gun.

Shells when filled are painted black, with red and white bands round the tip—except lyddite shells, which are painted yellow with red band at tip.

Fortress guns all have percussion fuses (which need no preparation) or depression angle fuses (which are prepared by removing the safety pin and cap, or safety plug).

The term 'Fire Control,' which is often misused, may be defined as the choice of methods to meet attack in all its forms, and the issue of standing orders to ensure the execution of plans; it involves the identification of attacking vessels and the selection of projectiles to deal with different targets, and the amount of fire to be expended upon each target. Fire Control is of course limited to the Fire Command, and must conform to a general scheme which is prepared in peace-time by the fortress commander. Naval officers and coast defence commanders mutually inspect each other's practice in methods of defence and attack.

The artillery usually taken into the field with an army consists of field guns, horse artillery guns, heavy field guns, balloon guns, field howitzers (light and heavy); but in mountainous countries these are supplemented or replaced by mountain guns and mountain howitzers; and in countries where pack animals cannot be used the fighting force takes portable guns, which are divisible into loads carried by porters or coolies.

The land forces are also equipped with siege, fortress, and coast-defence artillery.

In most armies the fighting unit consists of a brigade of 3 batteries, comprising guns and limbers, ammunition wagons, also wagons for telephone and observatory, and special stores for laying and signalling, and wagons for supplies and 'baggage.' Foreign armies also take forge wagons and travelling kitchens.

The field gun and its wheeled carriage with sights, recoil gear, and shield constitutes the fighting unit. The Q.F. gun is one of which the carriage does not recoil on firing, being held fast by a spade at the end of the trail, but the gun itself is allowed to recoil on guides until checked by a hydraulic buffer. The general horizontal direction of the gun is given by shifting the trail, called traversing. The gun is elevated or depressed by a screw; it is layed by open or telescopic sights, or when firing from behind cover by a clinometer, with spirit-level for elevation, and a dial sight with horizontal graduated circle for line. The gun is loaded with fixed ammunition—that is, the shell and brass cartridge are combined as in the case of a rifle cartridge. After loading, the breech is closed by a breech-block (screw or wedge) worked by one motion of a lever. The gun is fired by a percussion lock contained in the breech-block. The men who lay the gun and attend to the breech mechan-

ism are seated on the trail and are protected from shrapnel and rifle bullets by a steel shield. The gun is a nickel steel tube made in two layers shrunk together to give greater strength, and British guns are further strengthened by wire-winding. The gun is rifled with a number of small grooves to give the shell sufficient spin to keep it point foremost during its flight. The calibre (diameter of the bore not including the grooves) of our 18-pr. Q.F. gun is 3·3 inches, that of most foreign field guns is 75 millimetres or 2·95 inches. The system of breech action in our service is that called the 'interrupted' screw: the French system is the 'eccentric' screw, but the wedge breech action is used in all the Krupp equipments, except the Argentine guns, which use the Welin screw. A field gun with ordinary Q.F. action can fire 20 aimed rounds a minute, but Krupp's 'fully automatic' action is capable of 40 rounds a minute—a rate of fire only possible for a few rounds, as against torpedo-boats. German guns have the ordinary type of sight, but the British, French, and Italian guns have the 'independent line of sight.' The *Goetz Panorama Telescope* (which is replacing the dial sight) enables the layer to lay on an aiming point behind him. The clinometer is used when the target is not visible from the gun, to give elevation either for the angle of sight or for the range. The recoil gear differs in the German, English, and French guns.

The types of ordnance in use are almost infinite in their variety and are continually undergoing changes in detail by makers like Schneider, Krupp, Vickers Maxim, Ehrhardt, Armstrong, Coventry Ordnance Works, but taking the English, French, and German guns as standard types of field guns the following differences are apparent:—

	English.	French.	German.
Weight of shell (lb.) . .	18·5	16	15
Muzzle velocity (f.s.) . .	1610	1740	1525
Calibre (inches) . .	3·3	2·95	3·03
Weight of gun behind team (cwt.)	43	41·5	42
Rounds in limber . .	24	24	36
„ wagon . .	76	96	88
Weight of wagon behind team (cwt.)	42·75	46	42·5
Men carried . . .	6	8	10
Range (yards) . . .	6500	9000	5500 (time fuse)

A howitzer is a short and stumpy gun, so mounted as to be capable of firing at angles up to 45 degrees, and thus causing a 'vertical' or high-angle descent of projectiles to reach men behind gun shields or steep cover, or to destroy 'overhead' cover; its shell weighs 35 lb. to 40 lb., and with a velocity of 1000 feet per second it ranges about 6000 yards; the calibre is from 4·2 to 4·7 inches.

The Q.F. heavy field gun can throw a 60-lb. shell nearly 6 miles. The 6-inch heavy howitzer fires a 90-lb. shell nearly 7 miles.

The horse artillery gun carries no men (the gunners ride like cavalry) and in the Brit. service the gun and shell are lighter than the 'field' equipment.

A mountain battery has no limbers or wagons; the Brit. gun is a 12½-pr., forming 4 mule loads, and it can be brought into action in one minute, but the Russian mountain gun (Schneider) is only 4 lb. heavier, and throws a 14·31-lb. shell.

Naval ordnance corresponds with the growth in dimensions and speed of battleships of the super-Dreadnought type. New ships building for Great Britain and Japan are to mount 15-inch guns. The United States and Japan both have vessels with 14-inch guns throwing shells of 1400 lb. The Brit. battleship *King George V.* has 13·5-inch guns. France at present has only 12-inch guns, but is to have 13·4-inch guns for her new 'Dreadnoughts.' Portugal's new fleet and Russia's Black Sea fleet will carry 13·5-inch guns. With regard to Germany it can only be said that 'no reliable details' are available as to her recent naval activities, but her 'Dreadnoughts' launched in 1911 mounted only 12-inch guns.

The erosive effect of various powders affects the life of a gun; in Italy, for example, the 12-inch gun which throws a shell of 870 lb. is good for only 100 rounds, whereas in France 200 rounds can be fired with less damage to the gun, owing to a better powder. Changes in artillery go on in every country all the year round, and often are only heard of after they have in turn become obsolete.

Jerram, *Armies of the World;* Loyd and Hadcock, *Artillery, its Progress and Present Position.*

ORDOVICIAN SYSTEM, group of strata occurring below the Cambrian and above the Silurian formations; well developed in region formerly inhabited by **Ordovices** (Celtic tribe in Wales); hence name suggested by Lapworth, 1879; Murchison called the group Lower Silurian; consist of all types of sedimentary rocks, as sandstones, slates, and quartzites, or metamorphic rocks, and are widely distributed; divided as follows: Caradoc or Bala series; Llandeilo beds; Arenig beds; contain numerous fossil remains, including molluscs, plants, fish, and insects. The O. period was one of great volcanic activity.

ORDU (41° N., 37° 45′ E.), town, on Black Sea, Asia Minor; ancient *Cotyora.* Pop. 6200.

ORDUIN-NASHCHOKIN, ATHANASY LAVRENTEVICH (d. 1680), Russ. statesman; insisted on carrying on Polish and Swed. Wars till Russ. demands were conceded; enlightened home policy, developing trade, navy, etc.

ORE, substance taken from earth's crust, containing one or more minerals, generally in composition with other elements or compounds. The operation preliminary to the extraction of the ore is called **Ore-dressing.** Ore is sent to the surface undressed, and it may contain native metal or metal combined with other substances, such as sulphur and oxygen. The material combining with the metal may be quartz or felspar, and is of no value except for the metal it contains. Ore-dressing is generally carried out by mechanical means, and chiefly consists of crushing the rock into small fragments, for which purpose various types of machines are employed.

Crushing is generally divided into three stages: coarse, medium, and fine, and for each process a different machine is used. As a rule, *coarse crushing* is carried out by a machine having a movable jaw set vertically, which approaches to and recedes from a fixed jaw. The ore is fed or falls between the two jaws, and is crushed by the pressure of movable jaw. *Medium crushing* is done by horizontal rollers or stamps. The rollers are placed close together, and the ore fed to them; they revolve in same direction, and crush ore as it passes through. The process resembles the domestic mangle. Stamps are generally worked by steam, and resemble steam hammers in their action. *Fine crushing* is accomplished by gravity or pneumatic stamps.

The ore is *sized* by a series of grids, having differently gauged meshes. Zinc and lead ores are cleaned from their adhering clay by sluicing with a stream of water. In diamond mines, as at Kimberley, the material from the mine is exposed to elements and weathered. Disintegration is completed by stirring in vats of water, and the débris is passed over a greased surface, which retains the diamonds.

ÖREBRO (59° 16′ N., 15° 12′ E.), town, on Svartå, Örebro, Sweden; iron-mining centre; mechanical works. Pop. (1911) 31,066. The län or division of Örebro lies in interior of S. Sweden; area, 3500 sq. miles. Pop. (1911) 208,626.

OREGON (44° N., 121° W.), north-western state of U.S.A.; bounded N. by Washington, W. by Pacific Ocean, S. by Nevada and California, and E. by Idaho; length from N. to S., 375 miles; breadth, 290 miles; area of land surface, 96,699 sq. miles; area of water

surface, 1092 sq. miles; coast-line, *c.* 300 miles, steep and rocky with numerous indentations.

O. is traversed by volcanic and snow-capped mountains—Cascade Mts. running parallel with coast, with highest peaks, Mt. Hood (11,225 ft.), Mt. Jefferson (10,200 ft.), Pitt (9750 ft.), Diamond Peak (8807 ft.); Steens Mts. in S.E. (9000 ft.); Blue Mts. in E., with average elevation *c.* 6000 ft.; undulating tableland running eastward, broken by several mountain ranges; extensive plains and large valleys with fine arable and pasture land. Principal rivers are Columbia, Snake, Powder, Grande Ronde, Owyhee, Burnt, Malheur, Jamhill, John Day, Deschutes, Willamette, Umpqua, Rogue; numerous lakes in S., viz. Malheur, Harney, Summer, Goose, Manns, Warner, Klamath, Crater, etc. Climate is varied; mild on coast with heavy rainfall in winter; dry and hot E. of Cascade Mts., with severe winters; average mean temperature, 50° F.; average annual rainfall, 36 inches; irrigation necessary in some parts. Fauna includes wolf, fox, deer, bear, elk, lynx, coyote; numerous aquatic birds, viz. puffin, gulls, terns, petrels, etc.; abundant marine fauna. Extensive forests, especially in W. and mountain regions; chief trees are pine, fir, spruce; also hemlock, cedar, maple, ash, aspen, oak, and others.

O. was probably first discovered by Spaniards; taken by Francis Drake as far as 43° N. (1519), and named *Albion*; visited and explored by several Spaniards, including Juan Perez, 1774; Columbia River discovered by American, Robert Gray, 1792; Nootka Convention (1790), between Spain and Great Britain, gave Brit. subjects the right to trade and settle on unoccupied coast; Spain ceded territory N. of 42° to U.S.A., 1819; *Astoria* founded by John Jakob Astor, 1811; several trading posts established by North-Western Fur Co. and Amer. Fur Co.; Ind. mission founded, 1834; serious boundary disputes between Great Britain and America, which were finally settled, 1846, boundary being fixed at 49° N. lat. O. became a state, 1859, and was admitted into the Union.

O. has a Gov., Senate (30 members, elected for 4 years), and House of Representatives (60 members, elected for 2 years); the state has 2 Senators and 3 Representatives in Congress, and is divided into 33 counties. Principal towns are Portland, Astoria, Salem (capital), Eugene. Roman Catholics predominate; then Methodists, Baptists, Presbyterians. Elementary education is compulsory; there are Oregon Univ. at Eugene, State Agricultural Coll., and other colleges. Total railway mileage exceeds 2600. Principal products are wheat, hay, hops, sugar-beet, potatoes, fruits, timber, live stock, wool, dairy produce; gold, silver, copper, coal are mined; lead, gypsum, quicksilver, nickel, opals found. Chief industries are lumbering, flour-milling, fish-canning, brewing, paper-making, printing, publishing, slaughtering and packing, machinery; valuable fisheries (salmon, trout, herring, oyster, halibut, cod, etc.). Pop. (1910) 672,765.

Lyman, *History of Oregon* (1903); Clark, *Pioneer Days in Oregon History* (2 vols., 1905).

OREGON, name for Columbia River (*q.v.*).

OREGON CITY (45° 21′ N., 122° 55′ W.), city, on Willamette, Oregon, U.S.A.; woollen- and flour-mills. Pop. (1910) 4287.

OREL, ORLOV (53° N., 35° E.), central government of Russia; area, *c.* 18,000 sq. miles; capital, Orel; surface undulating and well cultivated; principal rivers, Don, Oka, and Desne, with their tributaries; agriculture chief occupation; horses and cattle reared; manufactures include machinery, wagons, leather, and glass. Pop. (1910) 2,580,400.

OREL (52° 55′ N., 36° 7′ E.), town, capital of O. government, Russia, at confluence of Oka and Orlik; grain market; flour-mills. Pop. (1910) 88,200; (govt.) 2,580,400.

O'RELL, MAX, pseudonym of PAUL BLOUET (1848–1903), Fr. writer of wit and satire; author of *John Bull and his Island*, *Her Royal Highness Woman*, etc.; editor of the *Figaro*, 1901–3.

ORENBURG.—(1) (54° 50′ N., 57° 30′ E.) government, European Russia, along southern Urals; area, 73,254 sq. miles; great mineral wealth; produces cereals; live stock raised. Pop. (1910) 2,065,200. (2) (51° 47′ N., 55° 12′ E.) town, capital of above, on Ural; trading centre; tallow. Pop. (1910) 91,240.

ORENSE.—(1) (42° 20′ N., 7° 40′ W.) province, Galicia, Spain; mountainous. Pop. (1910) 411,573. (2) (42° 20′ N., 7° 40′ W.) town, capital of above, on Minho; warm springs; XIII.-cent. cathedral; chocolate. Pop. 16,500.

ORESTES (classical myth.), s. of Agamemnon and Clytæmnestra; bro. of Electra; reared by Strophius the Phocæan with Pylades. On attaining to manhood O. slew his mother and her second husband Ægisthus (*q.v.*), who had murdered Agamemnon in revenge for the sacrifice of Iphigeneia (*q.v.*). For this he was pursued by the Furies, nor was he given rest till interceded for by Athene, as described in the *Eumenides* of Æschylus.

ORFILA, MATHIEU JOSEPH BONAVENTURA (1787–1853), Span. chemist and toxicologist; b. Minorca; sent by authorities of Barcelona to study at Paris; after graduating, lectured on chem. in Paris; app. prof. of Medical Jurisprudence, 1819; later prof. of Chem. (1823) and dean (1830) in faculty of Med.; practically founded science of toxicology; author of many scientific works, chiefly on toxicology and medical jurisprudence.

ORFORD (52° 6′ N., 1° 32′ E.), small town, Suffolk, England.

ORFORD, EDWARD RUSSELL, EARL OF (1653–1727), Brit. seaman; signed invitation to William of Orange, 1688; made admiral, 1690; won battle of *La Hogue*, 1692; commander of Mediterranean fleet, 1694–95; cr. earl, 1697.

ORFORD, ROBERT WALPOLE, EARL OF (1676–1745), Brit. statesman; s. of Whig country gentleman of Houghton, Norfolk; member of Parliament for Castle Rising, 1701; sat for King's Lynn, 1702–42; Tories seized pretext for imprisoning him, 1712; Townsend married his sister Dorothy, 1713, and Walpole became First Lord of Treasury and Chancellor of Exchequer, 1715; on collapse of South Sea Co. was called to power, 1721, and retained it for 21 years. One of the greatest Brit. statesmen; decried in later times for cynical sincerity characteristic of XVIII. cent. at its best; strengthened hold of Hanoverian dynasty; pioneer in finance, firm upholder of peace, and author of a few classical epigrams.

Morley, *Life*.

ORGAN, musical instrument found in most churches and large concert halls. Its history has been described as 'nothing more than a narrative of the efforts made by men to bring under the control of one performer a large number of the instruments called flutes' (Stainer). The particular sort of pipe or flute, the use of which led eventually to the construction of an o., was the *flûte-à-bec* or beak-flute; that is, a pipe with a mouthpiece, which was placed against the lips to receive the breath of the player. The first step in organ-building was to set several flutes on end over a box of wind supplied by bellows. The contrivance known as *Pan's Pipes*, a graduated series of open pipes fixed together, may have furnished the idea for this. What the earliest o's were like we have no means of determining, for descriptions are meagre and indefinite, and there are no survivals. The instruments mentioned by many of the Latin authors (notably Tertullian) must have been of a rudely primitive kind; if for no other reason than that as yet there was no keyboard. Even when this was invented, in the VI. or VII. cent., the keys were so large and clumsy that they had to be struck with the clenched fist. As late as the XII. cent. the compass did not exceed two octaves, usually without semitones. An o. set up in Winchester Cathedral in 951 was the largest then known, having 26 pairs of bellows operated by

70 mes. This instrument had 10 keys, with 40 pipes to each key. Gradually the keys approximated more to the modern form, though for long the sharps were white and the naturals black, the reverse of the present colours. Early in the XV. cent. the important addition of *Pedals* or keys for the feet was made. This now essential feature of the o. progressed quickly in Germany, where it originated, but was slow in reaching England. Another important invention was the *Swell*, the enclosing of a complete department in a box, the front of which is constructed on the Venetian-blind principle, so that the sound 'swells' out or diminishes under the control of a foot-pedal. The Swell was first applied by Abraham Jordan to a London church o. in 1712.

No verbal description can possibly convey a clear idea of the construction and working of a large and complicated instrument like the modern o. For this the technical handbooks must be consulted; or, better still, an o. should be seen in process of building. Broadly speaking, there are three main departments: (1) the pipe-work; (2) the mechanism by which the player is enabled to produce and control the sound from the keys; and (3) the mechanism for blowing. As regards the pipes, these are of two chief divisions—metal pipes and wood pipes. Every 'speaking' *stop* has its separate set of pipes, running usually throughout the entire compass of keyboard or pedalboard. These sets are controlled by the familiar handles to the right and left of the player; so that when the player draws, say, a stop marked 'Flute,' he is operating on a series of pipes constructed to produce a flute quality of tone. Every stop has its individual tone character. Further, some stops are of unison pitch (8-feet stops), some an octave lower, some an octave and some two octaves higher. In the Pedal, the foundation pitch is an octave lower than that of the manual. The longest o. pipes made are 32 feet, the shortest half-an-inch or less. In most cases an o. has at least two manual keyboards besides Pedal. The lower *manual* is then called the 'Great,' the upper the 'Swell.' In a three-manual instrument the lower is the 'Choir.' Concert and cathedral o's have often four or five manuals, the additions representing so-called 'Solo' and 'Echo' o's. All these can be played separately, or combined by coupling actions. In recent years electric action applied to o's has secured many advantages, notably that of a shifting console. Blowing is also now frequently done by electric motor.

Hopkins and Rimbaults, *The Organ and its Construction*; C. F. Abdy-Williams, *The Story of the Organ*.

ORGANON (Gk. = 'instrument'), any system of rules, such as those of Aristotle and Bacon, to assist the mind as an 'instrument' of reasoning.

ORIA (40° 32′ N., 17° 40′ E.), town, Italy. Pop. 9500.

ORIENTATION, in architecture, is the placing of a church so as to have the chancel pointing to the east. The term is also used for the eastward turning of worshippers.

ORIENTE (2° S., 77° W.), province, Ecuador, E. of the Andes; capital, Archidona. Pop. 80,000.

ORIGEN (185–254 A.D.), Christian theologian who has left as great a mark on Christian dogma as any; b. at Alexandria; studied in the catechetical school, a leading seat of theological speculation; became head of the school, 203. He devoted himself diligently to the study of philosophy and Scripture; spent most of his time in Alexandria till 231, though he journeyed in Syria and elsewhere; ordained priest, 230, but a dispute arose, and he was deprived of his order. The remainder of his life he spent mostly in Palestine. His writings were very voluminous, but only a small part of them have been preserved—some in the original, some in Rufinus' Latin translation. Of his correspondence very little has been preserved. His *Hexapla*, or editions of the Gk. versions of the Old Testament, is preserved in part. O. wrote commentaries on Scriptures, but as he adopted the 'allegorical' method of interpretation, much of what he wrote is not now valuable. His main apologetic work is that against Celsus. Some theological and dogmatic works still survive. O.'s theology is intricate, and so many sided, if not contradictory, that in subsequent disputes controversialists of all sides appealed to him.

Swete, *Patristic Study*; Harnack, *History of Dogma*; Bethune-Baker, *Introduction to History of Christian Doctrine*.

ORIHUELA (38° 5′ N., 0° 57′ W.), town, on Segura, Alicante, Spain; textiles. Pop. (1910) 35,072.

ORILLIA (44° 36′ N., 79° 26′ W.), town, summer resort, on Lake Couchiching, Ontario, Canada; sawmills; iron foundries. Pop. 5000.

ORINOCO (9° 30′ N., 61° 40′ W.), river, N. of S. America; rises in Sierra Parima and flows through Venezuela into Atlantis Ocean; over 1500 miles long; flows through densely wooded and hilly region, and forms delta c. 120 miles from sea; principal tributaries, Apure, Meta, Guaviare, Ventuari, Caura, and Caroni; chief port, Bolivar. O. was explored first by Ordaz, 1531. As hundreds of miles of O. and tributaries are navigable, river is of great commercial importance.

ORIOLES, ORIOLIDÆ, an Old World family of passerine birds, with brilliant yellow plumage. The Golden O. (*O. galbula*) breeds rarely in England.

ORION (classical myth.), a great hunter who presumed to love the goddess Artemis, for which audacity she slew him; afterwards he was placed among the stars.

ORISKANY (43° 10′ N., 75° 20′ W.), town, New York State, U.S.A.; ironworks.

ORISSA (20° 30′ N., 86° 20′ E.), former kingdom, India; was great centre of Buddhism, afterwards of Hinduism; now a division of BIHAR AND ORISSA (*q.v.*); total area, 13,770 sq. miles. Pop. (1901) 8,200,000. Orissa has a number of tributary states.

ORISTANO (39° 54′ N., 8° 36′ E.), town, Sardinia; seat of archbishopric; has cathedral dating in part from XII. cent. Pop. 7500.

ORIZABA.—(1) (18° 39′ N., 97° 8′ W.) town, Vera Cruz, Mexico; sugar, tobacco. Pop. (1910) 32,894. (2) (19° N., 97° 15′ W.) volcanic peak (18,314 *ft.*); highest mountain in Mexico.

ORKNEY ISLANDS, group of islands and islets off E. part of N. coast of Scotland, forming county by themselves; separated from mainland by Pentland Firth; comprise 29 inhabited islands, 39 smaller islands (useful for grazing purposes), and large number of rocky islets or *skerries*; principal island, Pomona or Mainland, containing more than half population. Coastline is irregular, with deep bays; navigation rendered difficult by rapid currents; surface of islands low except in Hoy. Islands contain numerous lakes, principal being Stenness and Harray in Pomona. Only towns are Kirkwall and Stromness on Pomona. Antiquities, which are numerous and interesting, include cairns, brochs, stone circles, Picts' houses, castles, and churches. Original inhabitants believed to have been Picts; subdued by Harold Haarfager in 875, and continued under Norse rule till 1231. Agriculture and fishing are leading industries. Pop. (1911) 25,896.

ORKNEY, EARLDOM OF.—Norwegian *jarldom* dates from IX. cent., when Norwegians colonised Orkney Is.; modern earldom from 1379; held by Sinclairs of Roslin, 1379–1470. From Lord George Hamilton, cr. earl, 1696, it has descended to present holders, the Fitz Maurices.

ORLÉANAIS, ancient province, France; capital, Orleans; now mainly included in departments Loiret, Eure-et-Loir, and Loir-et-Cher.

ORLEANISTS, members of Fr. party, led by house of Orleans, seeking to establish constitutional monarchy in France. When opposition to elder branch of house of Bourbon revived after Restoration, house of Orleans stood out as candidates for rule; Louis Philippe, who became king, 1830, united hereditary and elective claim; dynasty overthrown, 1848, but again acquired political significance as alternative to despotism or republic under Second Empire; surrendered claim to Legitimists, 1873.

ORLEANS (47° 54′ N., 1° 55′ E.), city, on Loiret, France; capital of department, Loiret; with fine cathedral, Ste Croix (XIII. cent. onwards), St. Aignan,

St. Euverte, St. Pierre-le-Puellier (X. cent. onwards); Hôtel-de-Ville, with picture and sculpture gallery, and natural history museum; palais de justice; episcopal palace; Hôtel Dieu (hospital); houses of Joan of Arc (*Maid of Orleans*), Agnes Sorel, and Diane of Poitiers; equestrian statue of Joan of Arc; the Celtic *Genabum* was destroyed by Cæsar; renamed *Civitas Aureliani* by Romans, 272 A.D.; besieged by Attila, 451; sacked by Northmen, 855, 865; dukedom of O. held by Fr. royal family, XIV. cent. onwards; siege of English raised by Joan of Arc, 1429; a stronghold of Protestantism in XIV. cent.; notorious St. Bartholomew massacre, 1572; since taken by Germans in Franco-German War, 1870. Manufactures include blankets, cottons, machinery, agricultural implements, tobacco, preserved vegetables; trade in wine, grain, wool, oil, live stock. Pop. (1911) 72,096.

ORLEANS, CHARLES, DUKE OF (1391–1465), Fr. prince; nephew of Charles VI. and f. of Louis XII. of France; taken prisoner at *Agincourt*, 1415, and kept captive in England till 1440; occupied himself in composing Fr. verses (and possibly English), which are mediæval classics; kept open house for poets, musicians, etc.

ORLEANS, LOUIS PHILIPPE JOSEPH, DUKE OF, 'PHILIPPE EGALITÉ' (1747–93), Fr. prince; f. of Louis Philippe I. (*q.v.*); initiated connection of house of Orleans with constitutionalism; led outrageous private life, but inspired popular criticism of court before Revolution; member of 'Mountain' in National Convention, and voted death of king, his cousin; inevitably mistrusted, and included in general proscription of Bourbons; arrested by Committee of Public Safety; sentenced by Revolutionary Tribunal; executed.

ORLEANS, LOUIS PHILIPPE ROBERT, DUKE OF (1869–), head of Fr. Orleanists; went to France at Bourbon recall, 1871; exiled with his f., the Comte de Paris, 1886; served in Brit. regiment in India, 1888; arrested on return to France, 1890, but allowed to depart.

ORLEANS, PHILIP II., DUKE OF (1674–1723), Fr. statesman; seized regency on death of Louis XIV., 1715; Prime Minister, 1723; distinguished soldier and able administrator, but immoral and corrupt.

ORLOV, ORLOFF, noble Russ. family; founded by IVAN, who saved himself from execution by bold reply to Peter the Great, 1689. Grandson, GRIGORII (1734–83), favourite of Catherine II., and commander-in-chief, was cr. count, 1762, Roman prince, 1772; bro's, ALEXIS (1737–1808) and FEDOR (1741–96), famous admirals and generals; Fedor's five illegitimate sons were ennobled and allowed name of O. Of this line ALEXIS, ambassador, was made prince, 1856; son, PRINCE NIKOLAI (1827–85), diplomatist and author.

ORM, ORMIN (fl. XIII. cent.), Eng. author; wrote a book of metrical homilies in the Midland dialect and called by himself the *Ormulum*. The value of the work is linguistic rather than poetic.

ORMAZD, ORMUZD, see AHRIMAN.

ORMEROD, ELEANOR A. (1828–1901), Eng. entomologist; studied especially injurious insects and methods of combating their ravages.

ORMOC (11° N., 124° 40′ E.), town, W. coast of Leyte, Philippine Islands.

ORMOND (29° 15′ N., 81° 5′ W.), village, health-resort, Florida, U.S.A. Pop. (1910) 780.

ORMOND, EARLDOM OF, named from northern part of county of Tipperary; cr. for JAMES BUTLER, 1328; held by Butlers, prominent family in Irish history, till 1515, and from 1528 to present time. JOHN, 6th earl, was called by Edward IV., 'The finest gentleman in Christendom.'

ORMOND, MARQUESSATE OF, cr. 1642, for 13th earl, who was cr. duke, 1661 (Ireland), and 1682 (England).

ORMOND, JAMES BUTLER, 1ST DUKE OF (1610–88), Brit. statesman; grandson and heir of 12th Earl of O.; brought up in Eng. court as Prot.; succ. to earldom, 1633; commander-in-chief in Ireland, 1641; cr. Marquess of O., 1642; Lord-Lieut. of Ireland, 1643–47, 1648–50, 1662–69, 1677–85; proclaimed Charles II., 1649, and departed to St. Germain-en-Laye; after other honours, cr. duke, 1661; suffered from ill-will of Buckingham, who was suspected of instigating Blood's attack, 1670; blamed by Shaftesbury for not sharing in Prot. panic after Titus Oates' depositions, but effectively prevented Irish riots; one of most spotless characters of century.

ORMOND, JAMES BUTLER, 2ND DUKE OF (1665–1745), Viceroy of Ireland, 1703–7; succ. Marlborough as captain-general, 1711; impeached, 1715, and fled abroad to Bolingbroke; assisted in Jacobite invasion, 1715.

ORMSKIRK (53° 34′ N., 2° 53′ W.), market town, Lancashire, England; cordage. Pop. (1911) 7409.

ORMUZ, see HORMUZ.

ORMUZD, see PARSEES; AHRIMAN.

ORNE (48° 40′ N., 0°), department, N.W. France; formed of part of Normandy (*q.v.*), Alençon, and Perche; area, 2354 sq. miles; large forests; fine agriculture and pasture land; chief river, Orne; capital, Alençon; iron-wares, lace, linen, cider, horses, etc. Pop. (1911) 307,433.

ORNITHODELPHIA, see under MAMMALS.

ORNITHODORUS, see under MITES.

ORNITHOLOGY (Gk. *ornis*, a bird; *logos*, science), the branch of zoology which deals with Birds and Bird-life. It is concerned with a class of vertebrates which, less mentally endowed than most Mammals, and with less perfect instincts than the Invertebrate Insects, nevertheless stands, by reason of the diversity and unified perfection of its organs, almost at the top of the scale of life. It is, moreover, one of the most familiar and largest of vertebrate classes, containing more than 12,000 species.

Birds are feathered creatures—a sure guide to their identity, for no bird is without *feathers*, and no other creature possesses them. To birds the feathers are of the utmost importance, for not only do they form a light coat suitable for a creature which has conquered the air, but their conservation of warmth enables the body to be kept at the uniformly high temperature (sometimes as much as 112° F.) which is an index of a bird's extraordinary metabolism and activity. So they have helped in the conquering of climate, for wherever food is to be found, there birds occur irrespective of cold, from Arctic to Antarctic. Feathers, however, are not uniformly sprinkled over the body, but, with a few exceptions, are confined to definite feather tracts, or *pterylia*, which differ in position in different birds. In the feathers reside the distinctive colours, and these may be due to fine striations which disperse the light rays giving metallic colours, or to deposition of actual pigment, which is sometimes so soluble that, in the Turacos for example, it washes out when the birds bathe.

Birds are, again, predominantly flying creatures, only a few, such as the extinct Great Auk, the Burrowing Parrot (*Stringops*), the Penguins, and the Running Birds, having almost or altogether lost the power of flight. And with this habit many of the peculiarities of bird-structure are associated. Flight demands that the framework of the body shall be light and yet capable of bearing the great strain of rapidly moving wings. So the bones are light, many of them being hollow, and that part of the central axis of the skeleton, upon which under-pressure falls, is made rigid by the fusion of dorsal, lumbar, sacral, and caudal vertebræ. The body is buoyed also by the presence of many air sacs connected with the lungs, and penetrating, one might almost say, every nook and cranny where air can be stored, a phenomenon known as *pneumaticity*. But these air sacs are probably of more value as adjuncts to lung respiration, for the energy of flight demands a great supply of oxygen, and in this aerating function the air sacs share. Flight further demands a stable body which will offer the minimum resistance in the air; so the lungs, air sacs, and wing attachments are high, while the digestive organs

and heavier muscles lie low, and the body is boat-shaped.

Lastly, flight demands the presence of a means of motion—the *wings* and their muscles. The wings are formed of the fore-limb, to the bones of which long strong feathers are attached: to the hand bones are attached the longest feathers, primaries or manuals, usually 10 in number, to the fore-arm bones the shorter secondaries or cubitals, varying from 6 to over 30 in number, while the bases of these feathers are concealed by the wing coverts. A few feathers are also attached to the thumb, these forming the thumb, bastard, or false wing or *alula*. The wings are moved by exceedingly strong breast muscles attached at the lower end to a ridge, the keel, on the front of the breast-bone or sternum. As a rule, the stronger the muscles and the flight of a bird the larger the keel, which is altogether absent from the breast-bones of the flightless Running Birds.

Apart from those directly concerned with flight a few other bird characteristics may be mentioned. Many are skeletal: thus the lower jaw is composed of several bones, and unites with the skull through a quadrate bone; the skull itself is articulated with the skeletal axis through a single condyl; the surfaces of the vertebræ are saddle-shaped, concave from side to side, convex up and down; and the vertebral column ends in a set of fused vertebræ forming the ploughshare bone or pygostyle, which supports the tail feathers. A few bodily peculiarities are the absence of sweat glands in the skin, the only skin gland being the oil or preen gland on the rump; the frequent presence of crop, gizzard, and compound vent or cloaca; the four-chambered heart, with only a right aortic arch; and the presence of a song-box or syrinx with vocal chords at the lower end of the bronchial tubes.

Of the **life activities** of birds many deserve mention. Flight varies from the rapid beating of wings which propels the bird at speeds up to 50 feet a second, and even 100 miles an hour, through stationary hovering, and soaring against the wind, to simple gliding, achieved by several other vertebrates. The *moulting* of mammals is represented in birds by a more perfect autumnal moult, when the plumage is completely renewed, and often assumes a striking variation of colour; thus the speckled Ptarmigan of spring becomes grey in autumn and snow-white in winter. A spring moult also takes place, but it is less complete, although it furnishes the breeding garb, and is particularly characterised by the changes of design and colour which accompany it. The wooing of birds is of a nature peculiar to themselves, for no other creatures, unless it be man himself, makes so much 'business' of the preliminaries. The antics, stately exhibitions, scrapings, and curtseyings of the males in some species, and the coyness of the females, have a distinct suggestion of love-dazed humanity. Chiefly associated with the courting season is the wonderful power of *song*, best developed at this time in the males. But apart from exquisite emotional expression given to comparatively few in perfection, birds also have warning-calls, food-calls, and so on, recognised by their kind. Associated also with the breeding season is the *nest-building* habit—a structure, scraped in earth, burrowed in sand, plastered of mud, woven of grass, sewn of leaves, built in endless variety of shapes with materials innumerable, being created for the sheltering of eggs and of young.

The **food** of birds and their feeding habits are of great interest, especially as these are generally correlated with adapted structures in beak, claws, and food tract. Many species confine themselves to a diet of grain and seeds, and these, such as the Finches, have short stout beaks with splitting edges, large storing crops, and grinding gizzards; but the latter structures are small and the beak slender in such as feed on worms, insects, and the like. An almost abnormal food habit is exhibited by the honey-sipping Humming-Birds. In such tree-inhabiting species the feet are formed on the same plan, the toes being long, supple, and separate, suited for clinging to branches, and armed with moderate claws. In the birds of prey the claws become hooked talons and the beak curved and strong, fit structures to grasp and tear active living prey such as birds and mammals. Of birds which find their food on the seashore or in streams, the majority have long, unfeathered, wading legs, and swimming feet. But the latter may be completely webbed to the tip of the toes (as in Ducks), half-webbed (as in the Avocet), or having separate toes margined with a simple or lobed membrane (Grebe and Coot). The aquatic birds, also, present the greatest variety of beak structure, each type adapted to a special requirement. The Avocet, Curlew, and many others, which pick dainties from deep in mud, have extremely long slender bills; the Spoon-Bill dabbles in mud with its curious beak for insects, larvæ, molluscs, and worms; Ducks for the same end sift the same material through the plates bordering their bills; fish-eating birds have beaks curved at the tip to retain their slippery prey; the Pelican stores its catch in a large dilatable sac attached to its lower jaw. In all such flesh-eating birds the mechanical gizzard and crop are reduced in favour of purely digestive apparatus.

The *development* of birds—from egg, through chick, to adult—is familiar, but two great divergences may be mentioned. Some young are hatched equipped for an immediate start in life, *e.g.* the young of the farmyard fowl, such being known as *Præcoces*; while the majority leave the egg naked and blind, and have to be fed until they can use their own wings, *e.g.* the Blackbird, Robin, etc., these being known as *Altrices*. The young are covered with moderately simple down-feathers, and often pass through several stages of plumage before the adult coloration is attained. It is a curious and unique fact that two distinct down stages, a white, and a dusky brown, occur in a species of Penguin.

Birds as a class enter greatly into human economy. They are amongst the comparatively few creatures which man has been able to *domesticate*; their flesh is eaten, their eggs form an invaluable source of nourishment, the nests of the Eastern Edible Swifts are made into soup, the Oil-Bird of America furnishes oil and 'butter.' Apart from their food value they have been put to little direct use by man, but trained Pelicans catch fish for their Chinese owners. Many species are the objects of sport, as the game birds, or the agents of sport, as the hawking Falcons; the plumage of others is esteemed by some as ornament; and the ageless accumulations of the food-refuse and excrement of seabirds form the invaluable *guano* deposits of a few tropical islands. But the most beneficent work of birds towards man is indirect; for, although some destroy fruit and grain, these depredations are more than overbalanced by the unsparing war waged by birds upon destructive insects, insect larvæ, and vermin.

Birds fall two into sub-classes—I. ARCHÆORNITHES—Extinct Birds, such as the tailed *Archæopteryx*.

Sub-class II. NEORNITHES—including the divisions of 1, RATITÆ or RUNNING BIRDS (*q.v.*); 2, the extinct TOOTHED BIRDS or ODONTORNITHES (*q.v.*); and 3, the KEELED BIRDS or CARINATÆ, which include almost all living forms. The latter were once conveniently, if roughly, divided by their predominant habits into Swimmers (*Natatores*), Waders (*Grallatores*), Gallinaceous Birds or Scratchers (*Rasores*), Birds of Prey (*Raptores*), Climbers (*Scansores*), and Perchers (*Insessores*), the last two groups in part containing the Picarian Birds, characterised by their habits of building nests and laying white eggs at the bottom of excavations in trees, stems, or in the ground. Present classifications group existing Carinate Birds in about thirty more or less distinct orders separated into four divisions according to the minute arrangement of the palatal bones of the skull.

Coward, *Migration of Birds* (1912); Hartert and others, *A Hand-List of British Birds* (1914); Lea, *The Romance of Bird Life* (1900); Pycraft, *History of Birds* (1910).

ORNITHOPHILY, see POLLINATION.

ORNITHORHYNCHUS, DUCKMOLE, DUCKBILL, or PLATYPUS, one of the Monotremes (*q.v.* under MAMMALS for general characters)—a primitive Mammal found in the rivers of Australia and Tasmania, in the banks of which it burrows. It has many peculiar characters; is an active swimmer, with webbed and clawed feet, and jaws flattened like a duck's bill, with which it grubs in mud for worms, crustacea, aquatic insects, and such-like. Two eggs are laid at a time.

ORNITHOSAURIA, extinct Reptile (*q.v.*).

OROBUS, genus of plants, order Leguminosæ; related to Vetch (*q.v.*). Bitter Vetch, *O. tuberosus*, has purple flowers; its roots are edible and in Scot. Highlands are used in brewing a kind of ale.

ORONTES (35° N., 36° 50′ E.), chief river, Syria; falls into Mediterranean; modern Nahr-el-Asi.

OROPUS (38° 18′ N., 23° 49′ E.), ancient seaport, on Euripus, Attica, Greece.

OROSIUS, PAULUS (fl. 415 A.D.), Span. historian; adopted theological views of his contemporary, St. Augustine; wrote widely—read treatises against Pelagian heresies, 415; chief work, *Historiarum libri VII. adversus Paganos*; trans. by Alfred the Great.

ORPHEUS (classical myth.), Gk. hero; s. of Apollo and Calliope (according to principal legend); b. in Thrace; journeyed with Argonauts, and by his lyre, given by Apollo, delivered companions from dangers; able to charm animate and inanimate objects with his music. On death of his wife Eurydice, O. descended to Hades to rescue her, but lost her by disobeying orders and looking back to see if she was following him. There are diverse legends concerning his death; killed by Zeus, or torn in pieces by Mænads, women of Thrace. Myth was probably woven round some hist. sacred Thracian bard.

ORPHIC POETRY consists of fragments of verse older than Homeric and Hesiodic poems.

ORPHIC BROTHERHOOD consisted of number of ascetics in some ways akin to Pythagoreans; flourished in later Rom. Empire.

ORPIMENT, see ARSENIC.

ORPINGTON (51° 22′ N., 0° 6′ E.), town, Kent, England. Pop. (1911) (reg. sub-dist.) 16,075.

ORRERY, ROGER BOYLE, 1ST EARL OF (1621–79), cr. baron of Broghill, 1627; fought for Charles I. in Ireland, but accepted commission from Cromwell, and helped to subdue Ireland; secured Ireland for Charles II. at Restoration; wise statesman and voluminous, not always dull, writer.

ORSEOLE I., PIETRO, Doge of Venice, 971–91; founded new Church of St. Mark and bought Pala d'Oro; philanthropist.—**Orseole II.**, PIETRO, Doge of Venice, 991–1008; won naval victories, 998; originated yearly custom of wedding the sea.—**Orseole III.**, Doge of Venice, 1008–26; increased power of state, but was banished by republicans.

ORSHA (54° 30′ N., 30° 30′ E.), town, Mogilev, Russia, on Dnieper; trade in grain. Pop. 13,500.

ORSINI, celebrated Ital. family; Rom. branch produced Popes Celestin III., Nicholas III., Benedict XIII., and famous Ital. nobles; in Papal States O. were great enemies of Ghibelline Colonnas.

ORSINI, FELICE (1819–58), Ital. patriot; fought in War of Independence, 1848; worked with Mazzini till imprisoned, 1854; pub. *Austrian Dungeons in Italy*, 1857; executed in Paris after throwing bomb at Napoleon III.

ORTA, LAKE OF (45° 50′ N., 8° 23′ E.), lake, Novara, Italy; length, 7½ miles.

ORTELIUS, ABRAHAM (1527–98), geographer, of Ger. parentage; b. at Antwerp; pub. the first atlas (*Theatrum Orbis Terrarum*) and critical works on ancient and modern geography.

ORTHEZ (43° 31′ N., 0° 47′ W.), town, Basses-Pyrénées, France, on Gave de Pau; cotton fabrics. Pop. 6400.

ORTHOCLASE, or common felspar, consists of silicate of aluminium and potassium; white, green, and transparent; an important rock-forming mineral.

ORTHODOX EASTERN CHURCH, see GREEK CHURCH.

ORTHOPTERA (Gk. *orthos*, straight; *pteron*, a wing), an order of insects which includes earwigs, cockroaches, mantidæ or praying-insects, stick- and leaf-insects, grasshoppers, locusts, and crickets. These possess the common characters that the young reach maturity by a series of slight changes or moults, from three to six in number, instead of by a violent metamorphosis as in most other insects. The adults have mouths adapted for biting, are carnivorous or vegetarian, and may possess or lack wings. Amongst O. are found the largest of insects, and they are also amongst the oldest, for one Orthopterus form has been found in Silurian rocks. To-day their distribution is world-wide.

ORTIGUEIRA (43° 40′ N., 8° W.), seaport, Corunna, Spain. Pop. 19,000.

ORTLER SPITZE (46° 30′ N., 10° 34′ E.), highest mountain, Austrian Tyrol (12,800 ft.).

ORTOLAN, see EMBERIZIDÆ.

ORTON, ARTHUR, see TICHBORNE CASE.

ORTONA-A-MARE (42° 21′ N., 14° 26′ E.), seaport, Chieti, Italy; cathedral. Pop. 15,500.

ORURO.—(1) (c. 18° 10′ S., 67° 30′ W.) dept., Bolivia; area, 19,000 sq. miles; produces tin. Pop. 100,000. (2) (17° 55′ S., 66° 50′ W.) capital of above; has gold, silver, and tin mines. Pop. 21,000.

ORVIETO (42° 43′ N., 12° 6′ E.), city, Italy, on Paglia, in province Perugia; situated on isolated rock, 640 ft. high; has numerous interesting houses, palaces, and churches; cathedral (XIII.–XVI. cent.), S. Andrea, S. Giovenale, S. Domenico; bp.'s palace; Faina, Papi, and other palaces. O. was ancient *Volsinii*, later *Urbs Vetus*; passed to popes *c.* X. cent.; first *podesta* elected, 1199; became part of kingdom of Italy, 1860. Pop. 18,300.

ORYX, a genus of African antelopes, with maned neck, long, straight horns, and long tail. The GEMSBOK and BEISA are two common species.

OSAKA, OZAKA (34° 40′ N., 135° 32′ E.), seaport, Japan, on Yodogawa; cotton-mills; ironworks. Pop. 1,226,647.

OSAWATOMIE (38° 30′ N., 95° W.), city, Kansas, U.S.A.; coal mines; oil refineries. Pop. (1910) 4046.

OSBORN, SHERARD (1822–75), Brit. rear-admiral, explorer, and writer; commanded *Pioneer* in Franklin search expeditions, 1850–51 and 1852–54; served in Chin. and Crimean Wars; wrote accounts of Arctic voyages.

OSBORNE, see LEEDS, DUKE OF.

OSBORNE, royal mansion, Isle of Wight, England; presented by Edward VII. as convalescent home for army and navy officers.

OSBORNE JUDGMENT, see TRADE UNIONS.

OSCA LINGUA, the language of an ancient Ital. people of Campania and Samnium. The Oscan language does not differ substantially from Latin, but is a cruder and more primitive form of it. The language in very ancient times had taken a literary form, and an improvised comedy with fixed characters was in vogue. This farce, known as the *Atellanæ fabulæ*, was introduced into Rome, and existed side by side with the regular drama.

OSCAR I. (1799–1859), king of Sweden and Norway; succ. his f., Charles XIV., 1844; showed thorough knowledge of finance; successfully negotiated alliances to prevent Russ. aggression.

OSCAR II. (1829–1907), king of Sweden and Norway (1872–1905), of Sweden (1905–7); s. of Oscar I.; a gifted writer; separation of Norway and Sweden in his reign was due to no fault of sovereign.

OSCEOLA (*c.* 1804–38), Anglo-Amer. Indian; s. of Englishman, William Powell, by Creek Indian; wife seized as dau. of fugitive slave, 1835; inspired massacres of whites.

OSCHATZ (51° 19′ N., 13° 7′ E.), town, on Döllnitz, Saxony; sugar. Pop. (1910) 10,750.

OSCHERSLEBEN (52° 3′ N., 11° 13′ E.), town, on Bode, Prussian Saxony, Germany; sugar. Pop. (1910) 13,131.

OSCILLOGRAPH, an electrical instrument used to record the alternations of an electric current. Two delicate phosphor-bronze strips lie stretched vertically between the poles of a magnet. When a current passes, one strip moves back and the other forward, thus turning an attached mirror which, by reflecting a spot of light on to photographically prepared paper moved by clockwork, records the motion.

OSH (40° 43′ N., 72° 35′ E.), town, Ferghana, Asiatic Russia. Pop. (1910) 44,800.

O'SHANASSY, SIR JOHN (1818–83), Australian statesman; emigrated from Ireland, 1839; led agitation for separation of Port Philip from New South Wales and aided in framing constitution of new colony, Victoria, 1851–56; premier, 1857, 1858–59, 1861–63; important Land Act, 1862.

O'SHAUGHNESSY, ARTHUR WILLIAM EDGAR (1844–81), Eng. poet; wrote *Epic of Women* (1870), *Lays of France* (1872), *Music and Moonlight* (1874); charming sonneteer and lyrist.

OSHAWA (43° 50′ N., 78° 50′ W.), town, Ontario, Canada, on Lake Ontario; flour-mills; canneries. Pop. 5300.

OSHIMA (28° 20′ N., 129° 20′ E.), small island, Japan; has an active volcano.

OSHKOSH (44° 9′ N., 88° 26′ W.), town, Wisconsin, U.S.A.; trades extensively in lumber; meat-packing and dairy-farming. Pop. (1910) 33,062.

OSIER (*Salix viminalis*), species of willow from whose twigs baskets are made; grown in what are termed o. beds along low-lying flanks of water-courses, or on land subject to periodic inundation (*e.g.* Fen district); raised from cuttings about a foot and a half long, of vigorous two-year-old shoots which strike root very readily. The slips are cut for commercial purposes when about eight feet long.

OSIMO (43° 30′ N., 13° 29′ E.), town, Ancona, Italy; ancient *Auximum*; silk industries. Pop. 18,500.

OSIRIS, see EGYPT (RELIGION).

OSKALOOSA (41° 15′ N., 92° 39′ W.), city, Iowa, U.S.A.; brick and tile works. Pop. (1910) 9466.

OSMERUS, see under SALMON FAMILY.

OSMIUM (Os = 190·9), noble metal, occurs in platinum ores; bluish-white; S.G. 22·48; M.P. 2300–2500° C. *Osmiridium* alloy is used for tipping gold pens. Oxides: OsO, Os_2O_3, OsO_2, OsO_4 = 'osmic acid,' aqueous solution used for staining microscopic preparations.

OSMOSIS, diffusion of liquids through a septum. Place a jar containing sugar in solution and covered with parchment in a vessel of pure water; the water, flowing through the parchment into the jar, produces *osmotic pressure* on the parchment. Osmotic pressures are inversely proportional to the molecular weight of substances dissolved. Sap rises to great heights in trees and plants by means of osmosis.

OSNABRÜCK (52° 17′ N., 8° 3′ E.), town, Hanover, Germany; seat of R.C. bishopric; has episcopal palace and XIII.-cent. cathedral; formerly fortified. Pop. (1910) 65,957.

OSORIO, JERONYMO (1506–80), Portug. scholar and divine; bp. of Silves, 1564; wrote hist. and exegetical works in polished Latin.

OSPREY, FISH-HAWK (*Pandion*), forms a genus and family of Birds of Prey found in the Old World and America; feeds on marine and freshwater fishes; all but exterminated from Britain. The so-called 'osprey plumes' are not taken from this bird, but from the egret.

OSRHOENE, OSROENE, region, Mesopotamia; was small kingdom under Abgar dynasty, 137 B.C.–116 A.D.; afterwards came under Rom. control.

OSSA (39° 45′ N., 22° 40′ E.), mountain, Thessaly, ancient Greece; modern Kissovo.

OSSETT (53° 41′ N., 1° 35′ W.), town, Yorkshire, England; woollen mills; collieries. Pop. (1911) 4081.

OSSIAN, see MACPHERSON, JAMES; CELTS (CELTIC LITERATURE).

OSSINING (41° 10′ N., 73° 50′ W.), town, on Hudson River, New York State, U.S.A.; iron foundries; Sing Sing state prison. Pop. (1910) 11,480.

OSTADE, the name of two Dutch painters, brothers, both born at Haarlem. **Adrian Ostade** (1610–85) was a pupil of Franz Hals, and later fell under the influence of Rembrandt's style. He was a prolific painter, and dealt in a vigorous way with scenes and characters of rustic life. **Isaac Ostade** (1621–49) painted somewhat similar subjects, favouring winter aspects of the country and village street life.

OSTASHKOV (57° 8′ N., 33° 12′ E.), town, on Lake Seliger, Tver, Russia; leather. Pop. 11,500.

OSTENDE (51° 14′ N., 2° 56′ E.), seaport, watering-place, W. Flanders, Belgium; casino; taken by French, 1706, 1745; fisheries, oyster-beds. Pop. (1910) 42,207.

OSTEOLOGY, see BONE, SKELETON.

OSTEOPATHY, method of treating disease; based on theory that diseases are due to displacement of bones; consists in treating bones, blood-vessels, etc., by a system akin to massage; much practised in U.S.A.; a few qualified doctors in Britain have taken it up, and many laymen testify to wonderful cures.

OSTERMAN, ANDREI IVANOVICH, COUNT (1686–1747), Russ. statesman; held office under Peter the Great, Catherine I. (1725–27), and Peter II. (1727–30); aided Anne Ivanovna to establish her rule, 1730; banished, 1741.

OSTERODE.—(1) (51° 44′ N., 10° 14′ E.) town, Hanover, Prussia, in Harz Mountains; cottons, woollens. Pop. (1910) 7505. (2) (53° 41′ N., 19° 57′ E.) town, on Lake Drewenz, E. Prussia province, Prussia; machinery. Pop. (1910) 14,359.

OSTERSUND (63° 6′ N., 14° 42′ E.), town, Jemtland, Sweden, on Storsjö; tanneries. Pop. 7300.

OSTIA, ancient town of Latium in Italy, situated at mouth of Tiber, 14 miles from Rome; harbour for long was considered one of best in central Italy; O. became prominent with growth of Rome, and rose to be a trading port of great commercial importance; after construction of safer and larger harbours by Claudius and Trajan, O. began to lose its importance. Excavations began in XVIII. cent.; ruins, which are extensive and well preserved, include forum, temples, warehouses, and barracks; modern village of O. exists near site.

OSTIAKS, Finnish people of Siberia; towns, destroyed by Russians, 1501, still to be traced round Obdorsk; barbarians, and rapidly dying out.

OSTRACIIDÆ, see TRUNK FISHES.

OSTRACISM (Gk. *ostrakizein*, earthen tablet), judicial expedient of ancient Greece. Citizens not liable to process at common law but dangerous to state were banished, after ballot in which names of proscribed were written on earthen tablets; said to have been introduced into Athens by Cleisthenes, 508 B.C. Leaves being used at Syracuse, system was called *petalism*.

OSTRACODA, see under ENTOMOSTRACA.

OSTRACODERMS (Gk. *ostracon*, a shell; *dermos*, skin), or HYPOSTOMATA, extinct primitive fishes without jaws and without a backbone, but with complicated protecting shields; the oldest known vertebrates, found in Silurian and Devonian rocks.

OSTRAU, MÄHRISCH- (48° 59′ N., 17° 23′ E.), town, on Ostrawitza, Moravia, Austria; collieries; ironworks. Pop. (1910) 36,754. *Polnisch-Ostrau* is a commune in Silesia, Austria.

OSTRICH, see under RUNNING BIRDS.

OSTROG (50° 21′ N., 26° 31′ E.), town, Volhynia, Russia; tanneries. Pop. 15,700.

OSTROGOTHS, see GOTHS.

OSTROVSKIY, ALEXANDER NIKOLAIVICH (1823–86), Russ. dramatist; b. Moscow; wrote excellent comedies and hist. dramas (*The False Demetrius*, etc.).

OSTUNI (40° 46′ N., 17° 34′ E.), town, Lecce, Italy; cathedral. Pop. 5200.

OSUNA (37° 16′ N., 5° 7′ W.), town, Seville, Spain; grain, fruit. Pop. 18,000.

OSUNA, PEDRO TELLEZ GIRON, DUKE OF (1575–1624), Span. noble, called 'the great duke'; Viceroy of Sicily, 1610–16; of Naples, 1616–20.

OSWALD (d. 992), Eng. cleric; bp. of Worcester, 961; abp. of York, 972.

OSWALDTWISTLE (53° 45′ N., 2° 23′ W.), town, Lancashire, England; cotton-mills. Pop. (1911) 15,720.

OSWEGO (42° 8′ N., 76° 19′ W.), port, New York State, on L. Ontario, U.S.A.; falls of O. River supply water-power for large cornflour mills, starch works, etc. Pop. (1910) 23,368.

OSWESTRY (52° 52′ N., 3° 4′ W.), town, Shropshire, England; has workshops of Cambrian Railway; manufactures iron goods, leather, etc. In neighbourhood is old Brit. camp. Pop. (1911) 9991.

OTAHEITE, see TAHITI.

OTARIIDÆ, see SEALS.

OTCHAKOV, see OCHAKOV.

OTHMAN, see CALIPH.

OTHO I.–IV., see OTTO I.–IV.

OTHO, MARCUS SALVIUS (32–69), Rom. emperor; app. gov. of Lusitania, 58, by Nero, formerly his boon companion, but now anxious to obtain his wife, Poppea; aided insurrection of Galba, 68; revolted, 69, and with aid of prætorians became emperor; attacked by Ger. troops under Vitellius; showed great prowess, but slew himself after defeat at *Bedriacum*.

OTIS, JAMES (1725–83), leader of Amer. rebellion; advocate-general of Massachusetts, 1755; refused to plead for Crown when writs of search not specifying house to be searched were issued; resigned and took popular brief, 1761; represented Boston at Massachusetts General Court, 1761–69; wrote *Vindication of the House of Representatives of the Province of Massachusetts Bay*, 1762.

OTLEY (53° 54′ N., 1° 42′ W.), market town, on Wharfe, Yorkshire, England; textiles. Pop. (1911) 9843.

OTOCORYS, a genus of Larks (*q.v.*).

OTOCYON, see DOG FAMILY.

OTRANTO (40° 8′ N., 18° 30′ E.), seaport, Apulia, Italy; ancient *Hydruntum*; ruined castle.

OTTAWA (45° 28′ N., 75° 20′ W.), river, Canada; enters St. Lawrence by two channels, enclosing the island on which stands Montreal.

OTTAWA (45° 20′ N., 75° 43′ W.), capital of Dominion of Canada, in Ontario Province; beautifully situated on Ottawa (south bank) at confluence with Rideau, below Chaudière Falls. Notable features are R.C. cathedral, Christ Church, Government buildings on Parliament Hill, Archive Buildings, and Royal Mint on Nepean Point, museum, art gallery, univ., art academy, gov.-gen.'s residence (Rideau Hall), and several public parks. Founded 1829, O. was named BYTOWN until 1854; became capital of the two Canadas, 1858, of Dominion, 1867. Rideau Canal joins O. with Kingston on Lake Ontario. O. is centre of lumber trade; manufactures leather, ironware, machinery, matches, etc.; numerous saw- and flour-mills. Pop. (1911) 87,062.

OTTAWA (38° 33′ N., 95° 17′ W.), city, on Osage, E. Kansas, U.S.A.; flour-mills. Pop. (1910) 7650.

OTTAWA (41° 21′ N., 88° 45′ W.), town, Illinois, U.S.A.; coal centre; manufactures agricultural implements, cutlery, flour, glass, etc.; has mineral spring. Pop. (1910) 9535.

OTTER, see WEASEL FAMILY.

OTTERBURN (55° 15′ N., 2° 10′ W.), village, Redesdale, Northumberland; scene of Douglas's defeat of Hotspur, 1388, celebrated in ballads *Chevy Chase* and *The Battle of Otterburn*.

OTTER-HOUNDS, see DOG FAMILY.

OTTERY ST. MARY (50° 45′ N., 3° 16′ W.), town, Devonshire, England; Coleridge's birthplace. Pop. (1911) 3700.

OTTIGNIES (50° 40′ N., 4° 33′ E.), village, Brabant, Belgium.

OTTO I., OTHO (912–73), emperor of Holy Rom. Empire; s. of Henry the Fowler; elected king of Germany, 936; conquered Huns, Hungarians, Bohemians, and Dukes of Bavaria and Franconia; invaded France in aid of Louis IV., a prisoner of Hugh the Great; drove back Danes; in response to appeal of Adelaide, widow of Lothair, crossed Alps, and declared himself king of the Lombards, 951; defeated Magyars by decisive battle of *Lechfeld*, 955; crowned emperor, 962, and sought to revive empire of Charlemagne, but remained primarily Ger. king; struggled with Romans and Byzantine emperor. See EMPIRE, HOLY ROMAN.

OTTO II. (955–83), emperor of Holy Rom. Empire, 973; Bavaria partitioned, 976–78; Fr. attempts on Lorraine checked, 978; protected Papacy and attacked Muhammadans; greatly developed mediæval imperial idea.

OTTO III. (980–1002), emperor of Holy Rom. Empire, 983; crowned, 996, and with Popes Gregory V. and Sylvester II. sought to revive Rom. greatness, and brought mediæval empire to its height; general revolt in Italy, 1001; a visionary.

OTTO IV., THE LION (*c.* 1175–1218), emperor of Holy Rom. Empire; rival of Philip of Swabia for empire, 1197; after years of warfare was crowned, 1209, by Pope Innocent; excommunicated for annexation of Apulia, 1210; Germany set up rival emperor in Frederick of Hohenstaufen, 1212, crowned by pope; O. invaded France, Pope's ally; defeated at *Bouvines*, 1214, and retired from contest.

OTTO I. (1815–67), king of Greece; s. of Ludwig I. of Bavaria; elected king, 1832, by conference of London; insurrection, 1843, forced him to grant constitution, 1844, and to expel Bavarian suite, but he never became popular; foreign policy twice alienated Brit. and Fr. allies; insurrections ended in O.'s flight and deposition, 1862.

OTTO OF FREISING (*c.* 1114–58), Ger. chronicler and bp.; wrote *De Duabus civitatibus*, a chronicle in eight books; *Gesta Friderici imperatoris* (hist. work).

OTTO OF NORDHEIM (d. 1083), Duke of Bavaria, 1061; frequently in revolt against Henry IV., king of Germany; deposed, 1070; led Saxon revolts, 1073, 1077, supporting anti-emperor, Rudolph of Suabia.

OTTO OF ROSES, see ATTAR.

OTTOCAR I. (d. 1230), king of Bohemia; steered skilful course between rival emperors, Philip of Swabia and Otto IV.—**Ottocar II.,** THE VICTORIOUS, king of Bohemia, 1253–78; united Austria, Styria, Carinthia, and Carniola to Bohemia; slain at *Laa*.

OTTUMWA (41° 2′ N., 92° 29′ W.), city, on Des Moines, Iowa, U.S.A.; coal-mines, iron- and steel-works. Pop. (1910) 22,012.

OTWAY, THOMAS (1652–85), Eng. tragedian of the first order; b. at Trotton, in Sussex; entered Christ Church, Oxford, but failed to take a degree. His life was embittered by a long intrigue with Mrs. Barry. In 1680 he wrote a poem, *The Poet's Complaint of his Muse*, the fine tragedy called *The Orphan*, and *Caius Marius*. In 1682 appeared his greatest drama, *Venice Preserved*.

OUDENARDE (50° 51′ N., 3° 36′ E.), town, on Scheldt, Belgium; in province of East Flanders; with Notre Dame (XIII. cent.), St. Walburga, and fine town hall; textile industries. Here Allies under Prince Eugene defeated French under Vendôme, 1708. Pop. *c.* 7000.

OUDH, see UNITED PROVINCES OF AGRA AND OUDH.

OUIDA, pseudonym of LOUISE DE LA RAMÉE (*c.* 1840–1908), Eng. novelist; wrote *Strathmore* (1865), *Under Two Flags* (1867), *Puck* (1870), *Moths* (1880).

OUDINOT, CHARLES-NICHOLAS (1767–1847), duke of Reggio, 1810; marshal of France, 1809; dis-

tinguished in revolutionary wars under Marceau and Masséna; led 'grenadiers of Oudinot' in chief campaigns till capitulation of Paris, 1814; submitted to Bourbons and continued in high commands.

OUNCE, originally $\frac{1}{12}$ of a lb., as it still is in Troy weight, where an o. weighs 20 pennyweights or 480 grains; in avoirdupois weight 16 drams or 437·5 grains.

OUNCE, see under CAT FAMILY.

OUNDLE (52° 29′ N., 0° 28′ W.), town, on Nen, Northamptonshire, England.

OURO PRETO (20° 18′ S., 43° 18′ W.), city, state of Minas Geraes, Brazil; owing to mountainous situation, streets steep and crooked; has numerous interesting buildings and mining school; once famous gold-mining centre, but mines now almost exhausted. Pop. 12,000.

OUSE.—(1) (53° 43′ N., 0° 44′ W.) Yorkshire river, formed by junction of Swale and Ure, and enters Humber. (2) Great Ouse rises in Northampton and falls into Wash. (3) Little O., tributary of Great O. (4) river in Sussex; flows into Eng. Channel.

OUSELEY, SIR FREDERICK ARTHUR GORE (1825–89), Eng. composer; prof. of Music, Oxford, 1855; master of lit. on music.

OUTRAM, SIR JAMES (1803–63), Brit. soldier; app. *aide-de-camp* to Sir John Keane in First Afghan War, 1838; performed famous ride in disguise through Afghanistan, 1839; won title of 'Bayard of India' by defence of Hyderabad, 1843; distinguished in Ind. Mutiny, 1857–58.

OUZEL, WATER, see DIPPERS.

OVAR (40° 51′ N., 8° 38′ W.), town, Beira, Portugal, on Aveiro Lagoon; fishing centre. Pop. 10,700.

OVARIOTOMY, the operation of removing one or both of the ovaries, for cystic and other changes or to alleviate morbid conditions in other organs of generation; first successfully performed, partially, by Houston of Carluke in 1701, and completely by M'Dowell of Kentucky, in 1809; since the introduction of antiseptic methods the mortality has fallen to 5 to 7 % of cases.

OVARITIS, see GYNECOLOGY.

OVARY, DISEASES OF, see GYNECOLOGY.

OVATION, see TRIUMPH.

OVERBECK, JOHANN FRIEDRICH (1789–1869), Ger. painter; studied first in Vienna, later in Rome, where he attracted notice in 1811 by a picture of the Madonna. He painted several frescoes in Rome, and one fresco, *The Vision of St. Francis*, his best work of that kind, at Assisi. His most famous pictures, as well as his drawings and cartoons, deal with religious subjects.

OVERBURY, SIR THOMAS (1581–1613), Eng. poet and prose writer; friend of Robert Carr, a minion at court of James I.; became implicated in intrigues of Frances Howard, wife of Earl of Essex, and Carr; was poisoned in Tower. His *Characters* are important in the history of the essay.

OVERLAND ROUTE, route from Britain to India, *via* Paris, Lyons, Mount Cenis Tunnel, Brindisi, thence by boat through Suez Canal; journey takes 14 days.

OVERSOUL, term used by Emerson to express absolute reality from which is derived all that is valuable and universal in experience of mankind.

OVERTURE, the name of a musical form, originally given to the opening number of an opera. Strictly, it is the instrumental introduction to any vocal work, whether opera or oratorio; but there is also the concert Overture, an individual composition, of which Beethoven's *Egmont* and Mendelssohn's *Hebrides* are specimens.

OVERYSSEL (52° 25′ N., 6° 30′ E.), province, N. Holland, between Zuyder Zee and Prussia; area, 1291 sq. miles; rich grazing land; manufactures cotton. Pop. (1910) 387,381.

OVID, PUBLIUS OVIDIUS NASO (43 B.C.–17 A.D.), Rom. poet; b. Sulmo; s. of Rom. knight; ed. in rhetoric, Rome, with view to legal career; after filling minor offices, abandoned law for poetry; friend of Tibullus, Propertius, Æmilius Macer (with whom he spent a year in visiting Asia and Sicily), and other poets of younger generation; thrice married, lastly to member of Fabian *gens*, who introduced him into imperial society. In A.D. 9 Ovid was suddenly banished to Tomi, a town situated in semi-civilised country near mouth of Danube; reasons for banishment very obscure, though it is certain that Augustus cherished a grudge against O. for his immoral *Ars Amatoria*, written about the same time as the discovery of the liaison between Augustus's dau. Julia with Julius Antonius, 2 A.D. In his own writings O. speaks of an error of judgment as reason for his banishment, but the fact that the banishment coincides with Augustus's discovery of scandal between his granddaughter Julia and Silanus is significant. At Tomi O. spent remaining years of life, in discomfort and apprehension of barbarian inroads from Scythia; wrote continually to friends and patrons to procure his return, but Augustus remained firm, nor would Tiberius reverse his predecessor's decision. In character O. was a genial pleasure-seeker; though cynical and heartless he generally spoke kindly of his fellow-poets; probably greatest master of the elegy, his style is smooth and pleasing, never harsh or discordant. The *Amores*, dealing in three books with his relations with Corinna, who occupied his affections between his first and second marriage; the *Ars Amatoria*, giving directions to both sexes for the gratification of affection; the *Remedia Amoris*, sequel in different vein to *Ars Amatoria*; and *Medicamina formæ*, on the use of cosmetics, constitute his earlier poems. Next come *Metamorphoses* (in hexameters), recounting mythical tales of transformations; *Fasti*, unfinished antiquarian calendar; *Tristia*, poems of exile; and *Epistulæ ex Ponto*, complete the bulk of poet's work.

Church, *Ovid*.

OVIEDO.—(1) (43° 20′ N., 6° W.) province, N. Spain; area, 4205 sq. miles; drained by Nalon, Sella, Navia; cattle-breeding, mines, fruit; rich in minerals. Pop. (1910) 686,132. (2) (43° 22′ N., 5° 52′ W.) town, N. Spain; episcopal see, has cruciform cathedral; seat of univ.; manufactures textiles. Pop. (1910) 52,874.

OVOCA, see AVOCA.

OVULE, see FLOWER.

OVUM, or EGG, is a single cell which, when fertilised by male seed, develops into a many-celled animal. Eggs are distinctively female products, and the majority are so minute as to be almost invisible. In some groups of animals, however, the egg reaches large size, notably in the closely related groups of reptiles and birds, where it is covered with a limy protecting *shell*. In all cases, however, the ovum remains a single cell, its size depending on the amount of food material or *yolk* which accompanies the essential portion. This essential portion, as in all cells, consists of a protoplasmic body in which is embedded a nucleus or germinal vesicle, containing a number, definite for each species, of tiny chromatin threads (*chromosomes*). It is generally held that in the nucleus, and probably in the chromosomes, there resides the maternal heritage of the offspring, the mysterious foundations upon which, in conjunction with those of the male cell, are built the sum-total of the characters of the progeny.

Eggs vary as much in their mode of deposition as in their size and appearance. The majority are laid singly, as in birds and reptiles, but many also are held together in aggregates, such as the clumped spawn of frogs, the ribbons of toads or nudibranch molluscs, or the floating egg-rafts of some aquatic insects. Except in cases of vegetative reproduction, the egg is the beginning of all living things; but this fact is not always patent, for, characteristically in mammals, and exceptionally in other groups, the eggs develop and hatch in the body of the mother, and living young are born.

OWATONNA (44° 10′ N., 93° 20′ W.), city, Minnesota, U.S.A.; flour-mills. Pop. (1910) 5658.

OWEGO (43° 23′ N., 76° 36′ W.), village, summer resort, New York State, U.S.A., at junction of Owego and Susquehanna. Pop. (1910) 4633.

OWEN, JOHN (1616–83), Eng. Puritan theologian; ed. at Oxford; on the Parliamentary side during the Civil War; abandoning Presbyterianism, became Independent; accompanied Cromwell to Ireland and Scotland, and was made dean of Christ Church, 1651; as a scholar protested at the Restoration; on good terms with the king; helped to get Bunyan let out of prison.

OWEN, SIR RICHARD (1804–92), Eng. zoologist; conservator of Royal College of Surgeons, and, till 1884, superintendent of the Natural History Department of Brit. Museum; a comparative anatomist of great skill. His published papers, dealing with the description and classification of animals, cover a wide field: amongst Invertebrates—Sponges, Brachiopods, Cephalopods; amongst Vertebrates—recent Fishes, Monotremes, Marsupials, and Apes, and fossil reptiles, birds, and mammals. He also published general memoirs on the comparative anatomy of vertebrates.

OWEN, ROBERT (1771–1858), Eng. Socialist reformer; m. dau. of David Dale, owner of cotton mills at New Lanark on Clyde, 1799, and started to reform conditions of work of hands. O.'s importance is that he provided models for future legislation and roused strong feeling against existing conditions of labour; pub. *A New View of Society*, 1813. New Lanark grew into model town, and first infant schools of kingdom were established there. O. preached Socialism with success until he gave expression to his anti-religious opinions. Several experiments were made elsewhere in imitation of New Lanark. His sons, Robert Dale, William, David Dale, and Richard, became prominent in U.S.A.

OWEN SOUND (44° 35′ N., 80° 50′ W.), town, port of entry, Ontario, Canada, on Georgian Bay; machinery; wooden-ware. Pop. 10,500.

OWENSBORO (37° 47′ N., 87° 2′ W.), city, on Ohio, Kentucky, U.S.A.; tobacco factories; coal and iron mines. Pop. (1910) 16,011.

OWL-FACED MONKEYS, see Douroucolis.

OWLS, nocturnal birds of prey, with sharp strong beaks and claws. The 'wise' look so characteristic of owls is due to the fact that the eyes are large, are directed forwards, and are surrounded by a whorl or circle of fine radiating feathers. Owls are found all the world over, living mainly in trees but sometimes in old buildings, and feeding usually on rats, mice, and smaller mammals, or on birds, reptiles, and insects. They fall into two families: the **True Owls** (Bubonidæ), with almost 300 species, including the large Eagle-Owls (*Bubo*), which kill hares, rabbits, or even young deer, and the British Tawny, Long-Eared, and Short-Eared Owls (*Syrnium* and *Asio*); and the **Barn Owls** (Strigidæ), with 26 species, but only one Brit. and European representative—the White or Common Barn Owl (*Strix*).

OWOSSO (43° N., 84° 12′ W.), city, on Shiawassee, Michigan, U.S.A.; beet-sugar. Pop. (1910) 9639.

OX GROUP, a section of the cattle tribe, *Bovidæ* (*q.v.*), distinguished by a broad, naked muzzle, the presence of round or ridged equal horns, long tails, usually tufted, and a dewlap on the throat of the male. Although common in Europe, Asia, and Africa, there is only one Amer. species and one in Celebes. This last is the small black Anoa (*Anoa depressicornis*), included in the group of the Buffaloes (*q.v.*), to the young of which it presents a striking resemblance. Closely related to the Buffaloes are the Bisons (*Bison*), comprising two species, the European and the Amer. Bison—the American, now nearly extinct, being slightly smaller than the European species (only found in the forests of Lithuania and the Caucasus).

Distinguished from the Bisons and Oxen by the different position of the long hair forming a fringe over shoulders, flank, and tail, the Yak (*Poëphagus*) inhabits the high plateaux of Tibet, where the tame animals are used as beasts of burden.

Those nearly related to the typical Oxen are three Oriental species comprising the shy Gaur (*Bos gaurus*), with arched back and strange concave profile, found in the large Indian forests; the Gayal or Mithan (*Bos frontalis*) occurring in Assam and adjacent districts, with shorter and rounder horns and without the large frontal crest of the Gaur; and the Banteng (see Bantin).

Lastly, the typical Ox is represented at the present day only by domesticated breeds (see Cattle) belonging to two species, *Bos taurus* and *Bos indicus*, though half-wild herds of the former have been preserved at Chillingham Castle, Northumberland, and Cadzow Castle, Lanarkshire.

OXALIC ACID ($H_2C_2O_4+2H_2O$), crystalline solid, soluble in water; poisonous; salts present in wood sorrel (*oxalis*), rhubarb, dock; formed when sugar, fats, etc., are oxidised with nitric acid, or sawdust is heated with alkali. The simplest dicarboxylic acid, constitution, HOOC.COOH, gives ($CO+CO_2$) with hot H_2SO_4.

OXENBRIDGE, JOHN (1608–74), Eng. Nonconformist minister.

OXENSTJERNA, AXEL, COUNT OF (1583–1654), Swed. statesman; greatest member of prominent Swed. family; app. Chancellor by new king, Gustavus Adolphus, 1612, and restored peace and prosperity; made peace with Denmark, 1613; ended war with Russia by Treaty of Stolbova, 1617, acquiring lands on Baltic coast for Sweden; disapproved of aid to elector palatine, but arranged supplies and made negotiations; recognised leader of Evangelical Union, 1633; educated Christina; won provinces from Denmark, 1646; opposed abdication of queen. See Sweden: *History*.

OXENSTJERNA, BENEDICT (1623–1702), Swed. statesman; Chancellor and Prime Minister, 1681; vainly opposed foreign policy of Charles XI. and Charles XII.

OXENSTJERNA, GABRIEL THURELON, COUNT OF (1641–1707), Swed. poet and statesman.

OXFORD (39° 30′ N., 84° 45′ W.), town, Ohio, U.S.A.; seat of Miami Univ. Pop. (1910) 2017.

OXFORD (51° 46′ N., 1° 16′ W.), city, parliamentary and municipal borough, county town of Oxfordshire and seat of celebrated univ.; beautifully situated on junction of Cherwell and Isis (Thames). The principal streets (High St., Queen St., Cornmarket St., and St. Aldate's St.) meet at place called Carfax in centre of old O. The town belongs to an earlier date than the univ., and takes a prominent place in history; after many attacks by Danes, O. was taken by Sweyn in 1013; in 1142 besieged by Stephen; Ridley, Latimer, and Cranmer were martyred here in reign of Mary Tudor; during Civil War town became headquarters of Charles I.'s party, and was the scene of Jacobite riots in beginning of George I.'s reign.

The University is believed to have originated in XII. cent., and now comprises 21 colleges and 1 hall:—

All Souls' College, founded by Chichele in 1437, possesses beautiful chapel and important library; front quadrangle remains almost unchanged. Balliol College, founded by Devorguilla, mother of Balliol, king of Scotland, in 1269. Brasenose College, built on site of Brasenose Hall in 1509, contains a particularly fine gateway. Christ Church, most magnificent of all O. colleges, was founded by Wolsey in 1525 as Cardinal Coll.; the site included St. Frideswide Priory, and some of old buildings still exist; coll. was remodelled by Henry VIII., and in 1546 named Christ Church; buildings are of great architectural interest, particularly those built by Wolsey; old church of the Priory serves as cathedral and coll. chapel. Corpus Christi College was founded in 1516; Exeter College, founded 1314; Hertford College, founded 1874, but since XIII. cent. there have been many halls on same site; Jesus College, founded in 1571 for Welshmen by

Price, and site provided by Elizabeth; KEBLE COLLEGE, erected by subscription in 1870 in memory of Keble. LINCOLN COLLEGE, founded 1429; refounded, 1474; contains fine chapel. MAGDALEN COLLEGE was founded in 1458 by bp. of Winchester, who bought up Hospital of St. John the Baptist; hospital chapel and kitchen still remain; notable features are bell-tower and beautiful gardens; chapel music is celebrated. MERTON COLLEGE was founded first in Surrey in 1264 by Merton, and removed to O. in 1274; chapel and library particularly noteworthy. NEW COLLEGE, founded in 1379; chief features are chapel cloisters and gardens. ORIEL COLLEGE, founded by Edward II. in 1326; now almost completely modern (St. Mary's Hall was incorporated with Oriel in 1896). PEMBROKE COLLEGE was founded in 1624. QUEEN'S COLLEGE was erected in honour of Queen Philippa in 1340; buildings belong mostly to XVII. and XVIII. cent's. ST. JOHN'S COLLEGE, built in 1555 on site of St. Bernard's, includes portions of old coll.; Canterbury quadrangle was erected by Laud. TRINITY COLLEGE, founded 1555, stands on site of Durham Coll.; several of ancient buildings still remain. UNIVERSITY COLLEGE, endowed by William of Durham in 1249; none of old buildings remain. WADHAM COLLEGE, founded 1613, occupies site of Austin Friary; contains beautiful chapel and gardens. WORCESTER COLLEGE, founded in XIII. cent. as Gloucester Coll., was refounded in 1714. ST. EDMUND'S HALL was founded in 1226.

Other educational institutions are St. Hugh's Hall, St. Hilda's Hall, Somerville Coll., and Lady Margaret Hall for women; Manchester Coll., Mansfield Coll., Wycliffe Hall, Pusey House, and St. Stephen's House; connected with univ. are Sheldonian Theatre (where univ. public ceremonies take place), Ashmolean Museum, Univ. Museum, Indian Institute, Bodleian Library, Divinity School, Clarendon Press buildings, Univ. Galleries, Univ. Observatory, Radcliffe Observatory and Library, and Taylor Institute. Apart from cathedral, principal churches are St. Mary's, St. Michael's, St. Peter's-in-the-East, St. Giles', and All Saints'. O. contains many interesting old houses and remains of a castle. O. has no important manufactures. Pop. (1911) 53,049. See UNIVERSITIES.

Headlam, *Oxford* (1904); Godley, *Oxford* (1911).

OXFORD, EDWARD DE VERE, EARL OF (1550–1604), Elizabethan courtier and author of comedies and light verse; succ., 1562; first wife was dau. of Lord Burleigh; fought against Armada.

OXFORD, PROVISIONS OF, decrees of Parliament which sat at Oxford, 1258, for reform of abuses in realm; sole record preserved in *Annales monastici* (Rolls Ser.). See ENGLAND: *History.*

OXFORD, ROBERT DE VERE, EARL OF (1362–92), cousin of Richard II.; laden with honours and roused jealousy of nobles; defeated by Gloucester at *Radcot*, 1387; attainted and fled abroad.

OXFORD, ROBERT HARLEY, EARL OF (1661–1724), Brit. statesman; Speaker of House of Commons, 1701–5; Northern Sec. of State, 1704–8; Chancellor and Under-Treasurer of Exchequer, 1710–11; cr. Baron Harley of Wigmore, Earl of O., and Earl Mortimer, 1711; First Lord of Treasury, 1711, and made Treaty of Utrecht; dismissed by Queen Anne as suspected Jacobite, 1714; impeached and imprisoned, 1715; acquitted, 1717, but never regained power; highly praised by literary men, who had reason to be grateful for his liberal patronage. His character, though blackened by rivals, was without serious faults; *Life*, by Roscoe.

OXFORD MOVEMENT, THE, a revival of Church feeling in England, heralded by Keble's *Christian Year*, and inaugurated by Keble, Newman, Pusey, and others, who published *Tracts for the Times*; emphasised the catholicity of the English Church and the value of the Sacraments; differed from the Evangelical revival in its adherence to ecclesiastical teaching and tradition. The secession of Newman to Roman Catholicism (1845) did it tremendous harm; essentially a 'High Church' movement.

OXFORDSHIRE (51° 45′ N., 1° 15′ W.), county, England; bounded N. by Warwick and Northampton, E. by Bucks, S. by Berks, W. by Gloucester; area, 755 sq. miles. Surface generally is level; N. mostly bare and bleak, but in S. are finely wooded hills and valleys; S.E. crossed by branch of Chiltern Hills; well watered by numerous beautiful rivers, including Thames and its tributaries, Windrush, Evenlode, Cherwell, and Thame. Soil is particularly fertile, O. being one of most productive counties in England; chief crops are barley, oats, and wheat; stock raised; paper made at Shiplake and elsewhere, gloves at Woodstock, blankets at Witney, agricultural implements at Banbury; manufactures of bricks and lace also carried on. Chief towns are Oxford (county town), Banbury, Henley, Chipping Norton, Abingdon, and Woodstock. County holds important position concerning education, owing to celebrated Univ. at Oxford and other educational institutions. Oxford and Bampton are among few remaining castles; there are many ecclesiastical remains, finest specimen being Dorchester Abbey; interesting churches at Iffley, Adderbury, and Minster Lovell; many fine mansion-houses. O. played prominent rôle in Civil War; battles of *Chalgrove* (1643) and *Cropredy Bridge* (1644). Pop. (1911) 146,288.

Oxfordshire, in Victoria County Histories.

OXIDE, compound of an element or radicle with oxygen. Metals form chiefly basic o's, non-metals acidic o's. Also there are *peroxides*, which readily yield oxygen, or are oxidising agents, and a few neutral o's (*e.g.* H_2O).

OXIMES, first obtained by Victor Meyer (1882), are colourless liquids or crystalline solids. They contain the group $>C=NOH$, being formed by interaction of hydroxylamine and aldehydes (aldoximes) or ketones (ketoximes): $>CO + H_2NOH = >C=NOH + H_2O$, and yield primary amines by reduction: $>C=NOH \xrightarrow{4H} >CHNH_2 + H_2O$. Isomeric oximes exist, *e.g.* two benzaldoximes (C_6H_5CHNOH), α (M.P. 35° C.), β (M.P. 128° C.); they are probably stereoisomeric.

OXUS, or AMU DARYA, important river in Central Asia; rises in Pamir plateau, forms for some distance boundary between Afghanistan and Bokhara, flows through Bokhara and Khiva, and falls into southern extremity of Sea of Aral by numerous mouths. Two head-streams of O., Aksu or Murghab and Ab-i-Panja, unite at Kala Wamar; river has many tributaries in upper course, but few after it enters deserts of Turkestan, where streams often disappear in sand; before entering plains of Turkestan O. has difficult course through mountainous country; forms a delta *c.* 90 miles from Sea of Aral; largest island is Paighambar Island. River banks in some parts are fertile, and canals are made to assist in cultivation; in some seasons O. floods large tracts of country. River took prominent part in ancient history, and was crossed by both Cyrus and Alexander; believed to have flowed at one time into Caspian Sea. O. is navigable as far as Charjui, where it is crossed by railway from Merv to Samarkand; there is regular steamer service.

OXYGEN, O=16·00. Gaseous element, molecule= O_2; occurs free in air (23 % by weight) and combined in water (88·81 %), and in the rocks of the earth's crust (44 to 48 %); the most plentiful and widely diffused terrestrial element. O. was first obtained by Scheele (1773), and by Priestley (1774), who prepared it by heating 'mercurius calcinatus' (HgO); named by Lavoisier (oxygen = acid-producing), who thought it the essential constituent of an acid, and explained its function in combustion.

PREPARATION:

(i.) By heating mercuric oxide: $2HgO = 2Hg + O_2$.

(ii.) By heating potassium chlorate: $2KClO_3 = 2KCl + 3O_2$ (manganese dioxide catalytically causes decomposition at a lower temperature).

(iii.) A number of other highly oxygenated com-

pounds yield the gas when heated, *e.g.* MnO_2, PbO_2, CrO_3, BaO_2.

(iv.) From the air: (*a*) by Brin's process, by which heated baryta is alternately made to absorb and give up oxygen ($2BaO + O_2 \rightleftarrows 2BaO_2$); (*b*) by fractionation of liquid air. See LIQUEFACTION OF GASES.

PROPERTIES.—Colourless, invisible, tasteless, odourless gas; coefficient of solubility in water at 0° C. = 0·0489. Liquid oxygen is pale blue and strongly magnetic; B.P. (atm. press.) – 182·5°, critical temperature, – 119°; critical pressure, 58 atmospheres. Solid oxygen melts below – 223°. Vigorously supports combustion of phosphorus, sulphur, charcoal, iron, wood, a taper, etc. In the oxyhydrogen flame platinum melts, and lime shines with a dazzling light (lime-light).

PHYSIOLOGICAL ACTION.—Oxygen is necessary for respiration, and for the decay of dead organic matter. It is thus converted into atmospheric carbon dioxide, from which the carbon is removed by green plants in sunlight. On account of its vigorous action pure oxygen is substituted for air when respiration is difficult, as in cases of suffocation, gaseous poisoning, and low vitality. Its long-continued respiration is harmful.

Oxides are formed by combination with every element except (bromine) fluorine, and the members of the helium family. They may be basic, acidic, neutral, or peroxides.

OYSTER BAY (40° 50′ N., 73° 28′ W.), township containing several summer resorts, Long Island, New York State, U.S.A.; residence of Mr. Roosevelt, where Russo-Japanese Peace was arranged, 1905. Pop. (1910) 21,802.

OYSTER-CATCHERS, see PLOVER FAMILY.

OYSTERMOUTH, THE MUMBLES (51° 35′ N., 4° W.), town, Glamorganshire, Wales; has ruined Norman castle; Rom. remains. Pop. (1911) 6098.

OYSTERS, a genus (*Ostrea*) of Lamellibranch or Bivalve Molluscs which forms a favourite food supply of many nations. Its members possess the general structures of Lamellibranchs (*q.v.*), and in particular of the Pseudo-Lamellibranchia; are inactive creatures protected by a heavy shell composed of two unequal valves, the larger and convex left valve being that on which the animal lies, the lighter, flat right valve forming the upper lid. The two valves are held together by a single strong muscle. O's, of which there are many species, live in all seas, near the shore, preferably in shallow water free from disturbing currents. They congregate in great banks or beds, and so great is the fertility of the individuals that during the spawning season from May to Sept. the sea in the neighbourhood is turbid with the young or 'spat.' The young o's grow about an inch in diameter each year until the third year, after which growth becomes much slower. Seven to ten years is a common age for average o's.

The catching of o's for food forms a great industry centred chiefly in the U.S.A., France, and Britain. Many o's are dredged from native beds, but still more are cultivated in special ponds and artificial banks. The annual consumption is reckoned in many hundreds, almost thousands, of millions.

Related to the Edible O's are the Pearl O's (*Meleagrina* or *Margaritifera*) of tropical seas, the shells of which supply useful and ornamental articles of mother-of-pearl, and from which marine pearls are obtained.

OZAKA, see OSAKA.

OZANAM, ANTOINE FRÉDÉRIC (1813–53), Fr. author; prof. at Sorbonne; researches throw new light on Dark Ages; wrote important *Études Germaniques, Dante ou la Philosophie Catholique.*

OZIERI (40° 35′ N., 9° 1′ E.), town, Sassari, Sardinia. Pop. 10,000.

OZOKERITE, mineral wax varying from very soft to hard; colours—brown, yellow, green; may be streaked or spotted; generally found in bituminous sandstones of coal measures, chiefly in Galicia and Austria.

OZONE, O_3, allotropic form of oxygen, produced by passing electric sparks on the silent electric discharge through the gas; also by chemical means; peculiar smell; powerful oxidising agent, unstable, destroyed by heat; presence in the atmosphere uncertain.

P, 16th letter of alphabet; originally in Gk. a hook which gradually became a loop in Lat. alphabet; a labial mute; seldom used as initial letter in Teutonic; often silent, as in *pneumonia, receipt*; *ph* is pronounced *f*.

PAARL (33° 39′ S., 18° 54′ E.), town, on Berg River, Cape Province, S. Africa; wines. Pop. (1911) 11,020.

PABIANICE (51° 30′ N., 19° 20′ E.), town, Piotrkow, Russ. Poland; textiles. Pop. 27,500.

PABNA, PUBNA (24° N., 89° 17′ E.), town (and district), Rajshahi Division, Bengal, India. Pop. 21,000; (district) 1,500,000.

PACA (*Agouti paca*), large nocturnal Rodent found in forests and on river banks in Central and South America.

PACHMARHI (22° 30′ N., 78° 30′ E.), hill station, sanatorium, Hoshangabad district, Central Provinces, India.

PACHUCA (20° 5′ N., 98° 50′ W.), capital of state of Hidalgo, Mexico; silver mines. Pop. (1910) 38,620.

PACIFIC OCEAN, largest of the five great oceans of the world; occupying about half the water surface of the globe. P. O. extends from Arctic Ocean at Bering Strait to the Southern Ocean at *c.* 40° S., and lies between America (on E.) and Australia and Asia (on W.); total length from N. to S., *c.* 9000 miles; greatest breadth (near equator), over 10,000 miles. Area—*c.* 65,000,000 sq. miles—is more than twice area of Atlantic; drainage area, however, is only 7,500,000 sq. miles (much less than that of Atlantic); largest Asiatic rivers are Amur, Hoang-ho, Yang-tse-kiang, Mekong, Menam, Canton; American rivers are Yukon, Fraser, Columbia, Colorado. Salinity is less than that of Atlantic. Mean depth is about 2500 fathoms; greatest depth on Asiatic side, viz. 40 miles E. of Mindanao (Philippines), 32,089 ft. (greatest recorded ocean depth); between Midway Islands and Guam, 31,614 ft.; E. of Kermadec Islands, 30,920 ft.; N.E. of Japan, 27,925 ft. The coast-line of America and Australia is generally mountainous with few inlets—Gulf of California, Puget Sound, etc.; the Asiatic coast is generally flat with many large indentations—Yellow, China, Japan, Okhotsk Seas, etc.

P. O. has innumerable continental and oceanic islands, mainly in centre and west, either of volcanic or coral formation, viz. New Zealand, New Guinea, Borneo, Sumatra, Java, Japan, Philippines, New Hebrides, Galapagos, Solomon, Fiji, Samoa, Hawaii, Ladrones, Carolines, Aleutians, etc. Climate generally is tropical. Principal prevailing winds are the two trade-winds blowing from N.E. and S.E., with broad belt of equatorial calms between them. Monsoons also blow regularly, and violent storms occur in lat. 30° to 5° N., China Sea, etc. The currents resemble those of Atlantic; the warm Kuro-shiwo Current, or Black Stream of Japan, corresponds to Atlantic Gulf Stream; the cold Humboldt or Peruvian Current in South Pacific (corresponding to Atlantic Benguela Current) flows northward, eventually joining the South Equatorial Current.

P. O. was discovered by Vasco Nuñez de Balboa, 1513, when he crossed the Isthmus of Panama; traversed by Magellan, 1520–21, and named Pacific on account of calms encountered there after previous violent storms. Brit. Pacific cable connects Vancouver, Australia, and New Zealand; American cable links San Francisco and Manila (Philippines). Chief steamship routes are from Vancouver and San Francisco to New Zealand, Australia, and Japan; another route from New Zealand to Europe passes round Cape Horn. Panama Canal (*q.v.*) will revolutionise Pacific trade routes. Chief powers represented in Pacific are Britain, Japan, U.S.A., Germany, France.

Fox, *Problems of the P.* (1912); Colquhoun, *Mastery of the P.* (1902).

PACORUS, name of several Parthian rulers of Arsacid line. Chief: PACORUS, who won great victories in Syria, Palestine, etc., against Romans, as lieutenant of his f., Orodes I., 40 B.C., but was defeated and slain, 39.

PACUVIUS, MARCUS (*c.* 220–130 B.C.), Rom. tragic poet; considered one of great poets of Rome; works have almost entirely perished, but were famous for their sublimity.

PADDINGTON.—(1) W. division of London, N. of Hyde Park. Pop. (1911) 142,576. (2) eastern suburb, Sydney, New South Wales. Pop. 23,000.

PADDLE-WORM, see under CHÆTOPODA.

PADERBORN (51° 43′ N., 8° 45′ E.), town, Westphalia, Prussia; seat of bishopric; has R.C. cathedral; trades in cattle, wool, fruit; has large railway workshops. Pop. (1910) 29,418.

PADEREWSKI, IGNACE JAN (1860–), Polish pianist and composer; brilliant virtuoso.

PADIHAM (53° 48′ N., 2° 19′ W.), town, on Calder, Lancashire, England; cotton mills. Pop. (1911) 13,637.

PADILLA, JUAN LOPEZ DE (*c.* 1485–1521), Span. hero; led rebellion against Charles V.'s taxations; defeated at *Villalar* and beheaded.

PADISHAH, PADISHAG, one of titles of Shah of Persia and Sultan of Turkey.

PADSTOW (50° 33′ N., 4° 56′ W.), port, Cornwall, England; has good harbour; trades in fish; site of former monastery; has several interesting churches. Pop. (1911) 2480.

PADUA, PADOVA (45° 23′ N., 11° 53′ E.), city, N. Italy, capital of P. province, on Bacchiglione; Lat. *Patavium* (q.v.); chief features—arcaded streets, several ancient bridges, churches of St. Anthony, Eremitani (XIII. cent.), Madonna della Arena (frescoes by Giotto), Santa Giustino, Palazzo Ragione (1172–1219), univ. (XIII. cent.), library, Donatello's equestrian statue of Gattamelata, Museo Civico; chief industries, machine works, chemicals, silk, distilleries; great centre of learning and art during Middle Ages and Renaissance. Pop. (1911) 96,135; (prov.) 518,810.

Foligno, *Padua* (Mediæval Towns Series).

PADUCAH (37° 7′ N., 88° 41′ W.), city, Kentucky, U.S.A., at junction of Tennessee and Ohio; sawmills; railway workshops; trade in tobacco. Pop. (1910) 22,760.

PÆAN, Gk. hymn to Apollo, then of thanksgiving.

PÆLIGNI, ancient Italian people; fought against Rome in second Samnite War, 325 B.C.; received as allies by Rome, 305–302 B.C.

PÆONIA, land of the Pæones, a Thracian people; situated in N. of Macedonia, between borders of Illyria and eastern bank of river Strymon.

PÆONY (*Pæonia officinalis*), a member of the Ranunculaceæ, possessing showy, honey-bearing flowers and tuberous roots; fruit a follicle.

PÆSTUM, ancient city of Italy; called *Posidonia* by Sybarite colonists, VI. cent. B.C.; made Rom. colony and named *Pæstum*, 273 B.C., Christian bishopric; deserted during Muhammadan invasions; magnificent ruins, with famous temple of Poseidon.

PAGAN (21° 10′ N., 95° E.), town, Myingyan, Upper Burma; capital of Burma till 1298. Pop. 7500.

PAGANINI, NICOLO (1784–1840), Ital. violin virtuoso, remarkable for a technique still unsurpassed.

He travelled widely, and his astonishing feats gave rise to many weird legends; known also as a composer for his instrument.

PAGE, THOMAS NELSON (1853–), Amer. lawyer and author; noted for stories of negro life.

PAGEANT (M. E. *pagyn, padgin,* forms of Lat. *pagina,* to which *t* was added, as in other words, *e.g.* ancient).—(1) scene or act of play; so used, XIV. to XIX. cent's. (2) platform or stage of action of play; applied to the wheeled machine used by strolling players before construction of theatres. (3) any show.

All these uses appear early. (4) modern pageant, an attempt at representation of hist. events—when possible at actual scene of action—usually shows progress in history of a town, nation, or empire, an institution—*e.g.* army—or some aspect of civilisation, *e.g.* The Masque of Learning, Edinburgh (1912); great feature of early XX. cent., cf. Quebec Tercentenary P. (1908), Bath P. (1909), Union of S. Africa P. at Cape Town (1910), Festival of Empire, London (1911), all arranged by FRANK W. C. C. LASCELLES. LOUIS N. PARKER (1852–), dramatist, has produced many p's.

PAGET OF BEAUDESERT, WILLIAM PAGET, 1ST BARON (1506–63), Eng. statesman; one of chief sec's of state, 1544; member of council of regency app. by will of Henry VIII.; obtained Beaudesert, with other spoils, under Protectorate; Lord Privy Seal, 1556–58.

PAGET, SIR GEORGE EDWARD, K.C.B. (1809–92), Eng. physician; bro. of Sir James Paget (*q.v.*); ed. at Charterhouse and Cambridge (B.A., 1831; M.D., 1838); regius prof. of Physics at Cambridge, 1872; helped to develop modern medical education.

PAGET, SIR JAMES, Bart. (1814–99), Eng. surgeon; b. at Yarmouth, where he was apprenticed to a medical practitioner, and entered as a student at St. Bartholomew's Hospital; became a member of the Royal Coll. of Surgeons in 1836; lectured on morbid anat., and later anat. and physiology, and app. warden of the hospital coll. By 1851, when he resigned the wardenship and began practice as a surgeon, he was a famous physiologist and pathologist, his classic work, *Lectures on Surgical Pathology,* being given as a course of lectures in 1847–53 and pub. in 1853. Success as a surgeon soon came to him; in 1853 he was app. surgeon extraordinary to Queen Victoria; in 1871 cr. a baronet; pres. of the Royal Coll. of Surgeons, 1873; retired from practice, 1878. He discovered the disease of the breast and the disease of bone which are named after him, and was the author of *Clinical Lectures and Essays, Studies of Old Case-Books,* etc.

Memoirs and Letters, edit. by son, Stephen Paget.

PAGHMAN (35° N., 69° E.), small, mountainous district, Afghanistan.

PAHANG, see MALAY STATES.

PAHARI, term applied to group of Indo-Aryan dialects spoken in N. India; three main divisions—W., spoken around Simla; central, in N. of United Provinces; E., spoken in Nepal by Aryan population and called by them *Khas-kura,* though frequently termed, inaccurately, *Nepali.* Khas-kura contains a considerable admixture of Tibeto-Burman words and idioms, notably the indefinite tense formed by affixing verb-substantive to verb-root, and the impersonal conjugation (honorific). P. possesses small literature: *Birsicca,* collected folk-tales; *Ramayana,* by Bhanu Bhatta; and translations from Sanskrit.

Grahame Bailey, *Languages of Northern Himalayas.*

PAHLANPUR, see PALANPUR.

PAHLAVI, PEHLEVI, a Persian form of Parthian, word used of script in which the Zoroastrian sacred writings have been transcribed. For long there was dispute as to whether P. was Persian or Semitic, as it seemed strangely composed of both. It is now known to be Persian, but for many Persian words are written Semitic translations. The same characters are often used for several Semitic letters. Thus the system of writing is ideographic. The sacred books were written about the VI. cent., and are almost the only ones surviving in the original of a miscellaneous literature.

PAIGNTON (50° 26′ N., 3° 35′ W.), seaside resort, Devonshire, England. Pop. (1911) 11,241.

PAILLERON, ÉDOUARD JULES HENRI (1834–99), Fr. dramatist; wrote great satirical comedy, *Le Monde où l'on s'ennuie.*

PAIMPOL (48° 48′ N., 3° W.), seaport, Côtes-du-Nord, France; fisheries.

PAIN.—(1) pain-sensations, *e.g.* aroused by a prick or blow. The skin, except in a few small areas, contains a great number of special 'spots,' stimulation of which occasions pain-sensations. (2) an affective state, the opposite of pleasure (cf. 'painful' news); better called 'unpleasure,' or 'unpleasant feeling.'

PAINE, THOMAS (1737–1809), Eng. Theist and economist; b. in Norfolk of Quaker stock; sailed for Philadelphia, 1774; pub. (1776) a pamphlet entitled *Common Sense,* advocating Amer. independence, which was followed up by his *Crisis.* He returned to England in 1787, and published *The Rights of Man,* a reply to Burke. *The Age of Reason* is a plea for Theism. *Life,* by Conway (1892).

PAINESVILLE (41° 45′ N., 81° 20′ W.), city, on Grand, Ohio, U.S.A.; iron foundries, flour-mills. Pop. (1910) 5501.

PAINTING.—In view of our fragmentary knowledge, derived mainly from literary sources, of pre-Christian and Early Christian art, the history of p. may be said to begin with the liberation of art from the magnificently decorative and dignified, but formal and lifeless style of the Byzantine mosaicists. The XIII.-cent. Florentine master, Cimabue, is generally credited with being the 'father of modern p.,' but his excessively rare extant works prove him to have been scarcely more than an excellent follower of the Byzantine tradition. It was his pupil, GIOTTO, in Florence, and Duccio, in Siena, who first broke away from this tradition and infused life into the frozen images of their predecessors. Each became the founder of a great school that endeavoured to bring p. into closer touch with life; but whereas Giotto and his followers were more concerned with physical life and corporeality, the Sienese devoted themselves to expressing the inner life of the soul. The *Florentines* were more monumental, the *Sienese* more emotional. The medium of these early painters was *tempera,* that is, ground colours mixed with the yolk of eggs. Although these primitives produced many portable altarpieces and panels, they were essentially painters of frescoed wall decoration, which demands a broad treatment of flat masses of colour, this colour being invariably subordinated to linear design. Throughout the XIII. and XIV. cent's the painters worked entirely in the service of the Church.

Italian Renaissance.—In Siena the tradition of Duccio was carried on by Simone Martini, Lippo Memmi, and the Lorenzetti, but this art, which had never entirely shaken off the fetters of Byzantinism, was incapable of further developments, and, by the end of the XIV. cent., had fallen into stagnation and decay. To the Florentines whole worlds were left to conquer—the worlds of perspective anatomy, light and shade, movement, plastic life. But Giotto had moved too rapidly, and for a cent. his followers, the *Giottesques,* contented themselves with imitating his types and motifs without adding a new word to the artistic language. Giottism became a formula, almost as much as Byzantinism, until, on the threshold of the Renaissance, Masaccio broke new ground by increasing the weight and volume of his figures and investing his frescoes with something of statuesque classic dignity. Others continued to build upon the foundations laid by him.

The Florentine painters of the XV. cent. were stimulated by the spirit of the revival of classic learning and by the newly awakened love of classic art. They approached Nature and all the pictorial problems with passionate curiosity. Uccello and

Andrea del Castagno developed the science of perspective; Domenico Veneziano was the first Florentine to introduce the *oil technique*, which gradually was to oust the technique of tempera p.; Piero dei Franceschi was the discoverer of atmosphere; the Pollaiuoli, and after them Luca Signorelli of Cortona, almost exhausted the significance of the human body in muscular action; Filippo Lippi's pupil, Botticelli, was the supreme master of expressive decorative line and rhythmic movement.

Other schools had meanwhile risen in Italy. In *Padua*, the great seat of learning, the erudite and travelled Squarcione had founded a school for the study of the antique, from which issued not only the great Mantegna, the most 'classic' of the Ital. painters, but its influence spread over the whole of N. Italy and became paramount at Ferrara and the surrounding cities. In *Umbria*, at Perugia, Fiorenzo di Lorenzo, the first of a long line of painters whose art reflects the tenderness and gentle beauty, so inducive to serene spirituality, of the lovely Umbrian landscape under its limpid blue sky, became the teacher of Pinturicchio and Perugino—the most typical of the Umbrian masters.

The end of the XV. and the beginning of the XVI. cent's witnessed the full flowering of the Renaissance, dominated by the mighty triple constellation of Leonardo da Vinci, Raphael, and Michelangelo. Leonardo, the heir of two cent's of development, was a universal genius of vast knowledge and experience—a supreme master of line and colour, movement and expression, and, above all, of modelling by means of light and shade, the perfecting of which was his chief contribution to the evolution of art. Raphael, who had mastered all the difficulties of his craft while still in his teens, was an eclectic who deliberately took the best that he could find in others, Umbrians and Florentines, in Perugino, Leonardo, Maraccio, Michelangelo, Sebastiano del Piombo, and others, and combined these elements with an art of unrivalled purity and perfection. He was the greatest master of space composition. Michelangelo, the giant with the turbulent, passionate spirit, heightened the vitality of humour movement almost to breaking-point and invested it with a deep, general significance. What had been individual and realistic in his precursors, became in his hands typical.

Further development on these lines was impossible, and where art falls into mere imitation, decline is inevitable. Leonardo's followers in Milan contented themselves with the more or less mechanical copying of their master's types and designs. Raphael and Michelangelo impressed their genius upon Rome and the greater part of Italy. The XVI. cent. is the age of the *Mannerists*, or imitators of one master. Of those whose strong personality added a new note to the artistic achievement of the country are Correggio, who worked mostly at Parma, and perfected the art of *chiaroscuro*; and Andrea del Sarto, 'the perfect painter,' in Florence, where portraiture found a strong exponent in Bronzino.

The Mannerists were followed by the *Eclectics*, or imitators of many, who issued mainly from the Academy of the Caracci in Bologna. A wholesome reaction was the movement of the *Naturalists*, led by Caravaggio and Ribera, who had their headquarters in Naples and who returned to a closer touch with Nature. After them came complete decadence, except in Venice, where the rise of p. had been tardy, but where a great decorative tradition lingered to the end of the XVIII. cent.

Venetian p. owed its characteristics partly to the Republic's constant intercourse with the splendour-loving East, partly to the unique atmospheric conditions of the lagoon city, which could not fail to develop that keen sense of beautifully harmonised, mellow colour, which is to be found in Venetian art from the days when Jacopo Bellini and his sons, Giovanni and Gentile Bellini, founded the school from which were to issue such masters as Giorgione, Palma, and Titian, through the late XVI. cent., which could boast a Tintoretto and a Paolo Veronese, to Tiepolo, the brilliant and facile decorator who held undisputed sway in the XVIII. cent. What distinguished the Venetians throughout from the other Italians, and especially from the Florentines, was that they thought in colour, whereas the others conceived their pictures more or less as linear designs, to which colour was subsequently added.

Flemish School.—In the North, in Flanders, the art of p. did not reach perfection by a process of gradual evolution, as in Italy. It sprang from a flourishing school of miniaturists and illuminators, fully fledged, as Minerva issued in full armour from the head of Jupiter. The first masters of whom we have definite knowledge, the bro's Van Eyck (b. in the second half of the XIV. cent.), who are known as the inventors of *oil-painting*, represent the highest achievement of the early Flemish school. Technical perfection, exquisite finish, painstaking precision in the rendering of the minutest details of costume, types, arch. and landscape, could not go further. Yet, whilst every touch was guided by close study of actuality, the realism of the Van Eycks and their followers at Bruges—Memline and Gerard David—or of the Tournai master, Robert Campin, and of his pupils, Rogier van der Weyden and Jacques Daret, was anything but photographic. Their works are charged with tender feeling, poetry, and symbolism, and have a wonderful rhythm of design and pure, brilliant colour.

Towards the end of the XV. cent., when Bruges had lost its political importance and Antwerp had become the chief centre of commercial activity, the artistic hegemony, too, passed from Bruges to Antwerp, where Quentin Matsys became the founder of an important school. But already with Mabuse, who d. in 1532, and even more with Barend van Orley, a pupil of Raphael, the national tradition was sacrificed to the mannered imitation of the later Italians, until new life was infused into Flemish p., towards the end of the XVI. cent., by Rubens, a true son of his race. Rubens, too, had studied the Italian, and especially the Venetian, masters, but he never became their slave. His pictures, which represent Flemish taste and Flemish character of his period, have extraordinary vitality and movement. As a painter of the nude he stands unrivalled. His apparently spontaneous, impulsive brushwork is always controlled by an instinct for noble design and sumptuous colour. He had a whole army of assistants, who continued to work in his manner, but of whom only few were destined to rise to greatness. Chief among them was Van Dyck, who became the favourite painter of Charles I. and his court, and who in this capacity exercised an enormous influence upon the art of portraiture in England. But the towering genius of Rubens was as fatal for Flemish art as Raphael's and Michelangelo's had been for Ital. art. It created a generation of accomplished imitators, and stayed the normal course of slow evolution.

Holland.—The early art of Holland is almost merged with that of the primitive Flemings. The Reformation and the War of Independence waged against Spain retarded progress and were inimical to the fostering of the arts. But peace came in the end; and victorious Protestantism, that looked askance at religious art, brought the country back to prosperity. A new demand arose for art, but now patronage was no longer in the hands of the Church and the nobles. Art became democratic; it entered the citizen's home. The XVII. cent. in Holland witnessed the rise of landscape and of genre-p., of still-life and of civic portraiture. Excepting Rembrandt, the greatest of all Northern masters, a magician of golden light and mysterious shade, an artist whose profound human sympathy with all life made him probe the full significance of the visible world, the

Dutchmen were, above all, realists, whose chief aim was to create a literally true record of the life around them in terms of beautiful, precious paint. The 'small masters'—Terburg, Vermeer, Jan Steen, Dow, Metsu, and their kin—were the discoverers of indoor atmosphere, and delighted in expressing the material beauty of all manner of textures. Landscape was raised to the dignity of a subject worthy of being painted for its own sake, and not as a mere background, by Hobbema, Ruysdael, and their followers. Paul Potter, Cuyp, and others devoted themselves to animal p., whilst a whole band of able craftsmen, fascinated by the surface qualities of flowers, fruit, and inanimate objects, confined their attention to still-life. The XVIII. cent. in Holland was a period of stagnation, in which not a single new word was added to the artistic language evolved in the great epoch of Dutch art.

Germany.—In Germany local schools were flourishing as far back as the XIV. cent., though most of the painters' names are unknown to fame, the artists being known merely by their chief works, as 'the masters of such and such a picture.' Such schools arose in the Rhineland, at Cologne, Augsburg, and Prague. The early Ger. painters lacked the classic rhythm and beauty of the early Italians. Their figures were angular and realistic almost to the verge of caricature, but have great naive charm in their passionate sincerity. This characteristic absence of a real sense of pure beauty clung to the school even in later ages. ALBERT DÜRER himself (1471–1528) is no exception to the rule. He is intensely dramatic and serious, simple and direct, and combines in his work all the qualities that mark the Ger. Renaissance, a movement which was intellectual and moral rather than artistic. A keener sense of beauty, stimulated by contact with Ital. art, was the gift of HOLBEIN, whose noble style, while retaining the typical Ger. quality of careful, minute observation, had none of the taint of Ger. ugliness, and was marked by sympathetic insight into character. Holbein became Court painter to Henry VIII. of England, and gave the impetus to the great school of miniature p. that was to arise in that country.

France.—The early art of France was ruled by the contending influences of the Flemings and the Italians. Indeed, nearly all the early painters were of foreign, mostly of Flemish birth. The first great master of Fr. birth was the illuminator Jean Fouquet. In the XVI. cent. the leading figures in Fr. art were JEAN and FRANÇOIS CLOUET, whose exquisite portraits are closely allied to the style of Holbein. In 1531 François I. called to France the Italians Primaticcia and Rosso, who started the School of Fontainebleau, thus introducing the Italianising tendencies from which Fr. art was to suffer for two cents., during which most painters, including the great POUSSIN and the landscape painter, CLAUDE LORRAIN, received their training in Rome. In the pompous age of Louis XIV. the official Italianising school, presided over by LE BRUN, ruled with autocratic sway, but under the following reigns the decoration of the boudoir rather than of the state-room became the painters' chief object. WATTEAU, the great painter of the *fêtes galantes*, determined the direction of the Fr. *rococo*, which broke away from formal classicism, and devoted itself to the decorative rendering of the artificial, pseudo-bucolic life of the ruling classes, which gradually degenerated into coarse suggestiveness. Boucher and Fragonard must be mentioned among the great Fr. masters of the XVIII. cent.

Spain.—In Spain, individual expression was from the outset handicapped by the strict censorship of the Church and the Inquisition, which not only forbade the nude, but dictated even the details of Scriptural subjects, and would not allow the slightest departure from its dogma. Dominated during the XV. cent. by Flemish, and during the XVI. cent. by Ital. influences, Span. painting never entirely ceased to retain its national characteristics of intense seriousness and sombreness. In Italy religious art loved to dwell upon the joy of motherhood, in Spain it preferred to find its subjects in the sufferings of Christ and of the martyrs. Span. painting first rose to great achievement at Sevilla, which produced in the first half of the XVII. cent. the two greatest masters of the Span. school—VELASQUEZ, the first real impressionist portrait painter, and a very magician of the brush, unrivalled in the atmospheric truth of his tone-values; and MURILLO, 'the embodied expression of Span. Catholicism.'

The tradition of Velasquez was carried on at Madrid by a generation of painters who, like his son-in-law, J. B. del Mazo, had come under the spell of his genius. Then followed a complete eclipse of the Span. genius, until the versatile GOYA (1746–1828) made the national spirit flare up in a bright flame for a brief while. He was not only a painter, but a brilliant etcher and lithographer, and a great satirist who in his art mercilessly exposed the corruption, the vice, and the ignorance of his time, the dangers of the Inquisition, and the incompetence of the Government.

Britain.—Eng. art was entirely under the domination of foreign schools until with HOGARTH (1697–1764) arose a painter, whose robust, healthy style created a truly Eng. and democratic art, to oppose the essentially aristocratic art of the masters that had been called to the Eng. court from abroad—from Holbein to Van Dyck, Lely, Kneller, Moro, Mytens, Largillière, and many others. Hogarth, it is true, put his art to the service of his self-imposed mission as a preacher of morality, but in his painted sermons and anecdotes purely artistic considerations are never sacrificed to literary interest. The efflorescence of Brit. portrait-painting belongs to the second half of the XVIII. cent., and was headed by GAINSBOROUGH and REYNOLDS. Gainsborough based his style on the cool elegance of Van Dyck, and became the painter of all that was refined and dandified in Eng. society of that period. He delighted in cool harmonies of colour, and his best work is distinguished by a feathery looseness of touch. Reynolds drew his inspiration from the Venetians, the Bolognese, and, above all, from Rembrandt. He was an eclectic who for ever preached the 'grand manner,' but was at his best when he forgot his theories and devoted himself to straightforward portraiture. One of the greatest Brit. masters of portrait-painting, whose true merit has only comparatively lately found due acknowledgment, was the Scotsman RAEBURN, who exceeded all his contemporaries in virility of brushwork and incisiveness of characterisation. He is the father of the modern Scot. school of portraiture.

On a much lower plane is ROMNEY, whose pleasing paintings of pretty women follow a rather mechanical convention and are lacking in character and sincerity. The Royal Academy was founded in 1768, with Reynolds as first Pres. His advocacy of eclecticism, and his encouragement of the imitation of the Bolognese with their bituminous shadows, laid the foundation to the decline of the school, which, however, continued to excel in portraiture, and produced such distinguished painters as Hoppner, Opie, and Lawrence. The early Eng. landscape painters, notably those of the *Norwich school*, of which John Crome was the head, based their art on that of the Dutch school. A special branch of landscape, combined with animal and sporting life, was cultivated by G. Morland and J. Ward, whose technical method is really a development of Hogarth's manner of handling paint.

XIX.-cent. art, the significant movements of which are almost exclusively confined to France and England, was a constant struggle between classicism, or the pursuit of an arbitrarily imposed ideal of classic beauty, and a more naturalistic conception of painting. Classicism began to choke the free development in France under the first Empire under the lead of Louis David, who reflected the spirit of the Revolution and of the Napoleonic era by turning to the history and art of ancient Rome for his inspiration. His pupil, INGRES,

one of the world's greatest draughtsmen, but a cold, formal painter, became the head of the *Classicist school*, against which the *Romanticists* under DELACROIX rose in revolt. Apart from romantic subject-matter, Delacroix and his followers, basing their style upon Rubens and the Venetian colourists, instead of Raphael and Gk. sculpture, restored a new vitality to the art of painting.

In England, too, the early part of the XIX. cent. was marked by complete exhaustion, although with CONSTABLE arose a new school of landscape painting. Constable may be called the discoverer of the landscape in movement. His pictures are filled with the breezes of heaven, and he replaced the conventional vista and the brown tones of the earlier landscape painters by a realistic treatment of design and colour. Constable exercised an enormous influence, not only upon Delacroix, but upon the Fr. painters of the 'thirties, who became known as the BARBIZON SCHOOL. Among the masters of this school were the lyricist, COROT; the epic poet of Nature, MILLET; the animal painters, TROYON and Jacques; Diaz, who connects the Barbizon School with the Romanticists, DAUBIGNY and ROUSSEAU.

The next school that revolted against the classicism which remained the official art of France were the *Realists*, headed by COURBET, whose chief dogma was that it does not matter *what* you paint, as long as it is well painted. The *Impressionists*, headed by MONET, again were inspired by an Eng. master, TURNER, the greatest magician of light who ever wielded a brush. The Impressionists based their technique on their scientific knowledge of spectral analysis, dividing light into its constituents, the pure colours of the spectrum. Another group of Impressionists, led by MANET, devoted themselves to the representation of contemporary life, which was held in but slight esteem, although history shows that all vital art must be in sympathy with the life of its time. The influence of the Impressionists has been enormous, and has permeated the art of every country. In England, WHISTLER was among its chief exponents.

All these movements sailed under the flag of a return to nature from the artificialities of eclectic academic art. The same claim was made for the Eng. *Pre-Raphaelites*, chief among whom were HOLMAN HUNT, MILLAIS, and ROSSETTI, but the realism of this Eng. group consisted in a minute rendering of details, sometimes at the loss of the more important general truth. Their chief merit is that they introduced something of the sincere spirit of the early primitives.

United States.—West and Copley at beginning of XIX. cent. commenced the Brit. tradition, which lasted till Leutze introduced from Düsseldorf (1859) Ger. influence, which prevailed some ten years until ousted by Fr. art through Hunt (a pupil of Millet) and Hicks. The somewhat crude but native artists Cole and Doughty belong to period before Leutze; but Hunt's contemporaries Eastman Johnson and G. Inness were notable landscapists; indeed, the latter, with Wyant and Homer Martin, must be reckoned among America's strongest landscapists. The art display of Philadelphia Exhibition, 1876, quickened interest in art and gave birth to that numerous band who, like John La Farge, Winslow Homer, and Howard Pyle, have achieved eminence as distinctively Amer. painters, or, like Whistler, E. A. Abbey, Sargent, Fisher, Shannon, Alex. Harrison, Melchers, Hitchcock, Dannat, Stewart, and Gay, have their roots abroad and rank rather as cosmopolitan.

Modern Tendencies.—Towards the end of the cent., dissatisfaction with the convention of traditional methods, and with an art that is tied to the more or less faithful representation of superficial facts, and the recognition of the impossibility to carry the illusion of reality farther than it had been carried by the different modern realistic groups, led to the rather archaistic movement of the so-called *Post-Impressionists*, originated by CÉZANNE, VON GOGH, and GAUGUIN. Their art is essentially synthetic, and not imitative or representative. It is claimed for them that they probe the real significance of things, instead of being satisfied with representing their mere outward appearance. In this they have much in common with the painters of China and Japan, from whom they differ, however, in so far as they adopted a coarse, unbeautiful technique, far removed from the calligraphic suppleness of Eastern art. The later followers of the Post-Impressionists took up all manner of extravagant eccentricities. The most extreme groups of these modernists are the *Cubists* and the *Futurists*, whose pictures and intentions are utterly incomprehensible without lengthy printed explanations. See also JAPAN: *Japanese Art*.

Haldane Macfall, *A History of Painting* (8 vols.); T. Leman Hare, *Masterpieces in Colour*; Ruskin, *Modern Painters*; Muther, *History of Modern Painting*.

PAINTS, liquids applied for decorative purposes; prepared by mixing colour-powders or pigments (generally chromates or oxides) with oil or varnish, which is heated and rendered more absorbent by some metallic salt such as zinc sulphate or litharge. House-painters' colours generally consist of oil, white lead, and pigment, with turpentine added to 'thin' mixture. Artists' colours are much finer than common p., vehicle used being linseed oil, camphor, and amber resin mixed at high temperature.

Varnishes are resinous liquids hardened by heating; give protective coating; used separately or to form enamel paints.

PAISIELLO, GIOVANNI (1741–1816), Ital. composer; b. Tarento; studied under Durante, Naples; best operas, *L'Idolo Cinese*, *Il Barbiere di Siviglia*, *La Molinara*; church and chamber music.

PAISLEY (55° 51′ N., 4° 26′ W.), parliamentary burgh, river port, and seat of important manufactures, in Renfrewshire, Scotland; on White Cart River near its junction with Clyde; consists of old town, new town, and suburbs; possesses old XII.-cent. Abbey, founded *c.* 1163, and numerous public buildings. Industries include dyeing, bleaching, engineering, waaving, founding, brewing, distilling, tanning, shipbuilding, and manufacture of cotton thread, starch, soap, corn-flour, and preserves. Pop. (1911) 84,477.

PAITA, PAYTA (5° S., 81° 7′ W.), seaport, Puira, Peru, S. America; exports cotton. Pop. 4500.

PAJOL, CLAUDE PIERRE, COUNT (1772–1844), Fr. soldier; fought in revolutionary armies from 1791; adhered to Napoleon in 'Hundred Days'; peer of France, 1815.

PAKHOI, PEIHAI (21° 32′ N., 109° 17′ E.), treaty port, on Gulf of Tong-king, China. Pop. 21,000.

PAKOKKU (21° 42′ N., 95° 7′ E.), capital of Pakokku district, Upper Burma; commercial centre; shipbuilding yards. Pop. 12,000; (dist.) 365,000.

PALACE, official residence of a sovereign, abp., or bp.; any magnificent abode or building, as Ital. *palazzo*, Fr. *palais*; derived from *Palatium*, Augustus's residence on Palatine Hill; a place of amusement, cf. *gin p.*, *picture p.*

PALACKÝ, FRANTIŠEK (1798–1876), Bohemian historian and patriot; pub. *History of the Bohemian People* in dual tongue, 1836–67.

PALÆOBOTANY may best be defined as that branch of botany which treats of the structure, affinities, and distribution in time and space of fossil vegetable remains. The subject has considerable value technically in coal-mining, but its chief scientific importance lies in the suggestions it provides as to the phylogeny and inter-relationships of existing and extinct plant groups. Plant remains usually occur in a more or less fragmentary condition, and may be preserved in a variety of ways. Of these perhaps the most familiar are the casts, impressions, and moulds which give us in many instances a clear idea of the external form of the specimen or, as in the case of hollow plant organs, of their internal cavities. Such fossils do not, however, give

us any idea of internal structure, this being provided by petrifactions in which the whole of the plant tissues were thoroughly penetrated with calcium carbonate or silicic acid, which subsequently solidified. The calcareous concretions known as 'coal balls,' occurring in certain seams in the Lancashire and Yorkshire coalfields, are of the first type, whilst the black nodules found in various localities in France are of the siliceous type. By these methods of preservation the most delicate cells are often retained in their original form, and it is such specimens that yield the most valuable indications of plant affinities. In the case of coal it is the actual compressed, carbonised, and chemically altered remains of plant débris which are represented, and it is only occasionally, as in 'Spore' coals, that recognisable plant structures are found.

In **Palæozoic** times the now dominant flowering plants appear to have been non-existent, whilst on the other hand the various pteridophyte families were in their hey-day, many attaining treelike dimensions. The flora of this epoch also included an immense group of seed-bearing forms of fern-like habit as well as numerous Coniferæ, the majority of which belonged to families now extinct. Algal remains, many of which appear to be similar to those existing Siphoneæ possessing incrustations of lime, are found from the Ordovician and Silurian onwards, and one genus Nematophyeus, first described from the Devonian of Canada by Dawson, seems to be allied in character to the Brown Algæ. Neither these nor the Fungi or Bryophyta are, however, of much importance, and it is in the Pteridophyta, or Vascular Cryptogams, and Gymnosperms, the majority of which occur in the Carboniferous, that the interest of the epoch centres.

The *Palæozoic Pteridophyta* fall into four groups, viz. the Equisetales, Sphenophyllales, Lycopodiales, and Filicales respectively. The *Equisetales* were represented by the Calamarieæ, a group of arborescent forms possessing the whorled foliage and branch systems characteristic of the existing genus Equisetum, whilst the primary structure of the stem was also practically identical. The majority, however, unlike modern forms, arose from a basal root system and not from a rhizomic stem. The centre of the stem was generally hollow, the pith being fistular, and as a result the casts of this internal cavity are among the commonest coal-measure fossils known. In the older stems a broad band of secondary wood and also a well-developed zone of bark were present, the former being of a comparatively simple and homogeneous character, and consisting principally of tracheides. The leaves, except in the Devonian Archæocalamites, which had repeatedly forked leaves, were narrow and showed strong xerophytic characters. They are usually included in the form genera Annularia and Asterophyllites. Many types of fructification are known, some of which show an exceedingly complex structure. One of the best known is Calamostachys, which bore alternate whorls of sporangiophores and fused sterile bracts, whilst other types are Palæostachya, Cingularia, and Archæocalamites.

The *Sphenophyllales*, now entirely extinct, combined many of the characters of Lycopods, Ferns, and Equiseta, with certain peculiar to themselves, and are as a consequence of great value phylogenetically. The plants were of slender habit and bore whorls of leaves showing dichotomous venation. The stem was ribbed, and was traversed by a solid triarch xylem strand, whilst it also developed abundant secondary wood. It probably had a scrambling habit similar to that of Galium. The cones resembled those of the Calamarieæ superficially, but bore two stalked sporangia in the axil of each of the coherent members of the bract whorls. The complex fructification known as Cheirostrobus, from the Calciferous Sandstone of Scotland, is also included in this group.

The *Lycopodiales* were mostly gigantic arborescent forms with a large pith, and were clothed with a persistent armour of very characteristic leaf-cushions having a rhomboidal, hexagonal, or ovate form. The genus Lepidodendron, which extended from the Devonian to the Permian, comprised a number of species with stout median axes bearing dichotomising branches clothed with crowded lanceolate leaves. The pith was absent in one or two species (*L. pelaginoides*, *L. rhodumnense*), and where present was surrounded by a ring of secondary wood, outside which came the cortex, periderm, and leaf-cushions. These last, which were lozenge-shaped in Lepidodendron, show a median area indicating the actual region of attachment of the leaf. The fructification consisted of large cones bearing elongate ligulate sporophylls, each with a single sporangium on its upper surface containing microspores or megaspores. The underground portion of this genus and also of the allied genus Sigillaria consisted of massive repeatedly forked axes clothed with rootlets, and to these the generic name of Stigmaria has been applied.

The *Filicales* were on the whole synthetic in type, foreshadowing many of the characters of the modern groups in addition to exhibiting elaboration along peculiar lines of their own. The Psaronieæ were massive forms with complex stelar arrangements, and the stems possessed a complete clothing of adventitious roots: they were probably allied to the modern Marattiaceæ. The Botryopterideæ were monostelic in character and presumably eusporangiate. They resemble the Hymenophyllaceæ in the production of an axillary strand, but differ from all modern forms in the singular character of the petiolar strand. The Pteridospermæ or Cycadofilices were forms which combined with the possession a typically fern-like foliage, external form, and primary anatomical features, the character of seed production. The seeds were often elaborate structures, in some respects suggesting those of the Cycads, and in many cases exhibit striking ornamentation. Both the ovules and microsporangia were borne on specially modified foliage leaves in which the assimilatory portion is more or less reduced. The impressions of so-called fern fronds commonly occurring in the Coal Measure shales are, in the majority of cases, fragments of Pteridosperm foliage. Among the best known of these are Neuropteris, Mariopteris, Alethopteris, and Pecopteris, whilst Heterangium, Lyginodendron, and Medullosa are the genera which have been most thoroughly studied anatomically.

The *Gymnosperms* may almost all be referred to the Cordaitales, a group with specialised fructifications, and one which, anatomically, shows indications of affinities with the existing Araucaria (monkey puzzle) and Agathis (kauri pine).

The flora of *Permo-Carboniferous* times, whilst of the same general character as that of the older rocks, indicates that a regional differentiation had arisen, resulting in the development of a special flora, the *Glossopteris* flora, in certain parts of the world, notably in India (Gondwana formation), South Africa, South America, and Australia. The chief genera included are Glossopteris, a form with a large lanceolate leaf and a creeping jointed rhizome, Gangamopteris, Schizoneura, Phyllotheca, and a sprinkling of Cycads and Coniferæ. This flora had by Rhætic times spread northwards until we find its members constituting a characteristic feature of the plant remains of Indo-China. Certain species such as *Neuropteridium grandifolium* and *Schizoneura paradoxa* also occur both in the 'Glossopteris' areas and in the Bunter of the Vosges.

The **Mesozoic** floras, though in one or two instances providing forms which have persisted from the Palæozoic, are dominated by a new series of plants, Cycadales, Ginkgoales, and Coniferæ, which largely replace the arborescent Pteridophyte stock. The Equiseta show a graded series of forms commencing with large plants of the genus Equisetites, such as *E. Investeri* from the Rhætic, and leading up to smaller species (e.g. *E. Lyelli*). None of these appear to differ

essentially, except in their greater size, from the modern genus Equisetum.

In the Lycopods the genus Pleuromeia is of considerable interest as suggesting a link between Isætes on the one hand and the Lepidodendraceæ on the other, whilst herbaceous species such as Lycopodites and Selaginellites are also known. The Filicales are represented by members of the Marattiaceæ, Osmundaceæ (*e.g.* Iodites, Osmundites), Schizæaceæ, Gleicheniaceæ, Matonineæ, Dipteridineæ, and Cyathaceæ, as well as by a number of fronds which, owing to the absence of seri, are of doubtful affinities. It will thus be seen that the ferns still hold an important place during the Mesozoic. The Ginkgoales, now represented by the monotypic Ginkgo biloba, were abundant and widely distributed throughout *Rhætic*, *Jurassic*, and *Wealden* times, whilst the Cycads at this period attained the height of their prosperity.

Frond material of Nilssonia, Williamsonia, Podozamites, and others is abundant as impressions in the *Inferior Oolite*, whilst magnificent structural material of Cycadeoidea and Bennettites occurs in the *Lower Cretaceous* and *Upper Jurassic* of England and North America respectively. These latter produced remarkable flowers, the outer portions of which were protective, whilst the inner parts were extremely elaborate, microsporangiate and carpellary structures respectively. The Conifers comprise forms allied to the Araucarias, Pines, and Sequoias in addition to others of which the reproductive organs are unknown.

The **Tertiary** floras are remarkable for the sudden appearance and almost immediate dominance of the Angiosperms, many of which are closely allied to modern species. In the *Lower Cretaceous* beds lying immediately above the Jurassic in certain areas, the flowering plants are still in a minority, the flora being dominated by ferns, cycads, and conifers, but from the upper strata of the Lower Cretaceous onwards the Angiosperms hold the field. Among the more interesting forms are oaks, willows, poplars, Aralias, and Magnoliaceæ, the majority being trees, whilst the herbaceous forms are practically absent. In the *Eocene*, which is well represented in Britain, there are abundant plant remains, including palms, conifers, and a large number of Dicotyledons, represented by fruits alone in some cases and in others by vegetative fragments. Various species of oak, almond, laurel, eucalyptus, the swamp palm (Nipa), Rhus, and many others are frequently found, whilst aquatic Monocotyledons allied to Potamogeton and other genera also occur. Among the *Oligocene* forms the chief interest centres in those which occur in the Baltic and other amber deposits. These consist of both trees and herbaceous forms, Ericaceæ, Geraniaceæ, Umbelliferæ, and many more occurring with Pinus, Quercus, Laurus, and many other species of trees.

Following this period came the *Miocene*, the flora of which approximated more nearly to that of the present day with regard to the relative abundance of many orders, although the Tubifloræ were still sparsely represented or entirely wanting. The earlier *Pliocene* is marked by abundant and varied types, but the plants of the upper strata afford strong evidence of a gradual decrease in temperature which eliminated those forms demanding more tropical conditions and caused the flora to approximate to that now existing. Thus in the Cromer Forest bed hawthorn, oak, hornbeam, hazel, and many other still existing species were abundant, whilst plants of warmer and colder climes are alike absent.

The Pliocene was succeeded by a period, the *Pleistocene*, characterised by alternating periods of arctic coldness and temperate conditions and known as the 'Ice Age.' Whilst the glaciers held sway the temperate flora was eliminated or driven farther South, and was replaced by typical arctic forms such as dwarf willows and birches, mosses, and the like, whilst during the warm interglacial periods there occurs an influx of the more mobile members of the typical modern flora of temperate Europe.

PALÆOGRAPHY, science of ancient handwriting. It is usually held that every alphabet (*q.v.*) is derived from the Egyptian, and Egyptian handwriting dates back to at least 4000 B.C. Stone and metals were used in early times for reception of writing, but were early appropriated to inscriptions (*q.v.*); leaves are used in the East; bark (Lat. *liber*) gave its name to Lat. book; the Teutonic book, *Buch*, is derived from beech, the wood of which is specially suitable for inscription; and the Egyptian papyrus is one of the great historic writing materials. Linen was also used in Egypt, but the papyrus rolls appear in the earliest sculptures and are extant from the third millennium. *Papyrus* superseded skins in Greece in the V. cent. B.C. or earlier, and is said to have been introduced into Italy in the II. cent. B.C.; it was manufactured in Egypt until the X. cent. A.D., and used until that time for ephemeral matter throughout Europe, having been long displaced for literary and legal purposes by vellum.

Skins have a long history as writing materials, and when the discovery was made by which the skin was turned into *vellum* it slowly displaced the papyrus. The discovery, according to tradition, was made at Pergamum in the first half of II. cent. B.C.; hence the name *parchment*. Shortly afterwards it was introduced into Rome. Papyrus, however, was used throughout the Dark Ages, and the ancient custom of using waxen *tablets* continued among the Greeks and Romans until the IV. cent. A.D. The Romans used vellum largely for backing books, but in the Middle Ages this material became the literary writing material; it is still the material for legal title deeds, etc. *Paper* is the immemorial Chin. writing material; the Arabs learned the secret of its production and used it from IX. cent. A.D. onwards. It was known in Greece in the XII. cent., Italy in the XIII. cent., and came into general use in the XIV. cent.

The Greeks and Romans used the *stilus* for writing on wax tablets, etc., the reed (*calamus*) for the papyrus. No mention of the quill (*penna*) is found until the V. cent. A.D. *Ink* of various colours and ingredients had been used from Egyptian times, and black has always been the usual colour. It was removed by sponge or knife. A MS. written over an obliterated MS. is called a *palimpsest*; often valuable classical texts have been deciphered under mediæval superscriptures.

The classical *roll*, the first form of book, is composed of various membranes fastened together, following one after the other as the script is unrolled; the wax tablets, however, were joined like the leaves of a modern book, and received the name *codex*, applied later to the vellum books made in a similar way, a way which speedily became universal, although legal documents of a certain nature have been enrolled right down to modern times, and, in fact, gave its name of the Rolls to the old Record Office. *Diploma*, the folded membrane of the early codices, has given the Fr. word *diplomatique* p. (the modern Lat. *res diplomaticus*); the single sheet was called leaf (*folium*). The system of columns, called pages (*paginæ*), went back to classical times. The *Codices* of the Dark Ages very often employed triple columns.

Writing from right to left is the custom of Semitic nations and is found in the first Gk. remains. The practice of separating words by a blank was established IX.–XI. cent. The titles, placed at the end of the roll, as a colophon, in classical lit., commenced in the Middle Ages to appear at the heads of books; they were for long smaller than the text. The paragraph was marked by the Gks. and the first letter thereof enlarged, and a system of punctuation evolved.

Both Gk. and Lat. MSS. are divided into the two main classes of *book-hand* and *cursive*—everyday writing. The book-hand was the special sort of legible and decorative hand-writing used before the invention of printing for much-valued books and books intended for sale. It is judged, *a priori*, to have developed out of the cursive. Both have a separate history of development. Gk. and Lat. MSS. may also be classified as in *majuscules* (large letters) or *minuscules* (small letters), and the majuscules are either capitals or uncials, the former having a square, the latter a curved shape. The history of the word *uncial* is not known, but it was employed in this way in common speech in the Dark Ages. Lat. capitals have also a less square form, called *rustic*, and Lat. p. developed styles of 'half' and 'mixed' uncial. Nearly all literary documents were written in majuscules until the IX. cent., book letters for long imitating the size of those of the inscriptions.

Greek MSS.—Greece probably obtained its alphabet from Egypt through Phœnicia, although the medium is questioned by some modern authorities. Gk. MSS. of an early period (I. cent. B.C. or I. cent. A.D.) were found in excavations at Herculaneum in 1752, but no more have been found in the numerous modern diggings in classical territory. A great number of these that have survived have been conserved in Egyptian tombs and belong to the periods of Macedonian and Rom. supremacy over Egypt, while the rest, later examples, belong to the Byzantine empire which had its seat at Constantinople and kept Gk. culture alive throughout the Middle Ages. Alexander the Great conquered Egypt in 332; under the Ptolemies it became the centre of civilisation, and owing to the Egyptian habit of placing articles of value with the dead, and also of utilising papyrus for coffins, many copies of old Gk. classics made at that time have been preserved. Many MSS. of IV. cent. B.C. onwards have been discovered since the first find in 1778, and many more will, it is hoped, be found.

In the earliest specimens, many of the capitals (A, E, I, O; B, K, M, N, T, X, and the rudimentary form of S) of our present alphabet are present. Egypt became a Rom. province in 30 B.C., and the MSS. were much modified by Rom. influence before the second Gk. period began in 284 A.D., when Egypt was made a province of the Byzantine empire. The second Gk. period was chiefly marked by the development of long heads and tails to the letters. Many of these MSS. are not from the tombs, but from the old libraries of Europe. Three vellum codices of the Bible, in Gk. uncials of the IV. and V. cent., are now known by the places of their compilation or assigned creation, as *Codex Vaticanus*, *Codex Sinaiticus*, and *Codex Alexandrinus*. These, the palimpsest *Ephræmi Syri rescriptus* of the V. cent., and the *Codex Bezæ* of the VI. cent. are the 'five great uncials.' The Byzantine minuscule hands which became literary scripts in the IX. cent. have been classed as *codices vetustissimi* (IX.–X. cent.), *codices vetusti* (X.–XIII. cent.), *codices recentiores* (XIII. cent. to 1453), *codices novelli* (later than 1453, the end of the Græco-Rom. empire).

Latin MSS.—No examples, either on wax or papyrus, have been found dating before the Christian era. As it first appears in the I. cent. A.D. in Rom. tablets, an occasional papyrus, and the wall scratchings (*graffiti*) at Herculaneum and Pompeii, the *Lat. cursive* is easily seen to be the parent of our modern handwriting; several of our small letters stand there in a medley with our present capitals; at the same time many of these letters have since undergone revolutions. In the book-hands, however, the rustic capitals often employed from the I. to the VI. cent. are very nearly the same as our present capitals.

Mediæval MSS.—The barbarians who over-ran the Rom. empire and built up our modern nations adopted the Rom. script and developed it in their different ways. At first they devoted themselves, not to literary products, but to working out useful cursive scripts from which, later, new book-hands were made. After the acceptance of Christianity, handsome religious books were in demand. Ireland produced, among other famous MSS., the *Book of Kells*, in half-uncials of the VII. cent., with the beautiful illuminations which were the mediæval contribution to p.; and England, who learned her script chiefly from her Irish missionaries, produced the uncial Bible of Jarrow (*c.* 700), half-uncial Lindisfarne Gospels (of the same period), Bede's *Historia Ecclesiastica* (VIII. cent.), and the *Liber Vitæ* of Durham (IX. cent.).

Irish writing gave way to French in England at the Norman Conquest. Fr. writing owed much to Charlemagne's renaissance. He ordered the production of sumptuous books, and his helper, Alcuin of York, started a school of calligraphy at Tours, where he was abbot (796–804).

The book-hand of the XV. cent. was adopted by the first printing-presses, though Ital. printers soon turned back to models of the XII. cent., which was considered the great age of handwriting. Extensive contractions have been used from Gk. times in all cursive hands for economy of time and space, and an elaborate system of abbreviations was evolved in the Middle Ages. These may be found explained in Wright's *Court Hand Restored*, and Martin's *Record Interpreter*.

Sir E. M. Thompson, *Gk. and Rom. P.* (3rd edit., 1906).

PALÆOLITHIC, see ANCIENT HISTORY.

PALÆONTOLOGY (Gk. *palaios*, ancient; *ὄν, ontos*, being; *logos*, science), the science which reads in fossils the history of the past and endeavours to trace from them the story of life's progress in the world. That branch which deals with fossil animals is known as PALÆOZOOLOGY, that with plants as PALÆOBOTANY (*q.v.*).

To earlier observers *fossils* presented great difficulties. The two main theories which for many centuries held sway were that they were sports of nature with no more meaning than a mineral crystal, or that, as Xenophanes suggested about 500 B.C., they actually represented the remains of entombed animals. There were other views, as that of Empedocles, who interpreted hippopotamus' bones as representing the remains of extinct giants fallen in a war with the gods, or the idea that fossils were fruits of life that had failed to reach the surface. Many cent's passed before universal recognition was given to fossils as the remains of living things, but it is interesting to remember that, in the Middle Ages, the artist Leonardo da Vinci upheld that view. In the XVIII. cent. it was currently believed that fossils had been deposited by Noah's flood, although at its close Werner first suggested that by their aid different geological formations could be recognised.

But p. as a science began with Cuvier and Lamarck, both of whom described many fossil remains and showed their relationships with living animals. At the same time, William Smith, 'the father of English geology,' had observed in England that in different rock layers different series of fossils were preserved. One cannot pass over unmentioned the magnificent work accomplished for p. by Richard Owen (1804–93) and by Louis Agassiz (1807–73), and for palæobotany by Brongniart in 1828. New life was given to the researches of palæontologists by Darwin's evolution theory, and since his time innumerable workers have entered the field, of whom we can note only Prof. Cope (1840–97), whose remarkable investigations on vertebrates were illumined by wide-reaching generalisations, and Prof. von Zittel (1839–), who has been described as the premier palæontologist.

P. has accomplished much for her sister sciences of geology, botany, and zoology. She has helped to fill in our pictures of the world in ages long dead. From the nature of the fossil animals and plants discovered are revealed some of the conditions of their lives:

whether they lived in fresh water or in the sea, in marshy places or on dry land, and still more in detail, even whether they lived in the abysses of ocean or in shallow water. Furthermore, fossils of the same kind found in different places indicate that similar conditions prevailed, and often that the rocks in which they occur were formed at the same time.

To the biologist results are even more interesting and more important. Occasionally a missing link is found—the toothed bird *Archæopteryx*, which, distinctly avian, shows evidence of descent from reptile stock; or an extinct group may help to fill a gap in the table of descent—the reptilian Dinosaurs of Mesozoic times possess characters which point to the coming of birds. So p. illumines the history of life and sheds its own light upon the evolution of living things. Close study has shown that even in limited periods evolution has been at work—for example, Pond Snails (*Viviparus* or *Paludina*), found in the lowest and highest layers of the Pliocene deposits of Slavonia, appear to be distinct species, but specimens from the intermediate layers show that by gradual steps the highest form developed from the lowest. Another well-known example is that furnished by the horse and its ancestors. These in early Tertiary times at first possessed five toes, but were succeeded by species in which the number of toes was gradually reduced until at the end of the series representatives of our domesticated horse (*Equus*) appear in Pliocene deposits with only one toe.

A wider view gives further support to the theory of organic evolution. Zoologists, on grounds of the complexity and integration of their structures, place in ascending order fishes, amphibians, reptiles, and birds. This, however, is exactly the order in which those groups first appear as fossils. P., like many another science, gives its testimony in favour of the unity of organic things.

Von Zittel, *History of Geology and Palæontology* (Eng. trans., 1901); Ray Lankester, *Extinct Animals* (1905); Woods, *Elementary Palæontology: Invertebrate* (1909).

PALÆOSPONDYLUS, see CYCLOSTOMATA.

PALÆOTHERIUM, see under HORSE FAMILY.

PALÆOZOIC ERA, the lowest division of fossiliferous rocks; contain the remains of the earliest forms of life. They are also known as PRIMARY ROCKS, and are divided into groups — Permian, Carboniferous, Devonian, Old Red Sandstone, Silurian, Cambrian. See GEOLOGY, PALÆOBOTANY, PALÆONTOLOGY.

PALAFOX Y MELZI, JOSÉ DE (1780–1847), Duke of Saragossa, and grandee of Spain, 1836; famed for heroic defence of Saragossa against French, 1808–9; languished in Fr. dungeons till 1813; captain-gen. of Aragon, 1813.

PALAMAU (23° 52′ N., 83° 57′ E.), district, Chota-Nagpur, Bihar and Orissa, India; coal mines. Pop. 625,000.

PALAMCOTTAH (8° 42′ N., 77° 46′ E.), town, Tinnevelly, Madras, India; mission station. Pop. 21,000.

PALAMEDEIDÆ, Screamers (*q.v.*).

PALAMEDES (classical myth.), prince of Nauplia; stoned to death by Odysseus at siege of Troy.

PALANPUR, PAHLANPUR (24° 12′ N., 72° 28′ E.), native state, Gujarat, Bombay, India. Pop. 225,000.

PALATINATE, PFALZ (49° 30′ N., 80° E.), part of Bavaria, Germany. The Palatinate (also called *Rheinpfalz* or *Rheinbayern*) is bounded by Hessian province of Rhein-Hessen, Baden, Alsace-Lorraine, and Prussian Rhine Province; leading town, Spires; most important rivers are Rhine and Lauter; soil very fertile and produces corn, flax, fruits, and vegetables in large quantities; principal minerals are coal, iron, quicksilver, and salt. In old Germany P. was much larger region, ruled by a count palatine; two capitals were Heidelberg and Mannheim. Upper and Lower P. disjoined after Thirty Years War, when Upper P. (*Oberpfalz*) fell into hands of Bavaria; manufactures include machinery, chemicals, paper, beer, leather, and tobacco; cattle-rearing carried on. Area of Palatinate, 2289 sq. miles. Pop. (1910) 937,085. Area of Upper Palatinate (which lies in E. Bavaria on the Bohemian border; capital, Regensburg), 3728 sq. miles. Pop. (1910) 599,461.

PALATINE, PALATINUS MONS, largest of the seven hills on which Rome was built. Here Romulus laid the foundations for his city *Roma Quadrata*. There was a temple of Apollo on the P., and this temple Augustus rebuilt and founded therein a public library with a fine collection of Gk. and Rom. MSS. See ROME.

PALATKA (29° 40′ N., 81° 40′ W.), city, on St. John's, Florida, U.S.A.; trade in lumber. Pop. (1910) 3779.

PALAVARAM (12° 57′ N., 80° 13′ E.), town, Chingleput, Madras, India. Pop. 6500.

PALAZZOLO ACREIDE (37° 3′ N., 14° 55′ E.), town, Syracuse, Sicily. Pop. 15,500.

PALE, see IRELAND (HISTORY).

PALEMBANG (2° 46′ S., 104° 50′ E.), capital, P. residency, Sumatra; seaport; cotton, pepper, silk, dye-woods; great trading centre in Middle Ages. Pop. 60,200.

PALENCIA.—(1) (42° 30′ N., 4° 30′ W.) province, Old Castile, Spain; mountainous in N.; chief rivers, Pisuerga and Carrion; produces grain, wine. Pop. (1910) 196,031. (2) (42° 2′ N., 4° 26′ W.) city, capital of above, on Carrion; cathedral; woollens. Pop. 16,500.

PALENQUÉ, name given to ruined Mexican city; known to Spaniards from 1750, but not explored till modern times; possibly *Xibalba*, the mythical city of the Mayas.

PALERMO (38° 7′ N., 13° 22′ E.), capital of Sicily, on north coast facing Ital. mainland; important seaport in sheltered bay; P. means 'all-harbour'; beautifully situated in fertile valley (Conca d'Oro) partly surrounded by mountains; once the greatest European city. Notable features are fine cathedral (1169–85), San Giovanni degli Eremiti (1132), La Martorana (1143), Santa Maria della Catena; royal palace with beautiful Capella Palatina; Chiaramonte (Lo Steri, 1307), Bruiccia, Abetelli, and numerous other palaces; univ. (1805), Museo Nationale (with celebrated metopes from the temples of Selinunt), libraries, town-house, theatres, and old gateways; founded by Phœnicians; conquered by Carthaginians, Romans, Saracens, and Normans, 1071; then capital of kingdom of Sicily (*q.v.*); captured by Garibaldi, 1860, and annexed to Sardinia. Chief industries — machinery, chemicals, sumach, essences, sulphur, tartar, wine, green and dry fruits, tobacco. Pop. (1911) 341,656. The province of P. has area of 1948 sq. miles. Pop. (1911) 794,635.

PALESTINE (31° to 33° 21′ N., 34° 30′ to 36° 5′ E.) is the name given in early times to a part of the Syrian seaboard only, but applied during the Christian era to the whole country of the Jews.

History.—Situated at eastern end of Mediterranean, P. must at an early date have come into contact with the old civilisations of Assyria and Babylonia on the N.E. and of Egypt on the S.W. There are no native records for its early history, the only sources of which are references in Egyptian and Babylonian inscriptions. According to the earliest of these, P. was already in the IV. millennium B.C. inhabited by a Semitic race; the Semites, whose original home is by many scholars believed to have been Arabia, must have been preceded in P. by earlier races. Traces of these have been found in antiquities belonging to the stone age, impossible to ascribe to the Semites, who had attained to a higher degree of civilisation before migrating from their earlier home in Arabia.

Probably **Babylonian** supremacy was established towards close of IV. or beginning of III. millennium B.C.; an inscription of about 2920 expressly states

that Lugalzaggisi of Babylon was supreme over whole region from Mediterranean to Persian Gulf. About 2500 B.C. there occurred an invasion of the Amorites, who spread over all W. Asia; a result of this was decay of Babylonia and its conquest by the Elamites. The traditional rise of the Hebrew nation (see JEWS) occurs during Elamite period, which lasted till *c.* 2230, when Khammurabi, mentioned in *Genesis* as Amraphel, liberated his country from Elamite control and established his authority in P. as well as in Babylon.

This second period of Babylonian rule probably lasted till the end of the XVIII. cent. B.C., soon after which the country must have come under Egyptian suzerainty; and it has been suggested that it was conquered by the Hyksos prior to their invasion of Egypt.

The **Egyptians** retained control of P. until reign of Amenhotep IV. (succ. *c.* 1392), when their power began to decline, owing partly to the king's religious reforms and partly to the invasions of warlike people from the N. The Hittites are known to have invaded Syria in Amenhotep III.'s reign, but their great conquests began in that of Amenhotep IV., when appeals from all parts of Syria and P. for aid against them were sent to the Pharaoh at Tel-el-Amarna. After this the Hittites seem to have become predominant in the country, and they carried on long struggle against Egypt. Eventually (*c.* 1303) they concluded a treaty with Rameses II., whereby P. was recognised as a province of Egypt. The rise of the Aramæans took place about the same time as that of the Hittites, whom they eventually superseded.

From the end of the XIII. cent. B.C. P. was undisturbed by the great surrounding nations, and during a period of comparative isolation the Hebrews established their supremacy first under judges and later as a monarchy (see JEWS). This kingdom soon split into the two states of **Israel** and **Judah**, whose relations were marked by three distinct periods — (1) mutual hostility and constant war; (2) alliance, and combined enmity to Syria; (3) fresh disputes, and the gradual decay of both kingdoms before the increasing power of Assyria and Babylonia. Israel was eventually conquered by Assyria, *c.* 722 B.C.; and, after a prolonged struggle against Assyria and Egypt in turn, Judah was defeated by Nebuchadnezzar in 588; P. thus passed under control of the Babylonian empire, and so remained until with the fall of Babylon in 539 B.C. it came to the possession of Cyrus of Persia. Under the Persians a settled form of government was established in P. by Ezra and Nehemiah; and this period was marked by the growth of organisation, order, and ritual among the Jews. Persian domination came to an end with the break-up of Persian Empire before the victorious armies of Alexander the Great, after whose death P. came to the hands of one of his generals, Laomedan; in 320 it was seized by Ptolemy Soter of Egypt; between 314 and 301 it was held by Antigonus of Syria, but at the latter date it reverted to the Ptolemies, and became a buffer between Egypt and Syria. After a time of struggle between the Ptolemies and the Seleucids it was taken by Antiochus the Great, *c.* 198; his successors, Seleucus Philopator and Antiochus Epiphanes, persecuted the Jewish inhabitants and endeavoured to hellenise the country, a policy which resulted in a national rising under Mattathias and the establishment of the Asmonæan dynasty by his son, Judas Maccabæus. The dominion of the Asmonæans continued till 63 B.C., when internal disputes led to the intervention of the Romans; the country was then conquered by Pompey, who app. Hyrcanus II. as High-Priest. Hyrcanus left the conduct of affairs to Antipater the Idumæan, who curried favour with the Romans, and whose son, Herod the Great, afterwards became king of all Judæa, 40 B.C.

During the first half of the I. cent. A.D., P. passed through four distinct political phases: in the time of

Herod the Great it had been a single united kingdom, but at his death in 4 B.C. it was divided up into principalities under his sons, Archelaus, Herod Antipas, and Herod Philip; before long Samaria and Judæa became a Rom. province, while Galilee, Trachonitis, and Ituræa continued under native rulers; then the former kingdom was revived for a short time under Herod Agrippa; and finally the entire country became a Rom. province. Owing to the cruel oppression of the Rom. governors a great rebellion broke out in 66 A.D., but was eventually put down by Titus, s. of Vespasian, and in 70 Jerusalem was utterly destroyed. After the suppression of Bar Cochba's revolt in 132–35, the new city of Ælia Capitolina was built by Hadrian on the site of Jerusalem.

P. remained under Rom. control for several cent's, and after 395 A.D. formed part of the Byzantine empire; it was taken early in VII. cent. by Chosroes of Persia, but was recovered by Byzantines in 629. The Saracens obtained possession of it in 636, and remained supreme for four cent's. In the XI. cent. it was taken by the Seljuk Turks, and in 1095 Peter the Hermit's exposure of the treatment to which Christian pilgrims in P. were subjected by Muhammadans led to First Crusade; this resulted in capture of Jerusalem and election of Godfrey de Bouillon as Latin king of Jerusalem. During XII. and XIII. cent's eight other crusades were carried on, and in the XIII. and XIV. cent's occurred the great Mongol invasions. The country was eventually captured by the Ottoman Turks in 1516, and formed part of Selim I.'s empire. It has remained under Turk. dominion ever since, except for a short time in XIX. cent., when it was held by Egypt.

The P. Exploration Fund, founded 1864, has provided survey maps, etc. Dr. Bliss excavated south wall of Jerusalem, 1896–98, and Gath in 1898–1900. Macalister began to excavate Gezer in 1902.

Geography.—Palestine is washed on the W. by the Mediterranean, and on the E. merges into the Syrian desert without any clearly defined boundary. Its most characteristic physical feature is the deep gorge which forms the valley of the Jordan, dividing the country into two unequal parts by a line running N. and S. This gorge is central part of a fissure on earth's surface, and stretches from Antioch in N. to Ezion-geber on Red Sea in S. To W. of this valley rises an irregular mountain range, which is broken only by the Plain of Esdraëlon, but otherwise extends from Lebanon in N. to Beer-sheba in S.; these mountains are intersected by many deep, water-cut ravines, and culminate in Jebel Jermuk, 3934 ft. above Mediterranean; on the E. they slope abruptly to the Jordan valley, and near the Dead Sea they terminate in precipitous cliffs; on the W. they slope more gradually to the great plain, which extends to Mediterranean coast and is broken only by Mt. Carmel.

To E. of Jordan the surface consists of a vast plateau rising now and then into ridges and peaks which attain an extreme height of 4245 ft. On the W. this tableland slopes abruptly, at times precipitously, to Jordan valley; on the E. it slopes more gradually to the desert. Principal rivers are—Jordan, rising in valley of Lebanon, and passing through Waters of Merom and Sea of Galilee into Dead Sea; Kishon (Nahr el Makutta), draining Plain of Esdraëlon; Yarmuk, draining Hauran plateau, and entering Jordan on E.; Jabbok (Zerka), tributary of Jordan; Arnon (Mojib), entering Dead Sea. The Brook Kedron is generally dry. Lakes are Merom, Sea of Galilee and Dead Sea. Largest towns are Jerusalem, Jaffa, Gaza, and Safed.

Geology.—The Sinaitic mountains are composed chiefly of crystallines, which are of Archæan age; to the N. these are covered by sandstone and limestone deposits of Carboniferous age; the coastal plain is of Pleistocene formation, and volcanic rocks are found upon the limestone tableland of Moab; the Jordan valley coincides with a displacement or fault, so that the strata to the W. have been depressed and those on the E. raised; hence the two sides are of different geological character, crystallines overlaid by sandstones and limestones being found on the E., chalks and more recent deposits on the W.

The climate is extremely hot in summer and very wet in winter, the rainy season lasting from December to March. Characteristic trees are the olive tree, cedar, and sycamore; and considerable quantities of cereals and fruit are produced. There is a railway connecting Jaffa with Jerusalem. The inhabitants are chiefly Muhammadans, only about 14 per cent. being Jews. Pop. c. 700,000.

L. B. Paton, *Syria and Palestine* (1902); Huntingdon, *Palestine and its Transformation* (1911); Leach, *Romance of the Holy Land* (1911); Macmillan, *Guide to Palestine and Syria* (1908); Cook's *Tourist's Handbook for Palestine and Syria* (1906).

PALESTINE (31° 46′ N., 95° 37′ W.), city, Texas, U.S.A.; cotton industries. Pop. (1910) 10,482.

PALESTRINA, see PRÆNESTE.

PALESTRINA, GIOVANNI PIERLUIGI DA (*c.* 1524–1594), Ital. composer; b. at Palestrina, from which he derived his surname. He was early appointed choirmaster at the Vatican, and in 1544 wrote an epoch-making set of Masses dedicated to Pope Julius III. In 1555 he became music director at the Lateran, and in 1561 went in a similar capacity to S. Maria Maggiore. In 1563 he was officially requested to demonstrate how the secularising abuses which had crept into the music of the Church could be reformed, and the result was the famous *Marcellus Mass*, since regarded as a classical model by the R.C. Church. This is his chief title to fame.

PALEY, FREDERICK APTHORP (1815–88), Eng. classical scholar; editions of classics famous.

PALEY, WILLIAM (1743–1805), Anglican theologian and scholar; archdeacon of Carlisle, 1782; pub. *The Principles of Moral and Political Philosophy*, 1785, *Horæ Paulinæ*, 1790, and *View of the Evidences of Christianity*, his most famous work, 1794; *Natural Theology*, 1802; energetic opponent of slave-trade; an able and kindly man.

Meadley, *Life of P.* (1809).

PALGHAT (10° 45′ N., 76° 43′ E.), town, Malabar, Madras, India. Pop. 46,000.

PALGRAVE, FRANCIS TURNER (1824–97), Eng. critic and poet; prof. of Poetry at Oxford, 1886–95. His poetical work was considerable, but he is best known by his *Golden Treasury of English Lyrics*.

PALGRAVE, SIR FRANCIS (1788–1861), Eng. historian; deputy keeper of Public Records, 1838–61, and edit. several Record Office publications; one of pioneers in scientific study of history.

PALI, an Ind. language, which in early times (*c.* 600–200 B.C.) was the chief speech of cultured people in N. India. It has filled for India a very similar rôle to that of Latin in mediæval Europe: inscriptions, religious treatises, canon law, learned lit. were all written in Pali, besides which it exercised a profound influence on the surrounding cruder dialects. It is no longer in common use, being now restricted to the use of Buddhists in Siam, Indo-China, Burma, and Ceylon. In origin Pali is closely related to Sanskrit, and thus belongs to the Indo-European group. In 1882 a Pali Text Society was founded, which has published many of the more valuable Pali works.

PALIMPSEST, a manuscript from which the original writing was washed off with a sponge or scraped so that a new writing could be superimposed. Many ancients texts have been discovered and restored from p's, *e.g.* the Vatican Cicero. See PALÆOGRAPHY.

PALINGENESIS, theory that the soul undergoes succession of rebirths; also employed by Schopenhauer (*q.v.*) for theory of reappearance of the will after death, in a new individual, until the will-to-live is exhausted.

PALISSY, BERNARD (1510–89), Fr. potter; worked for some twelve years as a glass- and portrait-

painter. About 1538 he settled at Saintes as a land surveyor, and shortly afterwards, determined to discover how to make enamels, he began a series of experiments which lasted sixteen years before proving successful. Fame came to him by the ware he produced, with objects in high relief, mostly coloured; and he was appointed 'inventor of rustic figulines' to the king. He established a workshop in Paris in 1564; escaped the massacre of St. Bartholomew by the intervention of Catherine de' Medici; but in 1585 was thrown into the Bastile as a Huguenot, and died there.

PALITANA (20° 31′ N., 71° 53′ E.), native state, Kathiawar, Bombay, India; capital, Palitana. Pop. of state, 53,000; (town) 13,500.

PALK STRAIT (10° 5′ N., 80° E.), separates India from Ceylon.

PALLADIUM (Pd = 106·7), metallic element in platinum group; occurs, alloyed with platinum or gold, in S. America and the Harz. Silvery white, S.G. 11·4; unalterable in air, when heated in oxygen forms PdO; dissolves in hot nitric acid; used for coating silver, and as a substitute for gold in dentistry. After heating, palladium 'occludes' (*i.e.* absorbs) about 900 times its volume of hydrogen, increasing nearly 10 % in bulk.

Chief compounds: PdO, $PdCl_2$, $PdSO_4$; PdO_2, $PdCl_4$, K_2PdCl_6.

PALLANZA (45° 55′ N., 9° 33′ E.), town, health-resort, on Lago Maggiore, Novara, Italy. Pop. 5600.

PALLAS ATHENE, see ATHENA.

PALLAS, PETER SIMON (1741–1811), Ger. naturalist; travelled in Kirghiz Steppes and Siberia (1768–74), and wrote account of flora and fauna.

PALLIUM, or PALL, vestment bestowed by pope on abp's, who cannot act as such before it has been bestowed; it is a strip of lamb's wool, looped in front, and hanging down back and front.

PALM.—(1) in anatomy, is the inner surface of the undivided portion of the hand. (2) botanically, the palms are a group of monocotyledons mainly tropical in distribution; the majority are arborescent and unbranched (Hyphæne, the Doum Palm, branches), and bear an apical crown of leaves, which are primarily entire, but become palmately or pinnately divided, owing to the loss of the more delicate tissues. Some genera (*e.g.* Calamus, the Rattan Palm) are climbers, whilst others, such as Nipa, a swamp palm, have a very short stem and radical leaves. The inflorescence is large, and during its earlier stages is enclosed by a protective sheath or spathe. In the majority it is axillary, but in a few (*e.g.* Corypha, the Talipot Palm; Metroxylon, the Sago Palm) it is terminal, and results in the death of the plant. The flowers are trimerous, and may be dioecious or monoecious. On fertilisation a berry (Phœnix, the Date Palm) or a drupe (Cocos, the Coco-nut Palm) is produced. Economic products —fibre (Cocos), oil (Cocos, Elæis), vegetable ivory (Phytelephas), sago (Metroxylon), areca-nuts, etc.

PALM BEACH (26° 40′ N., 80° W.), town, winter resort, Florida, U.S.A.; on Atlantic.

PALM CIVET, a carnivore; see under CIVET FAMILY.

PALM OIL, see OILS.

PALM SUNDAY, the day celebrating Christ's entry into Jerusalem (the Sunday before Easter), thus called because of the carrying of palms to place them in church, though the origin of the custom is obscure. It has an elaborate ceremonial in the Rom. Church, and with it begins the mournful services of Passion Week; in the Eastern Church it is joyful; called simply 'Sunday before Easter' in Book of Common Prayer.

PALMA, SAN MIGUEL DE LA PALMA (28° 42′ N., 17° 52′ W.), one of the Canary Islands; chief town, Santa Cruz. Pop. 44,000.

PALMA (39° 35′ N., 2° 43′ E.), port, Majorca, Balearic Isles; seat of bishopric; has cathedral, episcopal and royal palaces; trades in wine, cereals, fruit, etc. Pop. (1910) 68,359.

PALMELLA (38° 34′ N., 8° 57′ W.), town, Estremadura, Portugal. Pop. 7200.

PALMER (42° 10′ N., 72° 15′ W.), town, Mass., U.S.A.; cotton manufactures. Pop. (1910) 8610.

PALMER, PALMER-WORM, name given to several species of destructive caterpillars; in America especially to that of moth *Ypsilophus pometella*.

PALMER, EDWARD HENRY (1840–82), Brit. archæologist; devoted himself to Oriental studies, became Lord Almoner's prof. of Arabic at Cambridge; perished in an expedition connected with Arabi's Egyptian rebellion; wrote chiefly on Oriental subjects.

PALMER, RAY (1808–87), Amer. Congregationalist minister and hymnologist.

PALMER, ROUNDELL, see SELBORNE, EARL OF.

PALMERSTON (12° 28′ S., 130° 51′ E.), town, capital, Northern Territory of S. Australia, on Port Darwin.

PALMERSTON, HENRY JOHN TEMPLE, VISCOUNT (1784–1865), Brit. statesman; succ. his f. in peerage, 1805; Sec. of War in Tory Government of Duke of Portland, 1809, and retained this office till Huskisson's resignation, 1828; adhered to Canning under Lord Liverpool's administration, and warmly supported Canning's policy of aiding revolution abroad during that statesman's brief premiership, 1827, deserting Tory party. He became Minister of Foreign Affairs under Whig Government of Earl Grey, 1830, and made alliance with new constitutional ruler of France, Louis-Philippe, thus ending long enmity of England and France; actively assisted in establishing Belgian kingdom and supported popular claimants, Donna Maria in Portugal and Isabella in Spain; remedied unfortunate result of Canning's assistance to Greece, *i.e.* the weakening of Turkey, by helping to put down revolt of Turk. pasha, Mehemet Ali, 1840.

These measures met with strong opposition at home, especially after disasters in Afghanistan, 1841; fall of ministry, 1841; again Foreign Minister under Lord John Russell, 1846–51; vote of censure on his policy carried in House of Lords, counter-vote in House of Commons, 1850, P. making impressive speech of vindication in Lower House. P. was dismissed by queen, 1851, for unauthorised action with regard to France; Home Sec. in Aberdeen administration, 1852; Premier, 1855–58, 1859–65; last years marked by temporising in all great questions being agitated at home and abroad; not an impressive personality, but skilful and popular.

Dalling and Ashley, *Life* (1870–76).

PALMISTRY, the pseudo-science of pretending to tell a person's character or fortune by the study of the lines and formation of the palm of the hand. It has been practised all over the world and from very ancient times. To do it for money is now illegal in England, but the law is constantly evaded, and there was a considerable revival of it in the XIX. cent. According to medical experts it is entirely worthless.

PALMYRA, celebrated ancient city in Syria, once important centre of caravan trade owing to central position in oasis in Syrian Desert. Mark Antony attempted (*c.* 42 B.C.) to plunder city, but inhabitants fled with their property; under first Rom. emperors P. was independent, with large trade and considerable importance as commercial and religious centre; during Parthian War in III. cent. rose to great power; under Odenathus and then Zenobia P. extended its sway far and wide, till captured by Romans and Zenobia taken prisoner (*c.* 270). Rom. Emperor Aurelian treated inhabitants leniently till they revolted a few months after capture, when he returned and almost completely destroyed city; although partly rebuilt under Diocletian and believed to have been fortified by Justinian, P. never recovered importance; was captured early in Arabian Conquest and turned into Muslim fort; now inhabited by wandering Arabs. Ruins of city are remarkable but of no particular architectural interest; Temple of Sun and Sepulchre Towers finest remains; there are interesting inscrip-

tions in Greek, Latin, and Hebrew, and some traces of foundations of houses and streets.

Wright, *Palmyra and Zenobia.*

PALNI HILLS (10° 27′ N., 77° 33′ E.), mountain range, Madura, Madras, India; highest summits, 7000 ft.

PALO ALTO (37° 25′ N., 122° 10′ W.), city, California, U.S.A.; seat of Leland Stanford, Junior Univ.; earthquake, 1906. Pop. (1910) 4486.

PALPITATION, see HEART.

PALSY, see PARALYSIS.

PALUDAN-MÜLLER, FREDERICK (1809–76), Dan. poet; masterpiece, *Adam Homo*, a satire.

PALWAL (29° 9′ N., 77° 22′ E.), town, Gurgaon, Punjab, Brit. India. Pop. 13,500.

PAMIERS (43° 6′ N., 1° 36′ E.), city, Ariège, France, on Ariège; cathedral; ironworks. Pop. 10,600.

PAMIRS, lofty plateau region in Central Asia, where Hindu Kush, Himalayas, Kuen Lun, and Tian Shan Mts. converge; average height, *c.* 13,000 ft. Mountain ranges are separated by broad valleys or *pamirs*, chief of which are Great Pamir, containing Lake Victoria; Little Pamir; Pamir-i-Wakhan; Sarez Pamir, with river Murghab; Rang Kul, Kara Kul, and Taghdumbash Pamirs; these valleys are drained mostly by tributaries of Oxus, occasionally contain lakes, and are intersected at intervals by passes; region almost destitute of vegetation, except along banks of rivers and lakes, where there is fine pasturage during summer months; climate severe and storms sudden and violent; inhabited by Kirghiz tribes.

PAMPA (36° 30′ S., 65° W.), territory, Argentina, S. America, W. of Buenos Ayres; largely covered with grass; cattle-ranches.

PAMPAS (*c.* 26° S., 61° 30′ W.), vast plain in Argentina, stretching from Andes to Atlantic and from Gran Chaco to Rio Colorado; consists mainly of level expanse covered with shingle; in some parts solitary trees to be found; contains several salt lakes; in N.E. is more fertile district, covered with pampas grass, where horses, cattle, and sheep are reared.

PAMPAS HARE, see VISCACHA.

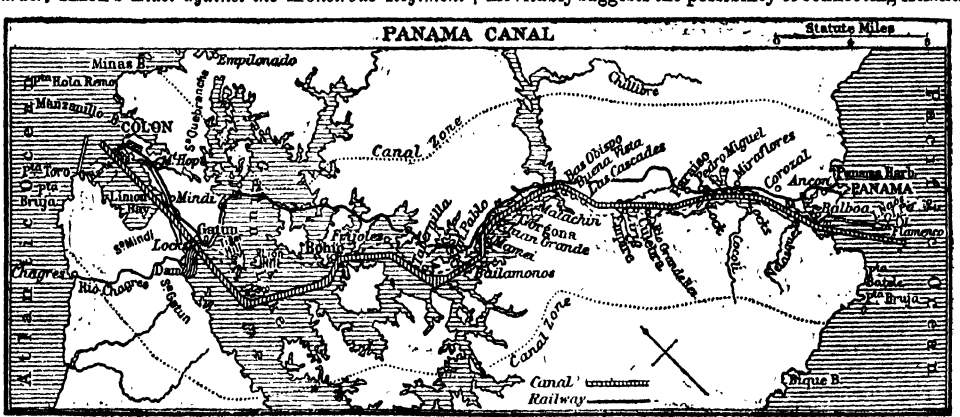
PAMPHLETS, small paper-covered booklets issued for controversial purposes, generally on a literary, political, or theological topic. There seems little doubt that in inception at least the p. is largely an Eng. institution, and it certainly attained its fullest scope in England in XVII. to XVIII. cent's. It is impossible to give anything here but a list of some of the more notable Eng. p's: Sexby's *Killing no Murder*, Knox's *Blast against the Monstrous Regiment of Women*, Milton's *Areopagitica*, Defoe's *Shortest Way with Dissenters*, Steele's *Crisis*, Swift's *Drapier's Letters*, Whately's *Historic Doubts*, the anonymous *Letters of Junius*, Burke's *Thoughts on Present Discontent*, and Shelley's *Necessity of Atheism*. These filled the rôle now played by review articles and letters and leading articles in the public press, and with the advent of a cheap press the p. has fallen into disuse.

PAMPHYLIA, originally a narrow, mountainous region on S. coast of Asia Minor lying along Gulf of Adalia; intersected by several rivers from the Taurus; inhabited by mixed races.

PAMPLONA, PAMPELUNA (42° 50′ N., 1° 12′ W.), town, capital of Navarre, Spain; strongly fortified; seat of bishopric; has fine Gothic cathedral. Pop. (1910) 29,472.

PAN, the great god of flocks and harvest festivals in the myth. of ancient Greece, and particularly associated with Arcadia. In art Pan is represented with horns and goat's feet, and playing on a set of pipes.

PANA (39° 20′ N., 89° 10′ W.), city, Illinois, U.S.A.; coal mines. Pop. (1910) 6055.



PANAMA (9° N., 80° W.), Central American republic; bounded N. by Caribbean Sea, W. by Costa Rica, S. by Pacific, E. by Colombia; length, *c.* 460 miles; breadth, 120 miles; area, 31,571 sq. miles. Off coast lie numerous islands; several large bays—Almirante, Gulf of San Blas, Chiriqui Lagoon, Gulf of P. It is traversed by mountains—Sierra de Chiriqui, with Chiriqui (11,970 ft.), Pico Blanco (11,740 ft.), Cordillera de Veragua, with Santiago (9275 ft.). Chief rivers, Bayano, Tuira, Chagres. Dense forests; climate tropical; fevers almost stamped out. Principal ports are Colon, Bocas del Toro, Porto Bello, Panama (capital), Dulce.

Columbus established a colony, 1499; destroyed by Indians and restored, 1510; disastrous scheme to colonise Darien region (eastern portion of Atlantic seaboard), 1695 (see DARIEN SCHEME); P. incorporated with Colombia, 1821; an independent state, 1855–61; revolted from Colombia and became separate Republic, 1903; a belt of land on either side of PANAMA CANAL (*q.v.*) is under jurisdiction of U.S.A. Railway runs from Colon to Panama. Chief products are coffee, cocoa, rubber, valuable timber, tropical fruits, live stock; gold, iron, copper, coal found; pearl fisheries. Pop. *c.* 400,000.

Albert Edwards, *Panama* (1912).

PANAMA (8° 59′ N., 79° 32′ W.), capital and principal port of Panama Republic, on Gulf of P.; with cathedral St. Ana, government palace, etc.; founded, 1519; exports india-rubber, hides, tortoise-shell, mother-of-pearl, coffee, bananas, mahogany, live stock. Pop (1910) 37,505.

PANAMA CANAL.—The narrow Panama isthmus inevitably suggests the possibility of connecting Atlantic and Pacific by canal. The project dates from early XVI. cent., but although pioneers of various nations entertained it in turn, no practical progress was made till Ferdinand de Lesseps (*q.v.*) and a Fr. company made the attempt (1879–89), which—after a dozen miles had been excavated and some £50,000,000 expended—

failed through gross mismanagement, disease, engineering and other difficulties. In 1902 the U.S.A. assumed the heavy task; negotiations with Colombia (*q.v.*) broke down, but obstacles were speedily removed by Revolution whereby Panama (*q.v.*) established itself as independent republic; for $40,000,000 U.S.A. acquired rights of existing company, and for $10,000,000 (plus $250,000 yearly after nine years) P. granted (1904) a 5-mile zone on each side of canal. Anglo-Amer. Treaty (Hay-Pauncefote, 1901), superseding Bulwer-Clayton Treaty (1850), guaranteed neutralisation of canal and use on equal terms by all nations; on U.S.A. proposing to remit canal dues of American coastwise ships, Britain claimed submission of question to Arbitration Court, 1912–13.

Abandoning idea of sea-level canal, Americans finally adopted Colon-Panama route; work begun, May 4, 1904; official opening originally fixed for Jan. 1, 1915, but completion expected in 1913; estimated cost to U.S.A., *c.* $375,000,000. Credit of achievement is due to Army Engineers and Sanitary Department, who removed greatest obstacle—fever, by exterminating mosquitoes.

Canal will be *c.* 50 miles long; over 20 angles; time of passage, 10–12 hours; three sections—(1) Atlantic, with Gatun locks (raising ships 85 ft.—canal's highest level) and dam: (2) Central, with gigantic Culebra cutting (*c.* 90 million cubic yards of earth removed): (3) Pacific, with Miraflores locks; depth, 41 ft.; width, 300–500 ft.

P. C. will enormously reduce distance by ship between E. and W. coasts of America, between Europe and Australasia, etc.; New York to all U.S.A. Pacific ports shortened by 8000 or 9000 miles; Liverpool to New Zealand by *c.* 1500 miles; hence canal's inestimable importance to America, Europe, Australasia, and East.

Johnson, *Four Centuries of the Panama Canal* (1907); Edwards, *Panama: the Canal, the Country, and the People* (1911).

PAN-AMERICAN CONFERENCES, American International Conferences (*q.v.*).

PANATHENÆA, a great festival of ancient Athens in honour of the patron deity, Athena. The robe of Athena was carried in a procession and placed on Athena's statue in the citadel. Important contests in the arts were held during the festival.

PANAX, see GINSENG.

PANCH MAHALS (22° 50′ N., 73° 50′ E.), district, Gujarat, Bombay, India; chief town, Godhra. Pop. 265,000.

PANCREAS, a gland present in vertebrates (with exception of some divisions of fishes), originating from a diverticulum of the gut near the beginning of the mid-gut or the stomach. It secretes ferments, such as trypsin, which aid the process of digestion by changing proteids and peptones into amino-acids, starch into sugar, and fats into fatty acids and glycerine. The p. of cattle or sheep used as food is known as *sweetbread*.

PANDA, see RACCOON FAMILY.

PANDANACEÆ, natural order of tropical trees and shrubs; flowers are unisexual and arranged on a spadix.

PANDECTS, see JUSTINIAN I.

PANDERMA (40° 18′ N., 27° 57′ E.), town, ancient *Panormus*, Asia Minor, on Sea of Marmora.

PANDHARPUR (17° 39′ N., 75° 21′ E.), town, Sholapur, Bombay, India, on Bhima; place of pilgrimage. Pop. 34,000.

PANDION, OSPREY (*q.v.*).

PANDORA (classical myth.), first woman; created to place discord in men's hearts by her beauty. P.'s casket, opened by Epimetheus, contained all human ills, or, according to different legend, blessings on mankind.

PANDULF (d. 1226), papal legate sent to Eng. king, John; bp. of Norwich later.

PANDURA, TANBUR, MANDORE, BANDORE, an ancient stringed instrument of the lute kind, with vaulted back, long neck, and two, three, four, or six strings plucked by the fingers; oval-shaped p. used by Egyptians and, later, by Spaniards; pear-shaped p. used by Persians and Assyrians.

PANENTHEISM, name applied by Krause to his attempted reconciliation of theism and pantheism; God is not in the world, nor outside it, but the world is in Him, and He extends beyond it.

PANGENESIS, theory of Darwin that the egg or bud, the agent in reproduction, contains granules (*gemmules*) from cells in all parts of the parent body; the gemmules give rise to cells similar to those by which they were thrown off. See HEREDITY.

PANGOLINS, see under EDENTATES.

PANICLE, see GRASS.

PANICUM, see MILLET.

PANIN, NIKITA IVANOVICH, COUNT (1718–83), Russ. statesman; chief minister during regency of Catherine II. after revolution of 1792; initiated idea of alliance of northern powers, including Britain, against France, Spain, and Austria; failure of this policy led to his fall, 1781; bro., Peter (1721–89), was distinguished general; Nikita's s., Victor, was also a statesman.

PANIPAT (29° 23′ N., 77° 1′ E.), town, Punjab, Brit. India; scene of defeat of Mahrattas by Afghans, 1761. Pop. 28,000.

PANIZZI, SIR ANTHONY (1797–1879), Eng. librarian of Ital. stock; studied at Padua, but, being implicated in revolution of 1821, fled to Liverpool. In 1828 he became prof. of Italian at Univ. College, London; assistant librarian at Brit. Museum, 1831, and from 1856 to 1866 librarian-in-chief; always took a keen interest in cause of Ital. freedom.

PANJDEH, PENJDEH (36° N., 62° 40′ E.), village, fort, Russ. Turkestan, on Murghab.

PANNA, PUNNA (24° 44′ N., 80° 14′ E.), native state, Bundelkhand, Central India. Pop. 195,000. Chief town, Panna. Pop. 12,300.

PANNONIA, ancient country, part of Rom. Empire, lying S. and W. of Danube in Austria-Hungary; probably originally inhabited by brave but treacherous Illyrian race; country fairly productive and originally well wooded; chief rivers, Drave and Save.

PANŒTIUS (II. cent. B.C.), Stoic philosopher; b. Rhodes; succ. Antipater as head of Stoic school at Athens. See STOICS.

PANORAMA, all that the eye can see at one time; also used of photographs and models giving extensive views of towns, etc.

PANORMUS, Lat. name for PALERMO.

PANORPIDÆ, see SCORPION-FLIES.

PANPSYCHISM, theory that not only human beings have a psychical life, but that all through nature atoms and molecules exhibit a rudimentary life of sensation, feeling, impulse.

PANSLAVISM, movement towards unity of Slav peoples; took definite shape *c.* 1825; congresses at Prague (1848) and Moscow (1867). The Russo-Turkish War was declared, *inter alia*, to free oppressed Slavs (1877); plays great part in Austro-Hungarian politics, and on death of present emperor will become still more important. Russ. Panslavists desire to unite all Slav peoples under rule of tsar. The Balkan Alliance of 1912 is the most significant Panslavistic confederacy.

PANSY, HEARTSEASE (*Viola tricolor*), a herbaceous dicotyledon; many varieties are garden favourites; flower is pentamerous and has velvety texture.

PANTELLERIA, PANTALARIA (36° 48′ N., 12° E.), island to S.W. of Sicily, Mediterranean; produces olives, cereals; exports wine. Pop. 9100. Chief town, Oppidola.

PANTHEISM, the philosophical and religious conception which makes God and the Universe the same thing. It is found in Hindu, Gk., mediæval, and modern philosophy; one of its greatest exponents was the Jewish philosopher, Spinoza; but worship of a God who is 'imprisoned in His universe' fails to satisfy the religious needs of many.

PANTHEON.—(1) Rom. temple built to Mars and Venus by Agrippa, 27 B.C.; rebuilt in Hadrian's reign;

now S. Maria Rotunda. (2) building in Paris, originally Church of Sainte Guinevière (1746); now dedicated *Aux grandes hommes la Patrie reconnaissante*, burial-place of celebrities.

PANTHER, see under CAT FAMILY.

PANTHOLOPS, see CHIRU.

PANTIN (48° 53′ N., 2° 23′ E.), town, Seine, France; railway wagons, chemicals. Pop. (1911) 36,359.

PANTOGRAPH, instrument for copying maps, plans, sketches, etc., on the same or a different scale; consists of long wooden or metal arms so arranged that while the artist traces over the original figure with one, a pencil placed in another makes an enlarged, reduced, or exact copy as desired.

PANTOMIME (Lat. *pantomimus*, spectacular performance with incidental music), in modern times signifies a play dependent more on pageantry, gesticulation, and burlesque than on strength of plot or excellence of acting; developed from rustic ballets and folklore plays; greatly developed in Italy; imported into France, where it became extremely popular though more sophisticated. In Germany the rough *Hanswurst* died about 1740; its descendant is the *Zauberposse*.

In England the masque preceded the p., which began to develop independently on the decay of the former about 1700, and grew to be a regular Christmas entertainment, and the 'Harlequin,' 'Columbine,' and 'Pantaloon' were familiar figures till the later half of the XIX. cent. The earlier p's were characterised by the alternation of serious and comic interludes, as in *Perseus* and *Andromeda* (early XVIII. cent.).

The XX.-cent. p. is a composite affair, containing ballets, spectacular effects, popular songs, and topical jests. Of these the music is by far the most inferior —songs are specially written for a season and seldom survive it, while a sameness pervades both the theme and the execution. The inspiration which has been given to music of this nature by the United States since 1911 is doing much to improve the quality of p. music.

PANTÓN (42° 30′ N., 7° 40′ W.), town, Lugo, Spain. Pop. 13,500.

PANTOPODA, see PYCNOGONIDA.

PANTUN, a type of Malay verse imitated in French and English. The pantun is a quatrain rhyming *a*, *b*, *a*, *b*; the first two lines have no immediate connection with the following lines, or with each other, but furnish rhymes for the last two.

PAOLI, PASQUALE (1725–1807), Corsican soldier; almost won independence for Corsica; fled to England, where he received a pension; raised another unsuccessful insurrection, 1795.

PAPACY is the name given to the historic line of the bp's of Rome as supreme heads of the Catholic Church. The office is elective. The power of election lay originally with the neighbouring bp's, clergy, and the laity of Rome. But from time to time the emperors interfered, and even, it would appear, popes appointed their own successors. Still, in all such cases ratification was expected from the people. In VIII. cent. the laity were excluded, but brought back again in IX. In 1059 the power of election was limited to the cardinal bp's, but the assent of the lower clergy and laity was required. Finally, even this assent was abolished in the Œcumenical Council of the Lateran, 1139, which left the whole matter, as it is still, in the hands of the cardinals.

On the ecclesiastical side this institution claims to represent the supreme authority committed, according to its theologians, by Christ to St. Peter. It is based on a doctrinal interpretation of certain texts of Scripture in which St. Peter is singled out for some especial office, and the practical exercise of this primacy is traced to the *Acts of the Apostles* wherein, from the election of St. Mathias onwards, his assumption of this authority is depicted. It is contended further, that the Early Christian Fathers unexpectedly admit in their writings and in their actions some authority in the See of Rome, greater than in any other Apostolic Church, and that they themselves agree in tracing this back in a continuous line to St. Peter as the first bp. of that see. Indeed, a letter of Pope Clement, written as early as 96 A.D., is so strong and authoritative that Bp. Lightfoot describes it as 'the first step towards Papal Aggression.' Even the early heretics appeal to the supreme jurisdiction of the popes as to the highest court of dogmatic competence.

To this divine appointment as Head of the Church other powers were added almost by the mere action of time, or by momentum. Beginning with the doctrinal position of succeeding to the primacy of St. Peter, and consequently of having power to decide all controverted points of faith and morals, the Papacy by the sheer weight of its power gradually gathered round it the administration of the whole Church. Catholic theologians seem willing to admit that the full force of the pope's powers was not at first fully recognised, but that the result of experience and of development produced an evolution whereby the sovereign pontiffs have by a consistent growth become the central authority in the Church, not merely in matters concerning the Creed, but in disciplinary regulations as well. The glamour of the Rom. name had no doubt its part to play in helping on the acceptance of the papal sovereignty, but the Catholic divines would contend that this fixing on Rome as the seat of the Papacy and the results following therefrom were due neither to accident nor to craft, but to the direct divine command, given by Christ and accepted by St. Peter.

At the present day the influence of the pope in the Church is paramount. The centralisation of administration is immense; and the Definition of Papal Infallibility in 1870 at the Council of the Vatican has, of course, added enormously to the dignity of the office. Though generally admitted, this belief had not yet found its place in the Catholic Creed, nor was it very accurately determined. Now it is declared of obligation on the whole Church that when the Pontiff (*a*) as Shepherd and Teacher of all Christians (*b*) defines (*c*) a doctrine concerning faith or morals (*d*) to be held by the whole Church, he cannot err. The conditions of infallibility must be noted, for they are all essential.

Early History.—Viewed from its historic position, the Papacy has had a tumultuous career. At the conversion of Constantine it emerged from the Catacombs, where it had assumed a leadership even in martyrdom, and became a central power, dealing almost on equal terms with the emperors. The genius of the place at once affected the policy of the pontiffs. Without any attempt to allow the tangled Gnostic heresies, the Rom. Church developed along a practical line of law and order. Gradually as the Imperial government shrunk more and more to the city of Constantine and became more and more absorbed in Eastern affairs, the popes were left as bp's, and therefore as Imperial officials, in a city which still retained, at least in name, the idea of majesty. Europe found itself with only one central figure, which, by the weight of history behind it, was forced on by the momentum of the past. Working purely through disciplinary methods and continuously upholding to the restless East an unchanging Creed, the triumph of Rom. steadfastness was assured. Even the General Councils, which typified the collective infallibility of Christendom, were presided over by Rom. legates or had their decrees confirmed by the popes. Otherwise, said St. Athanasius, the Acts would have been contrary to tradition. For a while there was some sort of rivalry to be feared from Antioch, Alexandria, and Constantinople. But it was the latter only which caused any serious opposition. However, it never really boasted of more than equal jurisdiction. Rome alone claimed the dominion of the world. For the Papacy looked West as well as East. Missions were sent out to the Western Islands where Imperial legionaries

had never penetrated; then as the Teutonic tribes, which flooded Europe from East to West and in their ships harassed every coast, settled down within boundaries, they, too, were drawn to the civilising pale of the Church.

It was the age of Benedictine enterprise, and the religious orders have always been Rome's farthest reaching hand. These missions were Roman in liturgy, language, Canon Law, and cast of civilisation. Ireland came first, the Franks next, then England's pirate ancestors, the Saxons, later the Germans, Danes, Norsemen, Wends, lastly, far down into XIII. cent., the Poles and Hungarians. The old inheritance of the empire that St. Jerome thought to be shattered beyond recovery was found, when the dust had settled and there was peace, to have been remade by papal statecraft. Stone after stone of St. Augustine's city of God fell into place; and the Church rose in the Middle Ages like the jewelled Jerusalem of the Apocalypse, set about with the quaint magnificence of secular power.

Middle Ages.—From Leo the Great (440–61) to Innocent III. (1198–1216), the Papacy appears in Europe as the principle of novelty and progress, expanding and assimilating, standing indeed always upon precedent, interpreted, however, to apply with surprising force and unexpected modernity to questions of political and social importance. Out of this long line stand prominent, Leo I., Gelasius I., Gregory I., Nicholas I., Gregory VII., and then Innocent III. The first two belong to the Imperial tradition—Leo going out to meet Alaric and bidding him depart from Rome, Gelasius laying down the principles of ecclesiastical interference in the Christian polity. But with Gregory I. the Middle Ages began. His upbringing was monastic, and the glory of the mid-period of Christian history was almost entirely due to monasticism; his methods are eminently practical; his Scripture commentaries may be over-allegorical, they are never philosophical. To his hand, too, came the newly baptized sword of the Franks. The baptism of Clovis and the monasticism of St. Benedict were a hundred and fifty years old when St. Gregory received pontifical consecration. But he was the first to use them in their completest way. From the two really sprang forth feudalism. It is true that the idea of the Holy Rom. Empire was conjured up to prop a failing Frankish line, and that Gregory VII. had to reform the Benedictines before he could use them. It is true also that under Innocent III. came the fearless obedience of St. Louis, a Celt, not a Teuton, and the zealous activity of St. Francis and St. Dominic, friars, not monks. Yet for almost a thousand years it was the political religiousness of the Germanic nations and the civilising influence of Benedictine monasticism which made mediæval Christianity. For both, the pope was the power supreme. To the one he appealed as a Spiritual Emperor, to the other as an Imperial Abbot.

At once the pope began to fit himself in with human life, and took his place, no mean one, in the world's polity. By the will of the people he accepted the hegemony of the nations. He transferred the Empire from Greek to German, and in recompense was allowed to sit in judgment on each elected representative of the new line of Cæsars. He crowned emperors, anointed kings, hallowed the newly dubbed knights. His bp's sat in the royal Council Chambers and helped in the efficient working of the courts of justice. Through his influence fields were tilled, fens drained, cathedrals and univ's built, and Europe broke out into art and music and song. By canonisation he set high a moral excellence in king and bp., monk and knight, burgher and hind that made the Ages of Faith an astonishing epoch, without equal in the records of the children of men.

Of all this Dante sang; and his poem does not begin, but ends the second chapter of the Papacy. It became powerful, enriched; eventually it became enslaved, tangled in a system. The captivity of Avignon and the Great Schism ruined its political prestige and went far to unsettle the foundations even of its spiritual dominion. Its power had come to it because it had been a unifying principle; but now its action in the pragmatic sanctions of Bourges (1438) and Mainz (1439), and in its recognition of the *Compactata* of the Hussites (1433), completed its work of giving individual life to the nations.

The essence of Protestantism, politically seen in the adage *cujus regio, ejus religio*, spiritually in the claim of the individual to judge of all matters of faith by the light of his own illumination, is the very antithesis of the genius of the Papacy. For the latter the Church is founded on a rock; it is something which may grow, but never change, which is novel perhaps, but always traditional, which is adaptable to modern life only because it stands in the full stream of all past human experience. Young nationalism, therefore, expressed, for example, in the Tudors, in German territorialising princes, even in Span. and Fr. monarchies, chafed under the Papacy. Some left, some remained. But over all the Papacy lost its true papal power. It hardly felt at home with the political organisation of Europe from the Renaissance to the Revolution. It lay crushed under the absolutism which Protestantism unconsciously produced. Philip II. really ruled his empire according to the political science, not of Julius II. or Pius V., but of Luther and Calvin.

Modern Times.—The Papacy, therefore, almost from XV. to XIX. cent., though it could boast of some great rulers, like Eugenius IV., Pius II., Pius V., Benedict XIV., etc., relinquished its imperial task of guiding the life of Christendom. Several of the popes, whose genius lies enshrouded in the massive decrees of Trent, issued well-balanced legislation, but it was chiefly to regulate the clergy, only in a minor fashion to guide the lay-folk.

Since the Revolution, the popes have once more taken their old place in the hegemony of the nations. Against Napoleon, Pius VI. and Pius VII. were really the leaders of traditional Christendom; under Pius IX., Leo XIII., and Pius X. the same force is to be noticed. Even among Christians who would reject any alliance with the spiritual claims of the Papacy, this institution is looked upon as the bulwark of the orthodox faith. It is regarded now as it was regarded by the East in the early ages, as the one great organised rule which moves but is unmoved, which, because it rests all its power on the traditions of the race and not on the individual's private judgment, has marched in majesty down the high road of human destiny, avoiding all bypaths and even all short-cuts. Here is its danger, because here is its power. When alone and without rivals it has a tendency to be progressive; when it finds itself surrounded with institutions which claim private judgment and the right to break off from the main advance, its tendency is to cling to the past, for it sees from its neighbours all the evils of too rapid change.

On the whole the Papacy has stood for the development of Europe and the human race, and, if now and again she may have appeared narrow in her ideas, her conduct has been in every century broad-minded and deep-thinking. She alone, too, is there left of all the older world; round her alone can the history of Christendom be written, for she traces back her unbroken line from Pius to Peter. 'Its chronicle has been a tragedy and a romance, or, as millions of its faithful believe, a prophecy and a fulfilment.' See ROMAN CATHOLICISM.

Hergenroether, *Catholic Church and Christian State* (1889); Milman, *Latin Christianity*; Allies, *Formation of Christendom* (London, 1904); Harnack, *History of Dogma*; Pastor, *History of the Popes* (1898); Creighton, *History of the Papacy* (1882); Horace Mann, *Lives of the Popes* (1902); Barry, *Papal Monarchy* (1902).

THE POPES.

Below will be found a complete list of the Popes from S. Peter to Pius X., with the date of their accession. In the case of the first 26 the dates are doubtful. (S. is prefixed to names of those canonised and B. to those beatified.)

	A.D.
S. Peter,	40
S. Linus,	67
S. Anacletus, or Cletus,	78
S. Clement I.,	90
S. Evaristus,	100
S. Alexander I.,	107
S. Sixtus I.,	116
S. Telesphorus,	125
S. Hyginus,	136
S. Pius I.,	142
S. Anicetus,	154
S. Soter,	168
S. Eleutherius,	177
S. Victor I.,	189
S. Zephyrinus,	200
S. Calixtus I.,	218
S. Urban I.,	222

Pius X.,	1903

PAPAL STATES, see STATES OF THE CHURCH.

PAPAVERACEÆ, natural order of plants; flowers, on long stalks, have two sepals and four petals; fruit is a capsule containing many seeds; yields opium (*q.v.*).

PAPAVERINE, see OPIUM.

PAPAW (*Carica papaya*), S. Amer. tree yielding melon-like fruit, which is used as a vegetable and peptoniser.

PAPEETE, PAPEITI (17° 32′ S., 149° 34′ W.), seaport, Tahiti; capital of Society Islands. Pop. 3700.

PAPENBURG (53° 4′ N., 7° 26′ E.), town, Hanover, Prussia; shipbuilding yards. Pop. (1910) 8430.

PAPER, material used for wrapping, writing, and printing, as well as a variety of other purposes.

History.—Paper was probably first made in Egypt, China, and Japan. Egyptian p. was made from the papyrus, a kind of rush which grew to a height of 10 feet in marshy districts. The outer covering of the rush was removed and the stems sliced longitudinally. They were then woven together by hand, moistened with Nile water, pressed, dried, and finally smoothed. Up to about the X. cent. most p. used in Europe was imported from Egypt. According to the Chinese, the manufacture of p. from cotton or other vegetable fibres commenced in II. cent. B.C. P.-making was probably introduced into Europe by the Arabs, and p. was first made from cotton fibres in Spain about XI. cent. Later the manufacture was carried on in Germany, France, and Italy. Until about 1495, however, p. was entirely hand-made, and large quantities were imported from France and Holland. John Tate in XV. cent. commenced to manufacture p. at Stevenage (Herts), and his mill was probably the first p. factory in England. P.-making was commenced in Scotland in 1685. P. was up to this time made chiefly from cotton and linen rags, but towards the end of XVIII. cent. p.-makers commenced experiments with a view to manufacturing p. from vegetable fibres other than those already mentioned. It was found that esparto grass, straw, and even wood pulp might be used as the basis of p. The demand for p. nowadays is so great that over 400 varieties of woods and grasses have been, and are, used; rags are only used for the better qualities of writing-p. *Esparto grass* abounds in North Africa and south-eastern Spain. The crop is plucked, not cut, and over 200,000 tons are imported into England annually from Spain alone, while some £2,000,000 worth of wood pulp is sent to England from Norway and Sweden.

Paper-Making.—Whether p. be made from wood,

rags, or grass, the primary substance contains a considerable portion of foreign matter, which must be removed and the remainder pounded to pulp before ready for use. *Wood* is cut into small cubes, which are crushed by rollers and then boiled in a solution of soda or sulphuric acid. This softens the tough fibres and reduces the whole to a pulp. It is imported into Britain in this form, resembling sheets of brown cardboard, and is thus received at the p.-mill. *Rags* are sorted, dusted, cut up into small pieces by machinery, boiled, and thoroughly cleansed before being reduced to a pulp. *Grass* is sorted and dusted and placed in boilers, which each hold about 3 tons of grass. Steam and caustic soda solution are then introduced for several hours, and the grass thus reduced to a pulp. Wood, rag, or grass pulp is now bleached, sized, and coloured. Sometimes each variety is mixed together in varying quantities, or they may be used separately —depending on the required quality of the finished p. The pulp is next poured into square frames or trays, which have a fine wire mesh for a bottom; this allows the water to drain off, and the pulp then settles in thin sheets. Pressure is applied to squeeze out the moisture, the sheets are sized (and if necessary glazed), and finally dried and cut to the required size. *Machine-made p.* was first manufactured in France, at the end of XV. cent. Pulp is placed in troughs and fed to strainers. When the water has drained off, the sheets are passed between a series of felt-covered rollers and sized by passing between hot cylinders. Glazing is done by cast-iron rollers, and the finished p. is wound on reels at the 'dry end' of the machine.

PAPER NAUTILUS, a genus of Cephalopoda (*q.v.*).

PAPER DUTY, see NEWSPAPERS.

PAPHLAGONIA, ancient mountainous district on N. side of Asia Minor, along Black Sea; boundaries uncertain; famous for hunting-grounds; known to Greeks in mythical period; *Paphlagon*, according to Argonautic legends, eponymous hero.

PAPHOS, PAPHUS, two towns on W. coast of Cyprus.—(1) Old P., on river Bocanus, was chief seat of worship of Aphrodite. (2) New P., on fertile plain.

PAPIAS, bp. of Hierapolis (*c.* 60–135 A.D.), included in Apostolic Fathers (*q.v.*); wrote *Exposition of the Lord's Oracles*, of which fragments are preserved in Eusebius. The work is valuable, as P. knew St. John and Polycarp.

PAPIER MÂCHÉ, substance manufactured from useless paper by pulping and drying, or by superimposing several sheets of paper one on another, and subjecting the whole to pressure; sometimes admixed with earthy substances; used for pilaster work, surface for gilding, and other japanned ornaments, masks, etc. The p. m. work done in Japan is world-famous.

PAPILIONACEÆ (Lat. *papilio*, butterfly), division of plants, order Leguminosæ; flowers have 5 petals, one of which, the *standard*, is superior; 2 inferior, forming the *keel* or *carina*; 2 lateral, forming *wings* or *alæ*; types are Pea, Bean, Clover, Broom, etc.

PAPIN, DENIS (1647–*c.* 1712), Fr. physicist; b. Blois; physician, then prof. of Mathematics, Marburg; invented 'digester,' safety-valve, and discovered principle of siphon; with Boyle experimented on properties of gases.

PAPINEAU, LOUIS JOSEPH (1786–1871), Canadian politician; leader of Fr. party in Quebec Parliament; chosen Speaker, 1815, and again, despite Dalhousie's opposition, in 1827, thus causing adjournment of Parliament; drew up 92 disloyal 'Resolutions' and advocated stoppage of supplies; Britain rejected demands, with result that riots broke out, 1837; forced to fly; returned at amnesty, 1840.

PAPPENHEIM, GOTTFRIED HEINRICH, COUNT OF (1594–1632), Ger. soldier; famous cavalry general on Catholic side in Thirty Years War; left for dead on field of *Prague*, 1620; field marshal, 1630; assisted in sack of Magdeburg, 1631; blamed for undisciplined fury as commander of cavalry at *Breitenfeld*, 1631; slain at *Lützen*.

PAPPUS OF ALEXANDRIA (fl. III. cent. A.D.), Gk. mathematician; known chiefly by his great work of eight books, of which only part remain; also wrote commentaries on the works of Ptolemy, Diodorus, and on the *Elements* of Euclid; only fragments of the latter have survived. P.'s great work gives a systematic account of the most important results of earlier writers, together with additions and notes. The theorems on centres of gravity named after Guldinus are due originally to P.

PAPUA, see NEW GUINEA.

PAPUANS (from the Malay *papuwah*, 'woolly-haired'), a tall race, dark brown to black in colour. Their origin is still disputed. They dwell in village communities in New Guinea, without priests, or hereditary chiefs. Except for the converts to Islam and Christianity they are spirit worshippers and pagan; great boat-builders and house-builders. Communal houses, 500 to 700 ft. long, are found in various parts of New Guinea, but generally each family has its own separate dwelling, 60 to 70 ft. long. Bows and arrows, stone and hardwood clubs and spears are the chief weapons. Stone axes are the commonest instruments used. The P. are akin both to E. Africans and aboriginal Australians in many customs and habits. Polygamy is common amongst them, but there are certain prohibited degrees of affinity. Their numerals do not go beyond 5.

PAPYRUS (*Cyperus papyrus* = *Papyrus antiquorum*), a reed allied to the sedges, which grows abundantly along the banks of rivers in hot countries (*e.g.* the Nile). The shoots attain a considerable height and have an extremely graceful appearance, the leaves forming a pendent crown. The flowers are borne in spikelets enclosed by long bracts. The pith of the stem was utilised by the ancients in the manufacture of paper, being cut into strips, which, whilst still wet, were pressed together. Much valuable lit. is preserved to us in ancient papyri, some taking the form of rolls (*volumina*), whilst others were composed of flat sheets bound together bookwise. The oldest known specimens date from about the XXXV. cent. B.C. See PALÆOGRAPHY.

PARÁ (GRÃO PARÁ) (4° S., 52° W.), state, Brazil, bounded by three Guianas, Atlantic and other Brazilian states; area, *c.* 443,900 sq. miles; thickly wooded and well-watered region; communication carried on by rivers, chief of which, Amazon; principal towns, Pará (capital), Alemaquer, Breves, Bragança, and Obidos; considerable stock-raising; fruits and cacao cultivated; rubber, gutta-percha, tonka beans, sarsaparilla, gums, and Brazil nuts produced. Pop. 570,000.

PARÁ, BELEM, BELEM DO PARÁ (1° 28′ S., 48° 24′ W.), city, port, capital of Pará State, Brazil, on Pará River; well laid out, with several fine squares and gardens; notable buildings are XVIII.-cent. cathedral, bp.'s palace, episcopal seminary, theatre, municipal and government buildings, public library, and Museum. P. was founded, 1615, by Portuguese; scene of many revolts; connected with Bragança by rail; important centre of commerce, and entrepôt for Amazon River trade. Pop. 120,000.

PARABLE, simple story with allegorical interpretation; popular since earliest times in Oriental countries; frequently employed in New Testament.

PARABOLA, the curve of section of a cone by a plane parallel to a generating line of the cone; or the locus of a point which moves so that its distance from a fixed point (*focus*) equals its distance from a fixed straight line (*directrix*). Taking the axis of symmetry for Ox and the vertex of the curve for origin, the Cartesian equation is $y^2 = 4ax$, where a is the distance of both focus and directrix from the origin. See CONIC SECTION.

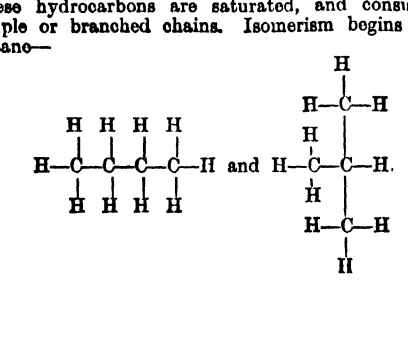
PARACELSUS (*c.* 1490–1541), Ger. physician; the

name given to himself by Theophrastus Bombast von Hohenheim; b. in Swiss canton of Schwyz; s. of a physician; received his early education from his f.; at age of 16 entered Basel Univ., but soon left to study chem. under Trithemius, and deserted him, in turn, to go to the mines of Tyrol to study minerals and metals. P. became convinced of the superior value of personal experience to theory and scholarship, and wandered over Europe studying diseases and the practice of med.

Returning to Basel in 1526, he became town physician, and lectured on med. in the univ. in the Ger. language, and not, as customary, in Latin, attacking the prevailing methods of the physicians and apothecaries and propounding his own views with much success. He was involved in many disputes, and, on becoming embroiled with the authorities, fled from Basel to Esslingen, and wandered, staying a few months at each place, in succession, to Colmar, Nuremberg, Appenzell, Zürich, Augsburg, and many other towns. Eventually he settled, in 1541, at Salzburg, under the protection of Abp. Ernst, and there in the same year he died, the cause of his death being uncertain, his friends attributing it to violence at the hands of his enemies, the physicians and apothecaries.

Of some 360 works which he is said to have written, only from 10 to 24, according to different authorities, are admitted as genuine, the others being assigned to disciples. Collected editions and translations into Latin, English, and other languages were published during the XVII. cent., but are now very rare. The influence of P. was very great in encouraging the direct observation of nature, with experiment and research, in opposition to mere annotation of Galen and other ancient physicians, and scholastic disputation. See MEDICINE.

Hartmann, *Life of P.*; Waite, *Hermetic and Alchemical Writings of P.*



PARACHUTE, an apparatus by which descents may be made from balloons or dirigibles; in shape it resembles an umbrella, and from its extremities metal stays are passed to the main upright to prevent it being turned inside out. Blanchard was first practical parachutist, 1793. Experiments are at present being carried on in connection with descent by parachute from aeroplanes.

PARADISE (Gk. *paradeisos*), the place of future bliss of the righteous in Christian and other religions. The word is of Persian derivation, and the Hebrew derivative is used of an enclosed part of garden in the Old Testament.

PARADOXURUS, a carnivore; see under CIVET FAMILY.

PARAFFIN, name given to the methane series of hydrocarbons, because p. wax consists chiefly of some of the higher members of this series. The name—derived from Lat. *parum affinis*, 'small affinity'—was given to the wax on account of its chemical inertness, which is shared by all the members of the series.

The p. hydrocarbons form a homologous series having the general formula C_nH_{2n+2}; there is thus a common difference of CH_2 between adjacent members, *e.g.* Methane, CH_4; Ethane, C_2H_6; Propane, C_3H_8; Butane, C_4H_{10}; Pentane, C_5H_{12}; Hexane, C_6H_{14}. These hydrocarbons are saturated, and consist of simple or branched chains. Isomerism begins with butane—

With the higher members isomers are more numerous. The p's occur as natural gas, petroleum, and earth wax or *ozokerit*. They are prepared—

(i) By heating the alkali salt of a fatty acid with alkali (*e.g.* soda-lime)—

$$CH_3.COONa + NaOH = CH_4 + Na_2CO_3.$$

(ii) By reduction of alkylhalides with nascent hydrogen or sodium—

$$CH_3I + 2H = CH_4 + HI$$
$$2CH_3I + 2Na = C_2H_6 2NaI.$$

(iii) By electrolysis of aqueous solutions of the alkali salts of fatty acids—

$$2CH_3.COONa + 2H_2O = C_2H_6 + 2NaHCO_3 + H_2.$$

Pentane is the first liquid hydrocarbon; thenceforth there is a fairly constant rise in B.P. and S.G. from member to member. The p's are insoluble in water, but dissolve in alcohol, ether, etc. They are not acted on by strong acids or alkalis, nor by oxidising or reducing agents, but form substitution products with chlorine.

PARAGUAY (25° S., 56° W.), inland republic, S. America, bounded N. by Bolivia and Brazil, E. by Brazil, S. and W. by Argentine; area, *c.* 171,200 sq. miles. Republic is divided from N. to S. by Paraguay River, eastern portion being larger and more important; large tract to W. of river unexplored. Surface consists of undulating plains, low hills, swamps, and dense forests; highest ground to be found in N. and E. Chief rivers are Paraguay, Pilcomayo, and Paraná. Soil is rich and fertile, vegetation luxuriant; leading industries, stock-raising and cultivation of *yerba maté* (P. tea), rice, sugar, tobacco, maize, and coffee; forests produce fine timber, gums, dyes, and oils. Principal towns are Asuncion (capital) and Villa Rica; inhabitants chiefly Spaniards and Indians. Pres. is elected for four years. P. was visited in 1515 by De Solis, and in 1526 by Cabot; colonised by Spanish; from 1608 progress made under administration of Jesuits until their expulsion, 1768; P. declared independent, *c.* 1811; 1865–70, war against Brazil, Uruguay, and Argentine, resulting in complete defeat of P.; frequent revolutions, *e.g.* 1911–12. Pop. *c.* 750,000.

La Dardye, *Paraguay* (Eng. edit., 1892).

PARAGUAY TEA, see MATÉ.

PARAHYBA.—(1) (7° S., 37° W.) maritime state, N. of Pernambuco, Brazil, S. America; surface elevated; chief products, cotton, sugar. Pop. 520,000. (2) (6° 58′ S., 34° 59′ W.) city, capital of above; port on river P. Pop. 30,000.

PARAHYBA DO SUL (21° 40′ S., 40° 50′ W.), river, Brazil, S. America; rises in state São Paulo; flows into Atlantic.

PARALDEHYDE ($C_6H_{12}O_3$), colourless liquid, with odour resembling ether and burning taste, obtained by the action of various acids or salts on aldehyde; used in med. as a hypnotic, especially to produce sleep in the insane, and, as it does not act on the heart, in patients with heart disease.

PARALLAX (Gk. *parallasso*, 'I vary'), the amount of apparent change in position of any distant object as seen from two points. Identical with p. is *Triangulation*, the former term being used in connection with Astronomy. The two eyes of a human being (and animals) form a parallax, and so enable us to judge distances. Theoretically, two observers at different parts of the earth, working in conjunction, might take the altitude and azimuth of a given star and, knowing the distance between their two stations, apply Triangulation and thus measure the distance of the star from the earth. However, in practice it is found that the distances of even the nearest stars are so vast that the diameter of the earth is useless as a base, and so observations are made after an interval of six months by the same observer, for in this time the earth will have made half a circuit of her orbit, which is thus used as a base. The majority of stellar distances are so immense, however,

that even with this huge base (186 million miles) it is impossible to obtain parallaxes for the majority of the stars.

PARALLELISM (*Psycho-physical*), theory that every conscious process or variation of conscious process is accompanied by a corresponding nervous process or variation of nervous process.

PARALYSIS, Palsy, condition in which there is loss or impairment of the power of voluntary muscular contraction or movement, the loss being either generalised in the muscles all over the body, or localised to one or several muscles. The course of the motor impulses from the brain to the muscles is in two main segments, motor nerve fibres passing from the motor nerve cells in the grey matter of the cortex of the brain by the motor tracts of the spinal cord to the anterior horn of grey matter of the cord, and from the nerve cells these motor nerve fibres go, by the anterior nerve roots, to the muscles. If there is injury or disease of the part of the brain controlling voluntary movement or of the motor tracts of the spinal cord, *i.e.* of the first segment of the course of motor impulses, loss of voluntary muscular power results; while if there is injury or disease of the anterior horn of grey matter of the spinal cord, of the anterior nerve roots, or of the motor nerve fibres to the muscles, *i.e.* of the second segment of the course, there is, in addition to loss of voluntary muscular power, atrophy of the muscles supplied by the fibres concerned. Besides being due to injury or disease of nervous structures (*organic paralysis*), p. may be due to functional derangement of the part of the brain controlling voluntary muscular movement, as in such mental conditions as hysteria, or *functional motor paralysis*; in addition, p. may be due to injury or disease of the muscles themselves.

Hemiplegia, p. affecting one side of the body, is due to a lesion of some part of the motor tract in the brain above the medulla oblongata. The chief causes are, when the onset has been sudden, injury, hæmorrhage, embolism (blocking of a cerebral artery), thrombosis (clotting of the blood in a cerebral artery, due usually to disease of its wall); and when the onset has been gradual, a tumour of the brain, altered states of the blood (*e.g.* in anæmia, diphtheria), abscess, chronic cerebral meningitis, or chronic degenerations of the nervous system.

Paraplegia, p. of both legs, is due usually to disease or injury of the spinal cord. The more common causes are pressure on the spinal cord as a result of injury or disease of the spine (*e.g.* fracture, curvature, or caries), and injury or disease of the cord itself (tumours, or acute or chronic inflammation).

Infantile Paralysis (*acute anterior poliomyelitis*) is a form of p. often occurring in young children, due to an acute inflammation of the anterior horn of grey matter of the spinal cord. The legs are usually first affected, but all the limbs or only a group of muscles may be implicated, and the muscles soon atrophy. There may be permanent deformity or a wasted limb, after recovering motor power.

Progressive Muscular Atrophy is the result of chronic inflammation with sclerosis of the anterior horn of grey matter. It is a disease usually of adult life, in which there is slow and gradual atrophy of groups of muscles, commencing generally in one or both arms, at the muscles of the hand. A characteristic feature of the disease is the peculiar fibrillary twitchings of the affected muscles.

Bulbar Paralysis, due to disease of the medulla oblongata or bulb, occurs most often in old persons, and is frequently associated with chronic diseases of the spinal cord. It is characterised by gradual p. and atrophy of the muscles concerned in speaking, mastication, and swallowing (*i.e.* of tongue, lips, pharynx, etc.), and is accompanied by difficulty in articulation, eating, swallowing, and sometimes in breathing. It invariably ends fatally, either from inanition or from pneumonia or similar complications.

Neuritis, or inflammation of a nerve or nerves, may cause p. of a muscle, a group of muscles, or an entire limb, owing to swelling and compression (*e.g.* the facial nerve in its long passage through the skull); while a *multiple neuritis*, causing a paraplegia, may occur in toxic conditions, such as lead or arsenic poisoning, diabetes, and similar toxæmias.

Pseudo-hypertrophic Paralysis (*progressive muscular dystrophy*) is a hereditary disease, usually affecting boys, transmitted through the females of a family who are not themselves affected. There is progressive weakness, with hypertrophy of some muscles and atrophy of others, while certain deformities are caused through the construction of muscles not being antagonised by those which are paralysed, the gait being peculiar and characteristic. Where the muscles are apparently enlarged there is really atrophy of muscle fibres, with increase of fibrous tissue and fat, the muscles of the calves and buttocks being those which are generally much hypertrophied. The essential changes are, therefore, not in the nervous system, but in the muscles themselves.

Parkinson's Disease, *Paralysis agitans*, is a chronic affection, usually occurring after the age of 50, characterised by progressive weakness, rhythmical tremors of certain muscles, a distinctive attitude, the body being bent forward, and a peculiar gait, at first slow and then trotting. It is believed to be due to a senile condition of the brain cortex.

The *General Treatment of Paralysis* includes rest in bed, support of the strength of the body, regulation of nutrition and of the excretions, careful attention to the action of the heart and of the lungs, regular sound sleep must be ensured, and for these purposes stimulants and other drugs are given as required. Precautions must be taken to prevent bed-sores, to which paralytic patients are very liable, and the skin of prominent parts exposed to pressure is bathed with eau-de-Cologne or methylated spirits. Massage and passive movement are employed with benefit after acute symptoms have disappeared, and electricity is often of value in maintaining the nutrition of atrophied muscles.

PARAMARIBO (6° 50′ N., 55° W.), capital, Dutch Guiana, on Surinam; exports coffee, sugar. Pop. (1910) 25,346.

PARAMATTA, Parramatta (33° 40′ S., 151° E.), town, on Paramatta, New South Wales, Australia; trade in fruit. Pop. 14,500.

PARAMŒCIUM, see under Infusoria.

PARANÁ.—(1) (20° 30′ S., 55° W.) southern state, Brazil; area, 85,451 sq. miles; large area forested; produces tea; chief town, Curityba. Pop. 327,130. (2) (31° 45′ S., 60° 38′ W.) capital, Entre Rios, Argentina, on Paraná, S. America. Pop. 41,000.

PARANAGUA (25° 33′ S., 48° 24′ W.), seaport, Paraná, Brazil, on Bay of Paranagua. Pop. 6300.

PARANDHAR, hill fort, sanatorium, Bombay, India, 20 miles S.E. of Poona.

PARANOIA, term which has been used for a considerable period in Germany and in America, and which is now coming into use in England, to define a type of insanity which is characterised by a marked and permanent delusion, while the affected person may be in other respects sane. In persons thus affected there is nearly always a hereditary tendency to mental or nervous derangement, and the condition is of slow and gradual evolution. Queerness and eccentricities of conduct frequently develop, the power of reasoning is affected, there may be delusions of grandeur and self-importance or of persecution and morbid suspicion. Normal instincts and ideas of morality are changed, the affected person's affection for his wife, parents, brothers, or sisters disappears; he dislikes the society of his fellow-beings, and his sexual instincts may be perverted. Persons affected with this type of insanity may be dangerous, and often commit crimes. King Louis II. of Bavaria, with his love of music and friendship with Wagner, his wild

extravagances, his various eccentricities of conduct, the sexual perversities of which he is suspected, and yet his statesmanlike action in regard to the war of 1870, is a well-known and typical example of the paranoiac. Change of scene, a nourishing diet, an open-air life, and similar conditions which will induce a healthy state of body, with diversion of the mind, and removal of all possible causes of irritation, is the treatment for paranoiacs, but the prognosis is bad in all such cases which have lasted over a year. See INSANITY.

PARAPLEGIA, *see* PARALYSIS.

PARASITIC DISEASES is a term now much more comprehensive than a few years ago, for many diseases formerly classified otherwise have been recently brought under this heading. Many are caused by bacteria, others by vegetable parasites of a somewhat higher type, while others again are due to parasites which are low forms of animal life. In certain diseases, in all probability of parasitic origin, the precise etiology is still obscure; while there are other diseases, such as some forms of anæmia, which, while they may be the result of the presence of animal parasites in the intestine, can hardly be included under the heading of parasitic diseases.

The diseases here considered may be sub-divided under A., those caused by vegetable parasites, including (1) those due to the pyogenic micrococci, (2) those due to specific bacilli, and (3) those due to higher forms of vegetable life; B., those caused by animal parasites, including (1) those due to protozoa, and (2) those due to higher forms of animal life; and C., those infective diseases (1) in which, although a micro-organism has been found, it has not been absolutely proved to be the cause of the disease; and (2) those which have not been proved to be caused by micro-organisms, although in all probability caused by them.

A. (1) SUPPURATION and SEPTICÆMIA are most commonly caused by the pus-forming or pyogenic bacteria, in the former causing the death and digestion of the tissues with which they come in contact, and an emigration of leucocytes which may, to a greater or less extent, break down under the influence of their toxins, and thus, with the dead and digested tissues, form pus; while in the latter the toxins formed at the point of introduction of the bacteria into the tissues, are absorbed into the blood, giving rise to fever and other untoward symptoms, and may cause secondary abscesses in other tissues or organs. The chief pyogenic bacteria are the *staphylococci* (micrococci arranged like grapes in bunches), *streptococci* (micrococci arranged in chains), and, less commonly, *pneumococci*, *bacillus pyocyaneus*, *bacillus coli communis*, and the *typhoid bacillus*.

ERYSIPELAS is an infective inflammation of the skin which is caused by a streptococcus, the *Streptococcus erysipelatis*, the advance of which in the skin is prevented by painting a ring of iodine some distance from the zone of inflammation.

ENDOCARDITIS may take place in certain forms of septicæmia, caused by the *Streptococcus pyogenes*, the *Staphylococcus pyogenes aureus*, the most common of the staphylococci, the *pneumococcus*, or less commonly the *gonococcus*, the *tubercle bacillus*, or the *typhoid bacillus*. Endocarditis due to the streptococcus has been successfully treated with anti-streptococcic serum.

GONORRHŒA is an infective inflammation of the urethra, due to a small diplococcus, the *gonococcus*, which may also be found in the conjunctiva, in gonorrhœal conjunctivitis, in the fluids of joints affected with gonorrhœal arthritis, and, more rarely, in the vegetations of gonorrhœal endocarditis, or in the pleuritic fluid.

A. (2) PNEUMONIA was at first attributed to the action of the pneumobacillus discovered by Friedländer, but it was found later that a much more active agent in the causation of the disease was an encapsuled diplococcus, the pneumococcus of Fraenkel. An anti-pneumococcal serum has been produced, but more accurate information regarding its action and value in treatment is still required.

ANTHRAX may attack man in various forms, according to the method of infection, malignant pustule being a local lesion of the skin, while the disease may also be of an intestinal or of a pulmonary ('Woolsorters' disease') type. The specific organism is the *anthrax bacillus*, which is a comparatively large, rod-like organism, found either single or in short chains, and forming spores under adverse conditions of life. A vaccine has been prepared from cultures of the bacillus which is successfully employed in immunising animals against the disease.

TYPHOID FEVER is an acute infectious fever caused by a micro-organism which is a somewhat short bacillus, with rounded ends, and surrounding it there are numerous long flagella, which give the bacillus its characteristic appearance. In addition to being present, in the disease, in the lymphatic follicles of the intestine, the bacilli are also in the mesenteric glands, the spleen, liver, and kidneys, and are found in the fæces and urine. A vaccine has been prepared from cultures of the bacillus which confers a very marked, if not altogether complete, protection on persons in whom it is inoculated.

DIPHTHERIA is caused by a slightly curved, rod-shaped micro-organism, a small bacillus with rounded ends which shows, when stained for microscopical observation, clear unstained spaces in its body, while aberrant types may be spindle-shaped, wedge-shaped, or, under certain conditions, club-shaped. In the disease they are found in large numbers on the surface of the diphtheritic membrane. An antitoxic serum, prepared by injecting into a horse the filtered products of the bacillus, is now universally employed in the treatment of the disease, successfully neutralising the action of the bacillus and its toxins in the patient; and the death-rate of the disease has fallen, since the introduction of the antitoxic serum, from about 40 % to under 10 %, while the mortality is practically *nil* when the serum is administered on the first manifestation of the disease.

TETANUS (or *Lockjaw*) is a disease caused by a micro-organism which grows in long slender threads, which break up into shorter motile rods surrounded by flagella, and these bacilli eventually become non-motile, lose the flagella, and form spores at one end, giving them the characteristic 'drum-stick' appearance. The bacilli are found, in the disease, only at the local lesion in which it is inoculated, and the effects are due to the action of the toxins of the bacilli upon the central nervous system.

CHOLERA is due to the 'comma' bacillus or vibrio, which is a slightly curved rod with a flagellum at either end, unable to reach its full development in the healthy stomach and intestine, and therefore exerts its evil effects upon the individual only when the digestive tract is deranged, *e.g.* by eating unripe fruit, or by intemperance. Haffkine has prepared a vaccine from cultures of the cholera bacillus, which seems to be an efficient protective against attacks, but more statistics in regard to this are still required.

RELAPSING FEVER is caused by a micro-organism, the *Spirillum obermeieri*, which is found in the blood of persons in the acute stage of the disease, while during the periods of intermission the organisms appear to disappear from the blood and go to the spleen. Infection is believed to be carried by some blood-sucking insect.

YELLOW FEVER is an infective fever, affecting chiefly the blood vessels of the liver, kidney, and gastro-intestinal system, and appears to be caused by a specific micro-organism, but up to the present, although different authorities have isolated organisms which they have assigned as the cause of yellow fever, the evidence does not sufficiently point to any one organism. It has been proved, however, that the intermediate host is a mosquito, the *Stegomyia fasciata*, and

by preventive measures, such as the draining of the stagnant pools where the mosquitoes breed, and the extensive use of mosquito nets, the spread of the disease has been controlled in districts where it was formerly endemic.

PLAGUE is caused by a short, oval bacillus with rounded ends, and when stained for microscopical examination a broad, clear, unstained band is left in the middle. In the body the bacilli are present in the lymph glands, the blood, and the spleen, and in the pneumonic form, in the lungs and sputum. It is found in the fæces and urine, which must therefore be carefully disinfected in cases of plague. Infection is carried by three different species of fleas living on two species of rat, and when an infected rat dies the fleas leave it for human beings, who thus become infected. Haffkine has produced a vaccine, of a type similar to his cholera vaccine, for the treatment of plague from cultures of the bacillus, which is of great value in preventing or diminishing the virulence of attacks. In individuals already attacked it has no effect, and in such cases the serum obtained by Yersin by inoculation of plague in a horse is employed with much success.

TUBERCULOSIS is due to a micro-organism which is a delicate rod, generally very slightly curved, and, when stained, shows clear spaces alternating with deeply stained masses in its substance. It may be found in the body, in the lungs and sputum, in lymph spaces and lymph glands, in tuberculous ulcers in the intestine, in the skin (in lupus), and in tuberculous nodules in all parts of the body. Koch, the discoverer of the bacillus, prepared from cultures a product termed tuberculin, which at first failed to produce the therapeutic effects expected of it, although, by the researches of Sir Almroth Wright regarding the opsonic index, a more exact knowledge of the factors affected has enabled more successful results to be obtained. In regard to diagnosis, however, tuberculin has been of great value, producing a characteristic reaction when administered by injection, or by treating the skin as in vaccination against small-pox, and applying the tuberculin in the same manner as calf lymph; a third method is to drop a weak solution into the conjunctival sac of the eye, producing a characteristic conjunctivitis.

LEPROSY is due to a bacillus which is very like the tubercle bacillus, but differs from it in being shorter and in having somewhat different staining properties. The bacilli are found in the body in a gelatinous substance in the lymphatics of the skin, or, in another form, they may affect the nerves.

A. (3) ACTINOMYCOSIS is due to a fungus, which is a streptothrix, found in long threads, or, under certain conditions, assuming a club-like form through the swelling of the sheath of the thread. It may affect any of the organs of the abdomen or thorax, cavities containing a purulent mass being formed.

MADURA FOOT is a tropical disease, occurring in India, due to a streptothrix, resembling that of actinomycosis.

B. (1) MALARIA is a disease which assumes various forms, due to various species of a protozoal parasite, the differences being chiefly in the arrangement of the pigment in the protozoon. Infection is carried by certain mosquitoes of the genus Anopheles, and the disease is now efficiently controlled by draining the swampy breeding-grounds of the mosquitoes, or, where this is impossible, by pouring kerosene on the surface of the pools, and by making the banks of streams clean and well built up.

DYSENTERY is caused by an amœba, the *Amœba histolytica*, which is a minute rounded globule of protoplasm, in which a distinct nucleus can be made out, and found, in the body, in the intestinal lesions, and, where abscesses occur, in the liver and lungs.

SYPHILIS is an infective disease, due to a specific organism, the *Spirochæta pallida*.

Those diseases in which investigators have found an organism, without yet having sufficient data to declare it the cause of the disease, include *hydrophobia* and *scarlet fever*; while the diseases which appear, from a greater or less accumulation of evidence, and from analogy, to be infectious, but which have not been proved to be due to micro-organisms, include *smallpox, typhus fever, measles, mumps, whooping-cough*.

See BACTERIOLOGY, PROTOZOA, and separate articles on diseases mentioned.

PARASITISM, a type of interrelationship between plants or between animals, in which one of a pair nourishes itself at the expense of the other. The term has sometimes been used to designate such associations as that of the 'Parasitic' Sea Anemone with a Hermit Crab, but this mutually friendly relationship of messmates is better known as *Commensalism*.

There are several more or less perfect types of true p., however, varying from the temporary association of some external parasites, such as Fish-Lice—the Copepod Crustacean *Argulus*—which attach themselves to the skin of freshwater fishes and suck their juices, or leave them and swim freely in the water at will, to the complete p. of internal parasites such as Tapeworms and Liverflukes, the adults of which can exist and feed only in the body of their hosts. Some parasites, again, pass their complete life-cycle in the same host, while others pass through a series of hosts at different stages, sometimes with the intervention of non-parasitic periods—thus the Fluke which causes liver-rot in Sheep passes from them to water, hence to a Water Snail, from it to grass, and so to Sheep again. Other non-parasitic animals may have parasitic stages—the larvæ (*glochidia*) of some Bivalve Molluscs are temporarily parasitic in the gills of Sticklebacks.

Amongst animals, both external and internal parasites frequently possess hooks or suckers for attachment, and almost all parasites, plant and animal alike, exhibit traces of degeneracy from their nearest free-living relatives—many internal animal parasites losing eyes, mouth, digestive organs, etc., and indeed becoming little more than a sac which absorbs the juices ready prepared by the unfortunate host.

PARASNATH (23° 58′ N., 86° 11′ E.), hill, Chota Nagpur Division, Bihar and Orissa, India; place of Jain pilgrimage.

PARAY-LE-MONIAL (46° 27′ N., 4° 9′ E.), town, Saône-et-Loire, France; place of pilgrimage. Pop. 4500.

PARCÆ, Fates (*q.v.*).

PARCHIM (53° 26′ N., 11° 41′ E.), town, on Elde, Mecklenburg-Schwerin, Germany; paper-mills. Pop. (1910) 10,610.

PARCHMENT, a writing material of great antiquity made from the skins of animals. In Asia among the Persians and Jews skins were universally used, and therefore Varro is not justified in saying that p. was an invention of Eumenes II. of Pergamum on the prohibition by Ptolemy Epiphanes of the exportation of papyrus. In Rome p. was used chiefly for wills and notes, while papyrus was used for literary work. P. is chiefly made from sheep-skin; vellum, a finer kind, is made from calf-skin. See PALÆOGRAPHY.

PARD, see under CAT FAMILY.

PARDON is the prerogative of the Crown, only exercised upon the advice of the Home Sec., in Scotland of the Sec. for Scotland. It may be granted before or after trial and sentence. A free pardon from the Crown is given to release an innocent person from prison after a miscarriage of justice. The commutation of a death sentence to penal servitude is in form a pardon.

PARDUBITZ (50° 3′ N., 15° 46′ E.), town, on Elbe, Bohemia, Austria; sawmills, iron foundries. Pop. (1911) 20,394.

PARÉ, AMBROISE (1510–90), Fr. surgeon; apprenticed to a barber-surgeon and trained at Hôtel Dieu; served as army surgeon; introduced treatment of gunshot wounds by bandaging in place of cauterisation by boiling oil, and prevented hæmorrhage by ligaturing arteries; author of an *Anatomy* and other medical works.

PARENZO (45° 14′ N., 13° 37′ E.), port, Istria, Austria; seat of R.C. bishopric; has fine basilican cathedral, built VI. cent.; Rom. remains. Pop. (1911) 12,358.

PARGA (39° 16′ N., 20° 51′ E.), seaport, vilayet of Janina, Albania. Pop. 5000.

PARIAH, in Tamil, signifies 'outcast'; used of low-born Hindus; also used of mongrel curs which infest Eastern cities.

PARIAH DOGS, see DOG FAMILY.

PARIDÆ, TITS (*q.v.*).

PARINI, GIUSEPPE (1729–99), Ital. poet whose writings are characterised by strong moral tone; admirer of Alexander Pope; works include *Odi* and *Giorno*; wrote excellent blank verse.

PARIS (48° 50′ N., 2° 20′ E.), capital of France and of Seine department; largest city of continental Europe; beautifully situated on both sides of Seine; first-class fortress; important railway, river, road, and canal centre of France. P. claims to be the world's most intellectual and artistic city, and its magnificent architecture, handsome streets, statues, art treasures, educational institutions, romantic history, places of entertainment, cafés, restaurants, and unique atmosphere give the *Ville Lumière* an irresistible appeal to people of all nations.

The Seine divides the city into two regions, the Right and Left Banks—*Rive droite* and *Rive gauche*—and is crossed by 32 bridges—notably Pont Neuf (1578), Pont de Notre Dame, Pont d'Jéna, Pont d'Austerlitz, Pont de la Concorde, and Pont Alexandre III. (1896–1900). The heart of P. is the Île de la Cité, in midstream, with famous Gothic cathedral, Notre Dame (begun XII. cent.; two fine square towers, 218 ft. high, and central spire, 300 ft.; beautiful stained glass); here Napoleon was crowned Emperor by Pope, 1804; the Palais de Justice and exquisite Sainte-Chapelle (XIV. cent.); Hôtel-Dieu; Prefecture of Police. Paris proper is encircled by a wall (obsolete *Fortifications*), the Ceinture Railway, and an outer ring of spacious boulevards. The Boulevard St. Michel, continued by Boulevard de Sébastopol, crosses P. from S. to N.; this main artery is intersected at right angles by Boulevard Montparnasse, Boulevard St. Germain, Rue de Rivoli, and the Grands Boulevards-Bonnenouvelle and St. Martin, and other leading thoroughfares. P. is comparatively flat with exception of hill of Montmartre, with Sacré-Cœur and quaint artists' quarters, with cabarets, etc.

On right bank are many handsome squares, including Place de la Concorde at entrance to Champs Elysées, with famous obelisk of Luxor (73 ft. high) in centre, where Louis XVI., Charlotte Corday, Marie Antoinette, Robespierre, and many other notabilities were guillotined; Place du Carrousel, surrounded on three sides by Louvre, with Arc de Triomphe on west forming entrance to Tuileries; Place Vendôme, with Napoleon column of victory; Place de l'Étoile, with beautiful Arc de Triomphe (1806–36), 162 ft. high, 137 ft. broad, covered with fine reliefs; 12 avenues radiate from this magnificent square including the Champs Elysées, the most fashionable promenade of Paris, with President's residence—L'Élysée; Place de la Bastille, with Colonne de Juillet; other fine squares are Place de la Nation, Place de l'Opéra, Place de l'Hôtel de Ville, Place de la République, etc. On left bank is the large Champs de Mars, with Eiffel Tower, 984 ft. high.

Outstanding features on right bank of Seine are Palais du Louvre, extending about ½ mile along the river (built as fortress, 1204; rebuilt, XVI. cent. onward), with world-famous art collections—left wing contains the Treasury; Palace of the Tuileries (begun, 1564; burnt down by Communards, 1871), with fine Jardin des Tuileries; Palais Royal, built by Richelieu, now containing shops and offices; the churches St. Germain l'Auxerrois (XII.–XVI. cent's), St. Eustache (XVI. cent.), St. Gervais (XVI. cent.), La Madeleine (1806–24), in Corinthian style, with 62 columns; Hôtel de Ville (municipal headquarters); Conservatoire des Arts et Metiers; the old Tour St. Jacques; Musée Carnavalet (historical museum); Port St. Denis and Port St. Martin; Halles Centrales (markets); Bourse, Bibliothèque Nationale, Grand Opéra (1861); Opéra Comique, Théâtre Français; Conservatoire of Music; Petit Palais and Grand Palais (exhibition buildings); Trocadéro (1878, in Oriental style), with museums of sculpture and ethnography; Parc Monceau.

On left bank opposite the Île de la Cité is the *Latin quarter*, with Sorbonne (univ., founded 1253), Collège de France, École de Médecine, École des Beaux Arts, and other educational institutions; Musée de Cluny, with collection of antiquities; Panthéon (1764), with fine frescoes and tombs of Voltaire, Victor Hugo, Rousseau, etc.; Luxembourg (1612–20), which includes the Palace of the Senate, a fine modern art gallery and beautiful gardens; Odéon (theatre); St. Sulpice (XVI. cent.), St. Germain-des-prés (1163), Hôtel des Monnaies (Mint), Palais de l'Institut, Palais Bourbon; Hôtel des Invalides, with tomb of Napoleon I.; Jardin des Plantes, with fine botanical and zoological gardens; Salpêtrière (famous hospital).

Chief cemeteries are Père Lachaise, Montmartre, Montparnasse. P. has interesting catacombs and remarkable sewers. Round P. lie beautiful wooded slopes, with suburbs of Versailles, St. Cloud, Meudon, Sèvres, Saint-Denis, Montreuil, Vincennes, etc.; and the famous Bois de Boulogne, with Jardin d'Acclimatation and Longchamp (racecourse), and Bois de Vincennes.

History.—In earliest times P. was known as *Lutetia*; capital of the Gallic tribe *Parisii*, on Île de la Cité. Under Roman rule Lutetia became a prominent town. Christianity was established in III. cent.; in IV. cent. it took the names of Parisia or Paris. In 451 St. Geneviève preserved P. from Huns. Clovis made P. the capital of his realm, 508; P., attacked by Northmen, IX. cent., became residence of Hugh Capet and permanent capital of France, 987; during reign of Philippe Auguste (1180–1223) Notre Dame was begun, castle of the Louvre built, univ. founded, and city surrounded by strong wall; Revolution, 1358, under Étienne Marcel, famous provost of the city. Charles V. (1337–80) erected Bastille; revolt of the *Maillotins*, 1382; between 1412–18 the government was alternately held by Burgundian party (known as Cabochiens) and Armagnacs; in 1420 Crown of France passed to England, and P. was held by English until 1436; unsuccessfully besieged by Joan of Arc, 1429; massacre of St. Bartholomew, 1572; besieged by Henry IV., 1594. Louis XVI., Louis XV., and Louis XVI. did much to beautify Paris, which became the centre of European civilisation. P. was chief scene of Fr. Revolution, 1789; Bastille stormed, July 14; Allies entered P., 1814; Napoleon I. resigned, and First Treaty of P. signed, followed by Second Treaty of P., 1815; fresh Revolutions, 1830, 1848. Peace of P., 1856, ended Crimean War. During reign of Napoleon III. P. was richly adorned by avenues, squares, and handsome buildings; besieged by Germans, Sept. 19, 1870; capitulated, Jan. 28, 1871. During Commune, 1871, numerous fine buildings were destroyed; great fire in Opéra Comique, 1887; Treaty of P., 1898, ended Spanish-American War; International Exhibitions, 1855, 1867, 1878, 1889, 1900; disastrous flood, 1910.

For administrative purposes P. is divided into 20 arrondissements, each comprising 4 quarters; each quarter is represented by one member in Conseil-Municipal and Conseil-Général of department of Seine; mayoral functions are shared by Prefect of Seine and Prefect of Police. P. has an extensive system of communications—suburban circular railway, underground electric railways (*Métropolitain*), motor-buses, cabs, etc.; numerous steamboats on Seine. Principal industries are ladies' clothes, hats, boots and shoes, furniture, jewellery, bronzes, mirrors, clocks, watches,

decorative articles, scientific instruments, book-publishing, objets-d'art. Pop. (1901) 2,714,068; (1911) 2,881,110.

Belloc, *Paris* (1900); Baedeker, *Paris* (1907).

PARIS.—(1) (33° 35′ N., 95° 32′ W.) city, Texas, U.S.A.; cotton industries. Pop. (1910) 11,269. (2) (39° 38′ N., 87° 45′ W.) city, Illinois, U.S.A.; flour-mills. Pop. (1910) 7664.

PARIS (classical myth.), son of Priam of Troy; awarded prize of beauty to Aphrodite, thereby offending Hera and Athene; stole Helen from Menelaus, causing Trojan War; killed Achilles by treachery.

PARIS BORDONE, see BORDONE.

PARIS, BRUNO PAULIN GASTON (1839–1903), Fr. scholar; apostle of Romantic school; his researches in Mediæval Fr. lit. were epoch-making.

PARIS, LOUIS PHILIPPE ALBERT D'ORLÉANS, COMTE DE (1838–94), grandson of King Louis Philippe, and, in 1842, heir-apparent; abandoned claim, 1873, to Comte de Chambord, who d. 1883; lived and wrote a good deal in England. See ORLEANISTS.

PARIS, PLASTER OF, see GYPSUM.

PARIS, TREATIES OF (1814–15).—(1) May 30, 1814; Talleyrand, on behalf of Louis XVIII., agreed to restore Fr. conquests made since 1791; Ger. empire was abolished, Belgium and Holland united, Italy parted asunder, Swiss independence guaranteed. (2) Nov. 20, 1815, more harsh towards France, because of the Hundred Days; territory to be that of 1789, war contribution of 700,000,000 francs to be levied, and garrisons of 150,000 men maintained on frontiers for 5 years. See FRANCE (HISTORY).

PARISH (Gk. *paroikia*), at first a district presided over by a bp.; after about 400 A.D. generally used as now of a smaller district with one priest. In England a parish consists of one or sometimes (especially in the north of England) of several townships. In its non-ecclesiastical sense a parish is a district capable of levying a poor rate; it may be coterminous with, or a portion of, an ecclesiastical parish. The Local Government Act of 1894 set up parish councils, and thus the parish got back something of its old position.

PARK, EDWARDS AMASA (1808–1900), Congregationalist divine in U.S.A.

PARK, MUNGO (1771–1806), Scot. African explorer; sent by African Association to explore valley of Niger, 1795; carried out two years' often solitary exploration; first modern European to reach the Niger, 1796; delayed by illness and imprisonment and believed to be dead; returned, 1799, and wrote famous *Travels*, model in this kind of writing; sent out by Government, 1805; slain with all his men; fate not known till 1812.

Joseph Thomson, *Mungo Park and the Niger* (1890).

PARKER, JOSEPH (1830–1902), Congregationalist minister; founder of City Temple.

PARKER, LOUIS N., see under PAGEANT.

PARKER, MATTHEW (1504–75), abp. of Canterbury; chaplain to Anne Boleyn, 1535; influenced by Ger. Reformation, P. was consecrated abp., 1559; on the validity of his consecration depends that of Anglican orders; P. was Elizabeth's chief tool in carrying out the new Anglican *via media*; helped to draw up the Thirty-nine Articles; made a valuable MS. collection now in Corpus Christi Coll., Cambridge.

PARKER, SAMUEL (1640–88), bp. of Oxford, 1686.

PARKER, SIR GILBERT (1862–), Brit. politician and novelist; b. Canada, and achieved fame by fine Canadian stories.

PARKER, SIR HYDE, Bart. (succ., 1782) (1714–82), Brit. vice-admiral; fought in Seven Years and Amer. Wars. His s., the admiral SIR HYDE PARKER (1739–1807), commanded Baltic fleet, 1801, and vainly gave signal for Nelson to retreat at *Copenhagen*.

PARKER, THEODORE (1810–60), Amer. Unitarian divine; ed. Harvard; became minister, 1837; though by no means destructive he took a more liberal line than others of his denomination, and was suspected; P. wrote largely on religion and other subjects; a vigorous anti-slavery worker and social reformer.

PARKERSBURG (39° 15′ N., 81° 30′ W.), ity, on Ohio, W. Virginia, U.S.A.; oil refineries. Pop. (1910) 17,842.

PARKES, SIR HARRY SMITH (1828–85), Brit. diplomatist; consul to China, 1856; one of three commissioners placed in control of Chin. government, 1858; imprisoned at Peking, 1860; consul at Shanghai; minister to Japan, 1865–82; supported westernising party; minister to China, 1882–85.

PARKINSON'S DISEASE, see PARALYSIS.

PARKMAN, FRANCIS (1823–93), Amer. historian; s. of well-known Unitarian minister, and nephew of distinguished physician; impaired health by residence among Indians of Rocky Mountains, which he explored; studied Fr. archives; prof. of Horticulture at Harvard, 1871–72; completed *France and England in North America*, 1892, chief work, in several vol's with different headings; combined popular style with accurate research, knowledge of Indian tribes, and impartial judgment.

PARLA KIMEDI (18° 47′ N., 84° 8′ E.), town, Ganjam, Madras, India. Pop. 18,000.

PARLEMENT (Fr. *parler*, to speak), Fr. court of justice abolished, 1790; name never applied in Fr. history to entire national gathering, but used in early times for privy council, *curia regis*, of which functions were primarily judicial; at first followed king, but was established in Paris by Philip IV. (1285–1314); composed of *chambre des requêtes*, *chambre des enquêtes*, and *grande chambre*, relic of older gathering, in which peers had right of sitting. Similar p's arose in provinces and often withstood tyranny of king, retaining right of registering national law before it came into force locally, and of 'remonstrance' if law infringed on local liberties; hence, king's *lettres de cachet* or personal appearance in *lit de justice* to enforce registration.

PARLEY, PETER, see GOODRICH, SAMUEL G.

PARLIAMENT, name of Brit. legislative assembly, composed of king, House of Lords, and House of Commons. Name P. came into use in XIII. cent. (*parlement* occurs, 1275); it developed out of Anglo-Saxon *witenagemot* and feudal court of Norman and Angevin kings, and was thus composed of the dignitaries who sat by virtue of their offices in the earlier assembly, and the barons who sat by virtue of their land tenancy in the later court. In neither did popular element or principle of representation appear. It was summoned at pleasure of ruler, usually in late Saxon times, and under the Conqueror at the three great festivals—Christmas, Easter, and Whitsuntide.

The council after the Conquest had little power beyond advice, though instances of resistance, like Becket's, are forthcoming. Magna Carta (1215) gave it control of taxation. It was frequently summoned during XIII. cent., when it acquired power of browbeating Crown and first received representative element. Henry III. and Edward I. both aquiesced in maxim that what touches all must be approved by all. Two knights for each shire were summoned to P., 1254, to be elected by lesser barons, and again in 1265, but these were not full P's, hence P. of Westminster, 1295, in which representatives of shires again sat, is called the *Model Parliament*. When writs for P. are not issued to all claimants (by Magna Carta) the P. is not considered full. In this Model P. sat the abp's and bp's, three heads of religious orders, 53 abbots and priors, 11 earls, 53 barons, the chief-justice, clerks, etc., representatives of lower clergy, two knights from every shire, and two burgesses from selected boroughs, with full powers to act for shires and boroughs. These representatives, it used to be thought, merely assisted in assessment of taxation; now it is agreed that they may have served as witnesses in settling numerous petitions of the time to the king in council for redress of legal grievances.

The House of Lords had always remained court of justice for trying peers (according to provisions of Magna Carta), but otherwise P. lost its judicial functions

in XIV. cent. The Commons appear in separate house in early XIV. cent., while lower clergy successfully resisted summons to appear, and were moreover represented by lower house of Convocation. Summons to P., for long merely a burden to Commons, became at this time a hereditary privilege of barons. Knights of shire were at first of knightly rank, but ultimately acquired this title as representatives of shire. The electorate, after law of 1430, was composed of freeholders of 40s. or above; in towns only burgesses were enfranchised. The *Speaker*, who was always chosen from knights, was already an institution by 1376.

The commencement of parliamentary initiative in legislation is seen in petitions of XIII. and XIV. cent's; power enormously increased by deposition of Richard II., but the baronage who led it showed themselves unfit to rule and became insignificant under Tudors. Henry VIII. made P. instrument of his despotic will, but at same time his constant use of it from 1529 was of constitutional importance. Ecclesiastical element was lessened by elimination of abbots and priors. Democratic influence of Calvinism may be seen in outbursts of independence of Commons in last years of Elizabeth's reign. *Petition of Right*, 1628, set forth political claims of Eng. people as opposed to Crown. House of Lords, abolished by Commonwealth, was restored, 1657, though bp's were not restored till 1661. Restoration meant no retrogression for P., while Commons won sole control of money bills, 1671 and 1678. *Bill of Rights*, 1688, made P. supreme in government; strife henceforth was between Whig and Tory, Liberal and Conservative parties; attitude of Commons, now chief power, to lords, as become *Mend or End.*

Acts of Union with Scotland (1707) and Ireland (1800) provided respectively for merging Scot. and Irish P's in P. of U.K. By *Triennial* Act, 1694, new P. must be summoned within three years of dissolution of old one, but necessities of government ensure its yearly sitting, and new P. is always summoned by proclamation dissolving old. Crown issues proclamation under Great Seal, by advice of Privy Council, to Chancellors of Great Britain and Ireland, ordering issue of writs of summons. Scot. peers are not summoned by individual writs, and only appear by 16 elected representatives. Repeated neglect of right to vote for Scot. representative peer entails loss of elector's peerage. A duly elected member of P. cannot resign (by resolution of House, 1623), but has means of escape from his position by obtaining *Chiltern Hundreds.* Sovereign has prerogative of opening P. at commencement of session, and sometimes does so by commission. Speaker of House of Commons is then elected and oaths of allegiance taken by all Lords and Commons; Commons then summoned to Upper House to hear *King's Speech*; both houses make formal declaration of their constitutional independence, and then draw up replies to King's Speech.

Legislation may be initiated in either House, though House of Lords does not introduce or amend money bills (bills of attainder and reversals of attainder were generally dealt with first by the Lords); judges of High Court of Justice attend to assist decisions of Lords when summoned. Bills, which replaced *petitions* in time of Henry VI., take the form of *Act of P.* (*q.v.*); after passing both Houses (which communicate with each other by messages), they receive king's assent generally by commission and become Acts of P.; royal prerogative of refusing assent not used since 1707; form of refusal is that the sovereign '*s'avisera.*'

In 1911 the Brit. Government passed the Parliament Act. Its chief enactments were: (1) Lords lost power of rejecting or amending a money bill; (2) the Speaker of the Commons decides what is or is not a money bill; (3) any bill, other than a money bill, passed by Commons in 3 successive sessions and rejected by Lords in those sessions becomes law if 2 years have elapsed between the second reading in the first Commons session and the final passing in third Commons session; (4) duration of Parliament is changed from 7 to 5 years.

Members of the Commons received payment for expenses in mediæval times like any other subjects employed on the king's business, the expenses being assessed on the locality from which they were summoned; in fact, the town was called on to furnish a member of P. as the port was called on to furnish a warship. This payment was automatically abolished in the XVIII. cent. (when members bribed the electors to return them), and never resumed until 1906, when funds were appropriated by Government for payment of £400 yearly to each member. In the Brit. Colonies, U.S., and most countries with constitutional government, members of both chambers receive salaries. Fr. members all obtain £600 yearly.

PARMA (44° 48′ N., 10° 19′ E.), town, on Parma, northern Italy; capital of province P., with cathedral (began 1059), Baptistery (XII. cent.), San Giovanni Evangelista (with frescoes by Correggio), Madonna della Steccata, Palazzo della Pilota (containing fine picture-gallery with works by Correggio, Tintoretto, Tiepolo, and others), Palazzo Municipale, univ. (1512). P. flourished under Romans, and rose to great importance during Middle Ages; home of Correggio. P. was once famed for woollen manufactures; chief industries, silks, iron-ware, pianos, tobacco. Pop. (1911) 51,919.

PARMENIDES, see Eleatic School.

PARMIGIANO (1504–40), celebrated painter of Lombard school, whose real name was Girolama Francesco Maria Mazzola. He worked at first in Rome, where he painted *The Vision of St. Jerome*, now in National Gallery, London; then in Bologna, where he executed a notable altarpiece, *The Madonna and Child*; and finally in his native Parma. *Cupid shaping a Bow* is his best-known picture.

PARNAHYBA (2° 58′ S., 41° 38′ W.), seaport, on Parnahyba, Piauhy, Brazil; exports hides. Pop. 10,500.

PARNASSUS, modern Liakoura (38° 31′ N., 28° 37′ E.), mountain-ridge, Greece; sacred to Apollo and the Muses.

PARNASSUS PLAYS, three entertainments performed at St. John's Coll., Cambridge, between 1597 and 1603. The plays record the adventures of two students, Philomusus and Studioso, and reveal satirically the small respect paid to learning at the time. Their chief value lies in their allusions to Shakespeare and his contemporaries.

PARNELL, CHARLES STEWART (1846–91), Irish politician; s. of John Henry P. of Avondale, County Wicklow; ed. at Magdalene Coll., Cambridge; M.P. for County Meath, 1875–80; at once commenced policy of opposition to England; in first speech in Parliament advocated Home Rule and preached Irish nationality; afterwards attacked Sir Michael Hicks Beach for using expression, 'Manchester murderers,' of Fenians; joined Amnesty Association (for obtaining release of Fenians), 1876; in 1877 he developed Irish plan of parliamentary obstruction, causing record sitting of Parliament, July 31 to August 1; sought to win over Fenians and establish united Irish party; this union was largely brought about by agrarian distress; 'Ireland for the Irish' became general gospel of revolutionists; National Land League was founded, 1879, of which P. became pres. He visited America to win support of Amer. Fenians, and obtain funds for League, 1880; represented Cork, 1880–91; chairman of nationalists in House of Commons, 1880; founded *The Irish National Newspaper and Publishing Company*, and reissued *The Flag of Ireland* as *United Ireland*, 1881; imprisoned, 1881–82, for speeches at League Convention in Dublin; acclaimed by his party as 'the uncrowned king of Ireland.' England began to see need of temporising, but better feeling was killed by Phœnix Park murders; P.'s condemnation of the crime threatened him with loss of influence over party; he refounded Land League as *Irish National League*, 1883; Fenianism continued, and

revolutionary crimes were repeated; attempts to blow up Tower of London and Houses of Parliament, 1885. P. was bitterly attacked, but refused responsibility, and continued policy of obstruction; chairman of Irish parliamentary party, 1886, when Gladstone declared for Home Rule; the Bill of 1886 failed, but resulted in alliance of Irish nationalists with Liberal party; P. had to face, in 1887, charge of having sympathised with Phœnix Park murders; a forged letter, by Richard Pigott, was pub. in *Times* under heading 'Parnellism and Crime.' In 1891 he m. Mrs. O'Shea, divorced from Captain O'Shea, 1890, on ground of her adultery with P. The Irish parliamentary party re-elected P. chairman, but Gladstone's letter to Morley, stating that P. must resign, altered matters. The Committee met, and P. refused a motion for his own deposition; 45 members (the Anti-Parnellites) retired, and in another room decreed his resignation; the minority of 26 (the Parnellites) stood by him. A great leader, to whom patriotism seems to have been sufficient moral code.

Life, by T. P. O'Connor (1891), Walsh (1892), E. M. Dickinson (P.'s sister) (1896).

PARNELL, THOMAS (1679–1718), Eng. minor poet. Goldsmith wrote his life, and Pope published a selection of his poems in 1719.

PARNON, modern MALEVOU (37° 10′ N., 22° 38′ E.), mountain-ridge, Greece, E. of Laconia.

PARODY, imitation, generally humorous, of another's writing; famous Eng. p's include works of Horace and James Smith, Hookham Frere, Calverley, Owen Seaman. See also BURLESQUE.

PAROPAMISUS (34° 40′ N., 67° E.), mountain range, W. of Hindu-Kush, India.

PAROS, PARO (37° 2′ N., 25° 11′ E.), Gk. island, in Cyclades (*q.v.*) group, Ægean Sea; separated from Naxos by narrow channel; length, 13 miles; breadth, 10 miles; area, 96 sq. miles; dominated by Mount Elias, 2500 ft. (ancient Marpessus); capital, Parikia, on N.W. coast; Naoussa Bay (safe harbour) on N.; famous white Parian marble quarries worked from VI. cent. B.C. onwards. Pop. 9000.

PARR, see under SALMON FAMILY.

PARR, SAMUEL (1747–1825), Eng. schoolmaster; pub. an edition of Bellenden, with a celebrated preface; his works, issued in 1828, filled eight huge volumes.

PARRAMATTA, see PARAMATTA.

PARROT TRIBE (order PSITTACIFORMES), an order of brilliantly coloured birds, containing almost 600 species, with large, strongly curved beak, fleshy tongue, and feet in which the first and fourth toes turn backwards, the second and third forwards. They are arboreal, feed mainly on fruits and seeds, live in companies, but pair in couples. The NESTOR PARROTS (*Nestor*), found only in New Zealand and neighbouring islands, include the KEA, which has gained an unenviable reputation on account of its habit of tearing open the backs of sheep in order to gorge upon the kidneys. The LORIES and LORIQUETS (*Loriidæ*) have brush-tipped tongues, and are confined to Australia and islands near it. In COCKATOOS (*Cocatuidæ*) the tongue is simple, and the head is crowned by a crest of feathers; whereas the TRUE PARROTS have a smooth tongue, have no crest, and often have a metallic green colouring in their plumage. True Parrots, of which there are about 440 species, are found in both Old and New Worlds. Familiar examples are the GRASS PARAKEET of Australia (*Melopsittacus*); the GREY PARROT of Africa (*Psittacus erithacus*), the most imitative, and best talker; the beautiful nimble Amer. LOVE-BIRDS or PARAKEETS (*Psittacula*); the most showy of Parrots, the large, long-tailed MACAWS (*Ara* and *Anodorhynchus*) of South Amer. forests, brilliant in coats of scarlet, blue, green, and yellow; and the peculiar winged, but flightless, nocturnal OWL PARROT (*Stringops*) of New Zealand.

PARROT-FISHES (*Scaridæ*), Wrasse-like fishes with teeth fused into a kind of beak, whence the name; mostly tropical.

PARRY, SIR CHARLES HUBERT HASTINGS, Bart. (1848–), Eng. composer; app. director of Royal Coll. of Music, 1894; knighted, 1898; composed *Prometheus Unbound*, *The Lotus Eaters*; also symphonies, chamber music, concertos, etc.; author of *Style in Musical Art* (1912).

PARRY, SIR WILLIAM EDWARD (1790–1855), Eng. explorer, admiral, and author; commanded *Alexander* in Capt. Ross's Arctic expedition, 1818; led famous expedition by which direction of North-West Passage was discovered, 1819.

PARSEES, a people originally in Persia, occupying the province of Farsitan (Farsees = Parsees = Persians), c. 558 B.C. Their religion was Zoroastrian and dualistic. Ormuzd, the 'Lord Wisdom,' the god of the sky, whose symbol is the sun, or fire, or light, is the creator, and against him Ahriman, the prince of darkness, wages war. In the VII. cent. A.D. the P's were practically exterminated by the Muhammadan invaders, save those who migrated to India, and whose descendants still live in the Bombay Province. They are now a rich merchant class, responsive to Brit. influence, and aloof from the Indians around them, preserving their race and religion intact.

PARSIMONY, LAW OF, nominalist maxim that it is bad scientific method to attempt to explain the same facts by independent hypotheses.

PARSLEY (*Petroselinum*), genus of plants, order Umbelliferæ; Common P. (*P. sativum*) is a familiar garden plant; seeds are sown in April.

PARSNIP (*Pastinaca*), genus of plants, order Umbelliferæ; Common P. (*P. sativa*) is cultivated for its root, which must not be cut before cooking; root of wild P. is not edible.

PARSONS (37° 20′ N., 95° 20′ W.), city, Kansas, U.S.A.; cars, machinery. Pop. (1910) 12,463.

PARSONS, FATHER ROBERT (1546–1610), Eng. Jesuit; entered Society of Jesus, 1575, and became a priest, 1578; with Edmund Campion went to England as missionary; forced to flee to the Continent, he there plotted against England and was mainly responsible for dispatch of Armada to England; rector of Eng. Coll. at Rome; wrote *Conference about the next Succession* (1594), to prove the Infanta of Spain Elizabeth's successor.

PARSONS, SIR WILLIAM (c. 1570–1650), 1st baronet (1620); nephew of Sir Geoffrey Fenton, whom he succ. as surveyor-general of Ireland, 1602; aided policy of colonisation; Lord Justice, 1640–48.

PARTABGARH (25° 34′ N., 81° 59′ E.), native state, Rajputana, India. Pop. (1911) 62,704. Capital, PARTABGARH. Pop. 10,000.

PARTHENAY (46° 39′ N., 0° 15′ W.), town, Deux-Sèvres, France; woollens. Pop. 7300.

PARTHENOGENESIS, see under REPRODUCTION.

PARTHENON, temple on Athenian Acropolis dedicated to Athena; dates from V. cent. B.C. (supplanting earlier temple); it became later a Christian church, then a mosque; famous for its sculptures, some of which were removed to England, 1821, among Elgin marbles. See ACROPOLIS, ATHENS.

PARTHIA, mountainous country S.E. of Caspian Sea; part of Realm of Seleucidæ, existing roughly between 250 B.C. and 220 A.D.; inhabited by an Iranian tribe; was a province of the Achæmenian and later Macedonian Empire; Gk. towns founded by Seleucus I. and Antiochus I.; capital, Hecatompylos (Hundred-gated). P. corresponds to modern Khorasan. Favourite tactics of Parthians was to retreat, and fire arrows in so doing—hence, a *Parthian shot* or *shaft*.

PARTICK (55° 53′ N., 4° 10′ W.), town, on Clyde, Lanarkshire, Scotland; shipbuilding yards; incorporated with Glasgow City, 1912. Pop. (1911) 66,848.

PARTINICO (38° 2′ N., 13° 7′ E.), town, Sicily; cotton and wool manufactures. Pop. 24,000.

PARTITION, division of land by its co-owners by authority of Court of Chancery. Recompense in the

form of pecuniary compensation must be made in the case where one party to the partition has laid out money on improvements of the estate, or where houses, forming part of the estate, cannot be divided.

PARTNERSHIP is defined by the Eng. Act of 1890 as 'the relation which subsists between persons carrying on a business in common with a view to profit.' Each of the partners must be competent to contract, and, therefore, if an infant enters into a contract of partnership, he is not responsible for the debts of the firm, and he may repudiate the partnership before or when he comes of age. A married woman can be a partner, but she cannot always be made a bankrupt with the rest of the firm. Barristers cannot make a professional partnership, though solicitors may and do. A private partnership cannot be formed of more than ten persons for banking, or twenty for any other business. If that number is exceeded, such persons can only carry on business together legally when registered as a company. A partnership may be at will, or it may be for a definite period. A *dormant* or *sleeping partner* is one who participates in the profits without taking any active share in the management, and without appearing before the world as a partner. Such a partner is, however, like any other, responsible for the debts of the firm. Every partner is an agent of the firm and of his other partners for the purpose of the business of the partnership, and his acts bind the firm and his partners, if they are performed within the usual course of the firm's business.

Lindley, *Treatise on the Law of P.* (7th ed., 1909); Sir J. Pollock, *Digest of the Law of P.*

PARTON, JAMES (1822–91), Amer. historian; wrote biographies of Franklin, Jefferson, Voltaire, etc.

PARTRIDGE, see under PHEASANT FAMILY.

PASADENA (34° 3′ N., 118° 5′ W.), city, California, U.S.A.; fruit industries. Pop. (1910) 30,291.

PASARGADÆ (30° 16′ N., 53° 26′ E.), former capital of Persia, said to have been founded by Cyrus after his defeat of Astyages; has been identified with ruins in plain of Murghab, near Persepolis.

PASCAL, BLAISE (1623–62), Fr. religious philosopher; b. at Clermont-Ferrand; at twelve years of age evolved, without books, first thirty-two propositions of Euclid; at sixteen wrote treatise on conic sections; invented several mechanisms; delicate, and after accident which brought him to death's door, retired to Port-Royal and embraced doctrines of Jansenists; wrote in their defence against the Jesuits the famous *Lettres Provinciales* (1656–57), supposed to be written by a man of the provinces to a Jesuit. First three letters defend Jansenists, rest attack Jesuits; novelty and literary merit is that they were in French, so that public—'even women'—might take part in controversy; they are in turn vehement, jovial, indignant, and disdainful. He wished to write an apology for Christian religion which would persuade the reader of its truth, and result was fragments which were collected as *Pensées*, another Fr. classic. His publishers thought fit to alter it for literary and religious reasons, but original text was *in extenso*, 1844; simple, graceful, dignified style.—*Life*, by Tulloch (1882), St. Cyres (1909).

PASCHAL I., pope, 817–24; crowned Emperor Lothair, with whom he made *Pactum Ludovicianum* (genuine but interpolated), 823; took part in iconoclastic controversy, vigorously upholding worship of relics.—**Paschal II.**, pope, 1099–1118; importance of his pontificate lies in continuation of investiture conflict, P. declining to give way.

PASCO, see CERRO DE PASCO.

PAS-DE-CALAIS (50° 35′ N., 2° 10′ E.), maritime department of N. France, formed out of Artois and Picardy; area, 2551 sq. miles; surface generally flat; capital, Arras; extensive coal-fields; agricultural products and varied manufactures. Pop. (1911) 1,068,155.

PASEWALK (53° 30′ N., 13° 59′ E.), town, Pomerania, Prussia; ironworks. Pop. (1910) 10,914.

PASIG (14° 30′ N., 121° E.), town, Luzon, Philippine Islands. Pop. 13,000.

PASLEY, SIR CHARLES WILLIAM (1780–1861), Brit. general (1860) and engineer; served in Baltic campaign, 1801, and Peninsular War; author of books on art of war, and inventor of engineering reforms.

PASQUIER, ÉTIENNE DENIS, DUKE (1767–1862), Fr. lawyer and statesman; imprisoned as Moderate, 1794, but speedily released on close of Terror; won regard of Napoleon, and was able statesman under empire and restored monarchy.

PASSAGLIA, CARLO (1812–87), Ital. ecclesiastic, supported doctrine of Immaculate Conception of Virgin, but wrote against temporal power of pope; excommunicated; recanted before his death.

PASSAIC (40° 50′ N., 74° 7′ W.), city, Passaic County, New Jersey, U.S.A., on Passaic; woollen and rubber goods. Pop. (1910) 54,773.

PASSAU (48° 34′ N., 13° 28′ W.), town, Bavaria, Germany; has large trade in timber, graphite, iron, grain, salt; seat of bishopric; has XVII.-cent. cathedral. Treaty of P. (1552) ensured religious liberty. Pop. (1910) 20,984.

PASSER, sparrow; see under FINCH FAMILY.

PASSION PLAY, stage performance representing the last scenes of Christ's life. See OBERAMMERGAU.

PASSION WEEK commences on Passion Sunday, a fortnight before Easter; Lenten fast.

PASSION-FLOWER (*Passiflora*), a genus of tendrillar climbing plants characterised by peculiar pentamerous flowers, possessing elaborate corona with ovary at the apex; fruit, a berry.

PASSIONISTS, see PAUL OF THE CROSS, ST.

PASSOVER, a Jewish feast, observed in memory of the coming out of Egypt. The feast was instituted traditionally by Moses at the command of the Lord. A lamb was to be killed on the evening of the 14th of Nisan, and its blood sprinkled on the lintel and doorposts. It was to be roasted and eaten by the people, who were to be ready equipped for a journey. For a week afterwards only unleavened bread was to be eaten. The origin and exact meaning of the feast is still obscure, and the different documents which compose the Pentateuch show different versions of it. Probably a pastoral festival in which a lamb was sacrificed was combined with an agricultural feast which the Israelites may already have found in Canaan.

Jacobs, *Studies in Biblical Archæology.*

PASSPORT, document entitling foreigners to travel in country; still used in Russian Turkey, and in times of war as a precaution against espionage.

PASTES, see GEM (ARTIFICIAL GEMS).

PASTEUR, LOUIS (1822–95), Fr. chemist; studied crystallography, and showed the relation between optical activity and molecular asymmetry, thus laying the foundations of stereo-chemistry; best known for his work on micro-organisms; showed that alcoholic and acetic fermentation and putrefaction are caused by living organisms, and that when these are killed or excluded decay is prevented. Thus he opposed the idea of spontaneous generation, and introduced sterilisation.

Studies on wine, beer, and the silk-worm disease led to investigation of the cause and means of prevention and cure of virulent diseases (*e.g.* hydrophobia), to the germ theory of disease, and the principles of preventive medicine, of which the Pasteur Institute is the enduring memorial; *Life*, by Franklands (1898).

PASTO (1° 16′ N., 77° 20′ W.), city, Cauca, Colombia, at foot of P. volcano; woollens. Pop. 13,500.

PASTON LETTERS, collection of correspondence and miscellaneous papers of Paston family between 1422–1509; throw much light on contemporary history and law; sold by William Paston, Earl of Yarmouth; passed through several hands; purchased, 1774, and edited by John Fenn; original manuscripts presented to George III.; lost trace of; authenticity doubted till vindicated by Gairdner, 1865; rediscovered at various times between 1875–89; majority in Brit. Museum; see Gairdner's Edition of *Paston Letters* (latest edition), 1904.

PASTORAL EPISTLES, *i.e. 1* and *2 Timothy* and *Titus* (*qq.v.*).

PASTORAL LETTER, document written by bishop to his congregation; read by clergy from pulpit.

PASTORAL STAFF, a staff with the top curved to resemble a shepherd's crook, one of the symbols of the episcopal office; the bp. was given it when invested, and if deposed he gave it up; some mediæval pastoral staffs are of beautiful workmanship.

PASTURE, see under GRASS.

PATAGONIA (*c.* 48° S., 70° W.), name given to extensive region in S. of S. America, stretching from Rio Negro on N. to Straits of Magellan on S., and divided in two by Andes. Portion E. of Andes, recognised since 1881 as belonging to Argentine, consists of vast plateau region rising in succession of terraces occasionally crossed by valleys; these plains are covered mostly by shingle, stones, and rock, and are almost destitute of vegetation, except in some parts where coarse grass and bushes grow; in hollows lakes are frequent. Chief rivers are Rio Negro, Chubut, Chico, and Santa Cruz; most fertile and productive country to be found at base of Andes; large tracts devoted to rearing of horses and cattle. To W. of Andes is Chilean P., strip of rugged mountainous country with luxuriant forests. P. was discovered by Magellan in 1520, and explored by Gamboa and many others. Patagonians (now almost extinct) are very tall and uncivilised.

Skottsberg, *Wilds of Patagonia* (1911).

PATAN (27° 38′ N., 85° 17′ E.), town, Nepal, India. Pop. 31,000.

PATAN (22° 51′ N., 72° 10′ E.), town, Baroda, India, on Saraswati. Pop. 35,000.

PATARA (36° 12′ N., 39° 21′ E.), ancient city, Lycia; chief seat of the worship of Apollo.

PATAS MONKEY, see under CERCOPITHECIDÆ.

PATAVIUM (45° 23′ N., 11° 53′ E.), ancient town, Italy, on site of modern Padua; was an important trading centre under Romans; sacked by Attila, 452.

PATEL, FRAMJEE NASARWANJEE (1804–94), Parsee merchant and publicist; went into business in Bombay at fifteen, at fifty-four had established two houses with Eng. partners and made a fortune; pioneer of education, and helped to found the Elphinstone Institution; pres. of the Parsee Law Association, and largely responsible for the Parsee legislation of 1865 relating to marriage, divorce, and succession.

PATELLA, a Mollusc; see under GASTEROPODA.

PATEN, plate for the Eucharistic bread.

PATENTS.—A patent in the U.K. is a grant from the Crown by *letters patent* to the true and first inventor of some manner of new manufacture, conferring on him the sole right or monopoly of making, using, or selling it during the period for which the patent is granted. This prerogative of the Crown was settled by Act of Parliament (22 James I.) in the XVII. cent. In 1883 the control of such grants was transferred to the Board of Trade. By the Patents Acts, 1907 and 1908, a limited examination into the novelty of the invention claimed is to be made at the time when a complete specification is deposited. But this investigation does not in any way guarantee the validity of any patent. The legal validity of a patent and the question of the possible infringement of some existing patent can only be determined in a court of law. A patent is granted for fourteen years, and is maintained in force by payment of annual renewal fees after the end of the fourth year. A patentee may, however, before the expiration of his patent, present a petition to the king in Council praying for an extension of his patent, and if the Judicial Committee of the Privy Council report that the patentee has been inadequately remunerated by his patent, the term may be extended for a further period of seven, or, in exceptional cases, fourteen years.

The essentials of the subject-matter of a valid patent are that it shall be an invention, new, and useful. It may be something entirely new, as, for example, the telephone was, or it may be some new mechanical method of carrying out an old process. But novelty is essential, and if the invention has become known in this country by prior use or publication, even by the inventor himself, no patent can afterwards be granted—an exception being made where the prior use was in the nature of an experiment, or where the matter has been disclosed in confidence to assistants. Utility, though not necessarily commercial profit, is equally required for a valid patent. It must be shown that the purpose designed will be fulfilled by the patent. The first step in the application for a patent is to fill in a declaration, obtainable at any postal money-order office, and send it to the Patent Office with provisional or complete specifications. This latter specification must be filled in with great care, and a fee of £3 must be sent with it. A fee of £1 must also be paid for further investigation. Unless opposition is made within two months after the public advertising of the patent, the applicant duly receives his patent sealed with the seal of the Patent Office.

In U.S.A. an inventor pays 15 dollars on application, and 20 dollars on p's being granted; p's last for 17 years.

Edmunds, *Patents*; Frost, *Patent Law and Practice*; Cunynghame, *Patents*.

PATER, see PEMBROKE.

PATER, WALTER HORATIO (1839–94), Eng. author; b. in London. His prose is of the prose-poetry type, and includes the famous *Studies in the History of the Renaissance*, *Marius the Epicurean*, and *Appreciations*.

PATERNO (37° 32′ N., 14° 53′ E.), town, ancient *Hybla*, Catania, Sicily. Pop. 25,000.

PATERSON (40° 53′ N., 74° 12′ W.), city, capital of Passaic County, New Jersey, U.S.A.; founded *c.* 1792; manufacturing centre; has foundries and machine-shops; slaughtering and meat-packing carried on; manufactures include silk and jute. Pop. (1910) 125,600.

PATERSON, WILLIAM (1658–1719), founder of the Bank of England, and a director, 1694; s. of Dumfriesshire farmer; became important in the City of London as a member of the Merchant Taylors' Company; established the Darien colony, 1698, but could not prevent its failure; persuaded the Government to adopt scheme for consolidation and conversion of the National Debt, 1717; his financial proposals were embodied in Walpole's Sinking Fund; gave active assistance in Union of England and Scotland; see Barbour's *P. and the Darien Co.* (1907).

PATHOLOGY, the science which treats of the causes, nature, and results of diseases, generally divided into (a) *general pathology*, and (b) *special pathology*. General p. includes *inflammation*, or the series of phenonema arising in normal tissues from the action of a chemical or physical irritant, the most common being the action of bacteria, and *repair*, the process of restoration of damaged tissues; *degenerations* and *infiltrations*, the former being the retrograde conversion of the complex protoplasm of a cell into a simpler substance, *e.g.* fat or colloid material, and the latter being the deposition of a new substance, *e.g.* fat, in an otherwise unaltered cell; *necrosis*, cellular death in a part of the tissues, and *gangrene*, death of the tissues in mass; *pigmentation*, the abnormal deposition of colouring material in the tissues, usually in the cells; *atrophy*, abnormal decrease in the size and number or the size alone of the elements of a normal tissue, and *hypertrophy*, abnormal increase in the size of the elements of a normal tissue, the term *hyperplasia* being applied to increase in number; *malformations*, errors in development of various parts of the body, *e.g.* hare-lip, due to incomplete development of the upper jaw; *tumours*, abnormal local growths of new tissue, with no physiological function, which may be either *innocent*, i.e. resembling the tissue from which it

springs, restricted in growth, and only harmful through pressure, or *malignant*, of more or less embryonic nature, irregularly invading the surrounding tissues and with a tendency to reproduce itself in other parts of the body, eventually causing death; *granulomata*, including those chronic infective diseases with a characteristic lesion resembling granulation tissue, *i.e.* tuberculosis, syphilis, leprosy, glanders, actinomycosis; *diseases of the blood*, e.g. pernicious anæmia, leucocythæmia; *œdema* and *dropsy*, the former being the undue accumulation of lymph between the cells of a tissue, causing it to swell, and the latter the accumulation of lymph in one or other of the body cavities; *thrombosis* and *embolism*, the former being coagulation of the blood in a part of the circulatory system, and the latter the impaction of a body, usually part of a thrombus or clot, in a vessel too small to allow it to pass farther; *animal parasites* of the human body, tape-worms, thread-worms, fluke-worms, and protozoa; *bacteria* are not generally included under the heading of general p., but under the special heading of *bacteriology* (q.v.). Special p. includes the different manifestations of diseases in the various organs, the results of a particular disease or morbid condition being naturally more or less widely divergent in different tissues and organs.

The modern science of p. is founded upon the researches of Rudolf Virchow (1821–1902) and Sir James Paget (1814–99), the *Cellular Pathology* of the former being pub. in 1850, and the *Lectures on Surgical Pathology* of the latter, delivered during the six years preceding publication in 1853. With the introduction of improved methods of experiment and investigation the science made rapid strides in the last quarter of the XIX. cent., the discoveries of Koch, working on the lines initiated by Pasteur, of the bacillus of anthrax in 1876 and of tuberculosis in 1882, being perhaps the most notable and the most far-reaching in effect. At the present time considerable attention is being devoted by pathologists to investigation regarding the bacterial and parasitic origins of various diseases, —cancer, for instance, a subject engaging at present much patient and elaborate research, being attributed by some authorities, so far on insufficient grounds, to such causes, while the p. of the nervous system, including the localisation of function on the cortex of the brain and cerebellum, and the p. of the blood and blood-forming tissues, are also among the most important problems now being investigated.

See HEART, KIDNEYS, SPLEEN, and other organs; also such articles as RESPIRATORY SYSTEM, URINARY SYSTEM, PARASITIC DISEASES, BACTERIOLOGY.

PATIALA, PUTTALIA (30° 20′ N., 76° 25′ E.), native state, Punjab, India. Pop. (1911) 1,407,659. Capital, Patiala. Pop. 25,000.

PATIÑO, JOSÉ (1666–1736), Span. statesman; sec. of navy and Indies, 1726, and afterwards of finance; Minister of War, 1730; counteracting influence to misrule given by Philip V., Alberoni, and Ripperdá.

PATKUL, JOHANN REINHOLD (1660–1707), Livonian patriot; led Livonian opposition to Sweden; formed leagues of northern powers for partition of Sweden; delivered by Saxony to Sweden and broken on wheel.

PATMORE, COVENTRY KERSEY DIGHTON (1823–96), Eng. poet and critic; b. at Woodford, Essex; in 1847 he became a librarian at the Brit. Museum. His poetry is delicate, chaste, and melodious. The best of his works is *The Angel in the House*, consisting of the four parts—*The Betrothal, The Espousals, Faithful for Ever*, and *The Victories of Love*.

PATMOS (37° 20′ N., 26° 33′ E.), one of Sporades Islands, Ægean, belonging to Turkey; area, 20 sq. miles; here St. John lived in exile and, according to tradition, wrote Apocalypse; site of monastery of St. John. Pop. 4000.

PATNA (20° 30′ N., 83° E.), native state, Bihar and Orissa, India. Pop. 285,000.

PATNA (20° 35′ N., 83° 4′ E.), capital of Bihar and Orissa, India, on Ganges, stretching almost 9 miles along right bank; Gov. headquarters, college, and other educational institutions; famous for massacre of P. (1763) and Sepoy Mutiny (1857); important commercial centre; rice, opium, indigo, cotton, salt. Pop. (1911) 136,153.

PATON, SIR JOSEPH NOEL (1821–1901), Scot. painter; noted works are *Reconciliation of Oberon and Titania* and *Quarrel of Oberon and Titania* (both in Edinburgh National Gallery), and *The Pursuit of Pleasure*. Wrote two vol's of poems.

PATRAS (38° 14′ N., 21° 44′ E.), fortified town, W. Greece; Orthodox archiepiscopal see; has cathedral; exports large quantities of currants, also olives, olive oil, wine, etc. Pop. 37,724.

PATRICIAN (Lat. *patricius*).—(1) Rom. noble. Rom. *populus* was divided into *gentes* or clans, each descended from common ancestor; head of *gens* was also its father, *pater*; besides those so descended, the p's, the *gens* contained aliens named clients. Outside the *gentes* there was the *plebs*, without rights of citizenship, possibly composed of outlawed members of *gentes*; plebs was admitted to some civil rights before fall of monarchy and gradually won equality. (2) title conferred at will by Byzantine emperor; also given under late empire to provincial gov. (3) use retained in Ital. cities where title is applied to hereditary noble.

Nearly all Rom. citizens of the patrician class had their clients, who were of the working class, but were also citizens. The patron was the legal adviser, protector, and guardian of his client, both in public and private life. The client, if his patron were a poor man, subscribed money for the marriage portion of his patron's daughter, for ransom in the event of being taken prisoner, for law expenses. Neither could accuse or give evidence or vote against the other.

PATRICK, ST. (*c.* 387–461 A.D.), patron saint of Ireland; subject of many legends; b. probably in Glamorganshire, Wales; he was carried off to Ireland by pirates about 405; escaped after six years, and fled to Lérins in Gaul. He formed the idea of evangelising Ireland. In 432 he was consecrated and went to Ireland, where Christianity had already some footing. He preached vigorously, and to him the real conversion of Ireland is due. Scholars differ as to the credence to be given to the authorities for his work.

Bury, *Life of St. Patrick*.

PATRICK, SIMON (1626–1707), bp. of Chichester, 1689; dean of Peterborough, 1691.

PATRON AND CLIENT, see PATRICIAN.

PATTESON, JOHN COLERIDGE (1827–71), bp. of Melanesia, 1861; murdered by natives by mistake.

PATTI (38° 8′ N., 15° E.), seaport, Messina, Sicily, on Gulf of Patti. Pop. 5600.

PATTI, ADELINA, BARONESS CEDERSTRÖM (1843–), famous soprano; from 1861 played all chief Ital. operatic rôles.

PATTISON, MARK (1813–84), Eng. author; at Oxford came under influence of Newman, but abandoned Catholicism for agnosticism. His writings are numerous, and perhaps best known is *Milton*.

PAU (43° 18′ N., 0° 20′ W.), chief town, Basses-Pyrénées, France, on Gave-de-Pau; fine castle (XIV. cent.); former capital of province of Béarn; birthplace of General Bernadotte; winter health-resort; linen, chocolate, hams, Jurançon wine. Pop. (1911) 37,149.

PAUL I., PETROVICH (1754–1801), Tsar of Russia; unhappy youth and violent temperament led to tyranny and misery of his rule, though those who suffered from his temper believed him to have good disposition; hatred of republicanism led to his successful but exhausting war with France, 1798; upheld Napoleon after his overthrow of republic, 1799.

PAUL III., pope. See FARNESE.

PAUL V., pope. See BORGHESE.

PAUL OF SAMOSATA, patriarch of Antioch, *c.* 260–72; raised great storm by heresies, specially opposition to doctrine of Trinity; evolved doctrine that the

Son was 'consubstantial' with the Father; condemned and deposed by Council, 269, but Antioch supported him; expelled by decree of Ital. bp's, 272; 'Paulicians' (*q.v.*) or 'Samosatans' were long important.

PAUL OF THE CROSS, ST., Paolo della Croce (1694–1775), founder of Passionist Fathers ('of the Most Holy Cross and Passion'), which was fully sanctioned, 1737; canonised, 1867.

PAUL, THE APOSTLE, called by some the second founder of Christianity, was born of the tribe of Benjamin. His Jewish name was *Saul*. He was a citizen of the Rom. Empire, and lived in the midst of the later Gk. civilisation. These three elements in him, the Hebrew, the Greek, and the Roman, are fundamental for the understanding of his work and person. He spent his early life at Tarsus in Cilicia, and then under Gamaliel at Jerusalem. It is uncertain whether he had ever seen Jesus in the flesh, but he became the bitter persecutor of the Christians. The turning-point of his life was the vision on the road to Damascus. But P.'s mind must have been prepared for the coming change. It is impossible to account for it merely by excitement—or sunstroke, as some would have it.

Henceforth the former persecutor of the Church was to be its most passionate defender. He began his ministry in Damascus, and spent some years in Arabia. He visited Jerusalem and became acquainted with St. Peter. His work was then carried on mostly around Antioch. (The exact dates of the various events in P.'s life are uncertain, and in some points, particularly as regards his writings, the order is uncertain too. The general chronological sequence of events is, however, known.) About 44 A.D. he was again in Jerusalem to confer with the elders, and about 47 set out on his first missionary journey, accompanied by Barnabas and Mark. They went to Cyprus, then, going through Paphos and Perga, came to Pisidian Antioch, then through Iconium, Lystra, Derbe, and back to Antioch in Syria. To P.'s great grief Mark had left them. P. and Barnabas then went to Jerusalem to settle the relations of Jewish and Gentile Christianity. P. and Barnabas were to devote themselves to work amongst Gentiles, the older apostles to the Jewish Christians.

About 51 P. set out on his second missionary journey, separating from Barnabas, who refused to go unless Mark accompanied them. P. was accompanied finally by Silvanus. They went to Cilicia and Syria, where he had been before, then to northern Galatia. Here he had to face again the difficult problem of the relation of Jew and Gentile Christian, and came into conflict with the Judaisers. About the year 50 he passed over into what is now Greece. His work on European soil commenced at Philippi. At Athens he faced the curiosity-loving Gk. mob and idle pedants; at Corinth he was among the luxury and immorality of a great commercial city, and his subsequent letters to his converts at Corinth show the troubles he had with his converts; moreover, that those, even though their conversion had been sincere, were far from exemplary Christians, is shown by the *Epistle to the Romans*, P.'s greatest work. After his visit to Europe P. returned to Galatia. He then went to Jerusalem, meeting once more James, the brother of the Lord. It had been P.'s great desire to visit Rome, and at length he resolved to go there, but the Jews got him arrested in Jerusalem; he was kept in prison at Cæsarea Philippi two years, and then carried prisoner to Rome. His letters to Philemon, Timothy, and Titus were written there. The exact date and the circumstances of his death are quite unknown, but he probably perished in the Neronian persecution.

St. P. was an extraordinary spiritual genius, but a man with real grasp of practical affairs; a 'spiritual man' if ever there has been one, and yet very human. Realising the supernatural side of religion, he never lost sight of plain moral and spiritual issues (witness, *e.g.*, his dealing with 'spiritual gifts'). Before his conversion he was a Pharisee, and despite his rejection of the law and what it signified afterwards, his theology retained a Jewish colouring to the end. His later writings, such as *Ephesians*, show a deeper and more mystical theology; his eschatology became more spiritual and his Christology developed. His letters are not systematic treatises, but were called forth by special occasions, and his theology developed as different aspects of it had to be faced. With the human passion and tenderness of much of his theology, which often renders it easy for any one to grasp his meaning, much that he wrote, especially in *Romans*, is singularly difficult, and deals with the law in a way quite alien from our present modes of thought. While St. John appeals to all classes of Christians, St. P.'s appeal is more limited; to some his writings are practically sealed books, and others have gravely misunderstood when they have essayed to interpret him. None of the writers of the primitive Church fully grasped his meaning, even when they adopted his phraseology, and while subsequent theologians have sometimes developed and drawn out his thought, they have as often obscured it. Even by the time the latest books in the New Testament were written the stage represented by P. was already passed through (St. John often thinks on quite different lines), and neither the personality of P. himself, nor the special circumstances under which he wrote, could ever occur again in Christian history.

The authenticity of the Epistles attributed to him is now assured, with the possible exception of the Pastoral Epistles (*1* and *2 Timothy* and *Titus*). His follower on some lines was St. Augustine, and at the Reformation there was a fresh impetus given to the study of the writings of the 'Apostle of the Gentiles'; but it is very doubtful whether he can fairly be called the founder of 'Protestantism'—Catholicism owes to him quite as much. Some have seen the root of his doctrines in the Hellenic mysteries of his day, others in Jewish eschatology. But among Christians none are greater than P.

Martin, *Philippians, Ephesians*, etc. (Century Bible); G. B. Stevens, *The Pauline Theology* (1895); Garvie, *St. Paul* (Century Bible Handbooks).

PAUL, THE DEACON (*c.* 720–800), Lombard historian; little known of his life; s. of Lombard noble, Warnefrid; became instructor of king's dau., and subsequently Benedictine monk at Monte Cassino; chief work incomplete, but valuable, *Historia gentis Langobardorum*.

PAULA, see Francis of Paula, St.

PAULDING, JAMES KIRKE (1779–1860), Amer. writer; friend of Washington Irving, in whose *Salmagundi* he collaborated. His works, edit. by his s., extend to four vol's. The familiar patter lines, *Peter Piper picked a peck of pickled peppers*, occur in one of his novels.

PAULICIANS, an Armenian sect first mentioned by the patriarch, Nerses II., 553 A.D. An account is given of them in an anonymous document included in the Chronicle of Georgius Monachus (this document is called Esc.). The P's (it says) were so called after Paul of Samosata, but their founder was Constantine of Mananali. They were persecuted by the Emperor Leo. V. and the Empress Theodora, who is said to have slaughtered 100,000. They spread over Bulgaria, Syria, and Cilicia, and are mentioned in Armenian writings down to the XIII. cent., then not till the XVIII. In 1828 a body of them migrated to Russ. Armenia, carrying with them a book, the 'Key of Truth,' containing rites and liturgies, some obviously very old. The theology of the P's was heretical, though they tolerated outward submission to traditional observances. Like the Manichæans they were dualists, believing in a Good God and an evil World-Creator; their Christology was adoptionist; they detested monasticism, and disbelieved in a sacerdotal ministry. One who was completely initiated became a 'Christ.'

Some Syrian P's still survive. In the IV. cent. they were probably the survivors of Adoptionist heretics.

Conybeare, *The Key of Truth*.

PAULINUS, ST., OF NOLA (353–431), of good family; consul, 378, then became Christian, and later ordained; bp. of Nola, 409; his letters survive and show a spiritual personality.

PAULUS, HEINRICH EBERHARD GOTTLIEB (1761–1851), Ger. theologian and Orientalist; prof. at Jena; wrote *Life of Jesus* (1828), and interpreted New Testament on rationalist principles.

PAUMOTU, or LOW ARCHIPELAGO (20° S., 140° W.), broad belt of c. 78 atolls in Pacific, belonging to France; extending over 1300 miles; largest, Rangiroa; sparsely inhabited; pearl fisheries; form altered by storms.

PAUPER, see POOR LAW, VAGRANCY.

PAUSANIAS (fl. II. cent. A.D.), Gk. writer; nothing known of his life except that his book, *Description of Greece*, was partly written under Hadrian (d. 138) and Antoninus Pius, and finished c. 174, under Marcus Aurelius; believed to have been native of Asia Minor, probably Lydian; travelled eastward as far as Jerusalem, as far as oracle of Jupiter Ammon in Libya, and was acquainted with Macedonia, Italy, and Spain. *Description of Greece* has often been printed; new Eng. edition, 1898, by J. G. Frazer, with translation and commentary. It is divided into 10 books, each treating of separate division of Greece, *i.e.* 1. Attica; 2. Argolis; 3. Laconia; 4. Messenia; 5 and 6. Elis; 7. Achæa; 8. Arcadia; 9. Bœotia; 10. Phocis. Accuracy has been established whenever possible to test accounts; great authority on Gk. mythology (with which he enlivens his topography) and archæology; describes buildings and works of art which have perished, and is often means of discovering and interpreting Gk. antiquities.

PAUSANIAS (d. c. 470 B.C.), Spartan regent, 479; joint commander of Greeks with Aristides at battle of *Platæa*, 479; admiral, 478, against Persia; relieved Cyprus and recovered Byzantium.

PAVIA (45° 11′ N., 9° 9′ E.), ancient town of N. Italy and capital of province P., on Ticino, near confluence with Po. Outstanding features are churches of San Michele (XI. cent.), S. Pietro in Ciel d'Oro (rebuilt, c. 1132), S. Francesca (XI. cent.), unfinished Renaissance cathedral (XV. cent.), Castle of Visconti (1360), Palazzo Malaspina (now Museo Civico), Univ. (1361), and 5 miles north of P. the magnificent Certosa di Pavia (Carthusian monastery); chief industries, iron foundries, chemicals. Pavia (ancient *Ticinum*) was Lombard capital, 572–774; Francis I. of France here defeated and captured by Charles V., 1525; Austrian possession, 1714; passed to Sardinia, 1859. Pop. (1911) 39,319.

PAVIA, BERNARD OF, B. CIRCA (d. 1213), bp. of Pavia (1198). See CANON LAW.

PAVLOVO (56° N., 43° E.), town, on Oka, Nizhniy-Novgorod, Russia; cutlery. Pop 13,500.

PAVLOVSK (52° 42′ N., 47° 8′ E.), town, summer resort, St. Petersburg, Russia. Pop. 5400.

PAVLOVSKIY POSAD, VOKHNA (50° 40′ N., 38° 40′ E.), town, on Klyazma, Moscow, Russia; silk- and cotton-mills. Pop. 10,500.

PAVO, Peacock; see under PHEASANT FAMILY.

PAWNBROKING is regulated in Great Britain by the Pawnbrokers Act of 1872. The pawnbroker must be a person of good character, and must take out a yearly licence. The maximum profit is fixed, and the pledge on which the money has been lent must not be sold till a year has elapsed after the transaction. A pawnticket must be given to the borrower, and on this ticket the conditions of the loan are stated. No licensed pawnbroker may take pledges from a young person under 12, or from a person intoxicated, may employ an assistant under 16 years, or do business on a public holiday. A stipendiary magistrate may at any time order a pawnbroker to produce his books and papers concerning any transaction where reasonable suspicion exists that stolen goods have been pawned.

P. in U.S.A. is regulated by each state; in Boston State the police grant licences, in New York State the mayor and aldermen; interest is 3 % for first 6 months, 2 % per month afterwards. In some states pawned articles can be sold a year after deposit; in Massachusetts, 4 months.

In France the *Monts de Piété* (originally started in Italy in the Middle Ages) are the instruments for pawnbroking. These institutions are authorised by the municipality and managed by a paid official, and the profits beyond working expenses are devoted to local charities. An official valuer decides the worth of the pledge, and at the end of the year the pledge, if not redeemed or renewed, is sold by public auction, the borrower being allowed three years to claim any surplus on the sale over the sum lent. In France, as in Great Britain, pawnbroking offers assistance to those in temporary financial difficulties, but the cost of the loan is far heavier at the private pawnbroker's than at the Mont de Piété.

PAWTUCKET, town, Rhode Island, U.S.A.; cottons, woollens, machinery, etc.; print-, bleach-, and dye-works; site of state armoury. Pop. (1910) 51,622.

PAX, tablet kissed by priest at Mass.

PAXO, ancient *Paxos* (30° 12′ N., 20° 10′ E.), one of the Ionian Islands, Greece; olive oil.

PAYNE, JOHN HOWARD (1791–1852), Amer. dramatist, actor, and song writer; author of poem 'Home, Sweet Home.'

PAYNE, PETER (c. 1380–1455), Eng. Lollard; teacher at Oxford; fled to Bohemia and joined Hussites; represented Bohemia at Council of Basel.

PAYSANDU (32° 27′ S., 58° 6′ W.), port and chief town of P. department, Uruguay, on river Uruguay; exports preserved meat. Pop. 21,000; (dep.) 45,000.

PAYTA, see PAITA.

PAZMANY, PETER (1570–1637), Hungarian ecclesiastic; Protestant, but joined R.C. Church; cardinal, 1629; prominent in politics; did much for Hungarian lit.

PEA (*Pisum sativum*), member of Leguminosæ, cultivated for its edible seeds; plant a tendril climber, the tendrils representing modified leaflets, but dwarf varieties are also grown; leaves pinnate and stipulate, with alternate phyllotaxis; inflorescence is racemose, the flowers being typically papilionaceous. See LEGUMINOSÆ, SWEET PEA.

PEABODY (42° 31′ N., 71° W.), town, Massachusetts, U.S.A.; manufactures leather. Pop. (1910) 15,721.

PEACE (59° N., 115° W.), river, Canada; rises in British Columbia, enters Great Slave River near Lake Athabasca.

PEACE MOVEMENT.—War was declared by Greeks and Romans of classical periods to be against *jus naturale* or universal rule of right. Whatever may have been the attitude of the primitive Church, war as such was never denounced by the later Christian Church (excepting heretic sects). Heralds of the peace movement may be seen in ancient Gk. Amphictyonic League, cities belonging to which might not wage war on or injure each other, and in mediæval Truce of God, which secured certain intervals of respite from warfare. A strong dislike of war marked reformers of Renaissance, such as Erasmus, and war is one of chief existing institutions attacked in More's *Utopia*. Outstanding XVI.-cent. rulers like Elizabeth of England and Henry IV. of France set themselves against mediæval ideal of warlike glory, preferring triumphs of diplomacy, and Sully credited Henry IV. with a 'great design' of European federation. The Treaty of Westphalia, 1648, was important as an international settlement.

The idea of the federation of mankind which sprang up among cosmopolitan XVIII.-cent. philosophers was due to XVI.- and XVII.-cent. jurists, Gentili, Hobbes, Grotius, Pufendorf, etc., who developed Roman ideas of *jus naturale* and *jus gentium* into 'international law,' and 'though they did not create a sanction, created a law-abiding sentiment.' Quakers preached against war in XVII. cent. Saint-Pierre published his *Projet de paix perpétuelle*, 1713, and in 1795 appeared Kant's *Zum ewigen Frieden*. A strong cosmopolitan

influence was exercised by the Fr. Revolution, and writings of men like Bentham, Saint-Simon, Victor Hugo.

XIX.-cent. railroads effected a great intermixture of races. Numerous peace associations arose, *e.g.* F.I.G. (*Fraternitas inter gentes*), an international society, and 'American Association for International Conciliation.' Peace Congresses, started in 1843, are now regularly held in different countries in rotation. Treaties of XVIII. and XIX. cent. show development of international law. The tendency to submit international questions to arbitration has increased; Alexander I. of Russia suggested an international code and court in 1804, and at Conference of Aix-la-Chapelle, 1818, and from his *European System* developed *Concert of Europe*, the idea of a league of Powers to keep order in Far East; Britain has been member of or plaintiff before over fifty international tribunals since commencement of XIX. cent., and four times that number of cases altogether have been settled by this means. The Berlin Congress, 1885, which partitioned Africa among the Powers, is of great importance as precedent. Hague Peace Conferences have provided permanent court of arbitration to which recourse is at present voluntary, but will, it is hoped, become obligatory. Again, during XIX. cent. several of the old cockpits of Europe—Switzerland, Belgium, Luxemburg—have become neutral states, as has Norway. International law has won recognition as customary code. An Association for the Reform and Codification of the Law of Nations and Institute of International Law were founded, 1873; former has become International Law Association. American Society of International Law was formed, 1906. Inter-Parliamentary Union, founded 1887, holds international congresses and aims at federation of the world.

International **Peace Conference** to abolish or mitigate warfare assembled at Hague, 1899 and 1907, under auspices of Tsar Nicholas II. Great Britain agreed to chief conventions, *i.e.* that arbitration should be accepted in international disputes, and that laws of war by land and sea should be ascertained and insisted on; many resolutions were adopted as to missiles, captives, prizes, etc.

In 1910 Mr. Andrew Carnegie placed $10,000,000 in hands of trustees to be used for abolishing war. Desirability of war is vexed question with modern philosophers; old assumption that it was contrary to *jus naturale* or absolute rule of right is now widely questioned, and important German school claims that fighting is permanent and desirable human quality. See ARBITRATION, WAR, NEUTRALITY.

Perris, *History of War and Peace* (1911); Angell, *The Great Illusion* (1910); Crane, *The Passing of War* (1912); Bloch, *Is War Now Impossible?* (1899).

PEACE, PIPE OF, see CALUMET.

PEACH (*Prunus Persica*), rosaceous tree grown for its fruit; allied to apricot, cherry, plum, and almond; best reared in shelter of old wall, facing south-east; requires deep, well-drained soil containing calcareous matter, which may be supplied in form of old mortar or lime. If soil is on light side, a judicious addition of loam will improve it, whilst plenty of vegetable manure is also beneficial. Normally the p. is grafted on to a hardier stock, mussel plum or almond being generally used, although other stocks are used for the most susceptible varieties. Young trees should be pruned annually, late Jan. or beginning of Feb. being best time.

PEACOCK, see under PHEASANT FAMILY.

PEACOCK, GEORGE (1791–1858), Eng. mathematician; 2nd Wrangler, 1812; largely instrumental in introducing to Cambridge continental calculus notation and methods, and in founding Cambridge Philosophical Soc.

PEACOCK, THOMAS LOVE (1785–1866), Eng. writer; friend of Shelley, who persuaded him to abandon business for letters and aided him financially; eventually obtained government post; f.-in-law of George Meredith. Poems include *Palmyra*, *Philosophy of Melancholy*, and *Rhododaphne*; his best novels are *Melincourt*, *Nightmare Abbey*, and *Maid Marian*. Edited by Prof. Saintsbury (1895).

PEAK, THE (53° 23′ N., 1° 53′ W.), mountainous district, Derbyshire, England; contains Kinder Scout (2088 ft.), Mam Tor, and Axe Edge, and several caverns. *Peveril Castle* is in vicinity.

PEAL, see under SALMON FAMILY.

PEALE, CHARLES WILLSON (1741–1827), noted Amer. portrait painter; f. of **Rembrant Peale** (1778–1860), also a painter.

PEA-NUT, see GROUND-NUT.

PEAR (*Pyrus communis*), member of Rosaceæ, indigenous to temperate Europe; cultivated for its fruit (known botanically as a pseudocarp, the edible portion representing the enlarged apex of the receptacle, whilst the fruit proper constitutes the core); requires a deep, fairly moist, clayey loam with good drainage, and a southern outlook.

PEAR, PRICKLY, see CACTUS.

PEARL, globular concretion found in shells of certain bivalve molluscs; highly valued for ornamental purposes, and classed among gems. Most molluscs line their shells with a smooth secretion consisting of thin scale-like films. If a particle of foreign matter—say a grain of sand—finds its way into the interior of the shell, it sets up irritation, and as the inhabitant of the shell cannot remove offending particle it surrounds it with a layer of nacreous matter. The longer this process continues, the larger of course will be the globule of nacre, which is known as a p. The principal sources of p's are the p. oyster (*Meleagrina margaritifera*), found throughout the Pacific; p. mussel (*Avicula margaritifera*), and freshwater mussel (genus *Unio*) of Brit. rivers.

The chief p. fisheries are those of Ceylon, carried on principally in the Gulf of Manaar. Those of the Persian Gulf were known to the ancients. P's are also obtained from the Sulu Archipelago, N.E. Borneo, New Guinea, Gulf of Mexico, and Australia. Native divers descend 60 or 70 ft., weighted by a stone and lowered from a boat by a rope. They carry a net and gather the p. oysters in it from the sea-floor. They remain below for perhaps 30 or 40 seconds at a time, and are hoisted to surface after signalling with a rope. The oysters are allowed to rot on the beach in sun's rays. Then in 7 or 10 days they are searched for p's.

Famous Pearls.—The largest known p., 2 inches in length and 4 inches in circumference, is in the South Kensington Museum, and valued *c.* £50,000.

Julius Cæsar presented Servilia (the mother of Marcus Brutus) with a p. worth £48,000. Cleopatra swallowed a p. valued at £60,000 to £80,000, while Tavernier sold one to the Shah of Persia for £180,000.

Scottish Pearls are obtained from freshwater molluscs in Scot. rivers. They were famous even in Middle Ages, but the search for them was practically abandoned many years ago. 'Freshwater pearls' are still searched for in Germany, China, and U.S.A.

Artificial Pearls are largely made in France, Germany, and Italy, by blowing a thin globe of glass and filling it with a solution of ammonia and fish scales.

Kunz and Stevenson, *Book of the Pearl*.

PEARL OYSTERS, see under LAMELLIBRANCHIATA.

PEARL SPAR, see DOLOMITE.

PEARSON, JOHN (1612–86), Anglican bp. of Chester. 1672: wrote *Exposition of the Creed*, 1659.

PEARY, ROBERT EDWIN (1856–), Amer. Arctic navigator and discoverer of North Pole; Rear-Admiral, U.S. Navy (retired); led expedition of Academy of Natural Sciences, Philadelphia, 1891–92, discovering Melville Land and Heilprin Land and demonstrating insular character of Greenland; in expedition 1893–95 discovered Iron Mountain; commanded expedition of Peary Arctic Club, New York, 1898–1902; led fresh expeditions, 1905–6, 1908–9; reached Pole, April 6, 1909. See POLAR REGIONS.

Peary, *The North Pole* (1911).

PEASANT PROPRIETORSHIP, see CROFTER, SMALL HOLDINGS.

PEAT, remains of bog-moss, *Sphagnum*, together with partially preserved remains of vegetation swamped and killed by its overgrowth; owes its preservative power to presence of humic acid. P.-bogs are found in many parts of England, are more common in Scotland, and still more numerous in Ireland. Various attempts have been made to compress p., and so make it commercially available as fuel, but no satisfactory system has yet been produced. It is, however, used as fuel by peasants.

PECCARY (*Dicotyles*), a genus and family of Swine, with five species confined to the New World, in the forests of which they wander in large herds.

PE-CHIH-LI, see CHIH-LI.

PECHORA (65° N., 57° E.), river, N.E. Russia; rises in Urals, flows into Gulf of P.

PECKHAM, JOHN (d. 1292), Eng. Churchman; lectured at Paris and Oxford; abp. of Canterbury, 1275; generally on good terms with Edward I., but a vigorous defender of Church.

PECORA, COTYLOPHORA, the Pecora, or true Ruminants, a group of Artiodactyle Ungulates, include deer, giraffe, cattle, and sheep. The name *Cotylophora* refers to the connection between the unborn young and the mother, the two being connected by patches of small villi or finger-like processes—that is to say, the placenta is cotyledonary. They have many structural features in common, such as the presence of horns or antlers, the absence of upper incisors and usually of canines, the presence of compound cannon bones in the fore-limbs, and the complete development of only the third and fourth digits.

Most interesting is their habit of *ruminating* or chewing the cud, associated with the presence of a four-chambered stomach, known as (1) the *Paunch*, (2) the *Honeybag* or *Reticulum*, (3) the *Manyplies* or *Psalterium*, and (4) the *Reed* or *Abomasum*. The food passes into (1), is softened, regurgitated, rechewed, and now passes along (2) into (3); filtered here, it finally passes to (4), where it is digested.

PÉCS, FÜNFKIRCHEN (46° 6′ N., 18° 13′ E.), town, Hungary; bp.'s see; cathedral; held by Turks, 1543–1686; woollens, porcelain. Pop. (1910) 49,822.

PECULIAR PEOPLE, THE, see FAITH.

PEDEN, ALEXANDER (c. 1626–86), Scot. Covenanter; minister of New Luce, but forced to leave by Ejectment Act, 1663.

PEDICULOSIS, condition in which lice (*pediculi*) are present on the head, body, or pubes. P. of the head is treated by soaking the hair with methylated spirits for one or two nights to kill the parasites and their eggs, and then the hair is thoroughly combed out with a small-toothed comb.

PEDICULUS, see LICE.

PEDIPALPI, see WHIP SCORPIONS.

PEDLAR, see HAWKER.

PEDRO, see PETER.

PEEBLES (55° 38′ N., 3° 13′ W.), town, on Tweed, Peeblesshire, Scotland; county town; manufactures woollens and tweeds. Pop. (1911) 5554.

PEEBLESSHIRE (55° 35′ N., 3° 20′ W.), inland county, Scotland, bordered on N. by Edinburghshire, on W. by Lanarkshire, on S. by Dumfriesshire, on E. by Selkirkshire; area, 348 sq. miles; country rough and hilly, rising to 2745 ft. (Broad Law); agriculture and sheep-farming are pursued; coal is mined, while wool-manufacturing is an important industry. Pop. (1911) 15,258.

PEEKSKILL (41° 17′ N., 73° 58′ W.), town, on Hudson, New York State, U.S.A.; iron manufactures. Pop. (1910) 15,245.

PEEL (54° 13′ N., 4° 42′ W.), watering-place, fishing town, Isle of Man; castle; ruined cathedral. Pop. 3300.

PEEL, ARTHUR WELLESLEY, VISCOUNT PEEL (1829–1912), Brit. Liberal statesman; s. of Sir Robert P.; elected Speaker, 1884, 1886, 1892; cr. viscount on resignation, 1895; chairman of Commission on Licensing Laws, 1896.

PEEL, SIR ROBERT, Bart. (1788–1850), Brit. statesman; s. of wealthy Lancashire cotton manufacturer; grad. from Christ Church, Oxford, 1808; Tory member for Cashel, 1809; Under-Sec. for Colonies, 1811; Sec. for Ireland, 1812–18; adopted ultra-Prot. imperial attitude, winning nickname *Orange Peel*; as chairman of Bank Committee, 1819, alleviated economic distress by restoring cash payments; supported Government in repressive measures; excellent administrator but fearful of revolution; Home Sec., 1822, with Liberal Canning as Foreign Sec. and chief influence; disliked Canning's assistance of revolution abroad and support of Catholic emancipation at home; with Wellington and Eldon, resigned when Canning became First Lord of Treasury, 1827. Canning died the same year, and Wellington formed a purely Tory ministry in which P. was again Home Sec.; compelled by expediency to pass Catholic Emancipation Bill, 1829, owing to agitation of country, but steadily resisted outcry for parliamentary reform; Tories forced to resign, 1830. P. had reorganised London Police (hence slang terms, *peeler, bobby*); member for Tamworth, 1833–50; led opposition in ministries of Grey (1832–34) and Melbourne (1834). He became Prime Minister, Nov. 1834; was forced to resign, April 1835. The restored Whigs continued sweeping reforms, but lost favour through distress of country, misfortunes abroad, and fear of Irish secession. Conservatives returned, 1841, with P. as Prime Minister. He restored order in finances, imposing Income Tax. Famous Free Trade measures, 1842, show new strength of manufacturing as opposed to landed interest; great Irish agitator O'Connell imprisoned; revolts in India crushed and Sind annexed; retired before new Liberal wave, 1846; killed by fall from horse; a 'Trimmer' of the best type.

Peel, from his Private Papers, edit. by Parker (1899).

PEELE, GEORGE (c. 1558–c. 1597), Eng. dramatist; wrote *Arraignment of Paris* (1584), a masque; *Old Wives' Tale* (1595); one of pioneers of great blank verse outburst.

PEERAGE, upper ranks of Brit. society, possessed of legal and social privileges usually hereditary. It might be defined as consisting of the temporal members of the House of Lords, as distinction originated in legislative powers, and spiritual lords of Parliament are no longer considered to be peers; but life peers have no right to legislate *ex honore*. '*Perage*' of England occurs in roll of Parliament of 1454; 'peer' in this sense, in 1321 (Middle English *per* is from Old French *per, peer*, from Lat. *par*, equal).

The technical meaning of peer originated in the feudal system: those were *pares* who took same oaths of service to lord; hence vassals who held immediately of the king of France and formed feudal court acquired title of peers. Above Fr. barons, or ordinary peers, were 'peers of France,' whose origin is wrapped in obscurity. Despite Charlemagne's legendary twelve peers, no hist. mention of the Fr. court of peers has been found before XIII. cent., when it was composed of six lay peers (the dukes of Normandy, Burgundy, and Guienne, and counts of Champagne, Flanders, and Toulouse) and six ecclesiastical peers (abp. of Rheims, bp's of Langres, Laon, Châlons-sur-Marne, Beauvais, and Noyon), who had each a separate function at the king's coronation; it is believed that they represented the full number of original tenants-in-chief. Kings assumed the right of creating new peerages, of which there were 49 at the Revolution, though the original number of 6 ecclesiastics still obtained. Fr. lay peers had the right of sitting in the *Grande Chambre* of the *Parlement de Paris* behind ecclesiastical peers and princes of blood; they could be cited to appear before no other court.

In England, as in France, tenants-in-chief, or 'barons,' did suit at the lords', that is, the king's, court, and chief barons acquired title of peers. There is evidence

in both countries that the name peer was originally given to *afferors* in manorial, borough, and other courts, but it only survived in the case of the great council of the realm. The Eng. Parliament, however, was not a mere feudal assembly, but inherited traditions of the Saxon *witenagemot*. Hence, from the Conquest, magnates were summoned as such, not purely as landowners, and it is doubtful in which capacity individual bp's may have appeared. Also from the custom of sending writ of summons to magnates, apart from general summons through sheriff of shire, the element of Crown selection entered into composition of Parliament. All tenants-in-chief were not summoned, and barony by tenure ceased to be qualification for seat in Parliament. Magna Carta made this special summons the right of abp's, bp's, abbots, earls, and greater barons; smaller barons appeared by representatives from 1254.

The peerage is divided into successive ranks of duke, marquess, earl, viscount, baron, possessing same privileges and divided only by order of precedence (fixed by statute, 1539). The family of a peer do not share his privileges and are not considered to have 'nobility of blood.' No claim can now be made to *peerage* on plea of barony by tenure; baronies are either by writ or (more usually) letters patent, but writ to ancestor is not sufficient proof of right to barony if it cannot be established that he actually sat in Parliament as baron by writ.

The first creation of barony by patent was 1387. Earls existed before the Conquest, though the legal status of dignitaries holding that title is obscure, as is that of immediate post-Conquest earls. The earl took a baronial character under the feudal system and represented the highest rank in the peerage until dukedom was created, 1337, for the king's son. The first marquessate created in the realm was in 1385; first viscounty, 1440. The Crown has the prerogative of creating peers. Peeresses are either so *jure suo*, by descent or creation, or as wives of peers, and have, like peers, the right to appear before no law court but House of Lords, but have not right to sit in the House of Lords.

PEEWIT, see PLOVER FAMILY.

PEGASUS (classical myth.), winged horse which sprang from the slain Medusa's blood; Bellerophon mounted him and slew the Chimæra.

PEGAU (51° 10′ N., 12° 15′ E.), town, on Elster, Saxony, Germany; felt, boots and shoes. Pop. (1910) 5785.

PEGMATITE, coarse granite rocks occurring in veins in diorites, gabbros, and syenites, and associated with plutonic and intrusive rocks; irregularly composed of alkalies, felspar, and quartz; irregularly distributed; some varieties rich in mica; used in porcelain manufacture.

PEGNITZ (49° 27′ N., 11° 10′ E.), river, Bavaria; unites with Rednitz at Fürth to form the Regnitz.

PEGU (17° 20′ N., 96° 30′ E.), town, Pegu division, Lower Burma, on Pegu River. Pop. 14,000.

PEHLEVI, see PAHLAVI.

PEIHAI, see PAKHOI.

PEINE (52° 19′ N., 10° 12′ E.), town, Hanover, Prussia; ironworks. Pop. (1910) 16,668.

PEIPUS, CHUDSKOYE OZERO (58° 35′ N., 27° 30′ E.), lake, Russia; discharges by Narova into Gulf of Finland; connected on S. with Lake Pskov; area, 1356 miles.

PEIRÆUS, PIRÆUS (37° 45′ N., 23° 10′ E.), town, Greece, on Saronic Gulf; the port of both ancient and modern Athens. Pop. 71,600.

PEISISTRATUS (*c.* 600–527 B.C.), tyrant of Athens; relation of Solon; of great wealth and influence. Pretending to have been attacked and wounded by Eupatridæ (*q.v.*) for upholding democracy, he gradually increased the armed guard assigned him by the indignant populace, and at last seized the acropolis, 560; expelled by Lycurgus and Megacles, 559; restored by Megacles, 554; again expelled, 552; remained in exile till 541. Returning with an army P. ruled till 527, when his sons Hippias and Hipparchus succeeded him; expelled his opponents, but ruled as a benevolent despot, building public works and protecting democrats against aristocrats.

PEKIN (40° 43′ N., 89° 34′ W.), city, Illinois, U.S.A., on Illinois; manufactures wagons; vicinity coal-fields. Pop. (1910) 9897.

PEKING, PEKIN (39° 53′ N., 116° 29′ E.), capital of China, between Peiho and Hun-ho, Chih-li province. P. consists of two cities, each surrounded by high walls with numerous towers and gates. The Tartar or Manchu city in N. includes *Hwang-cheng* (old imperial city), with military arsenal, public offices, univ., astronomical and magnetic observatory (founded XIII. cent.), residences of nobles, etc., and *Tsze-kin-cheng* (Forbidden City), with palaces and parks. The Chinese city on S. has Temple of Heaven and Agriculture, warehouses, theatre, etc.; summer palaces, several temples, and convents within vicinity. P. was imperial capital under various names for cent's; siege of foreign legations during which many fine buildings were destroyed, 1900. Pop. (1910) 805,110. See also CHINA.

PELAGIA, ST. (*c.* III. cent.), virgin martyr, whose historicity has been doubted.

PELAGIUS I., pope, 555–61; elected owing to influence of Emperor Justinian.—**Pelagius II.**, pope, 579–90; tried to settle disputes existing since P. I.

PELAGIUS (*c.* 360–420 A.D.), heresiarch founder of heresy called Pelagianism. For most of his life P., who was of Brit. birth, was reputed orthodox and was the friend of St. Augustine. The controversy in which he engaged with Augustine centred round original sin, which the Eastern Church had tended to minimise. P.'s religious experience was less stormy than Augustine's, and his religion, therefore, tended to develop into an ethical moralism, and did not emphasise the necessity for Divine grace. It was possible, according to him, to lead a sinless life. The controversy began in 410, and became acute in 419. P. is not heard of after 420. Pelagianism has appeared since in Christian doctrine, but has never given rise to a formal sect.

Harnack, *History of Dogma*; Bethune-Baker, *Introduction to Early History of Christian Doctrine*.

PELARGONIUM, genus of plants, order Geraniaceæ; the beautiful garden p's are hybrids. See GERANIUM.

PELASGIANS, people mentioned in *Iliad* as allies of Troy, and in *Odyssey* as a Cretan tribe; thought to have inhabited Thessaly, and by Herodotus to have preceded the Hellenes as inhabitants of Greece. A legendary King Pelasgus was at Argos. All the early population—pre-Mycenæan—of Greece and Rome is sometimes called Pelasgian. See GREECE (History).

PELECANIDÆ, Pelicans (*q.v.*).

PELECYPODA, see LAMELLIBRANCHIATA.

PELEW ISLANDS (7° N., 134° 13′ E.), group of small mountainous islands, W. Pacific, belonging to Germany. Pop. 3000.

PELHAM, Eng. family; originated from Pelham, Herts; from it descended P's of Laughton and Stanmer, Sussex, afterwards Dukes of Newcastle and Earls of Chichester.

PELHAM, GEORGE (1766–1827), bp. of Bristol, 1803; of Exeter, 1807; of Lincoln, 1820; s. of Earl of Chichester.

PELHAM, HENRY (1696–1754), Brit. Prime Minister; bro. of Duke of Newcastle; formed ministry, 1745, uniting all shades of Whigs; ended war, 1745; blind to signs of European coalition against Britain.

PELHAM, JOHN DE (d. 1429), Eng. Lord Treasurer, 1412–13; one of first prominent members of this family; aided Henry IV. to secure throne.

PELHAM, JOHN THOMAS (1811–94), bp. of Norwich, 1857–93; s. of Earl of Chichester; friend of Cardinal Manning.

PELHAM OF LAUGHTON, BARONY OF, cr. 1706,

for Sir Thomas P., Bart.; extinct, 1768. SIR THOMAS was prominent upholder of Revolution, 1688; Lord of Treasury, 1689–94, 1701–2; m. Grace, dau. of Earl of Clare and sister of Duke of Newcastle. His s. THOMAS, cr. Earl of Clare, 1714, became Duke of Newcastle-upon-Tyne, 1715, Duke of Newcastle-under-Lyme, 1756.

PELHAM OF STANMER, BARONY OF, cr. for 2nd baron P. of Laughton, 1762, with special remainder, by which cousin Thomas succ., 1768; 2nd baron was cr. Earl of Chichester, 1801.

PELHAM, SIR WILLIAM (d. 1587), Lord Justice of Ireland, 1579; ruthlessly stamped out Desmond revolt in Munster; marshal in Netherlands, 1581–87. His bro., **Sir Edmund** (d. 1606), chief baron of exchequer in Ireland, 1602; first Eng. judge to go on circuit in N. of Ireland.

PELICANS (*Pelecanidæ*), family of swimming birds with four webbed toes, found near lakes and swamps all over the world, except in polar areas. Their remains have been found in Britain.

PELION (39° 26′ N., 23° 3′ E.), mountain, Magnesia, E. Thessaly; celebrated in Gk. myth.; modern Zangora or Plessidi.

PELLA (40° 44′ N., 22° 27′ E.), capital of ancient Macedonia; Alexander the Great's birthplace.

PELLAGRA, mysterious disease occurring in Italy, Spain, Egypt, as well as several other widely-separated parts of the world, characterised by a burning of the skin, a red rash, pigmentation, nervous disorders, muscular wasting, and progressive general weakness; formerly believed to be due to eating diseased maize, but now attributed to a protozoon communicated by sandflies. Arsenic has a beneficial effect. In recent years p. has appeared in U.S.A. and Britain; investigations by Tropical Medicine Schools of these countries are in progress.

PELLEW, see EXMOUTH, VISCOUNT.

PELLICANUS, CONRAD (1478–1556), Ger. Prot. divine; studied at Tübingen; wrote first Hebrew Grammar in a European language; prof. at Zürich; a good scholar, and man of fine character.

PELLICO, SILVIO (1788–1854), Ital. poet and dramatist; was intimate with Byron, and trans. his *Manfred* into Italian.

PELLITORY (*Parietaria*), genus of plants, order Urticaceæ; Common P. (*P. officinalis*) has reddish stem, narrow leaves, and small flowers.

PELOMYXA, a protozoon; see under LOBOSA.

PELOPIDAS (d. 364 B.C.), Theban patriot; exiled, 382; drove out Spartans and oligarchs, 379; organised 'sacred band' of Theban youths, who established Theban military prestige.

PELOPONNESIAN WAR (431–404 B.C.), conflict between the Delian League (Athens and her allies) and Peloponnesian confederacy (Sparta, etc.). Three periods: (1) The *Archidamian War*, 431–421; (2) 421–413; (3) The *Decelean War*, 413–404.

(1) Athens had incurred jealousy of Sparta, and provoked war by damaging Corinthian trade. Immediate cause was aid given by Athens to Corcyra, in its revolt against Corinth, 434–433. Corinth in return stirred up Potidæa against Athens and made new coalition with Sparta against Athens, 432. Thebes attacked Platæa, 431, and Spartan king Archidamus marched with large army northwards. Pericles did not make hopeless attempt to defend Attica, but gathered inhabitants into Athens, which Spartans failed to storm; issued to make short raids when Archidamus retired. Siege of Athens was repeated, 430, when besieged were visited by terrible plague, 428, 427. Athenian fleet meanwhile won great successes, culminating at *Pylos*, 425, when Sparta sought peace. Failure at *Megara*, *Amphipolis*, and *Delium*, 424–422, made Athens accept truce of 50 years.

(2) Anger of confederacy with Sparta and intrigues of Athenians, Nicias and Alcibiades, led to alliance of Sparta and Athens, 421, but Athens accepted leadership of democratic states of Peloponnesus, 419; terrible disaster of Athens in Sicilian expedition, 415, put her at mercy of Sparta.

(3) Sparta now made Attic town of **Decelea** her base of operations against Athens. Persia again established suzerainty over Asia Minor, aided by Sparta, the banished Alcibiades assisting them with his advice; and the members of Delian League revolted. Athenians, with exhausted treasury, still retained naval supremacy, and Alcibiades, recalled, destroyed Spartan fleet at *Cyzicus*, 410. Restoration of Spartan fleet under Lysander led to crushing victory of *Ægospotami*, 405. Athens fell, 404.

PELOPONNESUS (37° 28′ N., 22° 10′ E.), ancient name of peninsula forming southern part of Greece; modern Morea. See GREECE.

PELOPS (classical myth.), grandson of Zeus and son of Tantalus, who killed him and presented him as a dish at an entertainment given to the gods. He was credited with reviving the Olympic games.

PELOTAS (31° 38′ S., 52° 24′ W.), town, Rio Grande do Sul, Brazil; trade in cattle; meat-preserving works. Pop. 20,000.

PELTUINUM (modern Ansedonia) (42° 22′ N., 13° 35′ E.), ancient town, Italy, on Via Claudia Nova.

PELUSIUM (30° 55′ N., 32° 30′ E.), fortified town, ancient Egypt, on Pelusiac mouth of Nile.

PELVIS, see SKELETON.

PEMBA (5° S., 39° 40′ E.), Brit. island off E. coast of Africa, N. of Zanzibar; made of coral; produces cocoa, cloves. Pop. c. 75,000.

PEMBROKE (45° 46′ N., 77° 4′ W.), town, on Lake Alumette, Ontario, Canada; lumber trade and manufactures. Pop. 5500.

PEMBROKE (51° 40′ N., 4° 54′ W.), county town, Pembrokeshire, Wales, situated on Creek of Milford Haven; contains mediæval castle and Monkton Priory. **Pembroke Dock** or **Pater,** 2 miles distant, is naval dockyard and garrison town. Pop. (1911) 15,673.

PEMBROKE, EARLDOM OF, was palatinate, possibly until Wales became shire land under Henry VIII. GILBERT DE CLARE, lord of Strigul, was cr. earl, 1138; not certain whether epithet, *Strongbow*, belongs to him or his s. RICHARD, earl, 1148–76. Richard's dau. and heir, Isabel, m. WILLIAM MARSHAL, who thereupon became earl (c. 1189), and was succ. in turn by his five sons (1219–52), after which earldom reverted to crown. WILLIAM DE VALENCE, the king's uterine bro., who m. dau. of coheir of last earl, was cr. earl, c. 1265; succ. by s. AYMER and afterwards by the HASTINGS, descendants of his dau. Isabel. Earldom reverted to crown on death of John Hastings, 1389; Humphrey, Duke of Gloucester, held it, 1414–47, William de la Pole, Marquess of Suffolk, 1447–50, Sir Jasper Tudor, 1453–61, 1485–95. Sir William Herbert of Raglan was cr. earl, 1468, Edward Prince of Wales, 1479; Anne Boleyn was marchioness, 1532–36; WILLIAM HERBERT was cr. earl, 1551, and dignity is still held by his descendants. MARY, COUNTESS OF P. (1557–1621), 'Sidney's sister, Pembroke's mother,' wrote poetry, and published her bro's *Arcadia* after his death.

PEMBROKESHIRE (51° 50′ N., 4° 55′ W.), most westerly county, Wales; bounded N., W., and S. by sea, E. by Cardigan and Carmarthen; area, 558 sq. miles. Coast is wild and rugged; chief inlets, Milford Haven and St. Bride's Bay; islands of Ramsey, Grassholm, Skomer, and Caldy lie off coast. Inland are fertile hills and valleys; in N. is Precelly Range; principal rivers, Teifi, E. and W. Cleddau. Agriculture is chief industry; stock-raising; deep-sea fishing; coal, lead, and slate worked. Chief towns are Pembroke, Haverfordwest, and Tenby. P. is celebrated for castles; also contains Cathedral at St. David's, some interesting churches, Brit. encampments, and cromlechs. Owing to settlement of Flemings (XII. cent.), who adopted Eng. language, population is mostly English-speaking. Pop. (1911) 84,869.

PEMPHIGUS, a disease of the skin, characterised by the appearance of large bullæ, or blisters, of which fresh crops may continue to come out for several

months; these burst, leaving a raw, ulcerated surface. The treatment is general, warm baths, tonics, and plenty of nourishing food being given, while arsenic and an antistreptococcic vaccine have both proved beneficial in certain cases.

PENAL LAWS, see CRIMINAL LAW.

PENANG (5° 18′ N., 100° 4′ E.), island lying extreme N. of Straits of Malacca, off W. coast of Malay Peninsula, with province of Wellesley (on mainland); forms one of Brit. Straits Settlements; capital, Georgetown; total area, 270 sq. miles. Pop. (1911) 278,003. See STRAITS SETTLEMENTS.

PENARTH (51° 27′ N., 3° 10′ W.), seaport, watering-place, at mouth of Taff, Glamorganshire, Wales. Pop. (1911) 15,488.

PENATES, Rom. household gods particularly associated with the store, as the *Lar* was associated with the hearth. As the State was considered a large family, there were public P. as well as private. The State P. of Rome were said to have been carried by Æneas from Troy. To the P. were offered the first-fruits.

PENCILS, in original form, sticks of metallic lead, then of plumbago; graphite powdered and cast into cakes, 1843; now mixed with clay and water and placed in crucible. Graphite mines exist in Siberia, Bavaria, and Ticonderoga (N. Y.); Cumberland mines are worked out.

PENDENNIS CASTLE, see FALMOUTH.

PENDLESIDE SERIES, series of strata below the Upper division of the Carboniferous limestones, and above the Millstone grits; consist principally of black limestone, black shales, and sandstones.

PENDLETON, suburb of Salford (*q.v.*), Lancashire. Pop. (1911) 64,386.

PENELOPE (classical myth.), wife of Odysseus (Ulysses); during his absence at Trojan War many suitors sought her hand, and she put them off on the pretence that she was weaving a robe for Laertes, her father-in-law; she unravelled by night the web she had woven during the day; Odysseus returned to her after 20 years' absence.

PENGUIN, SPHENISCIDÆ, interesting order of flightless birds, confined to Antarctic and Southern Oceans; good swimmers and divers, using their wings, totally devoid of quills, as paddles, while on land they walk erect, but awkwardly.

The KING (*Aptenodytes patagonica*) and EMPEROR PENGUINS (*A. forsteri*) are two of the largest species, the latter nesting and hatching its eggs in mid-Antarctic winter.

PENINGTON, SIR ISAAC (c. 1587–1660), lord mayor of London, 1642-43; a fishmonger; sheriff, 1638; sat for city in Short and Long Parliaments, and financed revolutionary forces; on commission for king's trial.

PENINSULA, a piece of land nearly surrounded by water, *e.g.* Balkan P., Denmark, Florida (the 'Peninsular State'), Italy, Malay P., Morea, Scandinavia; Spain and Portugal form *the Peninsula* or Iberian P.

PENINSULAR WAR (1808–14), war in which Britain assisted Spain and Portugal in driving French from Iberian peninsula. Portugal appealed to Britain for aid against Fr. general Junot, and Sir Arthur WELLESLEY was sent with troops, 1808; won decisive battle of *Vimeiro*, 1808, and Convention of Cintra was made, by which French evacuated Portugal; this constituted the first successful opposition to Napoleon on land. NAPOLEON made his bro. Joseph king of Spain, 1808, with consent of its king, Charles IV., but people revolted and forced Dupont to make *Capitulation of Baylen* (1808), by which 18,000 Fr. soldiers surrendered; every town which French retained had to be garrisoned; Napoleon himself led army of 135,000 men, and occupied Madrid, December 13, his marshals winning battles of *Burgos*, *Espinosa*, and *Tudela*.

SIR JOHN MOORE, who had superseded Wellesley, made *sortie* from Portugal to divert Napoleon from Andalusia; Napoleon turned to attack Moore, who then made famous retreat in bitter weather, fighting as he went; Napoleon, recalled to France, left Soult in command; SOULT overtook British at *Corunna*, and Moore was killed in great battle which covered embarkation of his troops, January 16, 1809. Soult then invaded Portugal and captured Oporto while other Fr. armies busily reduced Span. fortresses; Brit. reinforcement sent under Wellesley expelled French and invaded Spain, winning battle of *Talavera*, July 28; French succeeded in capture of Andalusia.

Napoleon dispatched MASSÉNA to conquer Portugal, 1810; he entered from N.E., while Soult attacked from Andalusia, a plan which failed from disagreement of the two generals. Wellesley, now Viscount WELLINGTON, was at first compelled to retreat before Masséna, and took up position behind *Torres Vedras* near Lisbon. Masséna, who received no help from Soult, was not strong enough to attack separately, and endured great hardships as Portuguese had laid waste country round; he retreated into Spain, 1811, but returned and was defeated by Wellington at *Fuentes de Onor*, May 5, 1811; Beresford won battle of *Albuera* against Soult's invading army, May 16. Wellington then invaded Spain, and Masséna, out of favour, was recalled; France remained successful in E., and defeated Brit. force under Blake at *Albufera*.

Under MARMONT, Masséna's successor, France lost *Ciudad Rodrigo*, January 1812, and *Badajoz*, April, thus opening Spain to Portug. attack; by great victory of *Salamanca*, July 22, Wellington compelled Joseph Bonaparte to fly from Madrid and evacuate Andalusia; Wellington occupied Madrid, August 12, but was forced to retire; Brit. troops sent to make diversion on E. coast signally failed. While Napoleon was fighting life and death struggle in Germany, 1813, Wellington succeeded in establishing himself between Madrid and France, and prevented Joseph Bonaparte crossing the Ebro, defeating his general, Jourdan, at *Vittoria*, June 21, 1813. Wellington then assisted Spanish in expelling French, fought several engagements in Pyrenees, and invaded France, October 1813; victories of *Orthez* and *Toulouse*, 1814; *Peace of Paris*, 1814.

Hutchinson, *Operations in the Peninsula, 1808–9* (1905).

PENIS, see REPRODUCTIVE SYSTEM.

PEÑISCOLA (40° 24′ N., 0° 25′ E.), fortified town, Spain, on Mediterranean. Pop. 3000.

PENITENTIAL, Catholic book imposing and regulating penances due for sin. It began with the discipline of the 'lapsed,' those who had fallen away during persecution. Various p's were compiled; the *Pœnitentiale Theodori* became the standard; owing to the development of canon law on the subject, p's were disused after XII. cent.

PENJDEH, see PANJDEH.

PENKRIDGE (52° 44′ N., 2° 7′ W.), town, on Penk, Staffordshire, England.

PENMARCH (47° 50′ N., 4° 25′ W.), decayed fishing town, Finistère, France.

PENN, WILLIAM (1621–70), Eng. admiral; distinguished as general at sea with Blake against Holland, 1653; took Jamaica, 1655; served against Holland with Duke of York, 1665.

PENN, WILLIAM (1644–1718), Eng. Quaker; founder of Pennsylvania; s. of Admiral Sir William P.; ed. at Christ Church, Oxford; sent down for nonconformity, 1661; led gay court life in Paris, 1661–64; attended Quaker meetings at Cork, 1667, and was imprisoned; speedily released, but henceforth a confirmed Quaker; preached in 1668, and was imprisoned, 1668–69, for publishing *Sandy Foundation Shaken* without licence; twice imprisoned, 1670–71; assisted Quakers to settle in New Jersey, 1676 onwards, and negotiated purchase of the colony.

In March 1680–81 P. received, for quitclaim of crown debt, province called *Pennsylvania* after his father, and

in 1682 received from Duke of York province afterwards called Delaware. P. immediately drew up constitution for the province, of which he was to be gov. as well as proprietor; its system of gov., council, and assembly was very similar to that of other colonial governments, but no oaths were to be taken and all forms of Christian religion were to be tolerated. P. landed, made treaty with the Indians, founded Philadelphia, and promulgated the 'Great Law' before close of 1682. The Great Law made swearing, drunkenness, incontinence, together with various amusements, punishable offences. Emigrants flocked in large numbers. P. visited England, 1684, and in 1686 obtained from James II. release of religious prisoners. He pleaded cause of fellows of Magdalen Coll. with king. Suspected of Jacobitism, he was deprived of governorship of Pennsylvania, 1692, but restored, 1694; returned to his colony, 1699–1701, and settled political disputes. These broke out again after his departure for England, and the colony proved unable to support expense of its own government; imprisoned for debt, 1707, and mortgaged the colony. P. was a fine-looking man, religious without rant, but without talent as administrator. See PENNSYLVANIA.

Fisher, *True William Penn* (1900); Colquhoun Grant, *William Penn* (1907).

PENN YAN (42° 40′ N., 77° 5′ W.), town, on Keuka Lake, New York State, U.S.A.; paper-mills. Pop. (1910) 4597.

PENNA, see PALÆOGRAPHY.

PENNANT, THOMAS (1726–98), Welsh zoologist and antiquary.

PENNAR, NORTH, PENNER, PINAKINI (13° 23′ N., 77° 43′ E.), river, India; enters Bay of Bengal below Nellore.

PENNAR, SOUTH (13° 32′ N., 77° 45′ E.), river, India, falls into Bay of Bengal near Fort St. David.

PENNE (42° 30′ N., 13° 55′ E.), town, Teramo, Italy; ancient *Pinna;* bp.'s see. Pop. 4500.

PENNINE CHAIN (54° 15′ N., 2° 25′ W.), range of hills stretching from Cheviot Hills to the Peak in Derbyshire, and forming one of chief watersheds in England; principal heights, Cheviot (2676 ft.), Crossfell (2930 ft.), Whernside, and Ingleborough.

PENNON, see FLAG.

PENNSYLVANIA (40° N., 77° 30′ W.), North Atlantic state of U.S.A.; bounded N. by Lake Erie and New York, W. by Ohio and W. Virginia, S. by Delaware, Maryland, and W. Virginia, E. by New Jersey and New York; length (E. to W.), *c.* 300 miles; breadth, 158 miles; area, 45,215 sq. miles; coast-line of 45 miles on Lake Erie.

Surface is varied; traversed from N.E. to S.W. by parallel ranges belonging to Appalacian system, viz. Alleghany Mts. (Western Range, *c.* 2500 ft.), Blue Ridge or South Mts. (Eastern Range); secondary ranges are Savage Mts., Wyoming Mts., Bald Eagle, Mauch Chunk, etc.; extensive Alleghany plateau (with general elevation 1000–2000 ft.) in W., with Pocono Mountain in N.E.; country flat in S.E.; several fine fertile valleys (Susquehanna, Wyoming, Cumberland, etc.). Geologically P. belongs mainly to the Archæan and Palæozoic periods. Numerous rivers have fine waterfalls; Delaware, Susquehanna, Ohio, Allegheny, Juniata, Lehigh, Lackawanna, Schuylkill, Monongahela; no lakes. Climate is healthy, but inclined to extremes; especially fine in S.E. province; valleys exceedingly hot; mean annual temperature of S.E. province, *c.* 52° F.; central province, *c.* 50° F.; average annual rainfall, *c.* 44 inches. Fauna includes deer, lynx, black bear, minx, fox, weasel, raccoons, skunk, porcupine, opossum; birds include bald eagle, hawk, turkey-vulture, quail, pheasant, grouse, thrush, woodpecker. There are extensive forests, trees including pine, hemlock, elm, birch, maple, cedar, willow, ash, poplar, chestnut, magnolia, pawpaw, wild cherry.

History.—First settlement was made by Swedes, 1643; taken by Dutch, then English; colonised by Quakers under William Penn (*q.v.*), who was made proprietor by Charles II., 1681. Several disputes arose concerning boundaries of Maryland, Virginia, and New York; Quaker rule ceased, 1764, and Scots-Irish pioneers predominated; great influx of immigrants (German, English, Dutch, Swedes, etc.). P. took a leading part in the War of Independence and Civil War. First Continental Congress met at Philadelphia, 1774; Scots-Irish rebellion against Federal excise tax, known as 'Whisky Insurrection,' 1794. P. was an original state of the Union; called 'Keystone State,' being the 7th of the 13 states.

P. is administered by gov. and General Assembly consisting of Senate (50 members, elected for 4 years) and House of Representatives (204 members, elected for 2 years). The state has 2 Senators and 36 Representatives in Congress, and is divided into 67 counties. Principal towns are: Harrisburg (capital), Philadelphia, Pittsburgh, Scranton, Reading, Erie, Wilkesbarre. Roman Catholics predominate; then Methodists, Lutherans, Presbyterians. Elementary education is compulsory; several univ's, colleges, and other institutions—Univ. of P. (at Philadelphia, non-sectarian), Lehigh Univ. (Bethlehem, non-sectarian), Lincoln Univ. (Presbyterian), Lafayette Coll. (Easton), Pennsylvania State Coll., Dickinson Coll., Westminster Coll., etc. Railway mileage is *c.* 12,000 miles.

P. is an important mining and agricultural state; principal products are maize, wheat, oats, rye, tobacco, fruit, potatoes, timber, live-stock, wool; important manufactures of iron and steel ware, machinery, railway carriages, shipbuilding, textiles, carpets, leather, glass, flour, sugar and petroleum refining, printing and publishing; extensive anthracite and bituminous coal mines; also petroleum natural gas, iron ore, pig iron, quarries, and brickworks; output of coal (1910), 231,966,070 tons. Pop. (1910) 7,665,111.

Legislative Handbook and Manual of the State of P. (1911); Sharpless, *Quaker Government in P.*

PENNSYLVANIA, UNIVERSITY OF, was founded as Charity School in Philadelphia, 1740, under influence of Franklin, who had become leader of Philadelphian intellectual life. Franklin became president of board of trustees (1749), who in 1750 purchased New Building, in 1751 opened elementary school, obtained charter, 1753, and further charter, 1755, incorporating the Coll., Academy, and Charitable School of the province of P.; property confiscated by state, 1779, when Univ. of P. was incorporated; restored, 1780, but amalgamated with the Univ., 1791.

PENNYROYAL (*Mentha pulegium*), a species of Mint; grows on damp moors, and has a well-known scent; a popular medicine.

PENRHYN, GEORGE SHOLTO GORDON DOUGLAS-PENNANT, 2ND BARON (1836–1907), s. of Colonel Edward Gordon Douglas, first Lord P.; Conservative M.P. for Carnarvonshire, 1866–68 and 1874–80; refused to recognise quarrymen's trade union at P. slate quarries, North Wales.

PENRITH (54° 41′ N., 2° 45′ W.), town, Cumberland, England; has ruined castle and old grammar-school; manufactures beer, leather. Pop. (1911) 8973.

PENRITH (33° 45′ S., 150° 44′ E.), town, New South Wales, Australia. Pop. *c.* 5000.

PENRY, JOHN (1559–93), Welsh Puritan leader; preached in Wales; incurred enmity of Abp. Whitgift; executed on charge of sedition.

PENRYN (50° 10′ N., 5° 7′ W.), port, Falmouth Bay, Cornwall; manufactures paper, gunpowder; exports granite; imports coal, timber. Pop. (1911) 3092.

PENS of metal superseded quill, *c.* 1840, though they were known as early as Rom. era; reed pens similar to those used in ancient times are still used by Persians, while Chin. and Japanese characters demand a fine brush. When wax tablets were used for paper, wooden *stylus* was employed to incise characters. Birmingham is centre of Brit. pen manufacture; about 200,000 gross of pens per week are made in Britain.

PENSACOLA (30° 27′ N., 87° 23′ W.), city, capital

of Escambia County, Florida, U.S.A., situated on P. Bay; possesses good harbour, well defended by several forts; has large shipping trade, foundries, and mills; founded *c.* 1700 by Spaniards. Pop. (1910) 22,982.

PENSHURST (51° 12′ N., 0° 12′ E.), village, Kent, at confluence of Eden and Medway; Sir Philip Sidney's birthplace.

PENSION, annual payment, generally to superannuated servant of public body. The Brit. Crown had unrestricted right of granting perpetual p's till 1887, when it was enacted that consent of Parliament should in future be obtained for appropriation of public funds for this purpose, and policy was adopted of terminating existing p's by buying off tenants for life. These payments were important as enabling the Crown to secure a parliamentary party; hence statutes of 1707 and 1716 to disqualify holders of p's from sitting in House of Commons; civil servants have since been made exempt from this disqualification. By statutes 1 & 2 Vict. £1200 yearly was set apart for p's to be granted for need and merit, with parliamentary approval. Superannuation Acts, 1834 and 1859, provide for p's of permanent Civil Service; special provision for colonial governors, 1865, 1872, 1889; for persons in Diplomatic Service by statute 32 & 33 Vict.; and for politicians by Political Offices Pension Act, 1869. Police Acts, 1890 and 1893, provide for p's of borough police; Poor Law Officers Superannuation Acts, 1896 and 1897, provide for Poor Law officers. P's are also paid to school teachers on superannuation. P's may be paid to superannuated or incapacitated clerks in orders of Church of England from revenues of cure they leave. Army and Navy p's are regulated by Pensions Act, 1839, Pay and Pensions Act, 1865, Pensions Commutation Acts, 1871, 1882, Pensions and Yeomanry Pay Act, 1884. See OLD AGE PENSIONS.

PENSIONARY, leading magistrate of civic corporations of Netherlands. The position was remunerative, but was annulled in 1795. The pres. at the time of the republic was called *Grand P.*

PENTAMETER, verse with five metrical feet (*e.g.* Blank Verse or *Iambic P.*), as—

'The qual | ity | of mer | cy is | not strained.'

PENTAPOLIS, see CYRENAICA.

PENTASTOMIDA, see ARACHNIDA.

PENTATEUCH, term applied to Mosaic books, *Genesis* to *Deuteronomy* (qq.v.) inclusive.

PENTECOST, ancient Jewish festival, in celebration of ingathering of harvest. It lasted fifty days, whence its name (Gk. for 'fifty'). In later portions of Pentateuch full ritual directions are given for its observances. See WHITSUNDAY.

PENTELICUS (38° 2′ N., 23° 55′ E.), mountain, Attica, Greece; modern Mendeli; marble quarries.

PENTHESILEA, queen of Amazons (*q.v.*); slain by Achilles.

PENTSTEMON, genus of plants, order Scrophulariaceæ; native of America, but cultivated in Brit. gardens; flowers of great beauty, e.g. *P. Hartwegi*, a scarlet flower.

PENUMBRA, see ECLIPSE.

PENZA.—(1) (*c.* 53° 45′ N., 44° 30′ E.) government, E. Russia; area, 14,997 sq. miles; watered by tributaries of Don, Oka, and Volga; produces grain; manufactures flour, leather, woollens. Pop. (1910) 1,803,900. (2) (53° 10′ N., 45° 3′ E.) chief town of above, at junction of Sura and Penza; paper- and flour-mills. Pop. (1910) 69,040.

PENZANCE (50° 7′ N., 5° 33′ W.), municipal borough, seaport, market town, and popular watering-place, Cornwall, England; beautifully situated on shores of Mounts Bay; has handsome public buildings, esplanade, and extensive harbour; chief industries, fishing and market-gardening. Pop. (1911) 13,488.

PEONY, PÆONY (*q.v.*).

PEORIA (40° 41′ N., 89° 36′ W.), city, Illinois, U.S.A., on Illinois River at end of Peoria Lake; contains some notable buildings; chief industries, distilling, brewing, slaughtering, and meat-packing; has many important manufactures; shipping point for grain and coal. Pop. (1910) 66,950.

PEPE, GUGLIELMO (1783–1855), Neapolitan soldier; supported Murat, but accepted Bourbon restoration; exiled, 1821; commanded against Austria, 1848–49, showing great skill and courage in defence of Venice; wrote accounts of events of time.

PEPIN, see PIPPIN.

PEPPER is, properly speaking, the product of unripe berries of *Piper nigrum*, a tropical shrub of climbing habit. Both black and white p. of commerce are derived from the same plant; the latter's loss of colour being due to removal, by maceration, of dried skin. The leaves of an allied form, *P. Betle*, are chewed by Asiatics, with areca-nut and a little lime, as a preventive of dysentery.

PEPPER, WILLIAM (1843–98), Amer. physician; prof. of Clinical Med. (1876) and of Theory and Practice of Med. (1887) at Univ. of Pennsylvania; author of valuable *System of Medicine*, and of other medical works.

PEPPERMINT (*Mentha piperita*), member of Labiatæ, with smooth stem and stalked ovate leaves, yielding, on distillation, an oil used medicinally and also in flavouring. For this purpose the upper parts of the plant, including the flowers, are cut in August, and left to dry on the ground before treatment. The cheaper kinds of p. cordial are not prepared from the plant extract, but are derived from an artificial substitute with similar properties.

PEPSIN, a ferment or enzyme obtained by drying the fresh stomach of a pig, sheep, or calf; consists, as med. employed, of a pale yellow-brown powder or translucent scales; used to assist gastric digestion in debilitated conditions or to predigest albuminous food. See DIGESTION.

PEPTONES, see under DIGESTION.

PEPYS, SAMUEL (1633–1703), Eng. diarist; b. London (probably); ed. Huntingdon, St. Paul's, Cambridge Univ.; m. Elizabeth St. Michel, a young girl, 1655; app. Clerk of the Acts of the Navy, 1660, and Sec. to the Admiralty, 1673. He was imprisoned in Tower, 1679, on charge of selling information to French. Though acquitted, he lost his post. Reappointed, 1684, he held his office till 1689. His *Diary*, begun 1659, was in cypher, and was never intended for publication. Hence he wrote freely of his thoughts, his vices, his domestic affairs; he noted down all the scandal he heard. It is invaluable as a source of information concerning XVII.-cent. manners. It stops short at May 1669. It was deciphered by Smith and pub. 1825. P. also wrote *Memoirs of the Navy* (1690).

Lord Braybrooke, *Memoirs of P.* (1825); J. Smith, *Life, Journals, and Correspondence of P.* (1840); Wheatley, *Samuel P. and the World he Lived in* (1880), *Samuel P., Citizen and Clothworker* (1897).

PERA, see CONSTANTINOPLE.

PERAK, see MALAY STATES.

PERAMELES, see BANDICOOT.

PERCEPTION, apprehension of particular objects present to sense. See PSYCHOLOGY.

PERCEVAL, hero of Arthurian legends; Celtic variant of wide group of legends (cf. Romulus, Siegfried); first version extant, *Syr Percyvelles of Galles*; later became hero of Grail search, supplanting original Gawain, and himself supplanted later; Chrétien de Troyes' *Perceval, Conte del Graal*, first Perceval-Grail poem; later best-known versions, Wolfram von Eschenbach's *Parzival*, Wagner's *Parsifal*, and Tennyson's *Morte d'Arthur*; see *The Legend of Sir Perceval* (Grimm Library, xvii.).

PERCHE, ancient division, France, corresponding generally to departments of Eure-et-Loire and Orne; capital, Mortagne.

PERCHES (*Percidæ*) include about 90 forms, confined to the fresh waters of the northern hemisphere; excellent game fishes, highly esteemed as food. The Common Perch (*Perca fluviatilis*) is the best known of the two Brit. species. The large PIKE-PERCH or ZANDER (*Centrokumus lucioperca*) is a central European game fish.

PERCUSSION CAPS, see under FULMINIC ACID.

PERCY, Eng. family, founded by WILLIAM DE PERCI, who held lands in Yorkshire and Lincolnshire at time of Domesday Survey. His male line died out in co-heiresses, but descendants of his grand-dau., Agnes, assumed name of P.; of this second house, HENRY PERCY was made Earl of Northumberland, 1377; direct line extinguished, 1670, on death of Joceline, 12th Earl of Northumberland. His dau. and heir, Elizabeth, m. 6th Duke of Somerset; her grand-dau., Elizabeth, m. Sir Hugh Smithson, ancestor of third and present house of P.

PERCY, SIR HENRY, HOTSPUR (1364–1403), Eng. noble; c. s. of Earl of Northumberland; gov. of Berwick and warden of Scot. Marches; commanded against Scots at *Otterburn*, 1388 (probably the *Chevy Chase* of later ballad); aided in deposition of Richard II.; fought at *Homildon Hill*; slain at *Shrewsbury* in revolt against Henry IV.

PERCY, THOMAS (1729–1811), bp. of Dromore, 1782.

PERDRIX, see PHEASANT FAMILY.

PERE DAVID'S DEER (*Cervus davidianus*), a species of deer kept in semi-captivity in the imperial park at Peking; probably a native of northern China. Small in size, its lack of a brow-line distinguishes it from other Old-World deer.

PEREDA, JOSÉ MARIA DE (1833–1906), Span. novelist; b. at Polanco; apostle of Realist School of Spain. He is perhaps most successful in his descriptions of fisher life, viz. *Sotileza* and *La Puchera*.

PEREGRINE, a member of Hawk Family (*q.v.*).

PEREKOP (46° 8′ N., 33° 40′ E.), town, Taurida, Russia, on isthmus of P.; formerly important fortress. Pop. 5600.

PERENNICHORDATA, an order of Tunicata.

PEREYASLAVL.—(1) (56° 43′ N., 38° 54′ E.) town, Vladimir, Russia, on Lake P.; linen-mills; fisheries. Pop. 9000. (2) (50° N., 31° 30′ E.) town, gov. Poltava, Russia, near Dnieper. Pop. 15,000.

PEREZ, ANTONIO (*c.* 1539–1611), Span. statesman; Sec. of State, 1564; had John of Austria's envoy murdered to please king, 1578; John secured his condemnation, 1581; P. escaped to Aragon; protected by Aragonese against king and Inquisition; escaped from Spain, but Aragon lost its liberties.

PERFUMES, fragrant odours or substances which are manufactured to emit them. They may be natural or artificial. Natural p's are plant products, except musk, ambergris, and civet. Artificial p's (alcoholic solutions) embrace pomades, scented soaps, hair oil, etc. Flowers for perfumes are grown at Grasse near Cannes, *e.g.* violets, jonquils, roses, orange-flowers, thyme, rosemary, myrtle, tuberoses, jasmine, lavender, geranium. The perfumes are obtained by pressing, extraction with a solvent, distillation, maceration in melted fat, or 'enfleurage,' *i.e.* absorption by cold fat.

Analysis of perfume essences has been followed by the artificial compounding of perfumes; thus essence of jasmine has been made. Partially or wholly synthetic perfumes are now elaborated; *e.g.* oil of bitter almonds is benzaldehyde; oil of winter-green is methyl-salicylate; coumarin, or essence of new-mown hay, is coumaric anhydride; vanillin, or essence of vanilla, is protocatechuic aldehyde methyl-ether; heliotropine, or heliotrope perfume, is protocatechuic aldehyde methylene-ether; artificial musk is trinitro-butylxylene; white lilac scent is terpineol, made from oil of turpentine; artificial violet perfume is ionone, made from oil of lemons.

Askinson, *Perfumes and their Preparation* (1907).

PERGA (37° N., 30° 55′ E.), ancient city, Asia Minor; seat of worship of Artemis; visited by St. Paul.

PERGAMUM, PERGAMUS (modern *Bergama*), ancient city of Mysia; known from beginning of V. cent. B.C. Philetærus, a eunuch, seized treasures of P. and founded small kingdom (283). Attalus I., who succeeded 241, took title king, with three successors preserved friendship with Rome; Attalus III. (d. 133 B.C.) left P. to Romans. P. became capital of Rom. province, Asia, and was one of the Seven Churches. Excavations 1878–86 revealed fine sculptures.

PERGOLESI, GIOVANNI BATTISTA, PERGOLESE (1710–36), Ital. composer; studied at Naples under Greco and Durante; composed two masses for double chorus, *Stabat Mater*; operas, *La Serva Padrona*, *La Sallustia*, *L'Olimpiade*, etc.

PERIANDER (ruled, 625–585 B.C.), tyrant of Corinth, and one of *Seven Sages of Greece*; destroyed possible rivals, and made Corinth famous.

PERIANTH, see FLOWER.

PERICARDIUM, see HEART.

PERICENTRE, see ANOMALY.

PERICLES (499–429 B.C.), Athenian statesman of 'golden age'; descendant of Alcmæonidæ; attended lectures of Anaxagoras, Protagoras, and Zeno, and acquired powers of oratory and cultivated well-balanced mind. On death of Aristides, c. 468, P. assumed leadership of democrats against oligarchic party under Cimon, but stooped to no demagogic arts; supreme after banishment of Cimon, 461. He and Ephialtes took judicial power from Areopagus and council of 500 and gave it to *dicastai*, chosen from citizens, who received small payment. The P. age was a time of tremendous activity; Athenian Empire was extended; seat of Delian League was transferred from Delos to Athens, but in 445 Athens was forced to abandon to Sparta claim to hegemony over Greece on land; Thucydides was exiled, 443, for attack on imperial policy. During 'the age of P.' a new town was built at Peiræus (*q.v.*); glorious temples and theatres (Parthenon, etc., see ATHENS) were raised by architects, Ictinus, Callicrates, Coræbus, and Mnesicles, and adorned by Phidias the sculptor and Polygnotus the painter; Sophocles and Euripides wrote their plays. The terrible Peloponnesian War broke out, 431; already the threat of storm had caused exile of Anaxagoras and death of Phidias and Aspasia, P.'s brilliant mistress; nevertheless P. conducted resistance to siege, 431–430; one of the world's greatest and noblest statesmen.—Evelyn Abbot, *Pericles* (1891).

PERIDINIALES, sub-class of Mastigophora (*q.v.*).

PERIDINIUM, see under MASTIGOPHORA.

PERIDOTE, gem-stone, variety of green olivine; transparent; shades of olive or leek green; found in Brazil, Ceylon, and Egypt; soft and difficult to polish.

PERIDOTITE, group of basic plutonic rocks of deep-seated origin; colours—mostly dark; several varieties, including dunites (which contain much olivine, and are granular); others contain augite, hornblende, or biotite; named after mineral they contain as hornblende-peridotite, etc.

PÉRIER, CASIMIR PIERRE (1777–1832), Fr. statesman and banker; criticised financial policy at Restoration; minister, 1831, and established the *juste milieu* between conservatism and democracy; descendants took name Casimir-Périer.

PERIGEE, see APOGEE.

PÉRIGORD, former province of France; now forms department of Dordogne and part of Gironde; old capital, Périgueux.

PÉRIGUEUX (45° 11′ N., 0° 44′ E.), town, on Isle, France; capital of Dordogne department; has St. Front cathedral (984–1047), and fine Rom. remains (baths, aqueduct, etc.); woollens, ironware, furniture, etc.; famous Pâtés de Périgueux. Pop. 28,300.

PERIGYNOUS, see FLOWER.

PERIHELION, see ANOMALY.

PERIM (12° 38′ N., 43° 20′ E.), small Brit. island in Strait of Bab-el-Mandeb; coaling station.

PERIM, PIRAM (21° 38′ N., 72° 24′ E.), island, in Gulf of Cambay, India.

PERINTHUS, HERACLEA PERINTHUS (40° 57′ N., 27° 58′ E.), ancient city, on Propontis, Thrace; modern Eski Eregli.

PERIODICALS. — While newspapers are concerned with the news of the moment, periodicals, which include magazines and reviews, are chiefly devoted to lighter reading for the entertainment or instruction of their readers. The *reviews*, one of the earlier forms of the magazine, are mainly of a literary, political, and critical character. In the pioneer journals, as in those of the present day, were found the contributions of eminent writers who found in their pages a convenient medium for the expression of their views. Reviews stand in a class by themselves, and as a rule leave the lighter forms of lit. to the magazines. In the latter a great development has taken place. At one time Brit. magazines were pre-eminent on both sides of the Atlantic, but there came a period when the best of the magazines in the U.S.A. surpassed those of the U.K. in enterprise, in excellence of typography, and in beauty of illustration. That superiority is now more disputed, not because American publications have become less attractive, but because Brit. publishers have responded to the stimulus of powerful competition.

Most of the first attempts to establish reviews and magazines met with small success. The cost of production was high, the machinery crude, and the readers few. The *Weekly Memorials for the Ingenious*, dated 1681, existed only for a year, and its immediate successors were not more fortunate. There were also the *Gentleman's Magazine*, founded in 1731, the *Scots Magazine* (afterwards the *Edinburgh Magazine*), and the *British Critic*, which managed to keep alive from 1793 to 1843. The *Edinburgh Review* (1802) and its great rival, the *Quarterly Review* (1809), were the outcome of political exigencies, and commenced a new era in magazine history. The *Edinburgh* stood for Whig principles, and the *Quarterly* was the organ of the Tories. Another still existing journal, the *Westminster Review*, was founded in 1824 to represent radicalism. The *Fortnightly Review*, founded in 1865, is published monthly. The *Contemporary Review* first appeared in 1866, and the *Nineteenth Century* in 1877.

Blackwood's Magazine, founded in 1817, set up a new ideal, and demonstrated the possibilities of this form of publication by opening its brilliant pages to fiction, verse, travel, and adventure, as well as to combative politics. Other notable ventures were *Fraser's Magazine* (afterwards *Longman's*), *Tait's Edinburgh Magazine*, and *Bentley's Miscellany*, which was incorporated with *Temple Bar*. *Cornhill*, *Country Life*, *The Field*, *Engineering*, *Badminton*, and *Cassell's* are typical of various classes.

No more remarkable departure took place than that represented by the production of *Chambers's Journal* (1832), published weekly, and also in monthly parts. That and similar journals provided general reading of the highest class and at a popular price.

In the early eighties the illustrated magazines began to appear. The *English Illustrated Magazine* (1883) was the first to challenge Amer. supremacy in this department. Among others are the *Strand Magazine* (1891), the *Pall Mall Magazine* (1893), *Pearson's Magazine*, the *Royal Magazine*, the *Windsor Magazine*, and *Nash's Magazine*. Several magazines devote themselves entirely to fiction, such as *Everyone's Story Magazine* and *The New Magazine*.

The success of *Tit-Bits*, started in 1881, led to the foundation of numerous penny weekly journals, which deal in interesting scraps. A later development for the increase of circulations has been the conduct of guessing, verse-making, and other competitions, in which large sums are given as prizes, usually made up by the entrance money of the competitors.

Of the thousands of Amer. periodicals and magazines the best known in Britain are *Harper's*, *Scribner's*, *M'Clure's*, *Munsey*, and the *Century*.

Probably the most famous foreign magazine is the French *Revue des Deux Mondes*.

PERIŒCI, ancient Laconian tribe; occupied mountainous country; unlike Helots (*q.v.*) they were free, but had no voice in government; subject to Spartiates, who oppressed them.

PERIOSTEUM, see BONE.

PERIPATETICS, name given to Aristotle's disciples, supposedly from his habit of walking to and fro as he lectured. The chief P's were Theophrastus, Eudemus, Dicæarchus, Critolaus, and Strato of Lampsacus. This school retained its influence longer than any other school of antiquity, and gave to the Church a more effective means of regulating the scholastic philosophy.

PERIPATUS (Class *Onychophora*, amongst Arthropods), caterpillar- or worm-like Arthropods, with beautiful brown or dark green velvety skin and long body borne on from seventeen to forty-three pairs of dumpy, unjointed legs; of great interest as forming a link between Arthropods and Worms. The head, which is not marked off from the body, bears two exceedingly mobile and sensitive antennæ, at the bases of which lie the eyes; respiration is carried on by tracheæ with scattered openings to the exterior, and the rejection of waste products by paired nephridia segmentally arranged, although there is no trace of segments on the exterior of the plump body.

The species of Peripatus are shy, night-loving creatures, and during the day lurk beneath stones, bark, etc., where there is sufficient moisture. They move slowly (but for the jaws, striped muscle being entirely absent), sensing every step of the way with their antennæ. They feed on insects, which they capture with a gummy substance secreted in a pair of oral papillæ. The distribution of the 50 or 60 species of Peripatus is remarkable. They are found only in the southern hemisphere, and there in far separated groups, each group showing similarities within its own limits; South America has many species widely spread; Africa has representatives in Cape of Good Hope and on the Congo; others occur in Australasia from Malay Archipelago to New Zealand; and one has recently been discovered on the N.E. frontier of India.

PERISSODACTYLA, ODD-TOED UNGULATES, a sub-order of *Ungulata*, comprising Tapirs, Horses, and Rhinoceroses. They are characterised by the presence of an odd number of toes in each foot, except in the fore-feet of Tapirs, where there are 4 digits; but in all cases the middle or third digit is larger than the others, and lies in line with the central axis of the limb as a whole. The middle digit is usually accompanied only by the second and fourth; the first is never present in living forms. All the back teeth are similar, and there are never less than 23 dorso-lumbar vertebræ; horns, if present, are not paired, but in the median line of the skull; femur has third trochanters; stomach is simple. There are many fossil forms dating from earliest Tertiary times.

PERITONITIS, inflammation of the peritoneum, or lining membrane of the abdominal and pelvic cavities, which may be localised or diffuse. It is caused by various micro-organisms, and an attack is usually brought on by exposure to cold or wet, general debility, or is associated with injury or disease of some abdominal organ. *Acute diffuse p.* is characterised by persistent vomiting, pain and tenderness in the abdomen, which is usually swollen because of the distended intestines, while there is generally constipation. The temperature is raised and the pulse rapid. The abdominal muscles are rigid, and the patient lies with an anxious expression and his knees drawn up. If the p. is due to sudden perforation of a hollow organ there is profound shock at first, recovered from three or four hours later. The only treatment of any value is by surgical interference, the abdomen being opened, irrigated, and drained.

Acute localised p. may be suppurative or non-suppurative, and occurs in lesions when the peritoneal

cavity has been shut off by fibrinous adhesions between the intestines and other parts. The symptoms resemble diffuse p., if somewhat less severe, and a distinct tumour can be felt at the affected part. The treatment is rest, sips of hot water, and the application of hot fomentations. Incision into the abdominal cavity and drainage may be necessary. *Tuberculous p.* is more common in children; the general health is low, there is wasting, and constipation alternates with diarrhœa. The treatment is by general hygiene, and feeding up on cod-liver oil, malt extract, and the like. Incision into the abdomen, without any drainage or irrigation, often cures all but the advanced ulcerous type.

PERIWIGS, see HAIR.

PERIWINKLE, see GASTEROPODA.

PERJURY is false swearing, at a judicial proceeding, and before a competent authority, by a person knowing it to be false. It must be material to the case being tried, that is, it is p. when the false swearing is explanatory of the case. The maximum punishment for p., or for procuring a person to commit p., is seven years' penal servitude.

PERKIN, SIR WILLIAM HENRY (1838–1907), Eng. chemist; pupil of Hofmann; prepared aniline black and mauve (1856) by oxidising aniline, laying foundation of coal-tar colour industry; condensed aldehydes with fatty acids; studied magnetic rotation.

PERLEBERG (53° 4′ N., 11° 51′ E.), town, on Stepenitz, Brandenburg, Prussia. Pop. (1910) 9665.

PERLIS, see MALAY STATES.

PERLITE, PEARLSTONE, glassy volcanic rock of pearly lustre; consists of silicate of aluminium, iron, lime, and alkali in varying quantities; occurs in spherules.

PERM, government of Russia, eastern part of which lies in Siberia; area, *c.* 128,200 sq. miles; Ural Mts. cross government from N. to S.; much of the surface covered by forests; chief rivers are Kama, Tobol, and Pechora; capital, Perm; P. is rich in mineral wealth, producing iron, silver, copper, platinum, nickel, lead, manganese, rare metals, and precious stones. Leading industries are agriculture, cattle-rearing, and mining. Pop. *c.* 4,000,000.

PERM (58° 1′ N., 56° 32′ E.), river-port, on Kama, chief town of P. government, Russia; tanneries; transit trade. Pop. (1910) 48,800.

PERMIAN, series of strata which, in U.K., rest unconformably on the Carboniferous system; grouped as follows: Upper Red Sandstone; Magnesian limestones; Marl Slate; Lower Red Sandstone and Mottled Sandstone. Lower Red Sandstone is found in Devonshire, Staffordshire, Cheshire, and Lancashire, Westmoreland and Cumberland. Magnesian limestone is the most important constituent of the P. series, and is highly fossiliferous as compared with the other groups.

In Germany the P. series consist of two groups, the Zechstein and Kupferschiefer and the Rothliegendo. The former represent the Upper Strata (Magnesian limestones and Upper Red Sandstones) and the latter the Lower (Marl Slate and Lower Red Sandstones).

In Russia the P. is well developed between the Ural Mt's and Moscow; especially well seen at town of Perm, hence its name. The life of the P. period included ferns and conifers, polyzoa (fossils found in the Magnesian limestones), brachiopods, lamellibranchs, and gastropods (fairly numerous), and some varieties of fish.

PERMUTATIONS AND COMBINATIONS, see COMBINATORIAL ANALYSIS.

PERNAMBUCO (9° S., 39° W.), state, N.E. Brazil; area, 49,573 sq. miles; surface broken and mountainous; fertile and wooded district along coast; chief river, San Francisco; capital, Recife (or Pernambuco). First settlements were made XVI. cent. P. has been scene of many revolutions. State is chiefly agricultural; sugar, coffee, cotton, tobacco, and fruits cultivated; manufactures, cotton, sugar, rum, and cigars. Pop. (1890) 1,030,224; (estimated 1910) 2,190,000.

PERNAU, PERNOV (58° 22′ N., 24° 34′ E.), seaport, watering-place, Russia; exports flax. Pop. 20,000.

PERNE, ANDREW (1519–89), dean of Ely, 1557.

PERNIS, HONEY BUZZARD, see HAWK FAMILY.

PEROGNATHUS, Pocket Mice, see POCKET GOPHERS.

PÉRONNE (49° 55′ N., 2° 56′ E.), town, Somme, France; captured by Germans, 1871. Pop. 4600.

PEROSI, LORENZO (1872–), Italian priest and musical composer; most famous works, *Resurrection of Lazarus* and *Passion of Christ*.

PÉROUSE, see LA PÉROUSE.

PEROWNE, JOHN JAMES STEWART (1823–1904), bp. of Worcester, 1891–1901; Old Testament scholar.

PERPENDICULAR, see ARCHITECTURE (GOTHIC).

PERPETUAL MOTION, generally used with reference to a machine which, when once set in motion, will continue moving for ever without assistance from any outside source of energy. Much ingenuity has been expended upon the problem of constructing such machines, but with establishment of the principle of the conservation of energy the impossibility of a p. m. has been realised. The initial energy of a p. m. machine is gradually used in overcoming resistance and friction, and therefore the machine must stop after a time if no further energy is imparted to it. If all friction and resistance could be avoided, a body such as a simple pendulum or a spinning top would retain for ever motion given to it, but only on condition that it was not made to act on other bodies—that is, to do any work; so that even if practicable, it would be of no utility.

PERPIGNAN (42° 43′ N., 2° 53′ E.), town, Pyrénées Orientales, France; strongly fortified; has cathedral dating from XIV. cent.; trades in wine, brandy, silk, wool. Pop. (1911) 39,510.

PERRAULT, CHARLES (1628–1703), Fr. author; started (in 1687) the *Querelle des Anciens et des Modernes* with his poem, *Siècle de Louis le Grand*; best known by his *Contes* (1697), including *Tom Thumb*, *Puss in Boots*, *Blue Beard*, *Little Red Riding Hood*, *Cinderella*, *The Sleeping Beauty*, taken from the Tales of Mother Goose (*Contes de ma mère l'oie*); exquisite style, simple, sententious, and witty.

PERRAULT, CLAUDE (1613–88), Fr. architect; bro. of Charles P.; introduced Palladian architecture into France; architect of Louvre; trans. Vitruvius, 1673.

PERRONE, GIOVANNI (1794–1876), Ital. R.C. theologian.

PERROT, SIR JOHN (*c.* 1527–92), lord deputy of Ireland; putative s. of Henry VII.; pres. of Munster, 1570–73, and crushed rebellion of James Fitzmaurice Fitzgerald; lord deputy of Ireland, 1584–88; able, but fell by machinations of enemies; condemned as traitor, 1588.

PERRY (36° 18′ N., 97° 18′ W.), city, Oklahoma, U.S.A.; cotton manufactures. Pop. (1910) 3133.

PERRY, MATTHEW CALBRAITH (1794–1858), Amer. commodore; s. of Christopher Raymond P. (1760–1818), whose five sons all won distinction in navy; fixed spot for colony of Liberia, 1819; advocated use of steam instead of sailing ships in war; made commercial treaty with Japan, 1854.

PERRY, OLIVER HAZARD (1785–1819), Amer. naval officer; distinguished in war of 1812.

PERSEPHONE, see PROSERPINE.

PERSEPOLIS, ancient city, former capital of Persia, situated in Kur Valley, *c.* 40 miles from Shiraz; now a great series of ruins, finest being those of Takhti Jamshid, or Throne of Jamshid; behind Takhti Jamshid and at Nakhshi Rustum, some miles distant, are sepulchres cut out of rock—buildings thought to have been begun under Darius I., and added to by other Achæmenidæ; believed to have been taken and palaces burned by Alexander, after which city gradually fell into decay. See PERSIA: *Architecture*.

PERSEUS (classical myth.), son of Zeus and

Danaë; with enforced aid of the Graeae and Nymphs, slew the Gorgon Medusa, thereby rescuing Andromeda, whom he married; turned Polydectes of Seriphus into stone by means of the Gorgon's head. P. is the subject of many and conflicting legends; worshipped as a hero.

PERSHORE (52° 7′ N., 2° 5′ W.), market town, on Avon, Worcestershire, England.

PERSIA, IRAN (25° to 40° N., 44° to 63° E.), country of S.W. Asia; bounded N. by Russia, E. by Afghanistan and Baluchistan, S. and S.W. by the Gulf of Oman and the Pers. Gulf, and W.S.W. by Turkey-in-Asia; extreme length E. to W., *c.* 850 miles; breadth from the Caspian to Pers. Gulf, *c.* 450 miles; area, *c.* 628,000 sq. miles.

Physical Features.—In the N. is the great range of the Elburz, over 19,000 ft. high; along the S.W. are a series of parallel mountain ranges running N.W. and S.E., with heights of from 10,000 to 13,000 ft.; the rest of the surface, in the centre and also the W., is a dry, barren plateau of from 6000 to 8500 ft. The whole district from mountains to mountains, S.E. of Teheran, forms the Dasht-i-kavir or Great Salt Desert, of height of *c.* 2000 ft., and covered with thin deposits of saltpetre. In many parts of the vast waste the soil is excellent, and, were irrigation possible, would produce good crops. More than half the entire area is drained towards the interior to salt marshes or lakes, more than one-fourth to inland seas and lakes (Caspian, Aral, etc.), less than a quarter to the open sea; and that portion, owing to the position of the mountains, sends merely short streams, the chief being the Karum, flowing to the Shat-el-Arab, at the top of the Pers. Gulf.

Geologically P. is far from having been extensively surveyed, but Lower Oolite, Cretaceous, volcanic, and metamorphic rocks have been observed. The CLIMATE varies extremely, but on the plateaux is generally one of extremes, very hot from May to Oct., very cold during other months. The low strip in the N. is damp and excessively hot in summer and mild in winter; in the S.E., winter and spring are temperate, summer warm, autumn oppressively hot. The rainfall is 5 to 10 inches on the plateaux; it occurs mostly in winter, and is entirely absent in summer, but the snow of the hills provides, in many of the districts in their neighbourhood, summer supply that can be used for irrigation. The FAUNA includes lions, leopards, bears, wolves, jackals, hyenas, antelopes, wild sheep and swine, the wild ass, and mountain-goat; the Persian horse (especially when crossed with the Arab) and the camel are valuable. VEGETATION is most luxuriant on the coast, where flowers, especially roses, grow in great profusion, and the date palm is widely spread. There is little timber, the forest district being mainly confined to the N. slope of the Elburz, but there are numerous varieties of shrubs. The orange, lemon, olive, almond, gum-trees, pomegranate, fig, mulberry, wine, rice, cotton- and tobacco-plants, sugar, a much-valued wheat, and the usual cereals are found.

HISTORY.

Our knowledge of early Pers. history is mainly derived from the Greeks. An agricultural and pastoral Aryan race, Zoroastrians and fire-worshippers, seems to have settled in Persia (Pers. FÂRS) S.W. of the Iranian plateau. The N.W. was occupied by the kindred race of Medes, and the Persians probably underwent Assyrian and Babylonian subjugation before becoming vassals of the Medes early in the VIII. cent. B.C. Nearly three cent's later CYRUS THE GREAT (Pers. *Kai-Khusru*) overthrow the Median yoke, and after defeating King Astyages (*c.* 550) founded the famous Persian dynasty of the **Achæmenides**, which lasted until 330 B.C. Their capital was first Pasargadæ, then Persepolis. Cyrus established his rule over Asia Minor, and died in 529; his son CAMBYSES (529–522) conquered Egypt; after his death and the attempted reign of the *Pseudo*-Smerdis, DARIUS I., *Hystaspes* (521–485), succeeded, and conquered Babylon (517).

Under Darius one of the greatest conflicts between E. and W. commenced. Darius conquered Ionia, Thrace, and Macedonia, and threatened Greece, but was forced to retreat after his repulse at *Marathon* (490). His s., XERXES I. (485–465), after recovering Egypt, for long henceforward a Pers. province, in 484 again invaded Greece, and was defeated at *Thermopylæ* and *Salamis* (480), *Platæa* (479), and lost many of his Ionian towns. His son, ARTAXERXES I., *Longimanus* (465–425), was succeeded by his son, XERXES II. (425), under whom the satraps who governed the various Pers. provinces began to assert their independence. He was deposed by DARIUS II., *Nothos* (424–404), no more successful than himself. His son, ARTAXERXES II., *Mnemon* (404–361), won a great victory over his insurgent bro. Cyrus, the younger, at *Cunaxa* (401), after which the 10,000 Greeks who had aided Cyrus made their famous retreat under Xenophon; the long, terrible journey through hostile country is immortalised in Xenophon's *Anabasis*. ARTAXERXES III., *Ochos* (361–337), recovered Egypt, which had again seceded.

The empire was overthrown under DARIUS III., *Codomannus* (336–331), by Alexander the Great, who won great victories at the *River Granicus* (334) and *Issus* (333), where Darius and his queen were captured, crossed the Tigris and Euphrates, won the battle of *Arbela* (331), and took enormous spoil from Susa, Babylon, Persepolis, etc. Over all this region, as far as India, Hellenic influence was established, and can still be traced. Darius was murdered by Bessus in 330. His realm, which had become a province of the Macedonian Empire, broke away again after Alexander's death (323).

P., without Egypt, was assigned to the satrap SELEUCUS NICATOR, founder of the **Seleucid Dynasty**, who ruled over nearly the whole realm of the old Achæmenides. In the middle of the III. cent., however, Bactria (which is said to have included a large part of India) and Parthia broke away, becoming independent states, and Parthia under ARSACES I. subjugated P. The **Arsacid Dynasty**, hated by the Persians, was speedily overthrown by the native **Sassanid Line**. Ardashir Babegan, grandson of Sassan, won Fars, Kerman, and part of Irak, and the final victory of *Hormuz* (218). The Middle Persian dynasty of the Sassanidæ protected P. for long against her two chief enemies, Rome on the W., Turkey on the E.; and P. was prosperous and renowned under SAPOR I. (241–72), SAPOR II. (309–79), who showed great rigour towards Christians, CHOSROES I. (531–78), and CHOSROES II. (590–628), who conquered Syria (storming Jerusalem in 614), subdued Asia Minor and Egypt, and threatened Constantinople, saved by the victory of the Emperor Heraclius in 628. After his murder by his son Siroes, the realm fell into disorder. The last Sassanid king, YESDEGERD III., lost P. to the Arabs by the battle of *Nahavend* (639).

P. then became a province of the caliphate, and when Bagdad was built in the middle of the VIII. cent. by Almansour it became the capital of the ABBASID EMPIRE. Under the nominal suzerainty of the caliphs the local dynasties of TAHARIDES (820–72), SAFFARIDES (869–903), SAMANIDES, and GHAZNEVIDS won fame. Finally, in 1038 the Seljukian Turks under Togrul Beg united P. under one rule. After their decline P. was conquered by Mongols under Genghis Khan (1223), and experienced great miseries under Hulagu Khan and his successors the Ilkhanians (1256–1366). In 1399 the Mongols were driven out by Timur and his Tatars, who, a hundred years later, were expelled by the Uzbeg Turks.

The **Shiite Dynasty** of Sufi was established in 1502, and lasted until 1736. ISMAIL I. (1502–24), who introduced Shiism as the state religion, drove the Uzbegs back beyond the borders of Khorasan and conquered Georgia, but was defeated in his attempt at a holy war against Turkey. The greatest of the line of Sufi was ABBAS I. (1587–1628), under whom Ispahan was made the capital. He defeated Uzbegs, Turks, and Mongols, extended his rule W. over Kurdistan and E. over

Kandahar, built towns and roads, and set an example of Western culture. The preponderance of religion, however, in the Shiite system, proved in the end fatal to the Sufides. Afghanistan was driven by persecution to revolt (1709); in 1722 the Afghans captured Ispahan; and in 1736 the Turks deposed the last *shah* (Pers. king) of this line. The Turk. NADIR SHAH (1736–47) ruled tyrannically over P., and under his successors the various states of P. revolted, Afghanistan and Baluchistan becoming finally independent.

The rest of P. was reunited in 1795 by AGA MUHAMMAD, a Turkoman eunuch, who deposed Lutf 'Ali Khan and founded the present Kajaran Dynasty, Teheran becoming the new capital. After his death in 1797 Georgia was again separated from P., becoming in 1802 a Russ. province, and P. was forced (1813 and 1829) to cede to Russia everything N. of the Aras, the present boundary. Attacks on Brit. power in N.W. India (1836–38 and 1856–57) signally failed, and P. has since sunk into a protected state. The boundary between India and P. was fixed by a Brit. commissioner in 1872.

During the reign of MUZAFFER-ED-DIN (1896–1907) court corruption and misrule led to the demand for a constitution, which was granted in 1907, and guaranteed by MUHAMMAD ALI MIRZA, who then succeeded. The new shah soon came to blows with the nationalist party; in 1908 martial law was proclaimed and the constitution abolished, but the nationalists took to arms, wrested from the monarch a new constitution, and deposed him in 1909 in favour of his son, AHMED MIRZA, still a minor. Meanwhile P. was distracted by attacks of Turks and Russians, and revolts within her frontiers. In 1907 Russia and Great Britain made a treaty, marking out their respective spheres of influence in P., and guaranteeing her independence and integrity; Russ. sphere is confined to N., Brit. sphere to S. Persia, with intervening neutral region; convention accepted by P., 1912. There are Brit. consuls-general at Teheran, Bushire, Ispahan, Meshed, and Tabriz, consuls at Kerman and Resht, and vice-consuls at Bunder Abbas, Mohammerah, and Seistan.

LANGUAGE AND LITERATURE.

Persian belongs to the *Iranian* group of languages closely allied to Indo-Aryan languages (*q.v.*), and forming with latter an important section of the Indo-European family. Language and literature fall into four periods, marking national activity and revival, intervals representing periods of decline.

I. **Zend** or **OLD IRANIAN.**—Extends from c. VI. cent. B.C. to c. 300 A.D.; represented by *Avesta*, sacred book of modern Parsis, which is ascribed to religious lawgiver Zarathustra (Zoroaster), who flourished between VII. and VI. cent's B.C. Language is archaic and closely related to Vedic Sanskrit. *Avesta* was collected under Sassanian kings, III. cent. A.D.

II. **Ancient Persian.**—Represented by inscriptions of Achæmenian dynasty, consisting of about 1000 lines of texts in cuneiform writing (*q.v.*) carved upon face of great rock at Behistun. After fall of Achæmenians no lit. was produced for five cent's.

III. **Pahlavi** (Middle Persian).—About 100 works have survived, chiefly religious and in Zoroastrian spirit.

IV. **Modern Persian.**—Begins with conversion of P. to Islam by Arab conquest, resulting in enormous Semitic admixture in thought and language, and adoption of Arabic writing. Lit. really begins with death of Caliph Harun-al-Rashid, and consists chiefly of poetry. FIRDAUSI (940–1020 A.D.), whose Shahnamah is P.'s great national epic, was first great poet, whose work had many imitators, and led to development of romantic, mystical, and didactic poetry. Passing over RUDAGI, lyric poet, X. cent., and ANVARI (d. 1190 A.D.), satirist, we come to OMAR KHAYYAM (d. 1123), whose *Rubá'iyát* or Quatrains have obtained disproportionate popularity in Europe through FitzGerald's translation; NIZAMI, epic poet (1141–1203 A.D.), author of *Khusrau and Shirin*, *Iskandar námah*, and *Laili and Majnun* (beautiful pathetic tale); JALAL-UD-DIN RUMI, greatest Sufi or mystic poet, author of *Masnavi* (6 vols.); SHEIKH SA'DI, great novelist and poet; b. in Shiráz c. 1176 A.D., author of *Divan* or collection of lyrics, and famous *Bústán* (Garden of Perfume) and *Gulistán* (Rose Garden); HAFIZ (d. 1389), pseudonym of P.'s greatest lyric poet, Shams-ud-din Muhammad; and JAMI (b. 1414), last of classic poets and Sufis. After Jámi lit. declines and becomes chiefly historical. No drama appears till beginning of XIX. cent., when great national passion-play *Tázieh* was produced, dealing with massacre of Hussain and his family. Among modern poets best are KÁANI SHIRÁZI, YAGHMA KHORÁSÁNI, and MIRZA SERÚN ISPAHÁNI.

Edward Browne, *Literary History of Persia* (2 vols.).

Architecture and Archæology.—P. learned much from the Assyrians. The difference of material brought constructional differences, the sun-dried brick and alabaster of Assyria being unsuitable for forms which could be carried out with the stone of P., but the platform by which Assyrian palaces were raised above the clay soil, and consequently the steps leading up to them, and the winged bull with human head which was an Assyrian architectural ornament, were repeated in P. The columnar feature is supposed to have been learned from the Medes. Of the brickwork of these empires and the Babylonian little remains, and much that has been learned of their architectural styles is deduction from buildings raised in P. while under their rule. The columns of the palace of Cyrus and Cambyses at Pasargadæ are still to be traced; the tomb of Cyrus here is also on a terrace after the Assyrian fashion.

The chief remains are at Persepolis, which Darius Hystaspes made the capital. Here are to be traced the palace of Darius, the two palaces of Xerxes, the palace of 100 columns, and other buildings all on the same platform, to which a broad flight of steps ascends. The palaces were raised by separate platforms; they were square in plan, with many rows of columns supporting the roof, and long porticoes on three of the four sides. The largest was the palace of Xerxes, which was 350 by 300 ft. in area, and apparently the largest building of antiquity. Characteristic capitals to the columns were bulls' heads back to back, giving the impression of Ionic volutes; some of the capitals consist of Ionic volutes. There are also remains of the pre-Muslim period at Susa, Ecbatana, and Teheran.

The Muhammadan art of P. is famed. The tomb of Zobeide (VIII. cent.) at Bagdad is interesting for its stalactite vaulting. The mosque at Tabriz ascribed to the Ilkhanians shows beautiful decoration of glazed tiles, brightly coloured and adorned by characteristic Arabic interlaced ornament. The mosque of Masjid Shah at Ispahan, built by Abbas Shah (1585–1628), has between its minarets a noble gateway, the squareness of which forms a fine contrast to the beehive-shaped dome behind; but it is its interior which has made this mosque famous, having, besides gay decoration, memorable perspective effects. The designs of architectural ornament, Pers. pottery, carpets, etc., are largely dependent for their effect on arrangements of lines, P. having acquired great art in this direction through being restrained by the Muhammadan religion from using animal and plant motifs in ecclesiastical ornament. The rosette, however, figures largely in antique sculptures of dresses and in wall decoration, and the Pers. rose is frequent in modern pottery design.

Government of P. was until 1907 a despotism exercised by the *Shahan* or *Shahin Shah* (Pers. king of kings), who was, however, unable to act against the precepts of the *Koran* or the traditions of Shiite Muhammadanism. The Great Council, or *Mejliss*, as re-established in 1909, consists of *c.* 150 members elected for two years and supposed to meet annually; the suffrage is confined to the upper and middle

classes. The Council was given the power of the purse, which had hitherto belonged to the Shah, and the control of foreign policy. Arrangement was made for the appointment of a senate, half the members of which were to be elected by the Shah, half by the Council, but this has never been carried out, nor is it yet certain how long the representative Council will be continued. There are separate ministers for the seven departments of the executive. Governors-general (*Hakim, Wali*, etc.), always royal or noble, govern the provinces (c. 30 in number) and appoint their own deputy-governors (also called *Hakim*) in the subdivisions of the same. The chief provinces are: Arabistan, Ardalan, Astarabad, Azerbaijan, Fars, Gilan, Hamadan, Irak, Ispahan, Kamseh, Kerman, Kermanshah, Khorasan, Kurdistan, Luristan, Mazanderan, Savah, Teheran, Yezd. The municipalities have a chief official known as *Beglerbegi, Darogha* or *Kalantar*; the village reeves are called *Kedkhoda*. The nomad tribes are outside this system, but their chiefs (variously known as Ilbegi, Ilkhani, Serdar, Sheikh, Tushmal, and Wali) are accredited officials of the central government. Justice is based on the *Koran* and is carried out by the Hakim (who are reputed extremely unjust and extortionate) assisted by the priests.

The regular (*nizam*) ARMY is nominally composed of 79 battalions of infantry, 23 batteries of field artillery, and 1 battalion of pioneers; the popular levy is supposed to furnish 50,000 cavalry and 10,000 infantry. The famous Cossack Brigade consists of 8 squadrons, 1 small battalion of infantry, and 1 horse battery of 6 guns. It is generally considered that the Persians are a fine fighting force badly provided and directed. There are 8 warships.

The chief towns are Teheran (the capital), Tabriz, Ispahan, Meshed, Kerman, Yezd, Barfurush, Shiraz, Hamadan, Kashan, Kazvin, Kom, Resht; the principal ports, Bunder Abbas, Bushire, Lingah, and Mohammerah on the Pers. Gulf, Astara, Bender-i-Gez, Enzeli, and Meshed-i-Sar on the Caspian Sea. Six miles of railway constructed by a Belg. Co., from Teheran to Shah Abdul-azim, were opened in 1888. The construction of a trans-Persian railway to provide an overland route *via* Russia to India is under consideration (1913), but is open to objection on strategic and other grounds. Road-making has been busily carried on in the last ten years, with the result that, besides the caravan routes and old roads from Teheran to Kom and Resht, there are now roads from Tabriz to the Russ. border, Kazvin to Hamadan and Meshed to Askabad. The Pers. Road and Transport Co., a Brit. firm, was formed in 1903. A state department of Posts and Telegraphs originated in 1909.

Products and Industries.—The inhabitants are chiefly agricultural and pastoral, and are very thinly distributed. Large quantities of wheat, barley, rice, fruits, asafœtida, gums, hashish, opium, silk, wool, lambskins, goats-hair, and cotton are produced. The wool of Khorasan is equal to that of Astrakhan. Hand-manufactures of carpets, felts, shawls, silk, cotton, prints, leather, copper, brass-ware, enamelled work, pottery, glazed tiles, and attar of roses, and dealing in pearls and pearl-shell are important. Minerals are abundant, but most of them are still unworked, the distance from markets and the bad communications rendering the transport of them unwrought impossible, while scarcity of fuel prevents treatment on the spot. Lead, copper, and turquoise (near Nishapur) are worked; silver-lead, iron in large quantities, coal (especially in the S.E.), tin, antimony, manganese, borax, salt, and naphtha (all along W. and in part of N.) are found. The oil, which has only lately begun to be worked by the British, promises to bring much profit. The exports amount to about £8,000,000 yearly, the imports, chiefly cottons, woollens, petroleum, glass, sugar, tea, coffee, drugs, amount to about £10,000,000.

Inhabitants.—Native elementary education is poorly supplied by the schools of the larger towns, but secondary instruction is fairly good, and W. powers are all making an effort to extend their influence by means of schools. Westernisation commenced with the polytechnic established in Teheran in 1849, and in late years Fr. and Ger. schools on a grand scale have been established. There are about 8,500,000 Shiite Muhammadans, about 850,000 Sunnites, 50,000 Armenians, 40,000 Jews, 30,000 Nestorians, and 10,000 Parsis. The principal ecclesiastic, the Mujtahid of Kerbela, has great authority under the Shiite creed; all the chief priests are called Mujtahids, the simple priests Mullâs; their appointment belongs to the church, but the state elects the church officials, Sheikh-ul-Islâm and Imâm-i-Jum'ah. Persians are usually tolerant to non-Mussulmans, but are subject to fanatical outbursts. About a quarter of the inhabitants are nomads, the chief nomadic tribes being Turks (720,000), Kurds and Leks (675,000), Arabs (260,000), Lurs (234,000), Baluchis and Gipsies (20,000). Pop. (estimated) 10,000,000.

Jackson, *Religion of Ancient Persia*; Ragozin, *Media, Babylon, and Persia* (1889); Benjamin, *P. and the Persians* ('Story of the Nations' Ser. (1888)); Curzon, *P. and the Persians* (1892); Layard, *Early Adventures in P.* (1894); Browne, *The Revolution in P.* (1910); Shuster, *Strangling of P.* (1912); Sykes, *P. and its People* (1910).

PERSIMMON, VIRGINIAN DATE PLUM (*Diospyros virginiana*), tree c. 60 ft. high; yields delicious plum-like fruit containing 8 to 10 seeds.

PERSIS, in ancient geography, district in S.W. of Persia now embraced in province of Fars; region mountainous, barren, and unhealthy along coast, but fertile and well watered inland. Little is known of history before time of Cyrus, who founded Pers. monarchy; Pasargadæ (*q.v.*), first capital, believed to have been founded by Cyrus, whose palace and tomb were built there; later capital, Persepolis (*q.v.*). After Macedonian Wars many Gk. cities were built in P.

PERSIUS, AULUS PERSIUS FLACCUS (34–62 A.D.), Rom. poet; b. at Volaterræ, in Etruria; taken to Rome when twelve, and studied grammar under the famous Remmius Palæmon, but his greatest debt was to Cornutus the Stoic, whose philosophy he followed with indefatigable zeal. P.'s poems consist of six satires. His expression is tortuous and enigmatical, but there are lines which prove that P. would have been great had he not died so young.

PERSON.—(1) a subject of legal rights and duties. (2) a rational individual, capable of moral rights and duties.

PERSONAL PROPERTY, anciently distinguished from 'real' property, by the fact that in the case of *realty* the thing itself could be recovered, but in *personalty* only damages could be recovered. Freehold land is 'real' property, the leasehold is 'personal.' Furniture, money, assurance policies, stock in public companies, are all p. p.

PERSPECTIVE, art of representing, by a drawing on a flat surface, solid objects or surfaces, in such a way that the drawing appears to the eye in the same manner as the object itself. The eye is supposed fixed at a point called *centre of p.*, the picture being drawn in a plane (*picture plane*) perpendicular to the line of vision. If now straight lines be drawn from every point of the object to the eye, the point where each of these lines cuts the picture-plane is corresponding point of the picture. The foot of the perpendicular from the eye on the picture-plane is the *centre of vision*, and all lines of the object perpendicular to the picture-plane appear to *vanish* at this point. Other sets of parallel lines inclined to picture-plane have *vanishing-points* at other points of the horizontal line through the centre of vision.

PERSPIRATION, see SKIN.

PERTH (31° 57′ S., 115° 52′ E.), capital, Western Australia, on Swan River; seat of R.C. and Anglican bp's; and of state univ. Pop. 54,354.

PERTH (56° 24′ N., 3° 27′ W.), county town of Perthshire, Scotland; city, royal burgh, river port, and assize town. Main part of town—including ancient quarters—stands on right bank of river Tay; chief suburb on left bank. Town is beautifully situated, with fine buildings—including ancient church of St. John; regularly planned and sometimes called 'The Fair City.' Till James I.'s assassination here (1437) P. was seat of Scot. king and Parliament, owing to vicinity of Scone (*q.v.*); scene (North Inch) of encounter between Clans Chattan and Quhele (see Scott's *Fair Maid of Perth*). Industries include dye-works, linen, floor-cloth, and glass manufactures, iron-works, foundries, etc.; salmon fisheries. Pop. (1911) 35,851.

PERTH, EARLDOM AND DUKEDOM OF.—James, Lord Drummond, was cr. Earl of P., 1605. Fourth earl, JAMES, followed James II. to St. Germains, where he was cr. duke, 1701. His s., James, was attainted after 1715 invasion; his s., JAMES, 3rd titular duke, commanded at *Preston*, *Carlisle*, *Stirling*, and *Culloden*, 1745; bro. and heir, John, also fought for Stewarts, 1745; uncle, Edward, 6th titular duke, was imprisoned in Paris as Jansenist. JAMES DRUMMOND (formerly Lundin) received restitution of Drummond Castle, etc., 1783, and was cr. Lord Perth, 1797, but left no male issue. Title of earl was assumed by Drummonds till 1853, when attainders of 1715 and 1745 were reversed.

PERTH AMBOY (41° 31′ N., 74° 20′ W.), city, port of entry, on Raritan, New Jersey, U.S.A.; terra-cotta, fire-bricks. Pop. (1910) 32,121.

PERTHSHIRE (56° 30′ N., 3° 45′ W.), large inland county in centre of Scotland; bounded by Inverness, Aberdeen, Forfar, Fife, Kinross, Clackmannan, Stirling, Dumbarton, and Argyll; area, *c.* 2500 sq. miles. County is almost completely mountainous, with many beautiful lochs, rivers, forests, and passes; chief mts. are Grampians, Sidlaws, and Ochils, and among highest summits are Ben Lawers (c. 4000 ft.), Ben More (3843 ft.), Ben Lui (3708 ft.), and Schiehallion (3547 ft.); river Tay, with tributaries (Garry, Tummel, Earn, and others), drains almost whole county; S. watered by Forth and Teith; largest lochs are Lochs Tay, Earn, Rannoch, Katrine, Vennacher, and Achray; chief towns, Perth, Crieff, Blairgowrie, and Dunblane. Antiquities include many cairns, stone circles, Rom. camps, castles; cathedrals at Dunblane and Dunkeld, and interesting palace at Scone. Much fruit is grown. Chief industries are dyeing, bleaching, tanning, brewing, distilling, quarrying, and manufacture of woollens, cotton, and linen. Pop. (1911) 124,339.

PERU (3° 20′ to 18° S., 69° to 81° 30′ W.), republic, in N.W. of S. America. Peru is bounded N. by Ecuador, E. by Brazil and Bolivia, S. by Chile, S.W. and W. by Pacific; area, 695,733 sq. miles; coast-line, *c.* 1400 miles. Surface has a narrow coastal strip rising rapidly to the Andes, which here form three or more parallel chains with a width of *c.* 250 miles, running in same direction as coast and having great fertile valleys and tablelands spread out among them. Mt's reach height of 21,000 to 22,000 ft., the highest peaks being Huascan (*c.* 22,050 ft.) and Huandoy (*c.* 21,090 ft.), while there are many volcanic peaks over 19,000 ft. in height. The plateaux attain a height of from 12,000 to 13,000 ft. above sea-level. To the E. of Cordilleran ranges is region of forest and pampas sloping to Amazon basin. Drainage of this region as well as of the northern and central tableland is carried off by head-waters of Amazon (Marañon) and of its great tributaries, Huallaga, Ucayale, and Javari, and by the upper streams of the Jurua, Purus, and Madeira farther S. The rivers of the coastal strip are unimportant. In extreme S.E. is Lake Titicaca, which belongs to a basin of inland drainage, though it discharges its own waters southward by the Desaguadero to Lake Aullagas in Bolivia. The largest towns are Lima (capital), Arequipa, Callao, Ayacucho, Cuzco. Climate varies with elevation; temperature on coast, 60° to 80° F.; on tablelands, 40° to 60° F.; in W. districts, 64° to 86° F.

History.—In very early times a considerable degree of civilisation was attained by various peoples in P. About the XII. cent. the *Incas* established themselves in the country, and, making Cuzco their seat of government, gradually increased their dominions until the whole region from Ecuador to Chile was under their sway. Their rule continued for over three cent's, during which they developed a fairly successful system of socialism and carried out magnificent building and engineering works. The Span. conquest of P. was carried out by Francisco Pizarro between 1531 and 1541, in which year he was murdered by followers of Almagro, the Inca prince. P. became a Span. viceroyalty in 1542, and so remained until the rebellion of the Span. colonies against the mother country early in XIX. cent.

P. was last of colonies to attain independence. It became a republic only in 1824 after defeat of Spaniards at *Ayacucho*; ruled by the liberator, Bolivar, until 1826. During next two decades various revolutions occurred and several new constitutions were drawn up, but under Ramon Castillo, Pres. in 1845–51 and 1855–62, the prosperity of the country increased. A boundary dispute with Brazil was settled in 1876; and in 1879 occurred the war with Chile which ended in 1883 with the Treaty of Ancon, whereby Chile obtained Tarapaca and the right to hold Arica and Tacna for ten years, after which a popular vote was to decide to which state these two provinces should belong; this question, however, still remains open. Another revolution took place in 1894–95. Boundary disputes have also occurred with Bolivia, Colombia, and Ecuador; that with Bolivia was settled by negotiations between the states concerned; that with Colombia and Ecuador was referred to Alfonso of Spain, who in 1910 refused to act further in the matter, which was then referred to the mediation of U.S.A., Argentina, and Brazil. Further boundary disputes with Brazil were settled in 1910.

Government is republican; executive power vested in Pres. (elected for four years by popular vote), two Vice-Presidents (similarly elected), and Cabinet of six ministers. Legislature consists of Congress of two houses—Senate (52 members) and House of Representatives (116 members), both senators and representatives being elected by popular vote. P. is divided for administrative purposes into 18 departments and two provinces. Primary education is gratuitous and nominally compulsory. The state religion is Roman Catholicism; other religions are tolerated in practice, although prohibited by the terms of the Constitution of 1860. Army numbers about 4000 in all, and military service is obligatory. The majority of the population are Indian; whites, chiefly Spanish, form about one-seventh and half-breeds about one-fourth, while there are smaller proportions of negroes and Chinese. Pop. variously estimated at from 2,661,000 to 4,500,000.

Resources.—Mineral resources are enormous, but the difficulty of transport has arrested development. Silver occurs in vast quantities, and gold, copper, lead, quicksilver, antimony, iron, petroleum, sulphur, and other minerals are produced. The forests of the eastern slopes produce valuable timber, as well as cinchona, coca, cacao, rubber, sarsaparilla, and vegetable ivory. Bananas, vines, olives, cotton, tobacco, coffee, sugar-cane, and cacao are cultivated, and various cereals are grown. Llamas and cattle are raised. Exports include minerals, sugar, cotton, wool, gums, etc.; imports textiles, machinery, provisions, and general goods. Railway mileage in 1911, 1656.

M. R. Wright, *The Old and New Peru* (1909); P. Martin, *Peru of the Twentieth Century* (1911).

PERU.—(1) (41° 21′ N., 89° 3′ W.) city, Illinois, U.S.A., on Illinois; agricultural implements. Pop. (1910) 7934. (2) (40° 46′ N., 86° 1′ W.) city, on Wabash, Indiana, U.S.A.; agricultural district; woollens. Pop. (1910) 10,910.

PERUGIA (43° 7′ N., 12° 23′ E.), city, on Tiber, Italy (Umbria); capital of province P.; with cathedral (XV. cent.), S. Pietro (XI. cent.), and other interesting churches; municipal palace, exchange (with fine frescoes by Perugino), old gateways, univ. (c. 1266), museum, etc. *Perusia* one of the twelve cities of Etruria; taken by Romans, 310 B.C.; passed to popes, IX. cent.; united to Piedmont, 1860; centre of Umbrian school of painting, XV. cent.; woollens, silks, liqueurs. Pop. c. 66,000. For Perugia province, see UMBRIA.

PERUGINO, PIETRO (1446–1524), eminent Ital. painter; studied at Florence; went to Rome about 1483, and in the Sistine Chapel executed the still extant fresco of *Christ giving the Keys to Peter*. From 1486–99 he was again in Florence, where he gave lessons to Raphael. He was at Perugia from 1499 to 1504, helping to adorn the Hall of the Cambio; in Rome again from 1507–12, where he assisted in decorating the stanze of the Vatican. He died at Perugia, from plague, and a fresco on which he was then engaged is now at South Kensington.

Brinton, *Perugino* (Masterpieces in Colour).

PERUVIAN BARK, dried bark of Cinchona (*q.v.*). See also QUININE.

PESARO (43° 55′ N., 12° 53′ E.), town, E. coast, Italy; walled and fortified; episcopal see, has two cathedrals and several palaces. Pop. (1911) 27,343.

PESCADORES (24° N., 119° 40′ E.), group of small Jap. islands in Strait of Formosa, China Sea. Pop. 50,000.

PESCARA (42° 20′ N., 14° E.), river, Italy; flows into Adriatic; ancient *Aternus*.

PESCARA, FERNANDO FRANCESCO D'AVALOS, MARQUIS OF (1489–1525), Ital. condottiere in service of Spain; fought with distinction at *Pavia*, and settled in Milan; conspired with Morone for crown of Naples, but plot was abortive.

PESCHIERA SUL GARDA (45° 26′ N., 10° 42′ E.), fortified town, Verona, Italy, at foot of Lake Garda.

PESCIA (43° 53′ N., 10° 42′ E.), town, Firenze, Italy; silk, olives. Pop. (commune) c. 18,000.

PESCIA (43° 53′ N., 10° 42′ E.), city, Lucca, Italy; cathedral; silk. Pop. 18,500.

PESHAWAR.—(1) (c. 34° 2′ N., 71° 45′ E.) district, North-West Frontier Province, India; area, c. 2560 sq. miles. Pop. 790,000. (2) (33° 59′ N., 71° 30′ E.) capital of above; important military station; centre of trade with Afghanistan and Bokhara. Pop. (1911) 97,935.

PESHIN, PISHIN (30° 27′ N., 67° E.), district, Brit. Baluchistan.

PESSIMISM, view that what is, is bad; opposed to *optimism*, the view that what is, is good (or as good as possible). Schopenhauer is the most distinguished modern pessimist; the ultimately real is blind, irrational will, which cannot be satisfied, and therefore, when it becomes conscious, as in man, leads to far more pain than pleasure.

PESSINUS, ruined town near Bala Hissar, Asia Minor; founded by Phrygians, subsequently belonged to Gauls; was centre of cult of Cybele.

PESTALOZZI, JOHANN HEINRICH (1746–1827), Swiss educationist; dwelt with waifs at his farm, Neuhof, but failed owing to lack of business ability; kept school at Yverdon, 1805–25; wrote novels on educational themes; taught by intuitional method, making psychology his foundation and combining manual with mental exercises. See EDUCATION.

PESTH, see BUDA-PESTH.

PETALISM, see OSTRACISM.

PETAURUS, FLYING PHALANGER, see under MARSUPIALS.

PETER I. (d. 1104), king of Aragon and Navarre; famous slaughterer of Moors.—**Peter II.** (1174–1213), king of Aragon; cruel, handsome, amorous, and a troubadour.—**Peter III., the Great** (1236–85), king of Aragon; profited by *Sicilian Vespers* (q.v.), 1282, to seize Sicilian throne.—**Peter IV., the Ceremonious** (1319–87), king of Aragon; long reign occupied in civil and foreign wars.—**Peter the Cruel,** PEDRO I. (1334–69), king of Castile; pitiless and extortionate, but gave order to realm.

PETER I., THE GREAT (1672–1725), emperor of Russia; succ., 1682; sole ruler on death of bro. Ivan, 1696; illiterate himself, but introduced western civilisation into Russia, modernising army and creating navy; encouraged trade. To win a port on Black Sea P. attacked Turkey and captured Azof, 1696; revolt of Strelitz faction ruthlessly crushed, 1698; defeated at *Narva*, 1700, in attempt to partition Sweden with Poland and Denmark, but captured part of Ingria and founded new capital, Petersburg, there, 1703; defeated Sweden at *Poltava* and seized Baltic provinces and part of Finland, 1709, thus acquiring wide seaboard; coalition of Sweden and Turkey compelled restitution of Azof, 1711; m. his mistress (afterwards famous Catherine I.), 1712; Finland wholly conquered, 1713; but restored to Sweden, 1721, for quitclaim of Baltic provinces, etc.; Caspian provinces wrested from Persia, 1722; law passed, 1722, empowering tsars to nominate successor. Peter the Great was a barbarian genius.

Life, by Barrow, Browning, Schuyler, Ragozin, Waliszewski.

PETER III. (1728–62), emperor of Russia; s. of eldest dau. of Peter the Great by Duke of Holstein-Gottorp; succ., 1762; offended nobility by Liberal reforms and favour shown to Germans, assisting enemy Prussia; overthrown by wife, Catherine II.; assassinated.

PETER DES ROCHES (d. 1238), justiciar of England, 1213; bp. of Winchester, 1205.

PETER, EPISTLES OF, in New Testament, though both bearing the name of Peter, must be considered separately.—**1 Peter** has fairly good attestations. There are parallels to it in Clement of Rome (though which is earlier is uncertain). It is referred to in *2 Peter*, by Polycarp, and the writer of the *Didache*. Irenæus first quotes it by name. If by the apostle St. Peter it cannot be later than the Neronian persecution, in which by unquestionable tradition he died. Some critics think it dates from the reign of Trajan or Domitian. Its theology shows Pauline influence.—**2 Peter,** according to most scholars, is not genuine. It has close parallel with *Jude*, which Epistle the author of *2 Peter* probably used; attestation not good; date, c. 150–200 A.D.

Commentary by Bennett (Century Bible).

PETER, ST., the 'chief of the Apostles,' often called Simon Peter, Simon being the Greek for the Semitic Simeon, and Peter (Gk. *petros*, rock) corresponding to Aramaic *kepha* (rock). P. is prominent in the Gospel story; he is one of the small group of apostles in closest personal association with the work of Christ. His confession at Cæsarea Philippi can almost be called the turning-point of the Gospel story. (The term 'Son of God' has probably here only a Messianic significance.) His denial of Christ at the Passion is also extremely important—particularly interesting in such a detail as his Aramaic accent's being noticed.

After the earthly life of Christ P. becomes leader of the Apostles in Jerusalem. Much controversy has raged round the exact relation of Peter and Paul as regards the admission of the Gentiles to Christianity. The date of his death is uncertain; according to early tradition he was the founder of the Roman Church and was martyred there, though probably not at the same time as St. Paul. How far he was 'bishop of Rome' is still further disputed. See PETER, EPISTLES OF.

Hort, *Judaistic Christianity*; Barnes, *St. Peter in Rome*; Lightfoot, *Apostolic Fathers*, 2nd edit., pt. i. vol. ii. p. 482.

PETER LOMBARD (c. 1100–60), mediæval scholar; first doctor of theology of Paris univ.; wrote great manual of scholastic system, *Sententiarum Libri*

IV., commentaries upon which were written by Albertus Magnus and Thomas Aquinas.

PETER OF AIGUEBLANCHE (d. 1268), bp. of Hereford, 1240.

PETER THE HERMIT, priest associated with First Crusade, which he preached and helped to lead in 1096; his army was destroyed by Turks; date of death uncertain; tradition has exaggerated importance of his work.

PETERBOROUGH (44° 17′ N., 78° 24′ W.), town, port of entry, on Otonabee, Ontario, Canada; machinery. Pop. 15,300.

PETERBOROUGH (52° 35′ N., 0° 16′ W.), city, municipal and parliamentary borough, Northamptonshire, England, on river Nene, on borders of Fen district; chief feature, cathedral, erected on site of two older buildings, begun in XII. cent., presents various types of architecture; other buildings include episcopal palace, deanery, town hall, and corn exchange. P. contains various educational establishments; important railway centre; manufactures agricultural implements. Pop. (1911) 33,578.

Soke of P., administrative county, containing P.; area, 83½ sq. miles. Pop. (1911) 44,722.

PETERBOROUGH AND MONMOUTH, CHARLES MORDAUNT, EARL OF (*c.* 1658–1735), Eng. statesman; succ. f. as Viscount Mordaunt, 1675; favoured Revolution of 1688; cr. Earl of Monmouth, 1689; implicated in Fenwick's conspiracy, and imprisoned, 1697; succ. uncle as Earl of P., 1697; gov. of Jamaica, 1702; general of allied armies in Spain, 1705, and expelled Fr. force of over double numbers; brilliant commander, but had ill-fate always to be considered light and untrustworthy.

PETERHEAD (57° 30′ N., 1° 46′ W.), port, Aberdeenshire, Scotland; centre of herring and other fisheries; large granite quarries and polishing works; convict station. Pop. (1911) 13,613.

PETERHOF (59° 50′ N., 29° 53′ E.), town, St. Petersburg government, Russia, on Gulf of Finland; gem-cutting industry; contains Great Palace of Peter the Great. Pop. 12,000.

PETERS, HUGH (1598–1660), Eng. Puritan; preached in England, then in Holland and America; returned to England and attacked Laud; served with Parliamentarians in Civil War; at Restoration arrested and executed, though denying complicity in king's death; an able leader, with some practical breadth of view, but violent and unrestrained.

PETERS, KARL (1856–), Ger. traveller in Africa; founded Ger. Society for Colonisation at Berlin; director of Ger. East Africa Co., 1885; commissioner for settling Anglo-Ger. frontier in East Africa, 1892.

PETER'S PENCE, tax formerly levied on R.C. families; institution attributed to Ina of Wessex (688–725) or Offa of Mercia (757–96); sometimes refused by Eng. kings; abolished in England by Henry VIII.; now voluntary contribution to maintenance of papal state.

PETERSBURG, see ST. PETERSBURG.

PETERSBURG (37° 10′ N., 77° 22′ W.), city and port of entry, Virginia, U.S.A.; situated at head of navigation, on S. bank of Appomattox River, 11 miles from its mouth, and *c.* 22 miles from Richmond; lay formerly in counties of Chesterfield, Dinwiddie, and Prince George, but is now independent. P. is an interesting and historic city, containing P. Female Coll., Bp. Payne Divinity School, Virginia Normal and Industrial Institute, many hospitals, orphanages, and other charitable institutions; has two public parks; at Blandford is fine old church, erected *c.* 1734. In 1645 Fort Henry was built by whites on site of present city; P. founded in 1733 and incorporated as town in 1748; scene of conflict between British, under Phillips, and Americans in 1781; chartered as city in 1850. P. took prominent part during Civil War; Grant, Federal commander, in hope of capturing Richmond, laid siege to P. in 1864; city defended for about ten months by Confederates under Lee; Grant exploded nine and killed great numbers of Confederates, but was repulsed in attack; on April 1, 1865, Confederates were defeated at Five Forks, and Richmond and P. occupied by Federals; some days later Lee was completely defeated at Sailor's Creek, and on April 9 surrendered at Appomattox courthouse. P. has large export trade, and numerous manufactures, including those of cotton, tobacco, bags, trunks, paper, flour, machinery, and agricultural implements; Falls above city supply water-power for factories. Pop. (1910) 24,127.

PETERSFIELD (51° N., 0° 57′ W.), town, Hampshire, England. Pop. (1911) 3947.

PETERWARDEIN (45° 17′ N., 19° 51′ E.), fortified town, on Danube, Croatia-Slavonia, Hungary; Turks defeated here by Prince Eugène, 1716. Pop. 4100.

PETHERICK, JOHN (1813–82), Welsh traveller; acquired extensive knowledge of Sudan, 1845–59; consul at Khartum, 1861; aided Speke expedition, 1862; pub. *Travels in Central Africa*, 1869.

PETIOLE, see LEAF.

PÉTION DE VILLENEUVE, JÉRÔME (1756–94), Fr. politician; one of Girondins; pres. of Convention; wrote on legal and other subjects.

PETITIO PRINCIPII, begging the question; in logic, the fallacy of assuming the proposition to be proved.

PETITION.—The subjects' right of petitioning has from early times been a fundamental part of the Brit. Constitution. P's, *i.e.* formal requests and applications, may be addressed to the Sovereign, to either House of Parliament or to a Court of Law. In 1689 the *Bill of Rights* (q.v.) finally confirmed the right of petitioning the Crown. Bills of Parliament used to be presented in the form of p's to the king, e.g. *Petition of Right* (q.v.), 1628. P's to Parliament now usually deal with questions of general policy (*e.g.* for and against Women's Suffrage) rather than particular matters demanding redress. The Standing Orders prescribe a certain form for such p's. Election p's may be filed under Corrupt Practices Act (*q.v.*).

PETITION OF RIGHT, THE, granted (but not acted upon), June 1628, by Charles I., to whom Parliament refused supplies until he conceded its demands for suppression of illegal taxation and imprisonment and billeting of soldiers on private persons. The term p. of r. is also applied to p's (regulated by *Petition of Right Act*, 1860) submitting claims against the Crown for possession or restitution of property; an old Common Law remedy.

PETŐFI, ALEXANDER (1823–49), Hungarian poet; b. Kis-Kőrös; his enthusiasm in the revolutionary cause inspired him to write noble lyrics and break down the pedantic traditions of Hungarian poetry.

PETOSKEY (45° 20′ N., 85° W.), city, Michigan, U.S.A.; on Little Traverse Bay; health resort; lumber. Pop. (1910) 4778.

PETRA, ruined city in N. Arabia, lying in valley near Mound Hor and surrounded by cliffs and ravines; once important caravan centre and capital of Nabatæans; many ruined buildings to be found; most remarkable remains are treasury, temples, tombs, and dwellings hewn out of cliffs and rocks enclosing city; architecture of Gk., Rom., and Oriental types. P. remained independent till *c.* 106 A.D., when taken by Romans; declined with rise of Palmyra.

PETRARCH, FRANCESCO PETRARCA (1304–74), Ital. poet; one of the greatest lyric poets of all time. His life was a somewhat stormy one, due to the varied vicissitudes of Ital. political life. Destined for the law, he studied at Montpellier and Bologna, but devoted himself to classical and especially Rom. letters. Although an ecclesiastic he never took orders, and refused a secretaryship to the Pope. He travelled extensively and made valuable discoveries of manuscripts. In 1341 he was crowned poet laureate at Rome.

In an age of great humanists P. stood pre-eminent;

this is reflected in his work by a tendency to repress all originality of style in favour of a purist imitation of the best Latin models. His chief works are the epic poem *Africa*, centering round the character of Scipio, the prose hist. biographies known as *De Viris Illustribus*, the prose dialogues *De Contemptu Mundi* and *Secretum*, a couple of theological treatises, and the famous collection of letters in groups called *Variæ*, *Seniles*, *Familiares*, *Ad Veteres Illustres*, and *Sine Titulo*. But his fame as a lyric poet rests on the *Canzoniere*, sonnets to the mysterious Laura (whom he met at Avignon, and whose death he laments in his *In Morte di Madonna Laura*), the lyrical story of one of the great loves of the world's lit. P.'s influence on subsequent sonneteers was considerable, and may be seen in the verse of Surrey and Wyatt. See SONNET.

Jerrold, *Francesco Petrarca, Poet and Humanist* (1909); Symond, *Renaissance in Italy* (vols. ii. and iv.).

PETREL FAMILY, *Procellariidæ*, a family of marine swimming birds found in all the great oceans. They are strong swimmers and include the Storm P., a British breeding bird.

PETRIOU (13° 40′ N., 101° 10′ E.), town, port, Pachim division, Siam. Pop. *c.* 10,000.

PETROGRAPHY, see PETROLOGY.

PETROL, one of the light oils (*q.v.*); a mixture of hydrocarbons; distilled from petroleum or paraffin; highly inflammable, and used as source of power for internal combustion engines as fitted to motor-cars, motor-cycles, and aeroplanes. To produce the necessary explosive mixture a carburettor (*q.v.*) or vaporising device is necessary. Passing through this instrument the p. is turned to vapour, and is mixed with a proportion of air. It is introduced into the cylinder, where the explosion takes place, through an induction pipe, the supply being shut off or opened by a valve. See ENGINE, MOTOR-CARS.

PETROLEA (42° 52′ N., 82° 6′ W.), town, Ontario, Canada, on Bear Creek; petroleum wells. Pop. 4600.

PETROLEUM (Lat. *petra*, a rock, and *oleum*, oil) strictly includes all the naturally occurring hydrocarbons, but the term is usually applied to the well-known inflammable liquid. It is found in very large quantities in Russia, Canada, U.S.A., Burma, and elsewhere. The earliest method of collecting p. was that of skimming the oil from the surface of water upon which it had accumulated. It is now obtained by drilling in much the same way as water is got by the artesian well system, the actual details of the drilling process varying considerably with the nature of the strata, which have to be bored through, and the depth to which the well must be carried. The oil may flow spontaneously, or may require to be pumped. It is sometimes possible to induce a flow of oil by stopping the escape of the gas which issues along with the oil, so that the latter is raised by the pressure of the gas. At Baku, on the Caspian Sea, compressed air is used for raising the oil.

When a well falls off in its yield, it is usual to shock it by the explosion of a special kind of torpedo in order to increase the flow. In some cases quite dry wells can be made to resume their productiveness by the use of the torpedo. The transport of p. in large quantities is generally carried out by means of the pipe-line system, the oil being forced through the pipes by pumps which vary in size, according to the length of the line and other matters, from about 30 to 800 horse-power. At the wells the oil is usually stored in circular wooden tanks, but in Canada it is frequently contained in reservoirs cut out of the soft clay of the oil regions. Clay-lined reservoirs are used to some extent in the Russian oil-fields. At the other end of the pipe-line the oil is received in large tanks made of boiler plate.

By various processes of refining, p. is made to yield a great variety of products, such as naphthas, kerosene, gasoline, vaseline, paraffin wax, etc. P. products are largely used in the manufacture of air-gas, oil-gas, and coal-gas, and for all kinds of lighting and heating purposes. Emulsions of p. are employed in the treatment of chest and lung diseases. P. is also used to a large extent as a lubricant for various kinds of machinery and for railway vehicles. The demand for p. has greatly increased on account of the enormous development of petrol-driven automobiles, and the use of p. as a liquid fuel is rapidly extending, recent tests having shown the value of this fuel, either alone or in conjunction with coal, for warships and other large vessels, and also for locomotives. See OIL, PETROL, ENGINE, FUEL.

PETROLOGY (PETROGRAPHY), the science of rocks and the investigation of their composition, structure, and history; sometimes called **Lithology**. Nearly all rocks consist of mineral ingredients, although a few are composed of animal or vegetable tissues. The origin of all rocks can be effectively traced, and they are classed according to their origin. P. goes hand in hand with GEOLOGY (*q.v.*), and a knowledge of p. is as important to the geologist as a knowledge of geology is necessary to the petrologist.

The number of important rock-forming minerals is relatively small, and does not exceed 100. The commonest is quartz; others are felspar, mica, chlorite, kaolin, calcite, olivine, augite, hornblende, magnetite, and hematite. Calcite composes limestones, while quartz is found in the sandstones and with a percentage of silica in igneous rocks. Disintegration produces constant changes in rocks, as does weathering. Some minerals are not affected by these causes, however, *e.g.* white mica and quartz. Felspar may be changed into kaolin, and muscovite to quartz, while biotite yields chlorite and epidote. Disintegration may so affect rocks that, the essential compositions being taken away or changed, the remainder may form sand or gravel and give rise to beds.

IGNEOUS ROCKS (Lat. *ignis*, 'fire') owe their origin to volcanic action. While some of the *crystalline rocks* are composed of the same ingredients as occur in many igneous rocks, they differ so materially from lavas that they could not have been consolidate at or near the earth's surface. These include diorites, doleritos, quartz-porphyries, granites, and gabbros. The microscope reveals them to be of igneous origin. They have cooled deep down in the earth, and denudation has caused them to appear near the surface. Thus the igneous rocks are divided into two classes: the *volcanic*, or superficial, and the *plutonic*, or deep-seated. Some of the igneous rocks are crystalline or massive, others fragmentary. The former include granite, obsidian, pumice, and basalt; the latter are composed of volcanic ashes more or less closely compacted together, and are known as *tuffs* (q.v.).

SEDIMENTARY ROCKS are generally the débris of pre-existing rocks which, having accumulated in seas, lakes, or upon land, have been subsequently subjected to pressure and pressed into solid form. Among these may be mentioned the sandstones, conglomerates, clays, and shales. ORGANICALLY DERIVED ROCKS.—Some rocks owe their origin to living organisms, *e.g.* corals, limestones, lyenite beds, and chalk; others again may be due to remains of vegetable life as peat and coal. METAMORPHOSIC ROCKS are rocks which have been changed by chemical action, percolation of water, or pressure. Sedimentary rocks are changed, too, at their point of contact with igneous rocks as limestones, which become crystalline marbles, sandstones are changed to quartzites, coal to graphite, and clay to porcellanite. Nearly all such rocks are distinguished by their foliated structure. Rocks which are subjected to intense pressure become schistose and crystalline in structure, and this applies equally to sedimentary and igneous rocks.

Some authorities form another class of rocks called the DERIVATIVE ROCKS, because these rocks are derived from other pre-existing rocks.

Williams, *Modern Petrography*; Harker, *Petrology*

for Students; Hatch, *Petrology Text-Book*; Adye, *Modern Lithology*.

PETRONIUS (I. cent.), Rom. satirist, probably GAIUS PETRONIUS, whom Tacitus describes as refined debauchee and connoisseur, hence the poet's surname *Arbiter*. Gaius P. was proconsul of Bithynia and boon companion of Nero; fell owing to jealousy and suspicion; committed suicide by slow degrees with great calmness. P.'s work has survived in a mutilated form; two books and some fragments extant; collection of satires, medley of prose and verse; marked by originality and strength; valuable picture of contemporary Rom. life; humorous in refined manner, in marked contrast to coarseness of Juvenal (*q.v.*).

PETROPAVLOVSK.—(1) (55° N., 69° E.) town, on Ishim, Akmolinsk, Asiatic Russia; trade in cattle. Pop. 20,000. (2) (53° N., 159° E.) seaport, Kamchatka, Siberia, on Sea of Kamchatka.

PETROPOLIS (22° 40′ S., 43° 5′ W.), town, health-resort, Rio de Janeiro state, Brazil; cotton industries. Pop. 20,000.

PETROVSK.—(1) (42° 59′ N., 47° 36′ E.) seaport, on Caspian Sea, Daghestan, Russian Transcaucasia. Pop. 9000. (2) (52° 17′ N., 45° 16′ E.) town, on Medveditza, Saratov, Russia. Pop. 14,500.

PETROZAVODSK (61° 45′ N., 34° 28′ E.), chief town, Olonets government, Russia, on Lake Onega; cannon foundry. Pop. 14,500.

PETTY, SIR WILLIAM (1623–87), Eng. politician and economist; sent to Ireland as physician, and volunteered to survey forfeited estates, which it was proposed to sell; drew up *Down Survey*, a model of statistical excellence; became chief agent of settlement; one of founders of Royal Soc., incorporated, 1662; ancestor of Earls of Shelburne.

PETUNIA, genus of plants, order Solanaceæ; native to S. America; flowers funnel-shaped and blue or white; garden flower in Britain.

PETWORTH (50° 59′ N., 0° 37′ W.), market town, Sussex, England.

PEVENSEY (50° 49′ N., 0° 22′ E.), small seaport, Sussex, England.

PEWTER is an alloy, generally of tin and lead, long known and valued. Cauldrons, mugs, plates, dishes, etc., were cast or hammered from this alloy. Common p. consists of four parts of tin to one of lead; a finer p. contains no lead, but antimony, and a little copper and bismuth.

PÉZENAS (43° 29′ N., 3° 27′ W.), town, Hérault, France, on Hérault; Rom. *Piscenæ*; trade in brandies. Pop. 7100.

PEZZA, MICHELE, see FRA DIAVOLO.

PFALZ, Ger. name for Palatinate (*q.v.*).

PFALZBURG (48° 47′ N., 7° 15′ E.), town, Lorraine, Germany, in Vosges; formerly a fortress; taken by Germans, 1870. Pop. (1910) 3804.

PFLEIDERER, OTTO (1839–1908), Ger. theologian of advanced critical school; wrote *Philosophy of Religion, Origins of Christianity, Primitive Christianity*, etc.

PFORZHEIM (48° 52′ N., 8° 41′ E.), town, Baden, Germany, at junction Nagold and Enz; Roman *Porta Hercyniæ*; jewellery. Pop. (1910) 73,788.

PHÆDRUS (I. cent. A.D.), the Rom. fabulist, appears to have been brought as a slave to Rome from Thrace. The fables were probably renderings of Gk. fables of Æsop and others, but some are original and refer to events of the reign of Tiberius.

PHÆTON, Tropic Birds (*q.v.*).

PHAGOCYTOSIS, term applied to the engulfing and destruction of micro-organisms and other minute bodies by certain cells of the body termed *phagocytes*. This power is possessed by minute unicellular organisms, such as the amœba, as their sole method of obtaining nutrition; in higher organisms we find phagocytic cells on the external surface and lining the alimentary tract; and in the most highly organised animals, such as man, there are many cells, fixed or wandering, which retain their power of p., the purpose of which is to remove débris resulting from injury, inflammatory processes, etc., or to remove foreign particles or micro-organisms.

The most important fixed phagocytic cells of the body are the large cells of the pulp of the spleen and of the lymph glands, certain endothelial cells, *e.g.* in certain lining membranes of the body, and neuroglia cells. Of greater importance are the wandering cells, which include the white corpuscles of the blood, all of which are not, however, phagocytes, the phagocytic power being possessed by the *polymorpho-nuclear*, *eosinophil*, and *large hyaline* leucocytes, but not by the *lymphocytes*. When a foreign particle or micro-organism is taken within a cell, if it is digestible a digestive fluid is secreted by the cell, which forms a vacuole around the foreign body, digests it, and the resulting products are absorbed. If the foreign body is not digestible, it may be retained for a time within the cell and at length discharged, or it may be killed and eventually digested, or, if it is very resistant, it may multiply and destroy the cell. See BLOOD, BACTERIOLOGY.

PHALANGERS, see under MARSUPIALS.

PHALANSTÈRE, see FOURIER, FRANÇOIS.

PHALARIS (d. 554 B.C.), tyrant of Agrigentum, Sicily; suppressed republic, *c.* 570; increased prosperity of state; ultimately overthrown by Telemachus, and consumed in instrument of his tyranny, the *brazen bull*; character, a problem of archæology.

PHALLIC EMBLEMS, see under PHALLICISM.

PHALLICISM, worship of the sex organs or of representations of them (*phallic emblems*), as symbols of the generative power in nature.

PHALLISM, Phallicism (*q.v.*).

PHALTAN (18° N., 74° 29′ E.), town, capital of native state Phaltan, Bombay, India. Pop. (town) 10,000; (state) 46,000.

PHANEROGAMS, see BOTANY.

PHARISEES, Jewish religious party frequently mentioned in the New Testament, especially as opponents of Christ. It must be remembered that it is the worst side of Pharisaism that is represented by the Evangelists. Their one great principle was loyalty to the Law, which is to them what Christ is to Christians.

PHARMACOLOGY, the science which deals with the physiological action on animals and on man, of drugs and of their therapeutic uses. The science of p. may be said to have begun with the experiments of WEPFER and BRUNNER in 1676, who produced convulsions resembling those of tetanus in dogs with nux vomica; and similar experiments of more or less value were carried out by later experimenters. HALLER (1708–77) conducted experiments on human beings, and in 1765 FONTANA published an exhaustive work showing the effect of poisons on different organs of the body. MAJENDIE, at the beginning of the XIX. cent., and CLAUDE BERNARD, somewhat later, made important physiological and pharmacological investigations, and by the middle of the cent., when BUCHHEIM established his pharmacological laboratory, the action of many important drugs had been ascertained and p. had gained a scientific basis. Modern methods of pharmacological investigation include the study of the effect of substances on bacteria, leucocytes, frogs, rabbits, guinea-pigs, and other animals, and not only the general symptoms, but the effects on the circulation, nerves, muscles, etc., must be studied experimentally. It is by such methods that the practical value and the therapeutic uses of a drug can be gauged.

Action of Drugs.—The action of a drug may be either *primary*, i.e. due to the unaltered drug, or *secondary*, i.e. due to compounds formed by the drug in the body; its action may be also either *direct*, i.e. the action produced on an organ with which the drug comes in actual contact, or *indirect*, i.e. when an organ or part of the body is affected secondarily to the action of the drug on another organ.

Drugs may be classified according to the organs

or parts of the body on which they act, but a number of drugs may be included in several classes, as they may act in different ways upon different organs.

I. Drugs arresting Putrefaction: those which prevent the growth of micro-organisms are termed *antiseptics*, and those which destroy micro-organisms *disinfectants*. Carbolic acid, perchloride of mercury, and peroxide of hydrogen are examples.

II. Drugs acting on Parasites: those which kill parasites inhabiting the intestine are termed *anthelmintics*, e.g. filix mas, santonin; the term *parasiticide* being usually reserved for those which act on parasites of the skin, *e.g.* mercury and sulphur preparations, formalin.

III. Drugs acting on the Blood: (*a*) on the blood plasma: *antitoxins*, e.g. diphtheria antitoxin, are injected to neutralise the toxins of certain diseases, while certain *toxins* may be injected to stimulate the plasma to form antitoxins; *alkalies*, e.g. potassium and sodium salts, are given to make the plasma more alkaline, as in gout. (*b*) On the red corpuscles: *hæmatinics* increase the amount of hæmoglobin in the red corpuscles, *e.g.* iron, arsenic. (*c*) On the white corpuscles: quinine arrests the migration of white corpuscles through the vessel walls. (*d*) Altering the coagulability of the blood: calcium chloride and other calcium salts increase coagulability, citric acid and citrates diminish it.

IV. Drugs acting on the Blood Vessels: certain drugs dilate the vessels, either applied locally, *e.g.* ammonia, silver nitrate; or taken internally, *e.g.* amyl nitrate, caffeine; or by acting on the nerve centres for the vessels, *e.g.* ether, chloroform. Others contract the vessels, either applied locally, *e.g.* suprarenal extract, lead salts; or taken internally, *e.g.* ergot, digitalis; or by acting on the nerve centres for the vessels, *e.g.* cocaine, belladonna. *Astringents* stop bleeding by diminishing the size of the vessels, while perchloride and certain other salts of iron stop bleeding by coagulating the issuing blood.

V. Drugs acting on the Heart: (*a*) directly on the heart: certain drugs increase the force of the contraction, *e.g.* digitalis, strophanthus; some increase the rate of the beat, *e.g.* atropine, cocaine; others slow the rate of the beat, *e.g.* digitalis, strophanthus, pilocarpine; some increase both force and rate of the beat, *e.g.* alcohol, ether; others decrease both the force and rate of the beat, *e.g.* arsenic, hydrocyanic acid. (*b*) On the vagus centre which controls the nerve supply of the heart: some slow the pulse, *e.g.* strychnine, digitalis; others increase the rate of the pulse, *e.g.* amyl nitrite, cocaine. (*c*) First stimulating and then paralysing the nerve ganglia of the heart, *e.g.* nicotine, lobelia.

VI. Drugs acting on the Skin: those which increase the amount of perspiration are termed *diaphoretics*, acting either on the terminations of the nerves to the sweat glands, *e.g.* pilocarpine, muscarine; or upon the centres in the spinal cord controlling these nerves, *e.g.* salts of antimony, ipecacuanha; those which decrease the amount of perspiration are termed *anhidrotics*, and act on the terminations of nerves to the sweat glands, *e.g.* atropine, hyoscyamus; or in a way which has not been exactly determined, *e.g.* nux vomica, quinine.

VII. Drugs acting on the Urinary System: (*a*) those drugs which increase the quantity of urine secreted are termed *diuretics*. Certain of them act by raising the arterial pressure either *generally*, by (1) acting on the heart, *e.g.* digitalis, caffeine; or by (2) acting on the blood vessels, *e.g.* digitalis, squill; or *locally* in the kidney, by (1) contracting the efferent vessels, *e.g.* caffeine, buchu; or by (2) dilating the renal vessels, *e.g.* pituitary extract, caffeine. Other diuretics act on the nerves controlling the secreting parts of the kidney or on the renal cells, *e.g.* caffeine, alcohol, potassium citrate, and acetate. (*b*) Certain drugs decrease the quantity of urine secreted, but this takes place by causing inflammation of the kidney and so they are not given medically, *e.g.* cantharides, turpentine. (*c*) Some drugs make the urine acid, *e.g.* benzoic acid. (*d*) Other drugs make the urine alkaline, *e.g.* potassium and sodium salts. (*e*) Those drugs which prevent the formation of calculi in the urinary passages are termed *lithontriptics*, the drugs given depending on the different causes of the condition—alkalies, benzoic acid, salicylates being given under various conditions. (*f*) Certain drugs prevent decomposition of the urine, *e.g.* urotropine, copaiba.

VIII. Drugs acting on the Bodily Heat: those drugs which decrease the temperature of the body are termed *antipyretics*, and act either by increasing the loss of heat, *e.g.* the diaphoretics and dilators of the cutaneous blood vessels (see above), or by diminishing the production of heat, *e.g.* acetanilide, phenagonum. Certain drugs cause a rise of temperature, *e.g.* cocaine and belladonna in poisonous quantities, but are not used medicinally for the purpose.

IX. Drugs acting on the Digestive System: (*a*) drugs which increase the amount of saliva secreted are termed *sialogogues*, and act (1) either on the secreting cells or upon the terminations of the nerves to them, *e.g.* jaborandi, mercury; (2) on the ganglion cells, *e.g.* nicotine; (3) reflexly by stimulation of the terminations of afferent nerves, in the mouth, *e.g.* acids, alcohol; in the stomach, *e.g.* antimony, ipecacuanha.

(*b*) Those drugs which decrease the amount of saliva secreted are termed *antisialogogues*, and act (1) either on the secreting cells or upon the terminations of the nerves to them, *e.g.* atropine, hyoscyamus; or (2) reflexly by their depressant action on the terminations of afferent nerves, *e.g.* opium, alkalies.

(*c*) Those drugs which act upon the stomach may (1) increase the amount of gastric juice secreted, *e.g.* aromatics and bitters, alcohol; (2) decrease the amount of gastric juice secreted, *e.g.* alcohol and ether in large doses, alkalies; (3) modify the contents of the stomach, either by making them more acid, *e.g.* dilute mineral acids, or more alkaline, *e.g.* alkalies (specially bicarbonate of soda), or by preventing putrefaction, *e.g.* carbolic acid, creosote; (4) dilate the blood vessels of the stomach walls, *e.g.* dilute mineral acids, pepper and other pungents, squill; (5) contract the blood vessels of the stomach walls, *e.g.* alum, dilute solutions of silver salts; (6) act as sedatives upon the nerves of the stomach, *e.g.* bismuth subnitrate and carbonate, opium; (7) stimulate the muscular movements of the stomach, *e.g.* strychnine, aromatics, and bitters; (8) act as emetics in various ways, (i.) on the nerve centre, controlling vomiting, *e.g.* apomorphine; (ii.) partly on the nerve centre and partly on the stomach, *e.g.* tartar emetic, ipecacuanha; (iii.) locally on the stomach, *e.g.* copper sulphate, mustard; (9) cause vomiting to cease, (i.) by acting on the nerve centre controlling vomiting, *e.g.* opium, bromides; (ii.) by acting locally as gastric sedatives, *e.g.* bismuth subnitrate and carbonate.

(*d*) Those drugs which act upon the intestines may act (1) as astringents, on the vessels of the walls of the intestines, *e.g.* alum and dilute silver salts solutions; (2) as astringents, constricting the vessels by coagulating albuminous fluids, *e.g.* tannic acid, lead salts; (3) by diminishing the muscular contractions of the walls of the intestines, *e.g.* opium, hyoscyamus; (4) by exercising a purgative action, chiefly by stimulating the muscular contractions of the walls of the intestines—(i.) laxatives or mild purgatives, *e.g.* tamarinds, figs, and other fruits, sulphur; (ii.) simple purgatives, more powerful than laxatives, *e.g.* cascara sagrada, aloes, rhubarb; (iii.) cathartics or drastic purgatives, *e.g.* jalap, elaterium, colocynth; (5) as intestinal antiseptics, preventing undue putrefaction of the intestinal contents, *e.g.* salol, soured milk.

(*e*) Those drugs which act upon the liver may act (1) as *cholagogues*, increasing the quantity of bile secreted, *e.g.* podophyllin, euonymin; or (2) as *anticholagogues*, decreasing the quantity of bile secreted, *e.g.* castor oil, calomel—but these drugs are not employed medicinally for this purpose.

(*f*) Drugs which stimulate the secretion of the pancreas include dilute mineral acids.

X. Drugs acting on the General Metabolism: the term *alterative* is applied to drugs which alter the course of a disease, but the mode of action of which is not understood, *e.g.* mercury in syphilis; while the term *tonic* is applied to drugs which improve the general health, and this may obviously be brought about in several different ways, *e.g.* by improving the digestion or the state of the blood. Strychnine, dilute mineral acids, iron, arsenic are all well-known tonics.

XI. Drugs acting on the Respiratory System: (*a*) certain drugs act locally on the bronchial tract, being administered by inhalation, some stimulating, causing increase of mucous secretion and dilatation of blood vessels, *e.g.* creosote, compound tincture of benzoin, while others may have a sedative action, *e.g.* hydrocyanic acid; other inhalations are employed to disinfect the foul secretion in certain conditions, *e.g.* creosote, carbolic acid; while certain inhalations relieve spasm of the muscular coats of the bronchial tubes, *e.g.* stramonium, amyl nitrite. (*b*) Some drugs act on the respiratory centre in the medulla oblongata, either stimulating it, *e.g.* ammonia, strychnine, or depressing it, *e.g.* physostigmine, chloroform. (*c*) Certain others act upon the bronchial secretion, increasing it, *e.g.* alkalies, ipecacuanha; or diminishing it, *e.g.* acids, belladonna; or disinfecting it, *e.g.* copaiba, cubebs. (*d*) Drugs which relieve spasm of the muscular coats of the bronchial tubes are termed *antispasmodics*, e.g. stramonium, hyoscyamus; while (*e*) those which cause spasm include physostigmine and pilocarpine. (*f*) Certain drugs have an effect upon expectoration, aiding the expulsion of the contents of the bronchial tubes, and classed according to their effect upon the general circulation as stimulants, *e.g.* acids, benzoin, turpentine preparations; or depressants, *e.g.* alkalies, antimony salts, ipecacuanha.

XII. Drugs acting on the Nervous System: (*a*) Certain drugs act upon the peripheral terminations of sensory nerves, some stimulating them, *e.g.* silver nitrate, zinc chloride, others depressing them, the latter being divided into (i.) those which relieve pain, termed *local anodynes*, e.g. carbolic acid, aconite; and (ii.) those which diminish sensibility, termed local anæsthetics, *e.g.* cocaine, extreme cold produced by the ethyl chloride spray.

(*b*) A number of drugs act on the nerve trunks, although not used medicinally for that purpose, causing irritation and inflammation, *e.g.* lead, arsenic.

(*c*) Some drugs act upon the spinal cord, a number (i.) increasing the irritability of the anterior horns of grey matter, *e.g.* strychnine, ammonia; while others (ii.) have a depressant action upon the anterior horns of grey matter, *e.g.* physostigmine, bromides.

(*d*) Those drugs which act upon the brain may be divided into (i.) drugs acting upon the motor centres, either depressants, *e.g.* alcohol, bromides, or stimulants, *e.g.* atropine, strychnine; (ii.) drugs acting as general cerebral stimulants, exciting the mental faculties, but, if taken in quantity, with eventually a paralysing influence, *e.g.* alcohol, opium, cannabis indica; (iii.) drugs acting as general cerebral depressants may be further classed as (*a*) *hypnotics*, which produce sleep, *e.g.* bromides, chloral hydrate; (*b*) *narcotics*, which, in addition to producing sleep, in large doses act as depressants of the circulatory and respiratory systems, *e.g.* opium, belladonna; (*c*) *general anæsthetics*, which lead to total unconsciousness, with abolition of reflexes and insensibility to pain, *e.g.* chloroform, ether.

(*e*) Drugs acting on the special sense organs, including (i.) dilators of the pupil of the eye, or *mydriatics*, e.g. atropine, cocaine; (ii.) contractors of the pupil of the eye, or *myotics*, e.g. pilocarpine, physostigmine; (iii.) drugs which paralyse accommodation of the pupil by acting on the ciliary muscle, *e.g.* atropine, hyoscyamine; (iv.) drugs which cause noises in the ear, *e.g.* quinine, salicylic acid.

(*f*) Drugs acting on the sympathetic nervous system, causing paralysis of the ganglion cells, *e.g.* nicotine, curara.

XIII. Drugs acting on the Generative System: (*a*) Those drugs which are supposed to stimulate sexual desire are termed *aphrodisiacs*, e.g. cantharides, cannabis indica, while those which have the opposite effect are termed *anaphrodisiacs*, e.g. bromides, opium; (*b*) drugs which stimulate the uterus to contraction are termed *ecbolics*, e.g. ergot, quinine; (*c*) drugs which increase the menstrual flow are termed *emmenagogues*, e.g. ergot, guaiacum; (*d*) certain drugs have a depressant action upon the contractions of the uterus, *e.g.* bromides, hyoscyamus; (*e*) those drugs which increase the secretion of milk in the breasts are termed *galactagogues*, e.g. jaborandi, and those which decrease the secretion of milk, *anti-galactagogues*, e.g. belladonna.

PHARMACOPŒIA, term applied to a book pub. by an authorised body, containing a list of drugs, their characters, and their preparations, together with a list of approved compound medicines with directions for preparing them. The first such work pub. under authority appears to be that of Nuremberg in 1542, a student, Valerius Cordus, having shown a collection of the receipts of various medical authorities to the physicians of that city, who persuaded him to publish it under the authority of the city council. The first edition of the London Pharmacopœia was issued by the Coll. of Physicians in 1618, the Edinburgh Pharmacopœia in 1699, and the Dublin Pharmacopœia in 1807, but by the Medical Act of 1858 the General Medical Council was ordained to publish the British Pharmacopœia to take the place of the former three. This work first appeared in 1864, and the latest edition is that of 1898. Most countries have now national pharmacopœias pub. by the respective governments, the pharmacopœia of the U.S.A. being issued, however, only under the authority of a commission of medical and pharmaceutical societies.

PHARMACY, the art of preparing and preserving drugs and compounding and dispensing medicines according to the prescriptions of physicians. *Druggists*, i.e. persons who sold drugs, and *apothecaries*, i.e. persons who dispensed medicines, were formerly classed among merchants and grocers, and had no organisation or separate status until 1617, when the apothecaries obtained a charter. By the end of the XVII. cent. apothecaries began to prescribe medicines and take upon themselves the duties of physicians, whose opposition they thus incurred, and by whom, in retaliation, chemists and druggists were encouraged to compound and dispense medicines. In 1748, and again in 1815, the apothecaries attempted, without success, to obtain legal control over the chemists and druggists; and when, in 1841, the apothecaries again made such an attempt, on the ground that there was no proper education or examination of chemists and druggists in Britain, the latter met the objection by forming the Pharmaceutical Soc. of Great Britain, which received a royal charter of incorporation in 1843, to protect their interests and to organise an adequate system of education in pharmacy.

In 1852 a Pharmacy Act was passed, establishing a register of pharmaceutical chemists, the Act of 1868 added a register of chemists and druggists and made it illegal for unregistered persons to sell the poisons mentioned in the Act, while the Poisons and Pharmacy Act of 1908 extended the list of poisons and laid down strict rules regarding their sale. There are three examinations which candidates for registration must pass, the first being in general knowledge, from which certificates of univ. entrance and certain other similar examinations exempt; the second, known as the Minor Examination, is in bot., chem., physics, materia medica, pharmacy, dispensing, posology, prescription reading, toxicology, and admits to the register of chemists and druggists; while the third, or Major Examination, is not compulsory, requiring an advanced knowledge of bot. and materia medica, microscopic

structure of plants and drugs, plant diseases, organic, quantitative analysis, spectrum analysis, optics, a knowledge of antitoxins, gland secretions, Röntgen rays, and similar resources of the modern scientific physician, and admits to the register of *pharmaceutical chemists*.

PHARNABAZUS (fl. V.–IV. cent. B.C.), Persian satrap of Phrygia under Darius II.; entrusted with reduction of Gk. cities of Asia Minor; received and assassinated Alcibiades (*q.v.*); defeated Spartans off Cnidus, 394.

PHAROMACRUS, see TROGONS.

PHAROS, see under LIGHTHOUSE.

PHARSALUS (39° 17′ N., 22° 27′ E.), town, Thessaly, Greece; scene of battle of *Pharsalia*, where Cæsar defeated Pompey, 48 B.C.

PHARYNGITIS, inflammation, frequently chronic, of the mucous membrane of the pharynx, or upper part of the throat, and of the soft palate, usually due to unhygienic surroundings, exposure to cold and damp, a debilitated condition, anæmia, or digestive disorders, or associated with a tendency to gout or rheumatism. It may often be due to speaking too much (especially in school-teachers or clergymen), or to excessive smoking. *Adenoids* (q.v.) is a form of chronic p. with adenoid vegetations and granulations. The treatment of acute p. is to apply a cold compress externally, with warm gargles of sodium bicarbonate or weak alum to relieve congestion. In chronic forms the practice is to remove cause of irritation, gargle regularly with a pinch of common salt or alum in water, or spray locally with menthol, astringent paints (*e.g.* silver nitrate, 20 grs. to the oz.) later. Tonics, cod-liver oil or iron, and a change of air are recommended.

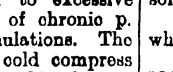
PHARYNX, that part of the alimentary canal that lies between the mouth and nasal passages above and the œsophagus or gullet below, the larynx, which leads to the trachea and lungs, going off from its anterior aspect. It is formed by the three overlapping constrictor muscles of the pharynx behind and at the sides, while in front the soft palate dips downwards and backwards, dividing the nasal p. from the oral p. Above the soft palate, in the posterior part, the Eustachian tubes, communicating with the ear, open, one on each side, and below their openings is a mass of lymphoid tissue, termed the pharyngeal tonsil. Between the p. and the mouth are projections called the pillars of the fauces, and between the anterior and posterior pillars on each side, the oval lymphoid masses, the tonsils lie. In the embryos of the higher vertebrates and in lower vertebrates the bronchial arches and clefts are situated in the walls of the p., and in water-breathing vertebrates the gills are situated there. See DIGESTION, EAR, ADENOIDS.

PHASCOLOMYDÆ, Wombats, see under MARSUPIALS.

PHASIANIDÆ, PHEASANT FAMILY (*q.v.*).

PHASMIDÆ, Leaf Insects (*q.v.*).

PHEASANT FAMILY, PHASIANIDÆ, large and important family of game-birds, widely distributed throughout the Old World, the majority being of Oriental origin. They are birds of splendid colouring, and often bear combs or wattles. Amongst them are the true Pheasants (*Phasianus*), a familiar (introduced) sporting bird in Britain, while other handsome genera are the GOLDEN PHEASANT (*Chrysolophus pictus*), the ARGUS PHEASANT (*Argusianus argus*), and the HORNED PHEASANTS OR TRAGOPANS of Northern India and China. The PARTRIDGES (*Perdrix*), with mottled protective colouring and alternate beating and gliding flight, ranges over a wide area in Europe and Asia, while one species is a Brit. resident. The QUAIL (*Coturnix*), though less in size, resembles the Common Partridge, but has a peculiarly distinctive note. It is a visitor to Britain, but ranges throughout Europe, N. Asia, and India, and winters in Africa. Most wonderful of all are the showy PEACOCKS (*Pavo*), of which three species are known, all of which hail originally from the Far East.



PHEIDIAS (b. *c.* 500 B.C.), the greatest sculptor of ancient Greece; b. at Athens. He executed a number of splendid statues for Athens, including an ivory and gold figure of the goddess Athena. A colossal figure of Zeus at Olympia was considered his masterpiece. Fragments of his work are among the Elgin Marbles in the British Museum. See SCULPTURE, ATHENS.

PHEIDON (*c.* VII. cent. B.C.), king of Argos; sought supremacy in Peloponnesus; said to have laid plot to murder flower of Corinthian youth; resisted by Sparta.

PHELPS, AUSTIN (1820–90), Congregationalist divine in U.S.A.

PHENACETIN, drug prepared by the action of glacial acetic acid upon para-phenetidin, a coal-tar derivative, consisting of colourless, tasteless, scaly crystals; used as an antipyretic for reducing the temperature in certain conditions, and as an analgesic for relieving the pain of neuralgia, sciatica, migraine, or headache.

PHENACODUS, see under HORSE FAMILY.

PHENAZINES, yellow solid, forming blue or red solutions in sulphuric acid, and yielding derivatives which are dyestuffs; p. itself is  ; M.P. 171° C.

PHENOL, see CARBOLIC ACID.

PHENOMENALISM, see METAPHYSICS.

PHENOMENON, that which appears, as opposed to *noumenon* (q.v.).

PHIDIAS, see PHEIDIAS.

PHIGALIA, ancient Gk. city in S.W. Arcadia, situated on rocky site amongst Peloponnesian Mts.; captured by Lacedæmonians, *c.* 660 B.C.; later regained independence, but fell into decay under Rom. rule; considerable part of city wall and a large square fortress still traceable; also temple, famous for its beauty and dedicated to Apollo Epicurius, some 5 or 6 miles distant.

PHILADELPHIA (39° 57′ N., 75° 9′ W.), city, on Delaware R., Pennsylvania, U.S.A. Public buildings include the old State House, where Declaration of Independence was promulgated in 1776, city hall, U.S.A. government buildings, mint, Masonic Temple. Univ. of Pennsylvania (*q.v.*) was incorporated in 1779; other educational establishments are the academies of music, art, and natural science, and there are numerous colleges and schools, including the William Penn Charter School, founded in 1689. There is a modern R.C. cathedral, completed in 1864; great number of churches of various denominations; fine system of parks, of which Fairmount Park is one of largest in America, with an area of over 3400 acres, containing numerous statues, monuments, and fountains. In neighbourhood are the zoological gardens. There are numerous hospitals and other philanthropic institutions.

P. was founded in 1682 by William Penn; incorporated as city, 1701; capital of Pennsylvania till superseded by Lancaster, 1799. First American Congress met here in 1774, and here Declaration of Independence was adopted, 1776, and Union Constitution drawn up, 1787; capital of Union, 1790–1800; first meeting of National Union Convention held here, 1866; site of international exhibition, 1876; damaged by storm, 1878; commemorated first coming of Penn, 1882; recent events include labour riots, 1910.

P. is largest city in Pennsylvania, and third in point of size in U.S.A.; great industrial and commercial town, situated on Delaware R.; important port, a ship channel enabling vessels of large draught to reach centre of city. Tonnage of foreign trade entered in 1910–11 was 2,672,883; cleared, 2,327,119; imports in 1910 valued *c.* £13,000,000, exports *c.* £13,051,389. P. has important shipbuilding yards, sugar and oil refineries, breweries, chemical works; manufactures carpets and other woollens, tapestry,

hosiery, cotton, hemp, and jute goods, silks, hardware, machinery, clothing; about half the glazed kid of U.S.A. is made here. Pop. (1910) 1,549,008.

Lillian I. Rhoades, *Story of Philadelphia* (New York, 1900).

PHILADELPHIA, RABBATH-AMMON (31° 56′ N., 36° E.), chief town of the Ammonites, Palestine.

PHILÆ (24° 1′ N., 32° 47′ E.), island in the Nile, Egypt, near Aswan Dam; covered with interesting temples and other buildings, of which most notable are the great columned hall known as 'Pharaoh's bed,' and the temple of Isis; these are sometimes submerged by waters of the Dam.

PHILARET (c. 1553–1633), ecclesiastical name of FEDOR NIKITICH ROMANOV, patriarch of Moscow; forced into his position among revolutions in which his powerful house fell; showed himself an able administrator; forbade peasantry to leave their holdings.

PHILATELY (Gk. *philein*, to love, and *atelēs*, free from taxation), the systematic collection of postage stamps. The craze started about the time of the first issue of Brit. penny stamps (1840), originating with the collection of Dr. Gray of the Brit. Museum. P. has now become a science cultivated by numerous societies and possessing a large body of lit. The Philatelic Society of London is the most important association of collectors.

PHILEMON AND BAUCIS, name of opera of Gounod's. See BAUCIS.

PHILEMON, EPISTLE TO, New Testament, book, written by St. Paul while in prison at Rome, about Onesimus, a runaway slave of Philemon's and convert of Christianity; authenticity hardly doubted.

PHILIP, the Apostle; often confused with Philip the Evangelist (*Acts* 6[5]); mentioned several times in Fourth Gospel.

PHILIP II. (382–336 B.C.), king of Macedon; f. of Alexander the Great. Anarchy prevailed after death of P.'s f., King Amyntas, 370. P. secured throne, 359, and speedily restored order; conquered several Gk. cities in Thrace, and founded Philippi, 358; capture of Olynthus inspired Olynthiac orations of Demosthenes; conquered Phocis, 346; commander-in-chief of forces of Amphyctyonic Council, 338; defeated Athens and Thebes at *Chæronea*, 338, and became supreme in Greece. P. instituted Macedonian phalanx.

PHILIP I.–VI., kings of France.

Philip I., PHILIPPE I. (1052–1108), succ., 1060; his vassal, William, Duke of Normandy, made himself stronger than Crown by conquering England; but P., though reputed lazy and debauched, always held his own against Normandy; excommunicated for evil living, 1094, but refused to repudiate wife; annexed Vermandois, Vexin, Valois, and bought Bourges.

Philip II., PHILIPPE AUGUSTE (1165–1223), succ., 1180; m. Isabella of Hainault, descendant of Carolingians, and thus strengthened Capetian dynasty; wrested his wife's lands, Artois, Amienois, Valois, Vermandois, from Count of Flanders; subdued Duke of Burgundy, 1186, and established strong rule; aided St. Bernard in monastic revival and persecuted heretics, especially Jews; went on Third Crusade, 1282; ambitious of conquering Normandy; aided sons of Henry II. in revolt, 1189, receiving homage of Richard and capturing Le Mans. On Richard's accession P. planned to divide his Fr. lands with John, but was diverted by feudal revolt of counts of Boulogne, Brittany, Champagne, and Hainault; assisted Arthur against John, and on Arthur's death united Normandy, Anjou, etc., to France (1202–4); recovered Brittany, 1206; repelled attacks of John and emperor, 1211–14. P. was the greatest of the Capetians; gave France unity; built royal castles and fortified towns, making Crown strong; religious, but enforced obedience of clergy to state; *Life*, by Hutton. See FRANCE (History).

Philip III., THE BOLD (1245–1285), succ., 1270; pious, virtuous, and mediocre; for some time continued to rule France after wise fashion of his f., Louis IX., but ultimately fell under influence of Charles of Anjou, who incited him to ambitious foreign policy; d. during ill-fated expedition to Sicily.

Philip IV., LE BEL (1268–1314), succ., 1285; united Brie, Champagne, and Navarre to France by marriage with Joan of Navarre; established strong despotism; attempt to tax clergy brought forth papal bull, *Unam Sanctam*, 1302; excommunicated for burning bull; transferred papal headquarters to France; Rom. law adopted. See FRANCE (History).

Philip V. (c. 1294–1322), succ., 1316, setting aside niece Jeanne; restored order after misrule of Louis X.; codified laws, improved coinage, crushed feudal risings.

Philip VI. (1293–1350), s. of Charles of Valois, younger bro. of Philip IV.; assumed throne to exclusion of niece, 1328; won great victory over Flemings at *Cassel*, 1328, but was unfortunate against English; Hundred Years War began, 1337; important acquisition of Dauphiné, 1349.

PHILIP II. (1527–98), king of Spain; m. Mary of Portugal, 1543, Mary I. of England, 1554, Isabella of France, 1559, Anne of Austria, 1570; his f., Charles V., abdicated, 1555, and P. became chief monarch of Christendom; attack of France and pope defeated by battles of *St. Quentin*, 1557, *Gravelines*, 1558; peace of Cateau-Cambrésis, 1559; lost northern Netherlands through persecution of Protestants, 1579; Armada defeated, 1588; strong, narrow, rigid mind; aided decline of Span. Empire.

PHILIP IV. (1605–65), king of Spain; assisted decline of Spain; governed by favourite Olivares till 1643; Portugal and Catalonia revolted, 1640; France gained territories by Peace of Pyrenees, 1659.

PHILIP (c. 1177–1208), Ger. king; Duke of Suabia, 1196; guardian of his nephew, Frederick II., western emperor, 1197; elected Ger. king, 1198; defeated rival claimant, Otto of Saxony, after 9 years' war; popular, warlike, and handsome.

PHILIP, THE MAGNANIMOUS (1504–67), landgrave of Hesse; one of first Protestants; became head of Ger. opposition to emperor; founded Marburg Univ., 1527; with Luther's sanction committed bigamy, 1540; made peace with emperor at Regensburg, 1541, but overthrew Catholic ruler of Brunswick-Wolfenbüttel, 1542; under ban of empire, 1546; surrendered, 1547.

PHILIP THE BOLD (1342–1404), duke of Burgundy, 1363; younger s. of King Jean; won title *le hardi* by gallantry at *Poitiers*, 1356; led French against English, 1372; crushed large Flemish army at *Rosbeck*, 1382; inherited Artois, Burgundy, Flanders, etc., 1384, and developed their resources; ruled France for Charles the Mad.

PHILIP THE GOOD (1396–1467), duke of Burgundy; in revenge for his f.'s assassination made Treaty of Arras, 1419, with Henry V.; aided him in early victories; deserted, 1429; bribed by fief of Champagne, but in 1435 drove bargain with France; aided in expulsion of English; strong, able ruler over whole of Netherlands; crushed Ghent rising, 1454, by terrible massacre.

PHILIP, JOHN (1775–1851), Eng. Congregationalist missionary to S. Africa; went out, 1818, and denounced treatment of natives by Europeans; influenced public opinion in England.

PHILIP, KING (c. 1639–76), chief of Wampanoag Indians, and called by them METACOMET. His father had made an alliance with the colonists of Rhode Island, but Philip abandoned the peace policy and commenced hostilities in 1675. He was vanquished and killed by a company under Benjamin Church.

PHILIPPA OF HAINAULT (c. 1314–69), wife of Edward III. of England, 1327; alliance important to Edward's Fr. ambitions; P. encouraged Eng. industries by bringing over Flemish weavers, working Tynedale coal mines, etc.; praised by Froissart.

PHILIPPEVILLE (36° 52′ N., 6° 53′ E.), seaport,

Constantine, Algeria, on Gulf of Stora; ancient *Rusicada*.

PHILIPPI (41° 5′ N., 24° 15′ E.), city, ancient Macedonia; scene of victory of Octavianus and Antony over Brutus and Cassius, 42 B.C.; visited by Apostle Paul, who addressed an epistle to its inhabitants.

PHILIPPIANS, EPISTLE TO THE, in New Testament, generally put with Epistles to Philemon, Colossians, and Ephesians as a group forming 'Epistles of the imprisonment.' The genuineness of P. is almost universally accepted, being only denied by very extreme critics. Early testimony to it is good, for it is referred to by Polycarp, and recognised by Justin Martyr, Marcion, and the Muratorian fragment. P. is important as showing a more advanced Christology than Romans and Corinthians.

Martin, *Philippians*, etc. (Century Bible).

PHILIPPINE ISLANDS (5° to 22° N., 117° to 127° E.), large group of about 3141 islands and islets in Pacific Ocean, belonging to U.S.A.; bounded N. and W. by China Sea, E. by Pacific, S. by Celebes Sea; total area, including Sulu Archipelago, *c.* 127,853 sq. miles; largest islands are Luzon in N., Mindañao in S., Mindoro, Samar, Leyte, Cebú, Negros, Panay, Masbate, Bohol in centre, and Palawan and Balabac in W. Coastline (over 11,000 miles) is broken, with numerous gulfs and bays; coral reefs, especially on E. Chief rivers are Cagayan, Pampanga, Agno, Bicol, Pasig, on Luzon; Agusán, Mindañao, on Mindañao; numerous lakes, Laguna de Bay, Taal, on Luzon; Lanas, Liguasan, Kadagun, etc., on Mindañao. P. Islands are connected by submarine ridge with Borneo and Celebes; traversed by high mountain ranges (mostly volcanic); highest peaks are Mount Apo, 10,312 ft., on Mindañao, Halcón, *c.* 8850 ft., on Mindoro, Mayón, *c.* 8000 ft., Banájao, 7382 ft., Datá, 7364 ft., Isargog, 6634 ft., on Luzon; there are 12 active volcanoes and several extinct ones. The islands are subject to frequent earthquakes, heavy rains, and violent hurricanes (typhoons); climate fairly healthy. Vegetation is luxuriant; immense forests of valuable timber. Fauna includes buffalo, boar, deer, antelope, water-buffalo (caraboa), etc.; mammals scarce; numerous birds, bats, reptiles, sea- and land-turtles; fish abound; beautiful and varied land, freshwater, and marine molluscs. Principal towns are Manila (capital), Bawan, Lipa, Laoag, Batangas, San Carlos, Tabac (in Luzon), Janúay, Ilo-ilo (in Panay), Aragao, Barili (Cebú), Baybay, Ormoc (Leyte).

Islands were discovered by Magellan, 1521, and named *San Lazarus* Islands; first Span. settlement established, 1565 (San Miguel on Cebú); Manila founded, 1571; present name dates from 1543, in honour of Philip II.; Manila taken by British, 1762, and held until 1764; revolts against Span. rule, 1872, 1896; scene of hostilities during Span.-American War; ceded to U.S.A., 1898; Filipino rising under Aguinaldo, 1899, which ended with latter's capture, 1901; military government abolished, 1901. Islands are now administered by civil gov., assisted by mixed commission of Americans and natives and P. Assembly. Dominant religion is Roman Catholic. Education is advancing rapidly under Amer. rule; St. Thomas Univ. at Manila; also industrial and trade schools, etc. Natives are mostly of Malayan origin, Negritos and Indonesians; chief tribes are Visayan, Tagálog, Bicol, Mows, Ingorrotes, etc. Railways on Luzon, Panay, and Cebú have been completed, and some are under construction. Chief products and exports are sugar, coffee, hemp, rice, tobacco, copra, cigars, indigo, timber, edible birds' nests; gold, iron, lignite, copper, sulphur, petroleum, rock-salt, gypsum are found; but mineral resources have as yet hardly been developed; extensive pearl fisheries. Pop.—about 25,000 Europeans and Americans, 50,000 Chinese, and *c.* 8,000,000 natives.

Atkinson, *The Philippine Islands* (1906); Blair and Robertson, *The Philippine Islands, 1493–1898* (1903–8); Wright, *Handbook to the Philippines* (1908).

PHILIPPOPOLIS (42° 3′ N., 24° 53′ E.), capital, E. Rumelia, Bulgaria, on Maritza; seat of Gk. and Bulgarian abp's; commercial centre; tobacco, silk-cocoons. Pop. (1910) 47,981.

PHILIPPSBURG (49° 13′ N., 8° 27′ E.), small town, Baden, Germany; tobacco.

PHILIPS, AMBROSE (*c.* 1675–1749), Eng. minor poet; wrote plays, pastorals, and miscellaneous verse. He was intimate with Addison and Steele, and had unpleasant passages with Pope.

PHILISTINES, name given in Old Testament to people on the coast of Palestine. Recent research tends to identify them with the PURASATI mentioned in Egyptian monuments of Rameses III., about 1200 B.C. They probably came from Crete, the extremely important and only recently discovered civilisation of which received its death-blow shortly before this. The incoming Israelites had a long struggle with them, Samuel and David being victorious, but the Philistines lifted their head again shortly. Gaza, on the way from S. Arabia to Edom, was one of their chief cities. Tiglath-pileser IV. of Assyria seized it (734 B.C.), and other towns around were conquered. Egypt succ. Assyria as the dominant power. An Arab migration took place about 300 B.C. It is difficult to piece together into a coherent story the fragmentary and contradictory notices of the Philistines and Philistia in the Old Testament. As known to the Hebrews they were either Semites or had absorbed Semitic civilisation. But excavations at Gezer show an undoubtedly Ægean element in their culture.

Cook, *Critical Notes on O.T. History*; Macalister, *History of Civilisation in Palestine*.

PHILLAUR, PHILAUR (31° 1′ N., 75° 50′ E.), town, on Sutlej, Jalandhar, Punjab, Brit. India. Pop. 7000.

PHILLIP, JOHN (1817–67), Scot. painter; at first dealt with Scot. subjects, but, going to Spain, drew his inspiration from there and became known as 'Spanish Phillip.'

PHILLIPPS, see HALLIWELL-PHILLIPPS.

PHILLIPS, EDWARD (1630?–1695?), Eng. writer; nephew of Milton, whose *Letters of State* he translated; first to edit Drummond's *Poems*; edited various works and wrote two novels.

PHILLIPS, JOHN, Eng. poet; wrote *Splendid Shilling* (1701) and other poems.

PHILLIPS, JOHN (1800–74), Eng. geologist; b. at Marden, Wilts; nephew of William Smith (*q.v.*), and accompanied him in his geological travels; app. prof. of Geol. at King's Coll., London, 1834; elected F.R.S., 1834.

PHILLIPS, STEPHEN (1868–), Eng. poet; poems include *Marpessa* (1890), *Christ in Hades* (1896); plays are *Paolo and Francesca* (1899), *Herod* (1900), *Nero* (1906).

PHILLIPS, WENDELL (1811–84), Amer. orator and abolitionist; b. at Boston. His great speech in Faneuil Hall in 1837 secured his recognition as the greatest orator of the anti-slavery party, and he became Garrison's chief guide and co-operator. He did much to advance the women's movement, and advocated the rights of the Indians.

PHILLIPSBURG (40° 39′ N., 75° 1′ W.), city, on Delaware, Warren County, New Jersey, U.S.A.; iron manufactures. Pop. (1910) 13,903.

PHILLPOTTS, HENRY (1778–1869), bp. of Exeter, 1831.

PHILO, Jewish philosopher, contemporary of Christ; lived at Alexandria, and forerunner of Alexandrian school. Little is known of his life, save a visit to Rome, 40 A.D. His philosophy blends Platonism and Judaism. The Jewish element is the claim to divine origin of Mosaic writings, through which Jews possess absolute truth in religious matters; everything right and good in Gk. philosophy previously taught by Moses. Philo adopts the allegorical method of interpreting the Old Testament customary among cultivated Alexandrian Jews. God is conceived as

the most general of existences, incorporeal, invisible, cognizable only through reason, imperishable, eternal; in essence incomprehensible; we can know that He is, not what He is, and attributes can be applied to Him only figuratively. The world is created by God not directly, since He is polluted by contact with matter, but through incorporeal potencies or ideas; like those of Plato, ideal patterns of things produced before creation of sensible world, yet differing as being efficient causes. The Logos is the highest of these divine forces, intermediate between God and the universe, dwelling with God as His wisdom, and giving rise to numerous lower potencies, ministering spirits, angels, demons, immortal souls. The Logos is the first-begotten of God; to us, itself a God. The human soul is imprisoned in the flesh, and the highest end of life is to loose the bonds of sense and rise to an ecstatic vision of the Divine.

Drummond, *Philo Judæus.*

PHILOLAUS, see PYTHAGORAS.

PHILOLOGY, the study of languages, especially as regards their hist. development and their mutual points of contact, their internal structure and external groupings. Though it has of late acquired a new form, it is an old science, pursued with good results in ancient Greece, in Alexandria, and in Rome. It lay dormant till the Renaissance, when it acquired a great impetus, especially in Italy, France, and Germany. The great names in this period were Budé in France, Lambin and Muret in Italy, Scaliger and Casaubon, who eventually settled in England, Justus Lipsius of Louvain, and Erasmus.

The beginnings of *comparative p.* were an attempt, often repeated but without much success at the time, to establish a common origin of Greek and Latin, possibly in Hebrew. In 1786 an Eng. scholar, Jones, published conclusions ascribing a common origin to Greek, Latin, Gothic, Sanskrit, and Celtic, and his work, taken up by Franz Bopp, and later by Jakob Grimm, became the foundation of the modern science of p. Grimm in particular crystallised much of the loose knowledge of his day, and gave his name to that law of p. which, so far as Teutonic languages are concerned, absolutely revolutionised the scientific study of languages. That law, briefly stated, amounts to this: that whenever a *p*, *t*, or *k* occurs in the parent language, it reappears in English, for instance, as *f*, *th*, or *h*, while aspirates *bh*, *dh*, and *gh* become *b*, *d*, and *h*. Changes ringing on this law are used to explain most alterations of the purely Teutonic languages (see TEUTONIC LANGUAGES). This discovery led to a much stricter investigation into the phenomena of p., and the placing of this as of other sciences under definite general laws.

This enabled a much more accurate classification of the languages of the world than had been possible before. Three large groups are recognised:—

1. Languages without inflection, *e.g.* Chinese, Tibetan, etc. These are also called Isolating Languages, because each word or sound represents an idea and composite ideas are represented by an agglutination of isolated words.

2. Languages capable of some degree of inflection, *e.g.* Turkish, Mongolian, Tamil, and some of the North American Indian languages.

3. Languages capable of a high degree of inflection. These are in every respect the most important, and are usually divided into the Semitic and the Indo-Germanic family, the latter being also termed Aryan.

The Semitic family embraces Hebrew, Phœnician, Syrian or Aramaic, Arabic, and the Abyssinian and Choan dialects. Changes in these languages (*e.g.* from singular to plural) are mainly effected by change of vowel.

The Indo-Germanic family, the members of which are probably derived from some lost Aryan parent language, is capable of considerable subdivision. Of several systems of classification proposed, the following is probably the most convenient:—

A.—Sanskrit, Zend, and Old Persian.

B.—Armenian.

C.—Roman (*q.v.*) and its offshoots, including perhaps Albanian, though this language is often put in a group by itself.

D.—Italic, comprising the *Romance Languages* (*q.v.*), Italian, French, Spanish, Rumanian, Romaunsh (the S.E. Swiss dialect), and Portuguese, with their dialects (*e.g.* Provençal).

E.—Celtic, in its few surviving forms, Welsh, Gaelic, Erse, and Bas Breton and Manx, and its extinct forms (*e.g.* Cornish). See CELTS.

F.—*Teutonic* (q.v.), comprising the Scandinavian languages, the Germanic languages (German, Dutch, Flemish, Cape Dutch, and Frisian), and English.

G.—*Slavonic* (q.v.), including Russian, Polish, Old Bulgarian, Bohemian, Lithuanian, Servian, and Lettish.

Brugmann's *Comparative Grammar*, Max Müller's *Essays on the Science of Languages*, and Paul's standard *Principien der Sprachgeschichte* (Strong, 1888).

PHILOSOPHER'S STONE, see ALCHEMY.

PHILOSOPHY, in the widest sense, is the reference of any set of phenomena to its determining principles, *e.g.* the p. of invention, of digestion, natural p.; in its technical sense, practically equivalent to Metaphysics (*q.v.*), an account of the fundamentally real, of the laws applying to all phenomena. The meaning and scope of the term have varied in different ages and among different writers. It was first used by Pythagoras as the disinterested pursuit of knowledge. All branches of knowledge were at first parts of p.; thus Aristotle included mathematics and physics in its scope. Later, as knowledge increased, the special sciences became independent, and the task of p. was to co-ordinate the principles of each science, to harmonise the claims of their postulates, so far as conflicting. Further, since Gk. thought sought the real substance underlying the phenomena of sense, p. approximated to Ontology, the science of being as being. If, however, as by modern empiricists, it is held that sensible objects and their laws may be known, but not any ultimate ground beyond phenomena, that things *are* only as they are *known*, p. then becomes Epistemology, an examination of the forms and categories of human thought. And great stress is laid on Epistemology, even by those who oppose this scepticism and seek the ultimate end of the universe. Besides these inquiries, p. is taken to include Logic, Ethics, Æsthetics, Psychology, Sociology, P. of Law, of Religion, of History. Certain of these have two aspects, and only as far as they deal with the fundamental nature of existence are they strictly parts of p.; in other respects, they are separate sciences. Thus, psychology, experimental science, and philosophical investigation of knowing mind; ethics, natural history of moral ideas, metaphysical theory of obligation; æsthetics, branch of physiological psychology and a p. of the beautiful.

Watson, *Outlines of Philosophy.*

PHILOSTRATUS, name of several Gk. sophists, especially—(1) THE EGYPTIAN, of the time of Cleopatra; (2) P. VERUS, in the I. and II. cent's A.D.; (3) FLAVIUS P., s. of preceding, taught at Athens and Rome; author of *Life of Apollonius of Tyana, Lives of the Sophists*, etc.

PHILOXENUS OF MABBOG (fl. latter half of V. cent.), Syriac writer and fervid upholder of the Monophysite doctrine. The work by which he is best remembered is his rendering of the Bible (the so-called *Philoxenian Version*), long the standard version of the Monophysites.

PHIPS, SIR WILLIAM (1651–95), gov. of Massachusetts, U.S.A., 1692; commanded force which captured Port Royal from French, but met no further success, 1690; brave but narrow-minded and quarrelsome.

'PHIZ,' see BROWNE, HABLÔT KNIGHT.

PHLEBITIS, inflammation of a vein; may follow injury to the wall of the vein, debilitating diseases in which there is a feeble circulation, or may occur in connection with a septic wound. A clot, or *thrombus*,

is apt to form, which may be carried to the heart or lungs with serious results. The symptoms of p. are pain and tenderness in the part affected, redness of the skin, the affected vein becoming like a cord. If it is septic there is much swelling, accompanied by high temperature. The treatment is rest, hot fomentations, elevation of the part continued for three or four weeks after inflammation has gone down to prevent detachment of the clot if one forms. For septic p. surgical interference is necessary, the area of suppuration being opened up.

PHLOX, a genus included in the Polemoniaceæ, and a favourite garden flower for borders and the like. The inflorescence is a cyme.

PHOCÆA (38° 40′ N., 26° 43′ E.), ancient city, on Ægean, Ionia, Asia Minor.

PHOCÆNA, see Dolphin Family.

PHOCIDÆ, see Seals.

PHOCION (*c.* 402–317 B.C.), Athenian politician and general; opposed patriotic resistance to Philip of Macedon, but strove to check war party, who brought on fatal battle of *Chæronea*, 336, and war with Antipater.

PHOCIS, ancient district in N. Greece, bounded by Corinthian Gulf on S.; mountainous and unproductive; chief mt., Parnassus; river, Cephissus, with productive valley; also fertile Crisæan plain; possessed Delphic oracle.

PHŒBUS, see Apollo.

PHŒNICIA (*c.* 32° to 36° N., 34° 45′ to 36° 30′ E.), coast region, Syria. Like the rest of Syria, P. was under overlordship of Egypt from about the beginning of the XVI. cent. B.C., and suffered from the invasions of Hittites from Asia Minor in the two following cent's. Egyptian rule began to decline soon after death of Amenhotep III., *c.* 1392, owing partly to the religious innovations of his successor, and partly to the continued aggression of the northern invaders; and soon afterwards P. ceased to be a dependency of Egypt and became a flourishing and independent country. Tyre and Sidon became most important cities, but colonies were also established on the Mediterranean islands and the coasts of N. Africa, as at Carthage, Hippo, Utica, Tripolis. The Phœnicians were a trading and colonising race; they are said to have had dealings with Solomon, and to have visited Britain in search of tin.

The country was invaded by Assyrians under Assur-nazir-pal in IX. cent. B.C., and from this time till late in the VII. cent. was a dependency of Assyria; Assyrian period was at first marked by peaceful prosperity, but in VIII. and VII. cent's numerous revolts took place, and about 630 P. again became virtually independent. Subdued by Nebuchadrezzar *c.* 605 B.C., P. became part of Babylonian empire, in the conquest of which by Cyrus of Persia it was included, 537 B.C. As part of the Persian empire, the various states were ruled by their own princes and the country enjoyed considerable prosperity; it was still dependent on Persia at the coming of Alexander the Great in 333 B.C., after whose victory at Issus several of the states at once surrendered; Tyre, however, opposed Alexander, and was besieged and after a magnificent resistance compelled to submit to the conqueror. The decline of Phœnician trade begins about this time, when Gk. colonies were planted everywhere on Mediterranean coasts.

After Alexander's death part of P. passed to Egypt, and afterwards belonged, for a short time in the III. cent. B.C., to the Seleucids; most of it subsequently came into the possession of the Ptolemies, and in I. cent. B.C. the whole was among the dominions of Tigranes of Armenia. It was conquered by Pompey in 64 B.C., and became part of Rom. province of Syria (*q.v.*), with which its subsequent history is coincident.

Phœnicians were of Semitic race; they acted as the carriers of the world, and had large distributing trade between E. and W.; among their most important industries was dyeing with Tyrian purple, which was obtained from the murex; linen-weaving, glass-making, and metal-working were also carried on. Most of their arts and crafts were taken from other nations; and the fact that they spread abroad so much useful knowledge is their chief claim to the gratitude of the world. Ægean civilisation is supposed to have been derived from contact with the Phœnicians, who in passing on the knowledge derived from Egypt and Babylonia, and possibly also in passing on the alphabet, form an important link in the chain of civilisation.

Rawlinson, *Phœnicia* (1889), and *History of Phœnicia* (1889).

PHŒNIX (33° 20′ N., 112° W.), city, on Salt River, capital Arizona, U.S.A.; agricultural region. Pop. (1910) 11,134.

PHŒNIX, fabulous bird of Egypt which lived for 500 years. Out of the ashes of the dead p. a new p. arose. The p. built his own pyre out of rare Arabic spices. The p. was especially associated with Heliopolis in Egypt.

PHŒNIX, see Date Palm.

PHŒNIX ISLANDS (3° 11′ S., 170° 40′ W.), group of small Brit. islands in Pacific.

PHŒNIXVILLE (40° 7′ N., 75° 30′ W.), town, Pennsylvania, U.S.A., at junction of French Creek with Schuylkill; steel and iron works. Pop. (1910) 10,743.

PHOLAS, see under Lamellibranch.

PHONETICS is the science of speech sounds, or of voice, *i.e.* embracing articulate and inarticulate sounds, but the former signification is the more general. The science has many immediate applications. By phonetics a correct pronunciation of foreign languages is best acquired, defects of speech are remedied, and the deaf and dumb are taught articulate speech. In this last department marvellous progress has been made in recent years. Moreover, the phonetician can by phonetic symbols register speech in languages that have no written form. In phonetics there are two methods of procedure. The external method describes the effect of sounds on the ear of the listener. (The descriptions of sounds by this so-called acoustical method are often vague, but for testing and comparing the method is very useful.) The internal method describes the position occupied by the vocal organs in the production of sound. This latter method is usually adopted. A detailed knowledge of the anatomy of the vocal organs is necessary.

Speech sounds fall into two main classes: (1) sounds which are produced by the passage of the breath through the mouth; (2) sounds which are produced by the passage of the breath through the nose. These may be combined, as in the French nasalised vowels. Numerous subdivisions of sounds produced by these two methods are determined by the extent and nature of the check to which the breath passage is subjected—*e.g.* in vowel sounds the breath has a more or less free passage through the throat and mouth, in the sound *f* there is an observable friction, and in the sound *p* the passage is blocked.

The following are the principal groups of articulate sounds: (1) *Stop Consonants*, where the passage of the breath is blocked and then released (*p, t, k, b, d, g*); (2) *Spirant Consonants*, where the stream of breath is checked by the lips and point or back of the tongue (*f, wh, th, kh, v, w, dh, gh*); (3) *Sibilants*, where the blade of the tongue acts on the passage (*s, z, sh*, and *zh*); (4) *Nasals*, where the mouth passage is closed by the lips or tongue, and the breath escapes by the nasal passage (*m, n, ng*); (5) *Vowel* sounds depend on the point of articulation of the tongue (tip, blade, or back) and its vertical position (high, middle, and low). The part played by the lips and nasal passage is also taken into account. The beginner in phonetics should first learn to isolate sounds and then to analyse them patiently. Various mechanical appliances are used in determining the position of the vocal organs, *e.g.* the laryngoscope (a mirror inserted in the mouth and throat), the X-rays, the palatogram (a thin plate inserted in the mouth which takes a chalk impression

of the point of contact). The sounds are then registered by adequate phonetic symbols.

The writing of all languages is at first phonetic, but orthography, which is by nature conservative, soon loses sight of the spoken sound. The written language is then said to be unphonetic, *i.e.* the pronunciation of the spoken word and the phonetic symbols of the written word no longer correspond—*e.g. knife*, the initial consonant of which was formerly sounded. The divergence in English is extremely great. Hence various attempts to institute a reformed spelling system have been made. Such reforms are not really an innovation, but a readjustment of the written symbol to bring it into its right relation to the spoken sound.

PHONOGRAPH (Gk. *grapho*, 'I write,' and *phonè*, 'sound'), an instrument which records sounds by transferring the vibrations of an elastic membrane to a needle which impresses them on a drum of tinfoil or wax, thus making a series of very fine indentations which, if the needle be passed over them again, will cause the delicate membrane to vibrate, thus producing sounds similar to the original ones, but of less intensity.

Many were the devices for recording sound waves brought out in the XIX. cent. All were for graphic records, however, and it was not until T. A. Edison invented his instrument in 1876 that the sounds could actually be reproduced. His first phonograph consisted of a chisel-like needle, a delicate membrane of gold-beater's skin, and a disc of tinfoil. Such an instrument was very imperfect, and from 1877 to 1888 Edison worked on improvements. The tinfoil was replaced by cylinders of wax, the gold-beator's skin by a thin glass plate, and the mechanical action of the machine by an electrical motor which drove the drum at a uniform speed.

Nowadays phonographs have reached a high state of perfection, reproducing such sounds as the human voice with almost lifelike reality, the mechanical parts of the machines being silent, ball-bearing clockwork motors. Cylinders or discs are made of a compound of shellac and other materials. A master record, taken in wax, is duplicated by a plaster cast and then electro-plated and used as a matrix. Wax impressions are again made and plated with copper, and from these 'negatives' the 'positives' are made by pressing the shellac into them by hydraulic power.

PHONOGRAPHY, see SHORTHAND.

PHONOLITE, CLINKSTONE, an igneous rock, composed of sanidine and nepheline, and belonging to Tertiary period; colours—green, grey, and brown; splits easily into slabs which, when struck with hammer, give metallic ring or clink, hence other name.

PHORMIUM, a genus, included in the Liliaceæ, which possesses isobilateral leaves. These are very resistent in character, the fibre termed New Zealand flax being derived from those of *Phormium tenax*.

PHORONIDEA, class of animals containing only the genus *Phoronis* with about six species. They are small marine animals which build leathery tubes encrusted with particles from the sea-floor, diatoms, sponge spicules, sand grains, and such-like. Several tubes are associated in a colony, though there is no organic connection between individuals. The animal itself is 'worm'-like, with an elongated body, crowned by a horseshoe-shaped group of tentacles within which lies the mouth. The individuals are hermaphrodite, and the development from the larva (Actinotrocha) to the adult is one of abrupt change. *Phoronis hippocrepia* occurs on Brit. coasts.

PHORORHACOS, an extinct land bird belonging to the group Stereornithes, Carinate birds the remains of which are found in the lower Tertiaries of S. America.

PHOSPHATES are salts of phosphoric acid, H_3PO_4 $\left(O=P\begin{matrix}OH\\OH\\OH\end{matrix}\right)$. From bone ash, $Ca_3(PO_4)_2$, or mineral phosphate, phosphoric acid and other phosphates are prepared.

Ordinary sodium phosphate is Na_2HPO_4, $12H_2O$; but, since the acid is tribasic, two other salts exist, viz. NaH_2PO_4 and Na_3PO_4.

The alkali phosphates dissolve in water, others in dilute acid by double decomposition, thus—

$$Ca_3(PO_4)_2 + 6HCl \rightleftarrows 3CaCl_2 + 2H_3PO_4.$$

When the acid is neutralised, the phosphate is reprecipitated; this complicates analysis. $CaH_4(PO_4)_2$, contained in 'superphosphate,' is soluble, and a plant fertiliser. Microcosmic salt, $NaNH_4HPO_4$, $4H_2O$, occurs in urine.

Solutions of phosphates give a yellow precipitate of Ag_3PO_4, a white crystalline precipitate of $MgNH_4PO_4$, $6H_2O$, and a characteristic yellow precipitate on warming with excess of a nitric acid solution of ammonium molybdate. Metaphosphates are $M'PO_3$, pyrophosphates, $M'_4P_2O_7$.

PHOSPHORESCENCE is the emission of a pale light—which may be white, orange, green, or violet—without apparent combustion. It is sometimes due to slow oxidation (chemiluminescence), or to electric excitation (electroluminescence), but otherwise is probably the accompaniment of molecular readjustment after strain produced by absorbed light energy. Diamond, when moderately heated, 'Bononian phosphorus' (barium sulphide), and Balmain's luminous paint (calcium sulphide) are phosphorescent in the latter sense. The phosphorescence of phosphorus and of organisms is due to oxidation. Fungi cause phosphorescence of decaying wood, minute organisms that of the sea, oxidation of fat probably that of glow-worms, fireflies, centipedes, and deep-sea fishes.

PHOSPHORUS, P=31·04, non-metallic element. Occurs combined, chiefly as calcium phosphate, $Ca_3(PO_4)_2$, in phosphorite, apatite, coprolites, bone ash. Widely diffused; essential to plants and animals. Isolated from urine by Brand in 1674.

P. is prepared from $Ca_3(PO_4)_2$ by separating H_3PO_4 and distilling with charcoal, thus—(i.) $Ca_3(PO_4)_2 + 3H_2SO_4 = 3CaSO_4 + 2H_3PO_4$, (ii.) $H_3PO_4 = HPO_3 + H_2O$, (iii.) $4HPO_3 + 12C = 2H_2 + 12CO + 4P$; or by heating a mixture of the phosphate with sand and charcoal in an electric furnace, thus—$Ca_3(PO_4)_2 + 3SiO_2 + 5C = 3CaSiO_3 + 5CO + 2P$.

Properties.—P. exists in several allotropic forms. I. White phosphorus is almost colourless, translucent, and waxlike; crystallises in octahedra, S.G. 1·83, M.P. 44°·3 C., B.P. 290° C. Molecule of vapour below 1500° C. = P_4, above, dissociation into P_2 molecules occurs. Molecule in solvents is P_4. P. is nearly insoluble in water, easily soluble in carbon disulphide. Ignites at 45° and burns to P_4O_{10}; kept under water. Luminous in dark (phosphorescence) owing to slow oxidation. When vapourised with steam shows greenish phosphorescence; peculiar smell; very poisonous, 1 decigram has caused death; vapour attacks jaw (*necrosis*, 'phossy jaw'). Use for matches now prohibited. Used as vermin killer, for chemical experiments, for making red and scarlet phosphorus, and as a nerve tonic.

II. Red phosphorus ('amorphous') is formed by action of light and heat on white phosphorus; change is promoted by a trace of iodine, and is rapid at 240–250° C., but reversed at higher temperature; dark reddish brown, partially crystalline, tasteless, odourless, insoluble in carbon disulphide, not poisonous, oxidised slowly in moist, hot climates. Used for safety matches.

III. Scarlet phosphorus (Schenck's) made by heating white phosphorus with the tribromide. Used for matches that strike anywhere (P_4S_3 also employed).

HYDRIDES: PH_3 (gas), P_2H_4 (liquid), $P_{12}H_6$, P_8H_2 (solid). CHLORIDES: PCl_3, PCl_5, $POCl_3$. OXIDES: P_4O_6, P_2O_4, P_4O_{10}. OXYACIDS: H_3PO_2, H_3PO_3, $H_4P_2O_6$, $H_3PO_4(HPO_3)$, $H_4P_2O_7$).

PHOTIUS (*c.* 820–91), patriarch of Constantinople; app. in irregular way; refusal of Pope Nicholas I. to confirm his election led to Council of Constantinople, 867, and secession of Eastern Church; deposed after death of emperor, 867, but restored, Pope John VIII. consenting; new council at Constantinople, 879, attacked Rom. doctrines; second exile, 886; cultured scholar.

PHOTOCHEMISTRY is the study of chemical change promoted by light. The fixation of the carbon of atmospheric carbon dioxide by green plants in sunlight is the most important photochemical process, whilst the action of light on silver salts forms the basis of photography. Other examples: $H_2+Cl_2=2HCl$; $CO+Cl_2=COCl_2$; $CH_4+Cl_2=CH_3Cl+HCl$.

Violet rays have the greatest chemical effect; they are called actinic.

PHOTOGRAPHY.—Photography is the name given to the process by which the rays of light reflected, or emitted by objects, are used to produce, by chemical means, a permanent picture of the object. It is the outcome of many attempts to fix the vivid pictures produced in the 'Camera Obscura,' which has been known since the XVI. cent. The camera is a light-tight box, in one side of which is fitted a lens which projects images of external objects on to the opposite side where a plate is fixed. The first permanent pictures were made by Daguerre, in France, in 1839. His process gave one picture, a positive on a plate of silvered copper—for each exposure. Daguerre was also the first to discover the *latent image*. He had attempted to secure a visible image on the plate by exposure in the camera, with little success; but he found by accident that if a plate, which had been exposed in the camera for a very short time, and showing no trace of an image, was then exposed to the vapour of mercury a complete image *developed*, and became visible. Henry Fox-Talbot, in England (1841), discovered a process of making negative images on paper which were developed by gallic acid. These *negatives* represent the light parts of the subject as black or opaque, and the dark parts as white or transparent, and by placing this negative, after treatment to make it translucent, on a fresh piece of sensitive paper, and exposing to light, a positive print is obtained which represents the lights and shadows of the picture in their proper relation. It is from this process, rather than from the process of Daguerre, that modern photography has developed. The next advance was the use of glass plates in place of paper, which was rendered possible by the adoption of an organic substance to carry the sensitive salts. Albumen was first used, but was soon displaced, for negatives at least, by collodion, which was introduced by Scott-Archer in 1851. These collodion plates were exposed and developed whilst still moist with the solution of silver nitrate used to sensitise them, and from this they were known as '*Wet plates*' or '*Wet Collodion plates*,' to distinguish them from the gelatine '*Dry plates*,' which came into use about 1880. The Wet Collodion process is still largely used for special purposes such as the various reproduction processes.

The Gelatine **Dry Plate** is the only plate known to the majority of photographers. It consists of a glass plate coated on one side with a film of gelatine containing the sensitive bromide of silver in the form of an emulsion. The film contains no free silver, and is used dry. The image formed by exposure in the camera is invisible or *latent*, but, when treated with a suitable *developer*, the parts of the film which have been altered by light become dark and opaque owing to the reduction of the silver bromide into metallic silver in proportion to the amount of light action. The unaltered bromide is next dissolved by the *fixing solution*, which is sodium thiosulphate ('*Hypo*'), leaving the opaque silver in the film. After washing and drying, the negative is ready for the process of making prints.

If the negative is too dense it may be 'reduced' by treatment with solutions having a solvent action on the silver image, whilst if it is too thin and flat it can be 'intensified' by treatment which increases the density of the silver image, or changes its colour, increasing the contrast at the same time.

All the processes mentioned have the disadvantage that they are much more sensitive to blue and violet light than to green, yellow, and red, the result being that the latter colours appear much darker, and the former much lighter on the print than they ought. In 1873 Dr. Vogel discovered that certain dyes had the property of altering the colour-sensitiveness of plates treated with them, moving the region of maximum sensitiveness towards the red end of the spectrum. Plates so prepared are known as *Orthochromatic* or *Isochromatic*, and are much more sensitive to yellow and green than ordinary plates, but the sensitiveness to blue remains so strong that it is necessary to interpose a 'light-filter' or 'screen' of a yellow colour to subdue the blue and violet. *Panchromatic* plates are a further development, and are sensitive even to deep red. They require a strong yellow or orange filter during exposure, and must be handled and developed in almost total darkness.

Films consist of thin transparent celluloid, coated on one side with gelatino-bromide emulsion. They are either cut to the standard sizes, and used like plates; or the celluloid is in the form of a long band on which successive exposures are made. The first are known as 'Flat' and the second as 'Roll' films. The advantage of the latter is that, being wound on a spool together with a longer band of opaque black paper, fresh spools can be inserted in the camera, and exposed ones removed, in ordinary daylight. Films are prepared of the same speed as plates, and made orthochromatic in the same way.

The Camera.—The simplest form of photographic camera has already been described.

Another type of camera has extensible sides so that the distance between lens and plate can be adjusted to focus objects at any distance. The lens may also be made to be raised or lowered in relation to the plate, to 'swing back,' to enable the plate to be kept vertical when the camera has to be tilted, and so on. A form of camera largely used in press photography is the *Reflex*, inside of which is a mirror inclined at an angle of 45°, which reflects the image on to a ground-glass screen in the top of the camera. The picture may be observed on this screen, exactly as it will appear on the negative, up to the moment of exposure, when the mirror flies up and allows the light to fall on the plate.

The photographic Lens is made in many types: for portraiture, a lens of long focus and large aperture; for interiors and other confined situations, a lens of short focus and great covering power (wide-angle), and so on. The *Telephoto* lens enables large-scale photographs to be made of subjects impossible to approach closely, such as mountain peaks, architectural details, and wild animals.

Printing.—The print is usually made on sensitised paper, which may be prepared with a number of salts other than the bromide and iodide of silver used in making negatives.

The first class are called *Bromide* or *Development* papers, and consist of stout paper coated with a bromide of silver gelatine emulsion similar to that used for dry plates, but not so sensitive. It is developed and fixed in the same way as plates, and is, indeed, coated on glass and used in making lantern-slides.

Contact prints are made by placing the paper in contact with the negative in a printing-frame, exposing to weak white light for a short time, and developing. This paper is also suitable for making *Enlargements*. The negative is placed in an enlarging camera which projects the image, of any desired size, on to the paper. A variety of this paper made with specially slow emulsion is known as *Gaslight* paper, as all the operations may be conducted by artificial light.

The normal colour of a bromide print is neutral black and white, but the colour may be altered by

modifying the developer, or by *toning* after development. Bromide paper is prepared with a great variety of surfaces, from a high gloss to that of very rough drawing paper. A second class of papers are known as *Print-out* papers, or 'P.O.P.,' as the image becomes visible as exposure proceeds. The sensitive salt employed is silver chloride. It is suitable only for contact prints. When the picture appears slightly stronger than is required it is fixed with 'Hypo,' but, as the colour of the image is unpleasant, it is usual to tone the print with a solution containing gold chloride before fixing. This produces tones ranging from reddish brown to purple black. A variety of this paper, known as *Self-toning*, contains a toning salt in the emulsion, which tones the image when the print is placed in the fixing solution. 'Platinotype' paper is used for contact prints, but while the image becomes visible during exposure it must be developed. The sensitive salt is platinum, and it is developed in potassium oxalate, and fixed with weak hydrochloric acid. The prints are very permanent, beautifully soft and delicate, the colour ranging from black to warm sepia, with a matt surface.

A very large number of printing processes are based on the action of light on bichromated gelatine, gum, albumen, and similar substances. If the substance is readily soluble in water, the effect of light is to make it insoluble. This is the principle of the *Carbon* or *Autotype* process, also the *Gum-Bichromate* process. An insoluble pigment is mixed with the bichromated gelatine or gum, coated on paper, and exposed in contact with the negative. The print is developed in warm water, which dissolves the soluble portions, leaving a graduated thickness of insoluble pigment-bearing film representing the various shades of the picture. If the print is dabbed over with a greasy ink, the ink does not adhere to the soft, moist parts but only to the more or less hardened portions in proportion to the amount of light action. This is the principle of the *Oil* process, and of the *Collotype* reproduction process, in which the ink image is transferred to paper in a special printing-press.

By a modification of the above method a print may be produced in high relief, and this is the principle of various processes for producing photographs in relief, also the *Woodburytype* reproduction process.

Another modification is to mix a hygroscopic substance, such as glycerine, sugar, or honey, with the bichromated colloid. After exposure the print is exposed to moist air, when the parts unaffected by light absorb the moisture and become sticky, while the affected parts remain dry. If a very fine powder is brushed over the print it will adhere in inverse proportion to the amount of light action, thus producing a negative from a negative. It is chiefly used in *Photoceramic* processes, i.e. making photographic prints on china and porcelain.

An interesting print-out paper for the reproduction of colours has been produced by Dr. Smith. It is prepared by coating paper with a black film containing three dyes which combined appear black. These dyes bleach out in white light, but as each dye is bleached only by the colour rays which it *absorbs*, the black film bleaches to red under red glass, green under green glass, and so on, and if exposed under a coloured transparency it will give a fair reproduction of the colours. The printing is slow, and there is some difficulty in fixing the colours satisfactorily, but these faults will probably be remedied.

Colour Photography.—The production of photographs in natural colours has been attempted by experimenters from Daguerre and Fox-Talbot onwards, but no advance was made till 1861, when Clerk Maxwell suggested a method based on the Young-Helmholtz theory of colour vision, that our eyes perceive colour by the stimulation of one or more of three *colour sensations*. Each sensation is stimulated by a different range of vibrations, approximating to red, green, and blue-violet. White is perceived by the equal stimulation of all 3 sensations, and colours by stimulation in varying degree of one or more sensations. Clerk Maxwell showed that if negatives were made recording respectively the amount of red, green, and violet contained in the camera image, and if the positives were projected by lanterns so that the images coincided, using for the projection of each the same coloured light as had been recorded in the negative, then the picture would appear in its natural colours.

Clerk Maxwell's results were imperfect, but the principles he demonstrated are the basis of almost all modern processes of colour photography.

In addition to projection by three lanterns, the images may be combined by projecting them in rapid succession, as in the cinematograph, the stimulation of each sensation recurring so rapidly as to blend. Another method is employed in Ives' 'Kromskop,' in which the three images are superimposed and combined by an arrangement of transparent reflectors, but the most convenient way is to make the three colour-sensation records in very minute portions side by side on one plate. The divisions of colour are too small to be distinguishable by the eye, and only the colour produced by the combination is seen. The two disadvantages of this method are that (1) the picture must be in the form of a transparency, and (2) the great loss of light, which even in the whites amounts to two-thirds. Of several processes making use of this method the Autochrome plate of Messrs. Lumière is the most widely used. In this plate the compound filter consists of starch granules, dyed in three batches and mixed in the proportions which approximate to white when spread on glass in a film the thickness of a single grain. The panchromatic gelatine emulsion is spread on this film, and the plate is placed in the camera with the glass side next the lens so that the light passes through the coloured grains before reaching the plate. A yellow filter is required in the lens to correct the excessive blue sensitiveness of the plate (see above). The negative is developed, converted into a positive, and the image appears in its natural colours.

All the above methods are known as '*additive*,' as one light is added to another, but the three-colour principle may also be employed by subtracting colours from white, which has the advantage of enabling prints to be made on paper, as well as in the form of transparencies. The negatives are made in exactly the same way, through red, green, and violet filters, but the colours used for the print are the complementaries to those. The basis, which may be paper, porcelain, or glass, reflects or transmits red, green, and violet light (*i.e.* white), and it is required to subtract from it successively these colours in the proportions recorded in their respective negatives. This is done by making a print from each negative, by the carbon process generally, and transferring the tissues on to the paper or glass, one over the other, making them coincide. The colours of the tissues must be such that each absorbs the rays passed by the filter used for that negative, and reflects the rays passed by the other two filters. These colours are found to be for the red filter print, a greenish blue; for the green filter print, a magenta pink; for the violet filter print, yellow. The widest use made of this method is in reproduction of coloured pictures by means of half-tone process and the printing-press. Half-tone blocks are made from the three-colour negatives, and are printed in yellow, red, and blue inks, so that the three impressions coincide.

The Lippmann process, making use of the colours produced by *interference*, and Prof. R. W. Wood's process, based on *diffraction* (see LIGHT), are only of scientific interest so far.

One of the most remarkable developments in modern photography is the CINEMATOGRAPH, which records and reproduces action and movement by photography. This has been achieved by making use of the fact that the impression made on the retina of the eye by momentary vision persists for an appreciable time afterwards. The first practical apparatus, made by

Edison in 1892, was a camera which made a series of negatives in rapid succession on a roll of celluloid film; a roll of positives was made, and these were viewed in an instrument called the *Kinetoscope*, by one or two persons at a time. A few years later Mr. Friese Green in England and Messrs. Lumiere in France evolved the 'Cinematograph,' which projects the tiny pictures on to a screen (about 1000 per minute), enlarging them enormously.

One of the latest achievements is the production of living pictures in natural colours by the *Kinemacolor* process, on the principle of Colour Photography. The adoption of the full three-colour principle being very difficult, it was found that a sufficient range and variety of colour for most purposes could be obtained by the use of two complementary colours, the two selected being an orange-red and a greenish blue, which produce white when superimposed by projection. The camera is fitted with a mechanism which interposes 'filters' of these colours alternately as the film is exposed, so that the negatives record alternately the amount of orange-red and greenish blue in the subject. A positive film is printed from this, and projected by a cinematograph projector fitted with a similar filter mechanism to the camera so that the print from the orange-recording negative is projected by orange light, and that from the green-recording negative by green light. The impression produced on the eye is of a single, brightly-coloured, moving picture.

Amongst the numerous scientific applications of photography may be mentioned star-mapping and spectroscopic work in astronomy, X-rays in surgery, and the wide use of microphotographs in pathology and in the iron and steel industries. Several systems have been devised for the transmission of photographs by telegraph, the Korn system employing selenium, the electrical resistance of which varies with the intensity of the light falling on it, and the Thorne Baker system transferring directly without the necessity for development as in the Korn apparatus.

PHOTOMETRY deals with the measurement of the relative illuminating powers of different sources of light. The apparatus used is a *photometer*. The illuminating power of any source is the amount of light received by unit surface at unit distance from it. This varies inversely as the square of the distance, so that if the distance is doubled the light received by the same surface is one-fourth. A standard source must be fixed. The Brit. standard is a *sperm candle* burning 120 grains per hour and weighing six to the lb. For practical purposes, the *Harcourt lamp*, burning pentane and air, equal to 10 candles, is more manageable. The French *Carcel lamp* burns 42 grammes of colza oil per hour; the Ger. and U.S.A. standard *Hefner-Alteneck* burns amyl-acetate and gives a reddish but very accurate light. The relation between these sources has been defined as Harcourt = 1·02 Carcel = 10·95 Hefner (Zürich Congress, 1907). As a final standard Violle proposed the light given out by a square centimetre surface of platinum at melting-point.

Since equal illuminations cannot be gauged directly by the eye, various devices are resorted to in photometers. Rumford's consists of a rod a short distance from a ground-glass screen. Two lights, one of known candle-power (c.p.) are moved till the shadows thrown by the rod are of equal darkness; then the powers of the two sources vary as the squares of their distances from the corresponding shadows, and the unknown light is determined. Bunsen's is a simple and common form, consisting of a grease-spot on a screen of paper. When viewed from the same side as a light, the spot appears dark; from the opposite side it appears bright. The lights to be compared are moved on opposite sides of the screen till the spot becomes invisible from both sides, when the powers of the lights are proportional to the squares of their distances from the screen. In Lumner and Brodhun's photometer by an optical arrangement two patches appear, showing a spot from one source inside a ring from the other. Equal illuminations are judged accurately either (1) when the two patches are uniformly bright, (2) the two spots are of equal darkness. Photometers in general give varying results with different observers, when the lights compared are not the same tint. This difficulty is removed with the 'flicker' instrument, where the reflections from two lights are rapidly presented alternately, and equal illumination is achieved while the reflection becomes steady. The Harvard and other stellar photometers are described under STAR.

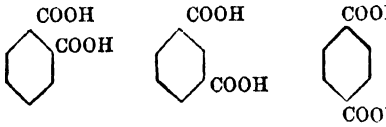
PHRAATES, five kings of Parthia who ruled between 175 B.C.–5 A.D.

PHRENOLOGY (Gk. 'science of the mind'), a science or pseudo-science which infers from the shape of the head and skull of any given person what are his characteristics. It comes under the domain of physiological psychology, but as a worked-out system it is due firstly to Gall, who began to publish writings on it in 1798. Earlier thinkers to some extent had forestalled him. It was only gradually in antiquity that the idea of the brain as the seat of the mind was evolved. From this it was not unnatural to go on to assert that each separate function had a different place in the brain. Both this view and its negative were vigorously upheld in the Middle Ages.

Gall worked out in full detail the idea of what are vulgarly called *bumps*. Other systems were worked out on similar lines by a number of other thinkers, particularly Spurzheim, who postulated 35 'bumps' (as against Gall's 26). Though these schemes have not generally won acceptance, they certainly resulted in a deeper study of the brain—a branch of physiology which is still far from having reached its completion. Thus, the rate of growth of the brain, the amount of grey and white substance, and the folds in the brain itself all have to be taken into account.

The physiological side of the question is a difficult one, for while anatomically the brain is fairly well understood now, physiologically much is still open to doubt. Though it seems probable that there is 'division of labour' in the brain, yet, if a portion be removed, its duties seem to be taken over by other parts of the brain.

Psychologically considered, p. is also open to question. It is difficult to assume the existence of a number of different faculties which are as separate from each other as are the organs of the body, or else to assume a sort of common substance on which they all worked. An attempt has been made to work out the principles of p. with recent research in psychology and physiology, but its validity is not always accepted by the best authorities. Even if these results, however, be fairly well assured, there still remains the difficulty of arguing from the shape of the brain itself to that of the skull on the outside, but the two do not by any means entirely coincide, and various circumstances, *e.g.* artificial malformation, may alter the skull without much affecting the brain. All these facts tend to prove that for the reading of character p. is really of little avail, and as popularly expounded it is often a pseudo-science rather than a real one.



Holländer, *Scientific Phrenology* (1902).

PHRYGIA, large country in Asia Minor, which varied greatly in regard to boundaries at different periods of history, but generally speaking formed western part of central plateau region of peninsula; consisted principally of plateau region, most fertile district being valley of Sangarius, and most thickly populated part in S.W.; celebrated for marble, vines, and wool. Little is known about nationality and origin of inhabitants, but they are generally supposed to have been one of oldest nations in Asia Minor. Exact date of beginning of Phrygian monarchy is unknown; downfall of kingdom believed to have been in VII. cent. B.C., at time of Cimmerian Invasion; in VI. cent. B.C. Crœsus conquered country, but was defeated by Cyrus c. 546 B.C., and P. passed into hands of Persians; invaded in III. cent. by Gauls, who took possession of E.

part of country and called it Galatia; country given by Alexander the Great to Antigones, and kept by him till his death; later succumbed to Pergamum kings; under Rom. Empire P. comprised part of Province of Asia, and in W. in particular Græco-Rom. civilisation spread; at reorganisation of Roman Empire by Diocletian all that remained of P. was divided into P. Pacatiana in E. and P. Salutaris in W. Name of P. disappeared at division of Eastern Empire, and now Byzantine P. is comprised in vilayets of Broussa, Konia, and Aidin. P. had important influence on Gk. art and culture. Chief deities were Cybele the Mother and Sabazias the Son (Gk. Dionysus). P. was early Christianised. See ASIA MINOR.

PHRYNICHUS, the name of three Gk. writers. The first, a tragic poet, flourished about 560 B.C.; the second, a poet of Attic comedy, and abused by Aristophanes; the third, a grammarian of the time of Marcus Aurelius.

PHTHALIC ACIDS, benzene dicarboxylic acids.

Phthalic acid.	Isophthalic acid.	Terephthalic acid
M.P. 184°.	M.P. above 300°.	sublimes.

PHTHISIS, condition due to tuberculosis of the lungs. See TUBERCULOSIS.

PHYLE (38° 10′ N., 23° 40′ E.), fortress of Attica, on borders of Bœotia; taken by Thrasybulus and the Athenian patriots, 404 B.C.

PHYLLITE, group of schistose clay-rocks containing quartz, mica, chlorite, and muscovite; composed of metamorphosed argillaceous matter.

PHYLLOPODA, see under ENTOMOSTRACA.

PHYLLOSTOMATIDÆ, see VAMPIRE BATS.

PHYLLOXERA, VINE INSECT, a genus of minute insects (family Aphidæ, order Hemiptera) which do enormous damage to vines. The life-history is very complicated, the females living on the vine roots and laying each 30 to 40 unfertilised eggs from which in a week the fresh brood hatches. So many generations succeed each other in a season that, barring accidents, the progeny of a single individual would in a year number more than 20 millions. In spring the leaves are attacked by newly hatched insects and great harm is done. In vineries the stems of roots are scraped in winter to destroy any *Phylloxera* eggs that may lurk in the crevices of bark.

PHYSALIA, see under HYDROMEDUSÆ.

PHYSETERIDÆ, a family of Whales (*q.v.*).

PHYSIOCRATIC SCHOOL, founded by Francis Quesnay (1694–1774); included Turgot, Gournay, Mirabeau, Morellet; doctrines preponderant under Louis XVI., and in Revolution; held that the earth is the only source of natural wealth; farmers, fishermen, etc., who use or increase the natural powers at work in the animal and vegetable kingdoms increase the actual wealth of a country; manufacturers and merchants only change form of articles so produced—the first being productive, the second unproductive; opposed to mercantile system; advocated freedom of foreign trade.

PHYSIOGNOMY, the theory and art of discerning mental character from bodily appearance. The earliest monograph on the subject is that wrongly attributed to Aristotle, which discusses (1) the signs of character in general, (2) the physiognomy of the sexes, and (3) the comparison of human and animal appearance. In the Middle Ages the study became implicated with cheiromancy and magic. Many treatises on it appeared in the XVI. cent., that of della Porta being the chief. In the XVII. cent. John Evelyn and John Bulwer treated of it in this country. By far the best-known XVIII.-cent. writer on it is Lavater, the later editions of whose works are admirably illustrated. Lavater tried to bring the subject into relation to the fine arts. More recent writers, *e.g.* Sir Charles Bell and Darwin, have discussed the subject from a more scientific standpoint.

PHYSIOLOGUS, name of a collection of animal stories widely read and circulated in the Middle Ages, originally written in Greek, and now existing in various forms in Lat., Syriac, Armenian, Arabic, Ethiopic, Old Eng., Old Fr., Old High Ger., Provençal, and Icelandic versions. It is sometimes called the *Bestiary*, as it contains stories of animals with morals appended. These were probably chiefly taken from scriptural commentaries, particularly on Genesis. Its science was curious and its theology doubtful, and it was condemned by Pope Gelasius in 496, but it remained popular, though writers took great liberties with the text, modifying it as they pleased.

PHYSIOLOGY, the science which deals with the functions of living organisms, as distinguished from anatomy, which deals with their structure. Human p. may be considered under the headings of *nutrition*, including the processes concerned with the digestion of food and its assimilation and absorption into the blood and thence to the tissues, the absorption of oxygen from the air by the blood through the agency of the lungs and its conveyance to the tissues, the circulation of the blood and of the lymph, with the excretion of waste matters by the bowel, kidneys, lungs, and skin; *growth* of the body, brought about by the continued division of the cells composing the tissues; and *reproduction*, which is a specialised form of growth in which there is increase of living substance formed by cell division in such a way that a new individual is set free; *nervous activity*, comprising the functions of the brain, which is the seat of consciousness, the spinal cord, sympathetic system, sense-organs, and nerves; *movement*, which is carried out by the muscles in relation with their supporting structure, the skeleton.

History.—The history of p. commences with the beginnings of med. as a science in ancient India and Egypt, followed by the speculations of the ancient Gk. philosophers regarding life. HIPPOCRATES was the first to attempt to explain the phenomena of health and disease in a rational rather than a mystical way, and ARISTOTLE a cent. later (c. 350 B.C.) dissected animals and investigated the functions of different organs, but his methods are more important than the results which he achieved. The cent's after this were occupied with speculations and discussions regarding the vital spirits and similar subjects, until the time of GALEN, who flourished about the middle of the II. cent. A.D. He made physiological experiments upon living animals, and made several discoveries of importance, particularly in regard to the nervous system; for every problem he found some answer, and his dogmatic teaching dominated the science of med. for many cent's. The Arab. school of med. which arose in the X. cent., in which the most eminent name is Avicenna, made no real advance in p., and mysticism and speculation held away until the XV. cent. With the fall of Constantinople (1453 A.D.) and the diffusion of the Gk. scholars through Western Europe, the writings of Hippocrates and Galen became known in the originals, and to their influence was due the revival of interest in anatomy and p. PARACELSUS, in the XV. cent., promulgated theories of life independent of Galen, but his influence was fleeting.

The study of anatomy was revived in Italy in the XVI. cent. by Vesalius, who dissected the human body and opposed the physiological theories of Galen; he was followed by FABRICIUS, and, at the beginning of the XVII. cent., WILLIAM HARVEY, who had studied under the Ital. anatomists, made the epoch-making discovery of the circulation of the blood (1628). About this period arose the Iatro-mechanical school, of which Borelli and Pitcairne were the most notable members, and the Iatro-chemical school, founded by the Dutchman Sylvius, one of his most eminent followers being

WILLIS, who made valuable researches in regard to the secretions. Both of these schools attempted, on opposing lines, to explain the phenomena of life in accordance with scientific facts. The invention and improvement of the microscope in the XVII. cent. stimulated research, LEEUWENHOOK and MALPIGHI especially making valuable discoveries with its aid, the science of Histology being founded by them (see CYTOLOGY).

VON HALLER, in addition to making various discoveries of greater or less importance, particularly in regard to muscular irritability, co-ordinated the different parts of the science, and gave it a definite form. JOHANNES MÜLLER, in the first half of the XIX. cent., laboured in the same direction, and showed, among other things, that different forms of stimuli produce the same effect upon a particular organ. VON BAER made valuable researches regarding the development of animal life, and may be regarded as the founder of the science of Embryology; CUVIER linked palæontology with comparative anatomy, and was the first to realise the inter-dependence of the organs and parts of an organism; LAMARCK foreshadowed the theory of natural selection, and promulgated an important, but still debated, theory of evolution. SCHLEIDEN and SCHWANN showed that all organisms are built up of cells, while VON MOHL and DU JARDIN discovered that protoplasm is the essential constituent of the cells.

Among noteworthy stages in the progress of the science are the discovery of the law of the conservation of energy by MAYER and HELMHOLTZ and its application to the living organism, the researches regarding the nervous system by MARSHALL HALL, who discovered the laws of reflex action, and of WEBER, who discovered the laws of inhibitory nerve action, and the widespread investigations of CLAUDE BERNARD, among whose discoveries may be noted the saccharine function of the liver and its connection with the nervous system. CHARLES DARWIN added to the primary ideas of evolution of Erasmus Darwin and Lamarck the theory of natural selection, and made possible an explanation of the structure and evolution of living things, and harmonised all the branches of science. See BRAIN, CELL, DIGESTION, HEART, NERVOUS SYSTEM, RESPIRATORY SYSTEM, REPRODUCTIVE SYSTEM, and similar articles.

PIA MATER, see BRAIN.

PIACENZA (45° 3′ N., 9° 40′ E.), town, near Po, northern Italy; capital of province P.; with cathedral (1122), Sant' Antonia; San Sisto (1499), formerly possessed Raphael's Sistine Madonna; communal palace, Farnesi and other palaces; Museo Civico, etc.; founded by Romans as *Placentia*, 219 B.C.; a leading town of the Lombard League in Middle Ages; united to Parma, 1545–1860; engaged in silk industry. Pop. (estimated) 36,600.

PIANOFORTE, a familiar keyboard musical instrument, evolved from its immediate predecessors the *clavichord* and the *harpsichord*, of which latter the *spinet* was a variety. The fundamental difference between the p. and the instruments named lies in the mechanism of the tone production. In the clavichord, the earliest mention of which occurs in a work of 1404, the tone was produced by brass blades impinging against the strings; in the harpsichord, by quills or strips of leather (technically called 'jacks') plucking the strings. In the p. the tone is produced by hammers striking the strings and rebounding immediately afterwards. The latter (technically the 'check' action) is an essential condition; for if the hammer were to remain in contact with the string for the minutest fraction of a second, the contact would deaden the vibration and practically stop the sound. The tone of the clavichord was weak and metallic; that of the harpsichord was louder, but hard and inflexible. Both instruments had the crowning defect implied in the fact that the tone could not be varied, as to loud or soft, by the player's impact of the key. It was precisely because this was at last attained in the p. that the new instrument was so named: that is to say, it could play *piano* (soft) or *forte* (loud), with ranges of power between these extremes. At first it was called indifferently 'pianoforte' or 'fortepiano.'

The inventor was a Florentine maker named Bartolommeo Christofori (1655–1731), his hammer action, essentially that of to-day, being announced and described in 1711. Other claims to independent discovery have been advanced, notably those of the Saxon organ-builder, Gottfried Silbermann, whose action admittedly resembled that of Christofori. Silbermann's p's certainly enjoyed some reputation, whereas Christofori's attracted no attention outside Italy. Nevertheless, Christofori is accepted by all the leading authorities as the real inventor. Harpsichords continued to be made till the beginning of the XIX. cent.; and it is significant that up to 1799 the title-pages of Beethoven's sonatas bore the words, 'for the p. or harpsichord.' Curiously enough, it was not until 1767 that the first recorded performance on a p. took place in England. This was at Covent Garden Theatre, when the playbill announced that 'Miss Brickler will sing a favourite song from "Judith," accompanied by Mr. Dibdin on a new instrument called the p.' In the last quarter of the XVIII. cent. the new instrument was more and more gaining supremacy over its predecessors. Once fairly established, its development towards perfection was rapid. In this process, such makers as Erard, Collard, Brinsmead, Pleyel, Broadwood, Steinway, Bechstein, Blüthner, and Chickering have played a prominent part.

The most natural form of the p. is that known as the *Grand*, in which the strings are placed in a horizontal position parallel with the keyboard. This form, the same as that of the harpsichord, was probably suggested by the varying length of the strings. Grand pianos are of three kinds—the concert-grand, the semi- or drawing-room grand, and the boudoir grand, these names denoting the length. In the more familiar *cottage* or upright piano the strings are stretched vertically over the sound-board from top to bottom of the instrument. The different forms involve certain differences in the mechanism, but the essentials are in all cases the same. The hammer action has already been mentioned. What is known as the *damper* action is necessary for checking the continuance of the sound when the finger has left the key. It consists of a piece of leather or felt, elevated upon a vertical wire connected with the back of the key. When the key is struck, this mechanism, which otherwise rests upon or presses against the strings, is immediately removed therefrom, so that the tone may be clear and unimpeded; when the key is quitted, the 'damper' instantly springs back and stops the vibration of the wires. Intimately connected with this action is the so-called *Loud Pedal*, which, on being pressed down by the foot, virtually deprives the instrument of its dampers, so that the sound runs on without check so long as the vibrations last. The *Soft Pedal* is a contrivance which shifts the hammers slightly to the side so that one string fewer is struck, thus producing less tone. The number of strings to each key varies in different instruments. In the grand p. there is usually one string to the lowest octave, two strings to the succeeding lower notes, and three to the middle and upper notes. The first p's had a compass of about five octaves, thus corresponding to the harpsichord. Gradually this has been extended, until the instrument has now a range of seven octaves. Probably the compass will be still further increased, though already the extremely high notes have a pitch nearly inappreciable by the ear.

Practically all the really great composers, Wagner excepted, have made important contributions to p.

music. Bach and Händel, and to some extent Haydn and Mozart, wrote for either the clavichord or the harpsichord, but, so far as their music is concerned, the p. may be regarded as synonymous with these instruments. Beethoven, especially in his sonatas, was the first great classic of the piano. Schubert, Schumann, Mendelssohn, Brahms, and Liszt made each his peculiarly characteristic addition to the growing lit. In Chopin the p. found its most poetic exponent, and his compositions remain unmatched in their kind.

History of the P., by Brinsmead (1889), Bie (1899); Krehbiel, *The P. and Its Music* (1911).

PIANOSA, ancient *Planasia* (42° 35′ N., 10° 3′ E.), island, Italy; off W. coast.

PIATRA (46° 56′ N., 26° 20′ E.), town, on Bistritza, Moldavia, Rumania; trade in timber. Pop. 18,500.

PIAUHY (7° 30′ S., 43° W.), maritime state, Brazil, drained by Parnahyba; cattle-rearing; capital, Therezina. Pop. 400,000.

PIAZZA ARMERINA (37° 22′ N., 14° 22′ E.), city, Caltanisetta, Sicily; bp.'s see; woollens. Pop. 25,000.

PICA, a magpie; see under CROW FAMILY.

PICARDY, old province in N. of France, now comprising departments of Somme and portions of Pas-de-Calais, Aisne, and Oise; contained many important towns, including Amiens and Boulogne, and battlefields of Agincourt, Crécy, and St. Quentin.

PICARESQUE NOVEL, THE (Span. *picaro, picaroon*, 'rogue'), type of story common in W. Europe from middle of XVI. to end of XVIII. cent. Since classical times writers have not been backward in catering to the taste of those who delight to hear of picturesque rascality. The p. n. emanated from Spain; first known story (pub. anonymously *c.* 1550), *La Vida de Lazarillo de Tormes*, wittily written tale of cynical irreverent young adventurer, ran through three editions before being placed on *Index*, 1559; expurgated version pub., 1573. From Spain, p. n. penetrated to Holland, where it enjoyed a limited popularity and formed, as in other countries, theme of many plays; thence to England, where Nash's *Unfortunate Traveller* was followed by Defoe's *Moll Flanders* and Fielding's *Jonathan Wild*. France adopted the idea enthusiastically; *Gil Blas*, *Barbier de Seville*, and *Mariage de Figaro* good though late examples. These ended true p. n., as interest in picaroon had declined; never popular in Italy and Portugal.

PICARIAN BIRDS, see under ORNITHOLOGY.

PICAS, MOUSE HARES, or TAILLESS HARES (*Ochotona*), genus of guinea-pig-like Rodents which live in mountainous regions of Europe, Asia, and America.

PICCINNI, NICCOLA (1728–1800), Ital. opera composer; Gluck's famous rival at Paris; wrote *La Cecchina*, *Roland*, etc.

PICCOLO, see FLUTE.

PICCOLOMINI, OTTAVIO, PRINCE (1599–1656), Austrian commander; distinguished in Thirty Years War; made famous attack on Gustavus Adolphus at Lützen, 1632; helped to win day at Nordlingen, 1634; defended Austria against Swedes, 1640 and 1648; cr. field-marshal, Prince of Empire, and Duke of Amalfi after peace of Westphalia.

PICENUM, former district, Italy, bordering on Adriatic; came under Rom. control about 270 B.C.; rebelled, 90 B.C., when Social War broke out.

PICHEGRU, CHARLES (1761–1804), distinguished general of Fr. Revolution; commander-in-chief of army of Rhine, 1793, and captured imperial fortresses; overran Holland, 1795; plotted with Bourbons and frequently fell under suspicion; great conspiracy for assassination of Napoleon, 1804; betrayed; either murdered or committed suicide.

PICKEREL, Amer. name for small Pike.

PICKERING (54° 15′ N., 0° 46′ W.), market town, Yorkshire, England. Pop. (1911) 3674.

PICKERING, EDWARD CHARLES (1846–), Amer. astronomer and physicist; b. Boston; invented meridian photometer, an instrument for classifying magnitude of the stars.

PICKERING, TIMOTHY (1745–1829), Amer. general and statesman; commanded in War of Independence, and held offices under Washington's administration. Sons, JOHN (1777–1846), philologist, and OCTAVIUS (1792–1868), who prepared State *Reports*, grandson CHARLES (1805–78), naturalist, and great-grandson, EDWARD CHARLES (b. 1846), astronomer, are all well-known men.

PICKET, or **PIQUET**, a small body of men posted beyond the general line of sentries for purposes of observation, and to give warning of attack.

PICKETING, see LABOUR (LABOUR DISPUTES).

PICKLE THE SPY, writer of correspondence revealing Jacobite secrets; held by Andrew Lang to be Alastair Ruadh Macdonnell (*q.v.*).

PICO (38° 20′ N., 28° 30′ W.), volcanic island of the Azores, rising to height of 7612 ft. Chief town, Lagens. Pop. 25,000.

PICO DELLA MIRANDOLA, GIOVANNI, COUNT (1463–94), Ital. philosopher; member of Academy, Florence; sought to reconcile Plato with Aristotle, religion with philosophy; later, a mystic.

PICRITE, rock well represented in Great Britain; contains abundant olivine and also augite and plagioclase.

PICROTOXIN, neutral principle, consisting of colourless glistening prisms of a bitter taste, obtained from the fruit of an Indian plant called the Indian berry (*Anaminta paniculata*); a powerful poison, used medicinally, internally to check the night-sweats of phthisis, and externally as a parasiticide.

PICTON, SIR THOMAS (1758–1815), Brit. general; distinguished in W. Indies, 1794–97, and app. gov. of Trinidad; stamped out disorder, built fine roads, etc.; complaints led to resignation, 1803; tried and found technically guilty of cruelty, 1806; commanded under Wellington in Peninsular War, and won fame at sieges of *Ciudad Rodrigo* and *Badajos*, 1812, *Vittoria*, etc., 1813–14; slain at *Waterloo*.

PICTOU (45° 42′ N., 62° 45′ W.), seaport, Nova Scotia; exports coal. Pop. 3400.

PICTS, see SCOTLAND (HISTORY).

PIEDMONT (45° N., 8° E.), division of Italy, partly surrounded by Alps and Apennines, consisting of four provinces, Navara, Cuneo, Alessandria, Turin; area, 11,336 sq. miles; long under house of Savoy (*q.v.*). Pop. (1910) 3,492,334.

PIENZA (43° 5′ N., 11° 40′ E.), town, Siena, Italy; cathedral; birthplace, Pope Pius II.

PIER, name given to solid support of masonry or brick which carries an arch or other similar superstructure, or to mole or jetty used to shelter a harbour or to form landing-stage or seaside promenade. P's are largely used in the construction of bridges and viaducts, their form depending upon the weight to be supported and the nature of the ground. Promenade p's are usually carried upon an open pilework structure of iron, or sometimes timber, so that they offer a small surface to the wave action. P's employed in harbour works are really breakwaters (*q.v.*).

PIERCE, FRANKLIN (1804–69), 14th Pres. of U.S.A.; distinguished in Mexican War, 1846–47; Pres., 1853–57, and established democratic cabinet; stemmed abolitionist movement as inexpedient, and supported slave trade in Kansas to retain loyalty of southern states to Union; made determined opposition to Brit. press-gangs, 1853; purchased Mexican territory and carried out arrangements for railways to be constructed from Mississippi to Pacific.

PIERRE (44° 21′ N., 100° 15′ W.), city, capital, S. Dakota, U.S.A.; trade in live stock. Pop. (1910) 3656.

PIERREFONDS (49° 40′ N., 2° 55′ E.), town, Oise, France; celebrated feudal château.

PIERS PLOWMAN, see LANGLAND.

PIETERMARITZBURG, 'MARITZBURG (29° 46′ S., 30° 13′ E.), capital of Natal Province, formerly of Natal Colony; 41 miles from coast, 2220 ft. above

sea-level; government buildings, town hall, Univ. Coll.; bp.'s seat. Pop. (1911) 30,539 (14,848 white).

PIETERSBURG (23° 50′ S., 29° 30′ E.), town, Zoutpansberg, Transvaal; goldfields. Pop. 3500.

PIETISM, a religious development in Lutheranism in the XVII. and XVIII. cent's. The Lutheran Church had a rigid and rather formal system, with too much emphasis on externals and dogmatic standards, and not enough on simple piety or the Bible. One of the leaders was Philip Jacob Spener (1635–1705). Pietism had most influence in N. and Central Germany, but by about 1750, was on the wane. It is sometimes viewed as carrying still further the principles of the Reformation.

PIG FAMILY (*Suidæ*), a family of Even-Toed Ungulate Mammals belonging to the section SUINA, and including 40 species found only in the Old World. They possess in common a long, cylindrical, mobile snout with the nostrils on its flat disc-like extremity; narrow, four-toed feet, only the two central ones touching the ground; canines of upper jaw curving upwards and outwards to form tusks. The true Pigs (*Sus*) are found in Europe, Asia, and Africa, inhabiting bush country and devouring vegetable or animal food almost indifferently, though they show preference for roots.

The COMMON WILD BOAR (*S. scrofa*), which persisted in England till the Middle Ages, is the probable originator of British DOMESTIC PIGS, of which there are many varieties derived from the old races of tall, bristly 'old English Hogs,' or small, brownish Scot. Highland Hogs, by crossing chiefly with Chinese stocks to give 'white breeds,' and Neapolitan to give 'black breeds.' Domestic Pigs are known also as HOGS, or SWINE: the male is a boar, the female a sow. The BUSH PIGS, or RIVER HOGS (*Potamochærus*), frequent the banks of rivers and lakes in Africa and Madagascar, while the BABIRUSSA and WART HOGS (*Phacochærus*) are confined to the Malay Archipelago and Africa respectively.

PIGEON FAMILY, COLUMBIDÆ.—The true Pigeons, found in most parts of the globe, include the swiftly flying Common Wood P. (*Columba palumbus*), the Rock P. (*C. livia*), the wild form of the Domestic P. inhabiting the cliffs and foreshores of Scotland and Ireland, and the smaller STOCK DOVE (*C. œnas*). The Carrier P. is one of the most useful of the many domestic varieties, serving as message-bearer in times of war and peace.

PIGEON-FLYING, sport popular in Belgium, England, and France. Homing pigeons are specially trained. Annual races take place in Belgium; birds sent from Toulouse to Brussels (*c.* 500 miles). Sport was introduced into U.S.A., 1875. The speed of pigeons is 1200–1800 yards per minute.

PIGEON-POST, the employment of trained pigeons to carry news; in use amongst the Greeks; still in use for military purposes in continental fortresses; carried out with remarkable success at siege of Paris, 1870–71.

PIGMENTS are powdered colouring matters applied through a medium in which they are insoluble. When natural, they may be of mineral, vegetable (*e.g.* gamboge, indigo), or animal (*e.g.* cochineal) origin. Substantive pigments have an original colour; adjective pigments (*e.g.* crimson lake) are precipitated on a colourless base (*e.g.* alumina).

Pigments must be finely ground in a drying oil (*e.g.* linseed) for oil paints, or in gum water for water colours. They must have stability and body, and must not interact, when mixed.

Important mineral pigments: lamp black and Indian ink (carbon), zinc white or Chinese white (ZnO), Venetian red and burnt sienna (Fe_2O_3), red lead (Pb_3O_4), white lead ($2PbCO_3$, $Pb(OH)_2$), viridian green (hydrated Cr_2O_3), vermilion (HgS), chrome yellow ($PbCrO_4$), cadmium yellow (CdS). Prussian blue is ferric ferrocyanide; carmine and crimson lake are cochineal combined with alumina, rose madder is alizarin (from *Rubia tinctorum*) with alumina. Indigo and alizarin are now prepared artificially.

PIGMY, see PYGMY.

PIGOTT, RICHARD, see PARNELL, CHARLES.

PIG-STICKING, sport popular in India, especially among Army officers. Wild pigs are hunted on horseback by riders armed with long lances.

PIG-TAILED BABOON, see under CERCOPITHECIDÆ.

PIGTAILS, see HAIR.

PIKE, wooden weapon tipped with iron, and from 12 to 14 ft. long, used very extensively in war before introduction of bayonet.

PIKE PERCH, see PERCHES.

PIKE, ZEBULON MONTGOMERY (1779–1813), Amer. general; surveyed Upper Mississippi, 1805; captured by Spain while exploring Louisiana, 1807; pub. *The Sources of the Mississippi and its Tributaries*, 1810.

PIKES (*Esocidæ*), long-bodied, slender, large-mouthed bony fishes, which are exceedingly voracious, feeding on their own kind and other fishes, and even on frogs, voles, and water-fowl; found only in the rivers of the N. hemisphere; *Esox lucius* in Britain, and in N. Asia and America.

PIKE'S PEAK (38° 50′ N., 105° 14′ W.), peak, Rocky Mountains, Colorado (14,107 ft.).

PILATE, PONTIUS (I. cent. A.D.), Rom. gov. of Judæa; procurator of Judæa, Idumea, and Samaria, 26–36; merciless tyrant according to secular historians; attitude towards Jesus Christ has made his character theme of much later speculation; Spenser's picture of him eternally washing his hands in hell is from old legend.

PILCHARD, see under HERRING FAMILY.

PILES, see HÆMORRHOIDS.

PILGRIM FATHERS, see MASSACHUSETTS.

PILGRIMAGE, a journey to a religious place, embarked on as an act of piety. P's have been a special characteristic of Catholic Christianity, but they are found too in non-Christian religions. Thus the river Ganges is sacred to Hindus; the city of Benares on its banks is specially holy to Brahmans. Certain spots were sacred in classical Greece, *e.g.* Apollo's shrine at Delphi. Every pious Muhammadan must sometime visit Mecca. P. is not found in the first age of the Christian Church, but before long Christians naturally desired to tread in the footsteps of the Saviour. The supposed spot of the birth of Christ was pointed out in the IV. cent. From this time onwards large numbers of Christians came on pilgrimage to the Holy Land. These became more frequent when Constantine built the Church of the Holy Sepulchre, where formerly a temple of Venus had stood, on the site of the tomb of Christ. His mother, the Empress Helena, discovered as she thought the true Cross, and happy was the church which preserved any portion of it. Indeed, the possession of relics gave any shrine a fame which drew thousands of pilgrims to it. As pilgrimages in Palestine increased, the demand for sacred sites produced a supply, and many were believed in by the credulous, which can have had but little historic attestation.

In the Middle Ages the popularity of the p. steadily increased, and a visit to the Holy Land was viewed as a means of expiating sin. Various abuses grew up, till some prelates were obliged to check the tendency of their people to leave their homes. England possessed many famous shrines, particularly that of St. Thomas Becket at Canterbury (cf. Chaucer's *C. Tales*). These were all destroyed at the Reformation, for Protestantism never took kindly to the idea of pilgrimage. Of present-day shrines, one of the most famous is Lourdes (*q.v.*), and thither thousands of Catholic pilgrims resort.

PILIBHIT (28° 48′ N., 79° 51′ E.), town, Pilibhit, United Provinces, Brit. India. Pop. 35,000; (district) 475,000.

PILLAR-WORSHIP.—The pillar (Gk. *baitulos*)

was a cult-object of early Hellenes and Semites. In the Dictæan Cave of Crete, the legendary birthplace of the Hellenic Zeus, a bætylic table of offering has been found, and Jacob's Bethel seems clearly to have been a similar observance. It is believed that the bætylic altar found at Cyrenaïca was associated with the Libyan Zeus Ammon, and that Celtic dolmens are akin. These pillars seem, therefore, to point to a universal primitive religion.

Evans, *Mycenæan Tree and Pillar Cult.*

PILLAU (54° 40′ N., 19° 56′ E.), fortified seaport, watering-place, E. Prussia, Prussia, at entrance to Frisches Haff; sail-making, shipbuilding. Pop. (1910) 7066.

PILLNITZ (51° 1′ N., 13° 53′ E.), village and royal castle, on Elbe, Saxony.

PILLORY, apparatus of punishment; board, with holes for head and wrists, mounted above platform; not used in Britain since 1837.

PILOÑA (43° 16′ N., 5° 35′ W.), town, Oviedo, Spain. Pop. 19,000.

PILOT, a special steersman taken on board a vessel to take it into or from a port or through a particular channel. In the U.K. p's are licensed and under the control of a number of different authorities, each of which has jurisdiction over a certain district, subject to the supreme control of the Board of Trade. The London Trinity House is the most important of these authorities. In cases where a ship requires a pilot and no qualified pilot offers his services, an unqualified pilot may take charge of the vessel, but he must relinquish his charge when a qualified pilot offers himself. In British waters and in most foreign ports British warships are not required to employ a pilot.

Pilotage in British waters may be either compulsory or free. If the former, a pilot has supreme control of the ship, temporarily superseding the master; but if the latter, he is considered as only advising the master, not superseding him. According to the majority of foreign mercantile codes the pilot is regarded as an adviser only, and the master is not freed from liability.

PILOT WHALE, see Dolphin Family.

PILOT-FISH (*Naucrates ductor*), so called on account of its supposed alliance with the Shark; a rare relative of the Horse-Mackerel; found in the open waters of the Atlantic and Pacific Oceans.

PILPAY, see Bidpai.

PILSEN (49° 45′ N., 13° 23′ E.), town, Bohemia, at confluence of Mies and Radbusa; famous *Pilsener* beer. Pop. (1911) 81,165.

PIMENTO, Jamaica Pepper, Allspice, fruit of *Eugenia Pimenta*, a tree of W. Indies; dried and sold as spice. **Oil of Pimento**, distilled from fruit, is a popular remedy for toothache.

PIMPERNEL (*Anagallis*), genus of plants, order Primulaceæ; Scarlet P. (*A. Arvensis*), 'Poor Man's Weather-Glass,' closes its petals in dull weather; Bog P. (*A. tenella*) has large pink flowers.

PIMPLES, see Acne.

PINAR DEL RIO (22° 26′ N., 83° 32′ W.), city, Pinar del Rio, Cuba; trade centre for tobacco district of Vuelta Abajo. Pop. 11,000; (dist.) 240,372.

PINCKNEY, CHARLES (1758–1824), Amer. statesman; member of congress of S. Carolina, and convention which drew up U.S.A. constitution, 1787; gov. of S. Carolina, 1789–92, 1796–98, 1806–8; U.S.A. senator, 1799; supported Jefferson; member state legislature, 1810–14.

PINCKNEY, CHARLES COTESWORTH (1746–1825), Amer. statesman; organised revolt of S. Carolina in War of Independence, and secured its accession to confederation; minister to France, 1796, when he and Directory defied each other.

PIND DADAN KHAN (32° 35′ N., 73° E.), town, Jhelum, Punjab, Brit. India, on Jhelum. Pop. 14,500.

PINDAR, Pindaros (c. 522–443 B.C.), Gk. lyric poet; b. Cynoscephalæ, Bœotia: after preliminary education at Thebes, he studied music and poetry at Athens; after long study began to write choral odes, and attained great fame, not only in Greece, but in Sicily, Cyrene, and Magna Græcia. He was frequently entertained by potentates, notably by Hiero of Syracuse and Arcesilaus of Cyrene; died, probably at Argos, at age of 80.

P. came of ancient Cadmean stock, tracing his ancestry to Ægeus, and was therefore thoroughly imbued with Theban tradition, but as branches of the family had settled in various parts of Greece, he was really Panhellenic in sentiment.

His poems consisted of songs in praise of gods and men, processional songs, festal songs, dirges, and pæans of victory, besides poems on other themes. A great part of his work has been lost, but his songs of victory (*Epinikia*) have come down to us in four books, describing and praising the victors at the four Greek games—Olympian, Isthmian, Pythian, and Nemean. The language is epic, abounding in Doric touches and homely pictures; his similes are numerous and sometimes of extreme beauty. References to mythology are frequent, as might be expected from P.'s family, and a deep religious feeling pervades all his poetry. He is sometimes obscure and complicated, but his syntax is usually easy of interpretation. P.'s influence on posterity may be judged from the action of Alexander the Great, who, when he razed Thebes, left the poet's house untouched, thus following the traditional example of Pausanias of Sparta. The discoveries at Oxyrhynchus (1905–7) provided several hitherto unknown poems of P.

E. Myers' *Translation* (2nd ed., 1883); O. Schiöder, *Text and Notes* (1908).

PINDARICS, a form of verse, so called from its imitation of the irregular odes of Pindar (*q.v.*).

PINDUS (39° 15′ N., 21° 46′ E.), range of mountains in Greece, separating Thessaly and Epirus; highest elevation, 7000 ft.

PINE (*Pinus*), evergreen coniferous trees of typically symmetrical appearance, this being due to the production of annual pseudo-whorls of branches. These produce scale leaves in the axils of which dwarf shoots, or 'foliar spurs,' arise, each bearing from two (*Pinus sylvestris*) to five (*P. strobus*) needle-shaped leaves. The male cones are borne in clusters, each one consisting of numerous stamens containing abundant, powdery pollen. The pollen grains have a pair of wing-like extensions which facilitate their transport by the wind. The female cones take three years to ripen, being pollinated about June, fertilised the following June, and matured during the third season. Each scale bears two winged seeds, containing an embryo with a whorl of cotyledons, embedded in a rich nutritive tissue. On this account the seeds of some species (*P. pinea*) are utilised as food. The p's (including *P. sylvestris*, the Scots *Fir*) are of immense value as timber trees, *P. sylvestris* yielding deal, *P. palustris*, pitch-pine, and *P. echinata*, yellow pine, whilst in addition turpentine is obtained by tapping the trunks of various species, and also by distillation of the resin exuded from the wounds. Tar and pitch are yielded on destructive distillation in closed chambers.

Veitch, *Manual of the Coniferæ.*

PINE BLUFF (34° 13′ N., 91° 55′ W.), city, Arkansas, U.S.A., on Arkansas; cotton manufactures. Pop. (1911) 15,102.

PINE-APPLE (*Ananassa sativa*), plant of order Bromeliaceæ; sharp leaves spring from root, and in centre flowers grow on a spike; fruit comes to Britain from the Azores.

PINEL, PHILIPPE (1745–1826), Fr. physician, chief physician at the Saltpêtrière and prof. of Pathology at École de Médecine, Paris; one of first to advocate humane treatment of the insane. See Insanity.

PINENE, see Terpenes.

PINERO, SIR ARTHUR WING (1855–), Eng. dramatist. See Drama.

PINEROLO (44° 53′ N., 7° 19′ E.), city, Turin

province, Italy; cathedral; textiles; formerly important Fr. fortress. Pop. 18,500.

PINK (*Dianthus caryophyllus*), a member of the Caryophyllaceæ, garden varieties of which are largely grown on account of their scent and attractive appearance. The plant is often propagated by layering, but is easily raised from seed.

PINK EYE, a disease of horses; symptoms are—high temperature, loss of appetite, redness of eye, stiffness and swelling of joints, constipation; treatment—stimulation of heart to prevent clotting of blood, laxatives, absolute rest.

PINKERTON, ALLAN (1819–84), Amer. detective; b. Glasgow; emigrated to America, 1842, to escape imprisonment as a Chartist; first detective for Chicago, 1850; organised secret service division of the N. Army at the Civil War, and established detective agency. Pub. various stories.

PINKERTON, JOHN (1758–1826), man of letters; b. in Edinburgh; settled in London; died in Paris. He is most frequently quoted for his collection of *Ancient Scottish Poems*.

PINNA, see under LAMELLIBRANCHIATA.

PINNACLE, architectural term for stone upright ending in spired point, used in Gothic architecture.

PINNIPEDIA, a sub-order of Carnivora (*q.v.*).

PINOCHLE, PENUCHLE, card game played with two packs; cards from two to eight discarded; combinations of cards sought, as in bezique.

PINS are generally manufactured in Wright machine; brass wire is drawn to requisite length; head shaped by die; dropped into slot and pointed by rotating cutter; coated with tin; formerly made with separate heads. P's and safety p's of various metals are found on prehistoric dwelling sites and in classical remains. Birmingham is Brit. centre of industry.

PINSK (52° 10′ N., 26° 7′ E.), town, on Pina, Minsk, Russia; potteries; active transit trade. Pop. 28,000.

PINT, see WEIGHTS AND MEASURES.

PINTADO, see GUINEA FOWL.

PINTO, contagious disease, occurring in Mexico and Central America, in which the whole body is discoloured brown, blue, and black; due to a vegetable parasite.

PINTO, FERNÃO MENDES (1509–83), Portuguese traveller and writer; set out for East, 1537; visited Japan, 1542; joined Jesuits and undertook mission to Japan, 1556, but deserted Order 1558; returned to Portugal and wrote famous *Peregrination*.

PINTURICCHIO, BERNARDINO DI BETTI (1454–1513), Ital. painter; executed large number of frescoes, including six on the walls of the Vatican library. At one time he was assistant to Perugino; painted also some fine panel pictures

PINZON, family of Span. sailors who claim to share with Columbus honour of discovering America; Martin Alonzo (d. 1493) and his bro's, Vicente Yañez and Francisco, supplied Columbus with funds and sailed in his expedition, 1492–93.

PIOMBINO (42° 55′ N., 10° 31′ E.), seaport, province Pisa, Italy, on Mediterranean. Pop. 8000.

PIOMBO, see SEBASTIAN DEL PIOMBO.

PIOTRKOW (51° 30′ N., 19° 40′ E.), gov., Russ. Poland; undulating and hilly; well cultivated; lignite and iron deposits; textile industries. Pop. 1,933,400. Capital, Piotrkow (51° 25′ N., 19° 45′ E.), manufactures flour. Pop. 40,000.

PIOZZI, HESTER LYNCH (1741–1821), Eng. writer; the Mrs. Thrale immortalised by Dr. Johnson; a prolific writer, but it is not as an author so much as the devoted friend of the lexicographer that she will be remembered. Only second to Boswell in literary interest are her *Anecdotes of Dr. Samuel Johnson*.

PIP, see POULTRY-FARMING.

PIPAL, Bo TREE, sacred Fig of Hindus, who believe Vishnu was born under it.

PIPE.—(1) musical instrument consisting of pierced cylinder; mediæval p. had three holes; was chromatic; Highland bag-p. has eight holes, one in back; achromatic. (2) device for smoking tobacco, probably N. American in origin, though some authorities hold that p. was used by ancients for smoking aromatic herbs; first made of stone, now of wood, clay, or meerschaum; briar p. most popular.

PIPE ROLLS, see RECORD.

PIPE-FISHES AND SEA-HORSES (*Syngnathidæ*), some 175 species of very long, slender fishes, with bodies covered by bony rings; found in almost all seas. Many of the males possess a brood pouch in which the eggs are retained until hatched. Five kinds of Pipe-Fishes, distinguished by their long, hard snout, occur on Brit. coast, as also does the peculiar Sea-Horse (*Hippocampus*), which clings to seaweeds by its prehensile tail, but it prefers warmer S. seas.

PIPERNO (41° 28′ N., 13° 12′ E.), town, ancient Privernum, Rome, Italy, on Amaseno. Pop. 7000.

PIPITS (*Anthus*), genus of Perching Birds closely related to the Wagtails, having long legs, a slender bill slightly notched at the tip, and dull-coloured plumage. They occur in almost all parts of the world.

PIPPIN I., PEPIN (d. 640), mayor of palace to Dagobert I.—P. II. (d. 714) established power over Neustria and Austrasia and external status.—P. III. d. 768) crowned, 751; f. of Charlemagne.

PIPRAWA, village on Birdpur estate, in Basti district, United PROVINCES, India. Buddha's birthplace is only 12 miles distant; there, after excavation, many finely wrought articles—now in Calcutta Museum—were discovered in a ruined tope or burial-mound.

PIPRIDÆ, Manakins (*q.v.*).

PIQUA (40° 7′ N., 84° 13′ W.), city, on Miami, Ohio, U.S.A.; iron foundries, wool, flour. Pop. (1910) 13,388.

PIQUET, card game, prob. of Fr. or Ital. origin; two players participate; pack prepared by discarding from two to six in all suits; no trumps; game of six hands. If loser scores over 100 points his score is deducted; if under, he is penalised by being *rubiconed*, i.e. score added to opponent's. Game originally of 101 points; very popular in England, XVII. and XVIII. cent's; now little played.

PIRACY, see under THEFT.

PIRÆUS, see ATHENS.

PIRANO (45° 32′ N., 13° 34′ E.), seaport, Istria, Austria, on Gulf of Trieste; exports salt. Pop. (1911) 15,320.

PIRKE ABOTH, 'Sayings of the Fathers,' part of the Mishnah; a book of proverbs illustrating Judaism just before time of Christ; Hebrew, but partly in Aramaic; printed in Jewish Prayer Book.

PIRMASENS (49° 12′ N., 7° 37′ E.), town, Rhine Palatinate, Bavaria; boots and shoes. Pop. (1910) 38,463.

PIRNA (50° 57′ N., 13° 56′ E.), town, on Elbe, Saxony; sandstone quarries, glass-works. Pop. (1910) 19,525.

PIROT (43° 12′ N., 22° 35′ E.), town, department Pirot, Servia; manufactures cloth; scene of defeat of Servians by Bulgarians in 1885. Pop. 10,700; (department) 100,000.

PISA (43° 43′ N., 10° 23′ E.), city, N. Italy (Tuscany), on Arno, capital of P. province, with well-preserved walls and fine quays along river known as Lung'arno. Outstanding features are cathedral of white marble (XI. cent.) with magnificent façade and valuable paintings by Andrea del Sarto, Salembeni, and others; marble baptistery (begun 1153), with famous pulpit by Niccola Pisano and fine marble font; Campanile or Leaning Tower (1174–1350), 183 ft. high; Santa Caterina (XIII. cent.), San Niccolo, Santa Maria della Spina, San Francesco, and other churches; Campo Santo, burial-ground (founded XIII. cent. by several shipfuls of earth from Jerusalem) surrounded by cloisters with frescoes by Tuscan and other painters, Univ. (La Sapienza, 1338), with library, natural history museum, and botanical garden; Communal, Agostini, Upezzinghi, and other palaces; Museo Civico, with

fine art collection; manufactures of silks, cottons, coral and alabaster work; royal stud-farm; horses and dromedaries in vicinity. P. was a Rom. colony, 180 B.C.; important commercial centre and one of greatest naval powers in XI., XII., and XIII. cent's; continuous wars with rivals, Venice and Genoa, led to final defeat by Genoese at *Meloria*, 1284; conquered by Florence, 1406; became independent under Charles XIII. of France, 1494; retaken by Florentines, 1509. In XII. and XIII. cent's P. held a prominent place in the history of art; birthplace of Galileo (*q.v.*). Pop. (1911) 65,200.

Ross and Erichsen, *Pisa* (Mediæval Towns Series).

PISA, COUNCIL OF (1409), Church Council, purporting to be general, held during great Western Schism, 1409. It deposed rival popes and elected Alexander V.; important in Conciliar movement as leading the way to Council of Constance; generally held not œcumenical. Other councils were held at P. in 1134 and 1511.

PISAN, CHRISTINE DE (1363–*c.* 1429), Fr. poetess; dau. of Venetian astrologer of King Charles V. of France; widow without means at twenty-five; wrote to keep her family. Amongst her numerous productions are *Faits et bonnes Mœurs de Charles V.*, moral and allegoric poems and fine ballades on events of the time.

PISANO, NICCOLA (*c.* 1206–78), eminent Ital. sculptor, architect, and engineer. Three important and excellent works of his survive, viz. the pulpit in Siena Cathedral, the shrine in St. Dominic's, Bologna, and the pulpit of the Baptistery, Pisa.

PISAURUM, modern PESARO (*q.v.*) (43° 55′ N., 12° 55′ E.), ancient town, on Via Flaminia, Umbria, Italy.

PISCES, see FISHES.

PISCICULTURE, the artificial rearing of fishes from the egg for the purpose of stocking suitable localities with young fishes. The aim of p. is to guard and shield the embryonic fishes during the early stages, when they are so liable to wholesale destruction, until they are able to fend for themselves, that is to say, until at least the yolk sac is wholly absorbed. Methods of hatching and rearing have long been carried out in specially adapted hatcheries, where especially trout and salmon were dealt with; but great advances have been made as regards edible marine creatures and many plaice and other marketable fishes, and oven lobsters are hatched and released on suitable grounds every year.

PISEK (49° 18′ N., 14° 10′ E.), town, on Wottawa, Bohemia, Austria; iron foundries. Pop. (1911) 16,479.

PISIDIA, a rugged and mountainous country of ancient Asia Minor, immediately N. of Pamphylia; boundaries not clearly defined; occupied from early times by wild and lawless people; traversed by St. Paul.

PISISTRATUS, PEISISTRATUS (*q.v.*).

PISO, Rom. surname in *gens* Calpurnia. From beginning of II. cent. B.C. this plebeian family produced many distinguished statesmen and generals; Cæsar's wife belonged to this family.

PISTACIA, genus of small trees, order Anacardiaceæ; flowers are diœcious and have no petals; fruit is a single-seeded dry drupe; *P. vera* yields Pistachio Nut used in cooking; *P. lentiscus* gives Mastic, a gum-resin; and from *P. terebinthus* Cyprus Turpentine is obtained.

PISTIL, see FLOWER.

PISTOIA, PISTOJA (43° 57′ N., 10° 55′ E.), town, Tuscany, Italy, near river Ombrone; of considerable importance during Middle Ages; contains many buildings of great sculptural and architectural interest; manufactures include iron- and steel-ware, small-arms, glass, and textiles. Pop. 62,800.

PISTOIA, SYNOD OF (1786), assembled under auspices of grand-duke of Tuscany; declared Bible and Fathers to be test of faith, etc.; condemned by pope, 1794.

PISTOLS.—As early as 1570 a firearm to be held and fired with one hand—that is, a pistol—was used by cavalry. At the Pigeon-House Fort, Dublin, are preserved pistols of the period 1625–90. A century later pistols were made with three brass barrels which unscrewed to load; they were fired by flint and steel. Like the musket, the pistol has undergone many changes in regard to its bore and the mechanism for loading and firing. As late as 1866 we had in use, side by side, the naval smooth-bore pistol and the cavalry rifle pistol, as well as Colt's and other revolver (rifled) pistols.

The Webley pistol is now used in the British Army; its calibre is ·441 inches; its length, 10½ inches (barrel, 4 inches); weight, 2 lb. 3 oz. The cylinder (1⅛ inch) is chambered to hold 6 cartridges, and it revolves on a tube, in which is the stem of the extractor. The barrel is rifled (7 grooves); weight of bullet, 265 grains; charge of cordite, 6½ grains; muzzle velocity, 640 f.s.; weight of packet of 12 cartridges, 9½ oz. The pistol may be fired in two ways: (1) by the trigger action for 'continuous' practice; (2) by the cocking action for 'single' practice. The extreme range of a bullet is 1550 yards, but the pistol is intended to be used at close quarters (it is sighted to 50 yards), and as loss of accuracy occurs in a continuous firing, this should only be resorted to in an emergency.

The latest type of pistol is 'automatic,' which relieves the firer of all manipulation except the replenishing of the magazine, taking aim, and pressing the trigger, but its special danger is that the recoil is apt to cause another shot to be fired unintentionally; and when the catch which holds back the hammer gets worn, the whole contents of the magazine may be discharged automatically.

PISTONS or VALVES, in brass musical instruments, are mechanical contrivances whereby the gaps in the instrument's natural scale of sounds are filled up. They lengthen or shorten the vibrating column of air in the tube, and so produce alterations of pitch. The narrow-scale instruments have three pistons: the first lowers a whole tone, the second half a tone, the third one and a half tones; and combinations of two, or all three, give further variations of pitch. The most generally familiar use of the piston is seen in the cornet.

PITCAIRN (25° 5′ S., 130° 5′ W.), island, S. Pacific; area, 2 sq. miles; produces coffee, fruits. Discovered 1767, and peopled in 1790 by mutineers of the *Bounty*; annexed by Britain, 1839. Pop. 170.

PITCAIRNE, ARCHIBALD (1652–1713), Scot. physician; studied med. at Edinburgh and Paris; prof. of Med. at Leiden, 1692; returned to Edinburgh, m., and remained there, to become the most eminent physician of Scotland; persuaded the Town Council to allow him to dissect the unclaimed bodies of paupers for the purpose of anatomical study, thus laying the real foundations of the Edinburgh school of med.; author of medical and other works.

PITCH is the term generally used to denote the precise degree of acuteness or gravity of any given musical note or notes. Musical sounds are produced by a series of vibrations, and according to the number of vibrations so is the sound of higher or lower pitch. More precisely, p. is the recognised standard according to which voices and instruments are set or tuned. In that sense it is synonymous with the term, 'concert pitch.' This pitch was formerly much lower than now — the later heightening being chiefly due to makers of wind instruments, who thus obtain a more brilliant tone. Uniformity of pitch has long been desired for all musical countries, so that the particular note, A or C, chosen for tuning should be everywhere of exactly the same degree, but so far this has not been secured.

PITCHBLENDE, $U(UO_4)_2$, uranate of uranium, a mineral, the source of uranium and radium (*q.v.*), found in Cornwall and Saxony; composed largely of oxide of uranium and generally found with uranite; colour, brown or black.

PITCHER-PLANTS, forms in which the whole leaf (*Sarracenia Darlingtonia*) or the apical portion

(*Nepenthes*) is modified to form a lidded pitcher-like structure for the capture and digestion of insects. The pitcher is often brightly coloured, and has an incurved lip round which are numerous honey glands. Beyond this is a slippery zone down which insect visitors glide helplessly, to fall into the liquid below and be prevented from returning by downward-pointing hairs. Here they drown and decay, and are digested by special secretions, thus forming an additional source of nitrogenous food.

PITCHSTONE, an acid volcanic glass occurring in dykes in S. Europe, S. America, and the Hebrides; has a greasy lustre resembling pitch. Colours: green, brown, yellow, blue, and black.

PITESCI, PITESHTI (44° 52′ N., 24° 52′ E.), town, Argesh, Rumania, on Argesh. Pop. 16,500.

PITH, see PLANTS (ANATOMY).

PITHECANTHROPUS ERECTUS, a genus of Anthropoid Ape, represented by a few fossil bones from Java, and believed to link the highest apes to man.

PITHECIA, see SAKI MONKEYS.

PITHIVIERS (48° 11′ N., 2° 15′ E.), town, on Œuf, Loiret, France; trade in grain, saffron. Pop. 6300.

PITIGLIANO (42° 36′ N., 11° 32′ E.), town, Grosseto, Italy. Pop. 5100.

PITLOCHRY (56° 42′ N., 3° 44′ W.), village, health-resort, Perthshire, Scotland.

PITT, THE ELDER, see CHATHAM, 1ST EARL OF.

PITT, WILLIAM (1759–1806), Brit. statesman; 2nd s. of great orator and statesman, William P., 1st Earl of Chatham; delicate, precocious child trained in oratory by f.; ed. at Pembroke Hall, Cambridge; called to Bar, 1780; member for Appleby, Cumberland, 1781, in Lord North's administration; took important part on opposition side, and a month after taking seat made 'the best first speech,' said North, that he had ever heard. The Amer. War brought about a dissolution, March 1782. P., under twenty-three, astonished the world by declaring that he would not accept a subordinate position.

On death of Rockingham, July 1782, Shelburne became Prime Minister and the youthful P. Chancellor of the Exchequer, while the Rockinghamites resigned. A vain endeavour to include Fox in the cabinet was the occasion of the life-long quarrel between Fox and P. Parliamentary criticism of terms of peace with America led Shelburne to seek to strengthen himself by alliance with North. Bitter opposition, headed by P., led to Shelburne's resignation. P. was pressed to accept treasury, but firmly refused, and Portland coalition ministry (including Fox) was formed, April 1783. Months of obscurity ended Nov. and Dec. by eloquent denunciation of Fox's India Bills. The ministry being dissolved by the king, P. formed new cabinet.

He was only twenty-four, and the 'boyish freak' of his accepting office excited mixed laughter and rage. His cabinet was without ability and opposed by House of Commons, led by Fox, but he was supported by king and lords, and, as s. of Chatham, by the country. He represented patriotic tradition in opposition to Whig carpet-bag politicians, and the result of an appeal to the country, 1784, was a triumph for the government; P. sat for the Univ. of Cambridge henceforward. He proceeded to restore Britain to the position in Europe she had lost by the Amer. War. He restored national credit by his genius for finance, initiated a scheme of offering public loan for private tender, lowered tea duties, suppressed smuggling, etc., while he himself, although bitterly poor, scarcely took legitimate spoils. He had already brought in bills for parliamentary reform and made a last vain effort to extinguish rotten boroughs, 1785. He carried a bill for free trade with Ireland, after some modifications, through Brit. parliament, despite the outcry of Eng. manufacturing interests, but the modifications caused its rejection in Ireland; he carried a commercial treaty with France, 1786, strongly opposed by landed interest; gave no support to repeal of Test and Corporation Acts, 1787, not being strong enough to alienate Church; made alliance with Prussia for restoration of Prince of Orange, 1787; alienated powerful interests by his support of Wilberforce, 1788–92; passed India Bill, 1788.

The great regency question arose when George III. became insane, 1788. P. carried his Bill of Regency through the Commons, 1789, but fortunately for him the king recovered. He was forced by opposition to allow Russ. aggression, 1791. P. refused to perceive the international importance of the Fr. revolution until his ally, Holland, was attacked, 1792, and until he was forced to repress seditious writings and call out the militia in London. War with France was declared, 1793. Unfortunate Irish action was taken, 1795, P. withdrawing measures of relief which he had intended to give to Catholics. Despite a tremendous deficit, P. was attacked for his anxiety to make peace with France; at the same time mobbed for his taxation. A repressive policy in Ireland and at home was adopted.

Encouraged by battle of *Nile*, 1798, P. formed a coalition against Napoleon. To meet the crisis the Income Tax was introduced, 1800. Legislative union with Ireland was passed, 1800. A quarrel with the king on Catholic emancipation was followed by a fresh attack of royal madness and P.'s resignation, 1801, after 18 years' rule. P. supported Addington till 1803, when he made a brilliant oration condemning the half-hearted conduct of war. Again called to office, 1804, he formed a new coalition, 1805, against Napoleon. Petty parliamentary attacks achieved the ruin of his health, and he never recovered his spirits after news of *Austerlitz*. His last words were, 'Oh, my country! How I leave my country!' Self-contained and apparently cold of nature, P. was passionately patriotic and a great orator. He had no vices save intemperance.

Life, by Gifford (1809), Rosebery (1891), Whibley (1905), Holland Rose (1911).

PITTAS, or OLD WORLD ANT-THRUSHES (*Pittidæ*), a family of about 70 Perching Birds, with brilliant crimson, green, and blue plumage, found in the tropics of Africa, South-East Asia, Australia, and the intermediate islands.

PITTIDÆ, Pittas (*q.v.*).

PITTSBURG (37° 26′ N., 94° 40′ W.), city, Kansas, U.S.A.; lead and zinc region; coal mines. Pop. (1910) 14,755.

PITTSBURGH (40° 27′ N., 80° 1′ W.), city, port of entry, capital of Allegheny County, Pennsylvania, U.S.A.; situated on Allegheny, Monongahela, and Ohio Rivers; business part of city is built on 'Point' between Allegheny and Monongahela, where they meet to form Ohio; residential districts lie mostly on surrounding hills; Fourth and Fifth Avenues are two busiest thoroughfares; principal public parks are Schenley, Riverview, West, and Highland Parks; P. contains many fine buildings, including court-house, Government buildings, Frick Office, city hall, Exposition building, Carnegie Institute, Carnegie Library, Phipps Conservatory (in Schenley Park), and St. Paul's Cath.; Univ. of P. embraces numerous educational institutions. Stockade built on site of P., 1754, and captured by French, who named it Fort Duquesne; taken by English, 1758, and called Fort Pitt, in honour of William Pitt; incorporated as borough, 1804, and chartered as city, 1816; Allegheny joined to P., 1906.

P. is a city of enormous industrial importance; built in centre of rich coal-fields; region also produces natural gas and petroleum; centre of extensive railway system; great river traffic, locks and dams being constructed on rivers to secure slack-water navigation; slaughtering and meat-packing are important industries; factories extend for miles along river banks; among leading manufactures are iron and steel products, glass, rolled brass and copper, foundry and machine-shop products, silver and nickel-plated ware, earthenware, tin-plate,

electrical machinery, bricks, carriages, and furniture. Pop. (1910) 533,905.

PITTSFIELD (42° 30′ N., 73° 18′ W.), town, Massachusetts; manufactures cottons, woollens, silks, boots, and shoes; has cathedral, and various educational and philanthropic establishments. Pop. (1910) 32,121.

PITTSTON (41° 18′ N., 77° 53′ W.), city, on Susquehanna, Pennsylvania, U.S.A.; anthracite coal mines. Pop. (1910) 16,267.

PITYRIASIS VERSICOLOR, skin disease, consisting of irregular, dry, yellowish patches, usually on front of the trunk, due to a parasitic fungus, *microsporon furfur*; treated locally by a mercurial ointment, internally by arsenic.

PIURA (5° 12′ S., 80° 52′ W.), coast department, N. Peru; area, 16,825 sq. miles; capital, P.; produces petroleum, tobacco, cotton; live stock raised. Pop. *c.* 220,000.

PIUS II., ÆNEAS SILVIUS PICCOLOMINI (1405–64), pope; studied at Siena, and was employed as secretary to various prelates, to Pope Felix V., 1438, and the Emperor Frederick III., 1442. He was made cardinal, 1448, and elected pope, 1458. He defended the papal claims as against councils, and did what he could to stir up Europe against the Turks. An acute and scholarly man, he was a typical product of the Renaissance; wild as a youth, he was serious later. His own writings are the chief source of information about him.

Boulting, *Enea Silvio de' Piccolomini*.

Pius IV., GIOVANNI ANGELO MEDICI (1499–1565), pope; cardinal, 1549, and pope, 1559; a careful statesman and man of the world; his pontificate marked by the Council of Trent.

Pius V., MICHELE GHISLERI (1504–72), pope; in early life a Dominican; became grand inquisitor, and was elected pope, 1566. A man of stern morals and the enemy of all corruption, he was a passionate opponent of Protestantism and a relentless persecutor. He urged on the persecution of Alva, excommunicated Queen Elizabeth, and drove the Jews from Rome. A high principled and intensely bigoted man, he typified the counter-Reformation. He was canonised, 1712.

Pius VI., GIOVANNI ANGELO BRASCHI (1717–99), pope; cardinal, 1773; pope, 1775. An able administrator, he carried through several reforms in the papal States. During his pontificate French Church was disturbed by the Revolution. Rome was captured by the French, 1798, and Pius taken prisoner.

Pius VII., LUIGI BARNABA CHIARAMONTI (1740–1823), pope; cardinal, 1785; pope, 1800. The events of his pontificate were largely concerned with France; he formulated the Concordat, 1801, and crowned Napoleon in Paris, 1804; but later relations became strained and Pius was taken off, only returning to Rome, 1814. He was a conscientious man and a patron of art.

Pius IX., GIOVANNI MARIA MASTAI-FERRETTI (1792–1878), pope; cardinal, 1840; elected pope on the death of Gregory XVI., 1846. At first his government showed liberal leanings, but forces were so strong that his concessions were of no avail, and a revolution took place in 1848, Pius himself having to flee. His return to Rome in 1850 began a reactionary policy. In 1859 the pope lost most of his dominions, the patrimony of St. Peter was annexed, and the Papacy thus deprived of all temporal possessions, in 1871. The doctrine of the Immaculate Conception of the Virgin was promulgated, 1854, and the Infallibility of the Pope in the Vatican Council of 1870. P. reigned longer than any other pope.

Pius X., GIUSEPPE SARTO (1835–), cardinal and patriarch of Venice, 1893; pope on the death of Leo XIII., 1903.

PIZARRO, FRANCISCO (*c.* 1475–1541), Span. conqueror of Peru (*q.v.*); as a boy served under Gonsalvo di Cordova in Italy; was with Balboa when he discovered the Pacific; along with Almagro (*q.v.*) set out for Peru, but having few men sent Almagro for reinforcements; the governor of Panama gave small help. P. went to Spain and received the royal assent to his undertaking conquest of Peru; landing in Peru, he marched inland, captured the Inca Atahualpa by treachery and strangled him. P. and Almagro set up Manco as nominal Inca; they founded Lima as the new capital, 1535. P. quarrelled with Almagro about their respective shares of land, and in a civil war Almagro was slain. P. was finally assassinated by Almagrists. See Prescott, *History of the Conquest of Peru*.

PLACE-NAMES, see NAMES.

PLACENTA, the structure by which a fœtus is nourished in the uterus, or womb, of its mother, and which is expelled after the young is born, constituting, with the membranes, the 'after-birth.' When the fertilised ovum reaches the uterus it becomes embedded in the decidua, or thickened lining of the uterus, and gradually enlarges. Processes, or villi, grow out from the ovum into the deep parts of the decidua on which it lies, where blood sinuses are formed, filled with maternal blood, into which the thin-walled, vascular, fœtal villi hang free, dissolved substances in the two bloods are exchanged by diffusion, the fœtal and maternal blood never becoming intermixed, and nourishment thus taken up for the fœtus. This forms the placenta, and to it the fœtus is attached by the allantoic stalk, which ater becomes elongated and is known as the umbilical cord. The fully developed human placenta is a circular disc-like structure, seven or eight inches in diameter, about 1½ inches thick at the centre, and becoming thinner at the edges, and weighing about 1 lb.

PLACUNA, see under LAMELLIBRANCHIATA.

PLAGIOCLASE, an important group rock-forming minerals; occurs as primary constituent of igneous rocks. See FELSPAR.

PLAGIOSTOMI, see under FISHES.

PLAGUE, term formerly applied to any epidemic disease of considerable mortality, but now restricted to a particular malignant contagious disease caused by a specific bacillus, the *Bacillus pestis*, and characterised by buboes, or swellings of the lymphatic glands, and carbuncles. Although the disease is noted in works of earlier date the first extensive epidemic of *bubonic* p. of which there is hist. evidence occurred in the VI. cent. A.D., beginning in Lower Egypt, passing along the N. African coast to Constantinople, and spreading all over the Rom. Empire. From this time epidemics frequently broke out in Europe, an exceedingly fatal cycle of pestilences, known as the *Black Death*, some of which, at least, were certainly bubonic p., occurring in the XIV. cent., when over a quarter of the population of Europe is believed to have been destroyed. P. continued to ravage Europe during the XV. and XVI. cent's, hundreds of thousands of persons dying of the disease, but in the first half of the XVII. cent. a decline began to set in, which was still more marked in the second half of the century.

For some years before the outbreak of the *Great Plague* of 1664–65 London had been unusually free from the disease, which is believed to have been introduced from Holland, although, bearing in mind the insanitary condition of London of that time, it is at least quite as probably of local origin. In 1665 there were about 70,000 deaths from p. in London in a population of 460,000, and the epidemic spread all over the country. In 1666 there were 2000 deaths in London, but since that year there has been no epidemic in England, and the disease finally disappeared from the country about 1680.

About the same time p. began to disappear in other parts of western Europe, reappearing, however, in 1703–14 from Constantinople along the Danube and as far as Hamburg, Copenhagen, and Scandinavia, while in 1720 there was a destructive outbreak in

Marseilles and S. France, nearly 90,000 persons dying altogether. A destructive epidemic occurred in Sicily in 1743, the disease being introduced by a ship into the port of Messina, and another spread from the East to Moldavia, Hungary, and Poland in 1770, spreading also in a different direction to Kieff in Russia, where there was a very fatal outbreak in the same year, and reaching Moscow, where a quarter of the population was carried off, in the year following. During this period p. was constantly present in the countries on the shores of the Eastern Mediterranean, Egypt, Syria, Asia Minor, and Turkey, and there were a number of outbreaks in Eastern Europe in the first half of the XIX. cent., extending on one occasion to Italy, where rigorous measures restricted the disease to one small district. P., however, has gradually disappeared from the Mediterranean countries, the last cases in Egypt occurring in 1845, although there was an outbreak in Tripoli in 1858, dying out the following year.

In 1878–79 the disease appeared in Russia in the neighbourhood of Astrakhan, creating considerable alarm in Europe, but it rapidly declined, after having caused several hundred deaths. P. was not known in India before the XIX. cent., but since 1815 there have been a number of outbreaks, while the disease has also been observed in China since 1871. It attacked Hong-kong in 1894, supposed to have been introduced from Canton, where an epidemic was raging, and this outbreak was followed by the destructive and long-continued epidemic at Bombay, which began in 1896, over 206,000 persons dying of the disease in Bombay presidency in 1897–99, 45,000 of them in the city alone. In spite of efforts to arrest the spread of infection the epidemic continued all over India, a maximum of 940,000 deaths in all India being reached in 1905. In the Bombay presidency the ravages of the disease reached a maximum in 1903, when 281,000 deaths were recorded. Outside China and India, however, the mortality of p. has not been great, except, to a less extent than in these two empires, in Arabia, where the precise mortality is unknown. After an absence of over 200 years p. broke out in Oporto in 1899, the source being unknown, and over 100 deaths occurred, the epidemic ceasing in 1900.

In 1899 there was also a limited epidemic in Russia near the mouth of the Volga, while in 1900 there was an outbreak of cases in Australia, widely scattered in the larger cities of the West, South, and East, but the outbreak never had serious proportions. In the same year p. appeared in Glasgow, 34 cases with 15 deaths occurring, the origin of which could not be traced. With the exception of this slight outbreak and of a small number of cases which have been carried from plague-infected countries to seaports from time to time, p. has not appeared in Britain since the XVII. cent.

The SYMPTOMS of p. usually include a preliminary stage of depression and pains, but the onset of the disease is sudden, with shivering, and the temperature rising to 103°, or even three or four degrees higher; there may be delirium, and there is marked prostration, headache, dizziness, and lethargy. In a day or two swellings usually appear, due to the inflamed glands, singly, or in groups, which may be very painful and may suppurate, while there may be small hæmorrhages under the skin.

There are three main varieties of p.—*bubonic*, with the characteristic glandular swellings, *septicæmic*, a very fatal type, in which the symptoms are more severe than in bubonic, without the glandular swellings, *pneumonic*, in which there is an inflammatory condition of the lungs, resembling pneumonia, with intense prostration, no glandular swellings, and usually death about the second or third day.

The only treatment is to treat symptoms as they arise, *e.g.* headache, or delirium, while alcohol and other stimulants may be given to keep up the strength of the heart. Some success has attended the injection of carbolic acid into the glands, but it is probably better to treat them by the same surgical measures as in simple inflammatory conditions. An antitoxin serum, termed the Yersin-Roux serum, is of great benefit when employed within twenty-four hours of the commencement of the disease, very large doses being injected. As a preventive measure inoculation with Haffkine's fluid, which is prepared from the sterilised virus of plague, has been proved to be of the greatest value, and is systematically carried out by the Indian Government. It has been shown that infection is carried by the fleas which have their habitat on the bodies of rats, and fleas also convey infection from one human being to another. This, in conjunction with the well-known fact that an unhealthy and filthy environment favours the disease, shows that the best preventive of p. is a clean and hygienic mode of living.

PLAICE, see under FLAT-FISHES.

PLAINFIELD (40° 36′ N., 74° 26′ W.), residential city, New Jersey, U.S.A. Pop. (1910) 20,550.

PLAIN-SONG, PLAIN-CHANT, a style of ecclesiastical music, unisonous, corresponding to Gregorian song; so called since, in the course of centuries, its former rhythmical motion was lost, and it became stiffened into a monotonous succession of notes of equal length. It exhibits peculiarities unknown to any other music; and is the only type of Church music prescribed by ecclesiastical authority.

PLANARIAN WORMS, see TURBELLARIAN WORM.

PLANE (*Platanus*), genus of trees, order Platanaceæ; *P. orientalis*, a native of the East, and Buttonwood, or N. Amer. Plane (*P. occidentalis*), are common; in Scotland the Sycamore (*Acer pseudoplatanus*) is called a p. (see MAPLE); p's are unaffected by smoke, hence their abundance in cities.

PLANET (Gk. *planetes*, 'a wanderer'), name given to eight celestial bodies revolving in same direction around sun by gravity, and known collectively as the Solar System (*q.v.*), and called p's because of their apparent wanderings among the fixed stars.

A p. may be distinguished by (*a*) this movement, or (*b*) its steady 'glare,' for unlike the stars p's very seldom twinkle, except when low in sky and thus near horizon vapours; and (*c*) telescopically by the fact that they show an appreciable disc, whilst even in the largest telescopes the stars are seen only as points of light, owing to their extreme distances.

The p. are divided into two groups, Major and Minor, and sometimes the four major p's nearest to the sun are called the Inner p., and the other four the Outer p.

The major planets are (in order of distance from sun, commencing with nearest) Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune (*qq.v.*).

The minor p. (*q.v.*) are small bodies, occupying a zone between the orbits of Mars and Jupiter.

All p's shine by reflected light, but probably both Jupiter and Saturn have some inherent luminosity.

Planets, Minor, PLANETOIDS, ASTEROIDS (Gk. *astron*, 'a star'; *eidos*, 'form'), small planets revolving around sun in a zone between orbits of Mars and Jupiter. Some Ger. astronomers, working in connection with Bode's Law, agreed to constitute themselves into 'celestial police,' and to patrol heavens in search of a planet which, according to Bode's Law, should have been revolving in an orbit between Mars and Jupiter. They did not find a large planet, as expected, but instead discovered several small bodies, called the minor planets, which revolve in orbits approximating to that of the missing planet. The first to be discovered was found by Piazzi on New Year's Day, 1801, and is called Ceres; it is 477 miles in diameter. Since that time over 700 have been discovered, and fresh ones are continually being found at the present day.

It is supposed, as the m. p. are mostly small and apparently fragmentary bodies, that they are the

wreckage of some former planet blown to pieces, perhaps, by some great convulsion.

PLANIMETERS, see CALCULATING MACHINES.

PLANKTON, the medley of marine animals and plants which, incapable of active movement, drift with the surrounding water. Its importance lies in furnishing the basis of the food-supply of all the animals in the sea.

The p. consists of three types of ingredients. (1) Most important in point of numbers and significance are the microscopically minute *vegetable organisms*—Bacteria, Diatoms, and Blue-Green Algæ (*Cyanophyceæ*). These form the true pastures of the ocean, for they alone (with a few of the simplest animals—Peridinians, some Flagellates and Halosphæra) aided by sunlight have the power of manufacturing from the inorganic substances in the sea the organic fats, proteids, and carbohydrates, upon which alone animals can subsist. (2) A PERMANENT ZOO-PLANKTON, formed of *animal organisms* which spend their whole life floating in the waters. Such are the microscopic Protozoa which, besides those mentioned above, include the Foraminifera—Radiolarians and some Ciliata (*qq.v.*); many Cœlenterates—Jelly-Fishes, Sea-Blebs (Ctenophores), etc.; the Arrow-Worms (*Sagitta*, *Spadella*), and a few Chætopods (*Tomopteris*, *Chætopterus*); countless hosts of minute Crustaceans, chiefly Copepods; and, amongst Vertebrates, the Sea-Squirts (*Salpœ*). (3) A TEMPORARY ZOO-PLANKTON, constituted by the early stages of animals which when adult live on the bottom or swim freely—for example, the larvæ of Zoophytes and Corals, of Star-Fishes and Sea-Urchins, of Molluscs, Worms, and Crustacea, and the eggs and larvæ of Fishes.

So minute are most of the members of the p. that only their enormous numbers and fertility can give them significance; and even Lohmann's examination of a cubic metre of Mediterranean water, which yielded 2,425,665 minute organisms, gives but a faint idea of the numbers generally present.

P., however, is not uniform in kind nor uniformly distributed in the sea. There are seasonal fluctuations varying from an almost pure zoo-, or animal, p. to an almost pure phyto-, or vegetable, p. There is a more or less distinct neritic, or in-shore, and oceanic, or off-shore, grouping. Again, polar seas are more fertile than temperate or tropical waters, and shallow seas than oceanic deeps.

P. is all-important economically as the ultimate food-supply upon which all fisheries depend. Man eats the haddock, which feeds on young cod and launces, which feed on copepods, molluscs, or worms, and these feed on diatoms. So it is in every case: in every marine food-chain diatoms form the final link.

PLANORBIS, Pond-Snail, see under GASTEROPODA.

PLANTAGENET, nickname of Geoffrey, Count of Anjou, who wore as badge sprig of broom (*Planta genesta*); applied to his Eng. descendants; Richard, Duke of York, f. of Edward IV., adopted this surname; last P. was Edward, Earl of Warwick, grandson of Edward IV., executed 1499.

PLANTAIN (*Plantago*), plant of order Plantaginaceæ; Greater P. (*P. major*), a common wayside plant, has long spikes whose seeds are given to cage-birds; Ribwort P. (*P. lanceolata*) is a 'soldier' to children, who knock off the head.

PLANTAIN-EATERS, see TURACOS.

PLANTIN, CHRISTOPHE (1514–89), Fr. printer; settled in Antwerp, established printing-presses there, and became distinguished for the excellence of his workmanship. His office in Antwerp, bought by the city in 1876, survives as the 'Musée Plantin.'

PLANT-LICE, see APHIDES.

PLANTS.—The living world is divided by common consent into two kingdoms, the *animal* and the *vegetable*. These are separated from each other by two main distinctions: the plant is not capable of free locomotion, and the p. possesses green colouring matter. Neither of these distinctions is anything like universally true. Many p's and parts of p's can move freely and whole classes of p's possess no green pigment. But it is true that in the vegetable kingdom there is a *tendency* towards these two properties; and those p's which depart from this tendency may be recognised as p's because of their near resemblance in other points to forms undoubtedly vegetable.

As a living being a p. possesses a certain *form*, a certain *structure*, and performs certain *functions*. The study of the form of the p. is termed *morphology*; of its structure, *anatomy*; and of its functions, *physiology*. These three branches of study have in the course of time given off subsidiary branches, such as *cytology*, which deals with the structure of the cell, and *palæontology*, which treats of the form, structure, and classification of fossil plants, and others which will be mentioned in their proper connection.

Morphology.—If we examine any common weed we observe that it may be divided into a *root system* and a *shoot system*. The root system occurs characteristically underground and is usually much branched. There may be present one large tap-root, which gives off side-roots—*e.g.* plantain; or there may be a bunch of more or less equal roots also giving off side-roots—*e.g.* grasses. The roots traverse a large volume of soil and fix the plant firmly in position; but they also serve to absorb moisture, and this is accomplished by fine hairs which are found near the tips of the finest root branches, and which attach themselves firmly to the soil particles. The tip of the root is protected by a little cap. Roots do not, however, always remain of the typical fibrous form. Very frequently they become swollen up and serve as stores of food—the most important examples of this being the carrot and turnip.

The *shoot system* is readily divided into two classes of organs—the stem and branches, and the leaves. The leaves are the part of the plant in which food is built up, and to carry out their functions properly it is necessary that they should spread a large area out to the light. This the form of the typical leaf aims at—it has a thin blade with a large area, and is frequently held out from the stem on a special stalk. The leaves also are frequently modified to suit other ends. Thus the bulbs of hyacinth and onion are nothing but collections of leaves which have become much thickened, lost their green colour, and have taken to storing food instead of manufacturing it. Many leaves are thin and brown—*e.g.* the scales which protect delicate buds from the weather. Most important modification of all is that which is seen in the *flower* (q.v.). The outer circle of the leaves which compose the flower is protective in function, and is named the *calyx* (separate parts are the *sepals*); the second circle is generally brightly coloured, and may have associated with it scent or honey glands, it is named the *corolla* (composed of *petals*), and serves to attract insects; inside the corolla are two sets of organs, the *stamens* and the *carpels*, also modified leaves, but bearing, the one *pollen-sacs*, the other *ovules*. The pollen-sac and the ovule are not modified leaves, they are special organs known as *sporangia*, whose special duty it is to produce *spores*, with which we shall deal later.

The *stem* has as its function the holding of the leaves and flowers in an advantageous position; to this end it is typically rigid or else suited to twisting itself round or otherwise fastening itself to an external support. It may, however, under certain conditions, take on the functions of a leaf; this takes place when for some reason the leaves are much reduced in size: thus in the common broom leaves are almost absent, and the stem becomes green and winged, and so increases the surface which it exposes to the light. The stem, too, may become thickened and form a food store; especially is this the case in underground stems (distinguished from roots by the fact that they bear buds which give rise to shoot systems), as in the potato.

The surface of stem and leaves is frequently set

with hairs, prickles, and spines, which are mere surface excrescences, or may be modified branches or leaves.

Anatomy or Phytotomy.—When we examine with the microscope a thin slice of a very young part of a p., we find that it is built up of a mass of little boxes closely united together and known as *cells*. The study of the structure of these cells is called *cytology*. It is found that they consist of a wall (made of *cellulose*, a substance seen almost pure in cotton wool) lining which is a layer of viscous, half-fluid substance, called the *cytoplasm*: this, together with a more solid, round object, the *nucleus*, which is embedded in it, is the actual living substance of the plant (*protoplasm*). Various other bodies are found embedded in the cytoplasm, of which in the plant the most important are the *chloroplasts*, which contain the green colouring-matter, *chlorophyll*. Inside the cytoplasm is a watery fluid containing various salts and other substances dissolved in it—the *cell-sap*.

All cells of the p. do not, however, remain in this state; if we examine older parts of the p. we find that many of the cells have taken on quite different shapes and properties in order to perform different functions. One important requirement of many parts of p's is mechanical strength, and this is attained generally by the thickening of the walls of the cells, which thickening may or may not be accompanied by a deposition in the wall of substances which change it into *wood*. At the same time these strengthening cells generally lose their contents and thus die, and elongate greatly, taking on the character of fibres. Another important function which must be carried out by the cells is the carriage of water and food substances. This is most easy if the cells are very long, and consequently we find that the water-conducting cells are greatly elongated, and very frequently that the end walls separating them disappear, so that the water can traverse tubes consisting of rows of cells joined end to end. Such cells are also dead, and have thickened walls which serve to strengthen the p. The cells which are used for conducting food are also long and wide, and the end walls between are pierced by small pores to allow of the more ready passage of the contents.

These different types of cells are not scattered at random through the p. but are arranged in definite groups called *tissues*. Thus the water-conducting cells and vessels are grouped together as *wood*, the food conductors form the *bast*, strengthening cells form the *stereome*. These tissues are also arranged definitely in the different organs of the p. As an example we may take the young stem of a p. such as the sunflower. To the outside we have a tissue consisting of a single layer of cells extending over the whole surface and known as the *epiderm*; inside this we have a broad layer of ground tissue, the *cortex*. Then comes a ring of bundles—the so-called *fibro-vascular bundles*—each of which has a group of wood cells inside and of bast cells outside; inside the ring of bundles is a central core of ground tissue, the *pith*. If we examined an older stem we would find that certain changes had occurred: there would be a complete ring of wood surrounded by a complete ring of bast—or at least the rings would be broken only by slender spokes, the *medullary rays*, connecting the pith with the cortex. This change has occurred because a single circle of cells running between the wood and bast has remained in an actively growing condition and has given rise to new wood and bast; this growing layer is called the *cambium*, and is responsible for the increase in thickness shown by many stems—of trees, for example.

The arrangement of the tissues varies greatly in different organs—roots, stems, leaves—and in different p's. In the simpler forms of vegetation not all the kinds of tissue described are found. Thus in the mosses it is impossible to distinguish true water-conducting vessels; and at the same time the mosses possess no true root. In p's like the seaweeds and their relatives the structure is still simpler—leaves, stem, root are all absent; we are left with a simple, or branched, more or less strap-like body, which is named a *thallus*; it consists of cells which may take on different shapes, but which are far less distinct in form and function than are those of the higher p's. In still simpler forms we find that the p. consists of a simple row of cells joined end to end, or may even be reduced to one single cell, *e.g.* the bacteria.

This tracing of similarities and dissimilarities between different members of the vegetable kingdom is known as *comparative morphology* or *anatomy*, and on the basis of such comparative studies is built up the system in which p's are classified.

The system is, however, largely based on the difference in the methods of reproduction seen in various p's. Reproduction is one of the p's *functions*, so that its study comes under the head of physiology.

Physiology studies the way in which a p. lives—that is, the different functions of the p. These functions are conveniently grouped under three heads: (1) growth and reproduction, (2) nutrition, (3) movement.

Of *growth* it must be remarked that, in general, increase of size is restricted to a definite region of the p. Thus the root elongates just behind the tip. In the stem growth is also restricted to particular regions. The actual process of growth consists of two distinct processes: one is the enlargement of the individual cells, due either to an increase of living substance or of cell-sap; the other is the division of the cell into two halves, a process which is carried out with great nicety. The rate of growth and the form which a p. assumes are influenced greatly by external conditions. Thus heat increases rate of growth, as does also moisture. A prime necessity is the presence of oxygen. Particularly light and water are efficacious in altering the form of a p.: many water p's produce one type of leaf in the water and another in the air; leaves grown in the shade are larger and of a finer texture than those from sunny positions. Growth ultimately brings the p. to a stage at which it sets about reproducing its kind.

Reproduction may be very simple: in the bacteria it consists simply in one cell dividing into two new ones. In the seaweeds and their relatives we have, however, a more complicated state of affairs; here we have special cells set aside for reproduction; they are termed *spores*, and may be of the most diverse design. For our purpose we may divide them into two classes: (*a*) *asexual spores* (usually spoken of simply as *spores*), which can germinate directly and produce a new plant; (*b*) *sexual spores* or *gametes*, which can germinate only after two have fused together and formed a completely homogeneous starting-point for the new organism. In many cases the spores and the gametes are produced by the same p. in response to different external conditions; but in some it is found that one p. will only give rise to spores, and that these spores give origin to a p. which produces only gametes, which give rise to a spore-bearing p., and so on. The two p's may be morphologically exactly alike, or they may differ the one from the other.

In such a case it will be seen that the complete cycle of development of a p. must include the p. which produces gametes and that which produces spores; the former is termed the *gametophyte*, the latter the *sporophyte*, and this phenomenon of the occurrence of two distinct types of p. in one life cycle is spoken of as the *alternation of generations*.

Considering the reproduction of the higher classes of p's we find that this alternation of generations is universal, but that the higher we go the less prominent becomes the gametophyte. In the mosses the leafy moss p. produces in special organs, as its tip gametes; from the fusion of these arises the moss capsule, in which are produced spores, which in turn give rise to new moss p's. The moss p. is thus the gametophyte,

the capsule the sporophyte. In the ferns the gametophyte is a tiny green thallus, which grows in wet places, and is not generally connected with the fern; from the fused gametes arises the fern p. or sporophyte, on the backs of the leaves of which are to be found sporangia containing spores. In the flowering p's the whole p. as we know it is the sporophyte; the sporangia are of two kinds: the pollen-sacs of the stamens, and the ovules: the spores are the pollen grains, and the *embryo-sac* a large cell in the ovule. The gametophyte is scarcely recognisable: it is reduced to one or two cells or even nuclei formed by the division of the pollen grain and embryo-sac; the fused gametes give rise to a new sporophyte which develops to a certain extent in dependence on the old p. — it forms the embryo inside the seed; when the seed is set free it continues its development and becomes a new spore-producing p.

Mention must be made of the fact that while in some of the seaweed-like p's the gametes are equal, yet in many and in all the higher p's there is a differentiation into a large female *egg* and a small, and often motile, male *sperm*; and that, as in the flowering p's, these two may be produced on different gametophytes, which have developed from different spores. The significance of the fusion of two gametes is probably to be found in the theory that the union of two different organisms produces a more robust offspring. It should be observed that it is this fusion of cells from two different p's that gives opportunity for *hybridising*—that is, the production of p's combining the properties of two different parents. This is of much importance in *plant-breeding*, as it allows of the production of new forms which may combine advantageous properties of two parents. The other means of securing new varieties consist chiefly in selecting carefully any forms which appear showing characters differing from those of the strain to which they belong.

Bearing in mind the different types of reproduction, we may turn to the **classification** of p's. The arranging of p's in a system of groups, each of which contains forms more nearly related to each other than to those of other groups, has a practical interest only when it is recognised that one type of p. has *evolved* from another ancestral type — that is, that an actual 'blood' relationship between different forms exists. P's are divided into four main groups. The first contains the seaweed-like forms, or *algæ*, and the *fungi*—toadstools, etc., which differ from the algæ by their lack of chlorophyll. These are distinguished by their simplicity of structure—there is no differentiation into leaves, stem, and root. An alternation of generations is frequently not to be observed. The *mosses* and *liverworts* are more complex, and many have distinct stems and leaves. All have typical alternation of generations, the gametophyte predominating. The *ferns*, and their allies the *club mosses* and *horsetails*, have distinct roots and vascular systems, and are distinguished from the highest plants—*cone-bearers* and *flowering plants*—by the fact that the latter produce seeds. In flowering plants and ferns the sporophyte is best developed. The study of fossil plants—*palæontology*—has shown that many plants formerly existed which bridged the gaps at present existing between the four great groups (see PALÆOBOTANY).

To return to physiology. We come now to the physiology of *nutrition*. The p., like the animal, consists largely of three types of organic compounds: fats, carbohydrates (*e.g.* sugar and starch), and proteids; the latter form the main part of the protoplasm. To these must be added a large quantity of water and certain mineral salts. Unlike the animal, however, the p. is able to build up these substances from carbon dioxide obtained from the air, and water and mineral salts obtained from the soil—the animal obtains its organic compounds from the p. or from other animals. The water supply is taken over by the root, which pumps a sufficient amount, containing the necessary mineral salts in solution, into the conducting vessels of the stem. The hairs suck up this water and perform a twofold function. In the first place they give off a large amount of water vapour; this is necessary in order that a large amount of water may pass through them, leaving behind the mineral salts necessary to the p's nutrition. This water vapour passes out through openings in the leaf surface—the *stomata*—through which enter, from the air, small quantities of carbon dioxide. In the leaf these meet—the mineral salts, the carbon dioxide, and the water necessary for the building up of organic food substances. In order to form these a supply of energy is necessary, and the second function of the leaf is to absorb by means of its green chlorophyll energy from the sunlight. In the leaf and with this supply of energy are formed sugar and starch from carbon dioxide and water, and with liberation of oxygen: from these carbohydrates in turn are formed fats, and, along with nitrogen from the mineral salts, proteids. The food substances are used partly to build up the p.'s structure, and are partly combined with oxygen and turned back into carbon dioxide, water, and energy, the latter being used for carrying on the vital activities of the p.

Movement in p's is chiefly carried on under the direction of external stimuli, with the object of obtaining suitable conditions of growth. Thus under the influence of gravity roots move down into the earth; under the influence of light, leaves turn so as to obtain a suitable light supply.

Ecology (q.v.) is a recent development of botany which aims at studying the way in which p's are related to their environment. *Plant pathology* is economically important in that it studies the cause and cure of p. diseases.

PLASENCIA (40° 5′ N., 6° 7′ W.), cathedral town, on Jerte, Caceres, Spain. Pop. 8200.

PLASMODIOPHORA, see under MYCETOZOA.

PLASMODIUM, see under MYCETOZOA, SPOROZOA.

PLASSEY (23° 46′ N., 88° 11′ E.), village, Bengal, India; here Clive defeated Suraj-ud-Dowlah (*q.v.*), 1757.

PLASTER OF PARIS, see GYPSUM.

PLASTER WORK is of ancient origin, and in some cases, as in the Pyramids, it has survived in good condition for thousands of years. The Greeks brought the art to great perfection, and used it in their temples. At a much later period p. was used in England for ornamenting mansions, and the decorated p. ceilings of Tudor times are specially fine. The extensive use of p. for small houses probably does not date back much more than a century. The composition of p. varies, but generally a mixture of Portland cement or lime with sand is used, ox-hair, sometimes horse-hair or goat's hair, being added to bind the mixture. Instead of hair, Manilla hemp fibre or sawdust may be used, the latter being employed also as a substitute for sand. Colours are obtained by colour-washes or by mixing certain oxides with the lime.

PLATA, RIO DE LA, RIVER PLATE (35° S., 57° W.), wide estuary on E. coast of S. America, between Uruguay on N. and Argentine on S., formed by junction of Paraná and Uruguay Rivers; *c.* 200 miles long, 25 miles wide at head, and 135 miles at mouth; through tributaries it drains vast area, including portions of Brazil, Argentine, Uruguay, Bolivia, and whole of Paraguay; shores of Uruguay on N. are lofty and rocky, and those of Argentine on S. low and flat; estuary of great commercial importance, but navigation is hampered by extreme shallowness; bed of estuary composed of sandbanks; Paraná, longer of two rivers, enters estuary by 11 outlets, largest being Paraná-quazu and Paraná de Las Palmas. Chief ports are Buenos Ayres in Argentine and Montevideo in Uruguay.

Estuary was discovered by de Solis in 1516, and explored by Magellan in 1520.

PLATÆA, PLATÆÆ (38° 13′ N., 23° 16′ E.), ruined city, Bœotia, Greece; situated on Mt. Cithæron; walls and portion of citadel remain; near here Persians were defeated by Greeks, 479 B.C.; destroyed by Spartans (427 B.C.); by Thebes (375 B.C.); finally restored, 330 B.C.

PLATALEIDÆ, Spoonbills (*q.v.*).

PLATEAU, an elevated tract of level or slightly undulating tableland.

PLATEN-HALLERMUND, AUGUST GRAF VON (1796–1835), Ger. poet and dramatist; b. Ansbach; studied Würzburg; best works, *Ghaselen* (Oriental poems), *Sonette aus Venedig*; *Die Abbasiden* (epic), and plays, *Der Romantische Ödipus*, etc.

PLATINUM, Pt=195·2, a noble metal, occurring in the Urals, native, but impure.

METALLURGY.—The crude metal is extracted with *aqua regia*, ammonium chloride added, and the platini-chloride, $(NH_4)_2PtCl_6$, crystallised; ignition yields spongy p., which is melted in a lime crucible by the oxy-hydrogen blowpipe.

PROPERTIES AND USES.—Tin white, soft, and malleable, can be welded at white heat; S.G. 21·42, M.P. above 1700° C.; unattacked by nitric or hydrochloric acid, corroded by hot caustic alkali; forms fusible alloys with tin, lead, etc., whose compounds must not be heated with p.

Used for making wire for chemical purposes and incandescent electric lamps, also for foil, crucibles, dishes, etc., for analysis, and for photographic prints. Finely divided p. catalytically causes combination between hydrogen and oxygen, and sulphur dioxide and oxygen. Demand for p. now exceeds supply, and so the metal is very costly.

COMPOUNDS: PtO: $PtCl_2$, K_2PtCl_4, $BaPt(CN)_4$.
PtO_2: $PtCl_4$, H_2PtCl_6, K_2PtCl_6.

PLATO (*c.* 427 B.C.–347 B.C.), Gk. philosopher; came of a wealthy Athenian family. In boyhood he inclined towards poetry, but at the age of twenty, after having been taught by the Heraclitean Cratylus, he made the acquaintance of Socrates, and thenceforward devoted himself to philosophy. After Socrates' death he is said to have travelled widely, and probably visited Italy and Sicily. When about forty years old he began to teach and write in Athens, where he remained till his death, except (the story runs) for two journeys to Syracuse, the first of which took place in 367 B.C., its purpose being to mould the young Dionysius II. (lately become the ruler of Syracuse, and then under the guidance of the philosophically minded Dion) into the perfect 'philosopher-king' whom Plato had sketched in the *Republic*. Dionysius, though enthusiastic at first, was soon bored, and banished Dion; Plato returned home unsuccessful, and a second visit a few years later also failed of its purpose.

All P.'s philosophical writings have been preserved. They are cast in the form of dialogues, and are as remarkable for dramatic power and literary beauty as for their substance. In most of them Socrates is represented as the chief speaker. In order of composition the slighter, so-called *Socratic*, dialogues undoubtedly come first, such as the *Laches* and the *Crito*; they were followed probably by the *Protagoras*, *Gorgias*, and *Meno*, and then by the first set of great constructive dialogues: the *Symposium*, *Phædo*, *Republic*, and *Phædrus*. Then come four dialogues in which logical outweighs ethical interest: the *Theætetus*, *Parmenides*, *Sophist*, and *Politicus* or *Statesman*; then the *Timæus* and *Philebus*, and, last of all, the *Laws*.

Plato's Philosophy.—The dialogues treat of practically all philosophical topics, though not after the manner of a systematic treatise. In his ethical and political teaching—and with this he doubtless began—Plato, like Socrates, is at war with sceptical theories that deny the possibility of a common good, and so reduce society to a collection of competing individuals, each of whom finds his welfare in purely selfish pleasures. Socrates had seen that the uniting force in society is reason, but by simply identifying virtue with knowledge, he had represented moral goodness as nothing but intellectual excellence. P. does more justice to the complexity of human nature, distinguishing three 'parts' of the soul, the rational, the appetitive, and (intermediate between them in value) the 'spirited,' which is the natural ally of reason, and includes the more generous emotional impulses, such as indignation at wrong-doing. Human welfare consists, not in mere pleasure, but in the harmonious activity of all functions of the soul under the guidance of the highest; and this harmonious activity is at once Wisdom and respect of Reason, Courage in respect of 'Spirit,' Temperance or moderation in respect of Appetite, and Justice in that each 'part' of the soul contributes to the good of the whole by doing its own proper business in its proper place and way. Vice, on the other hand, is spiritual anarchy or disease, and cannot be welfare, however pleasant it may seem. The highest welfare evidently requires the highest possible activity of reason, or knowledge; but P. allows that ordinary men may attain such welfare as they are capable of by following the precepts of those who know. This is of importance in P.'s political theory, which is not separate from his ethical theory, since man is necessarily a social being, and can make the best of himself only in a well-ordered State. It is above all things necessary (and P. vehemently accuses contemporary democracy of ignoring this), that those who know should rule, and that each citizen should perform that function in the State which he is best fitted to perform. Now the mass of men is not capable of wisdom, but can recognise and follow wise rulers, and exercise the virtue of Temperance; they should be the productive workers and traders in the State. A smaller number is representative of Spirit, and should be the State's courageous warriors; a very few, selected early for mental, moral, and physical promise, and carefully trained, not only in general culture, but through many years' arduous study of science and philosophy, are to be the rulers of the State. They must have no private interests, but devote themselves wholly to the public good; and therefore Plato denies them any private property and private family life. Necessities are to be provided for them; all children are to be children of the State.

The goal of the 'philosopher-king's' knowledge P. calls the *Idea* (or Form) of the good. Most men have opinions which they hold without justification or steadfastness about this, that, and the other changeful event or thing. But true knowledge is reasonable and abiding, and has for its object what really and eternally is. The mathematician is not concerned with this diagram that he uses, but with circularity itself or triangularity itself; the philosopher, not with this or that imperfect action, but with virtue itself, to which our acts only approximate; and, generally, he who knows, knows not particular material things, or the flux of events in time, but immaterial, universal, eternal objects. Such an object P. calls an Idea or Form; but the word is apt to mislead the modern reader, who thinks of Ideas as somehow in his mind, whereas P. means real objects which the mind apprehends in knowing. What in common parlance we often nowadays call 'actual' things—the particular objects of sense-perception—are not for P. real objects. Sense-perception, though it stimulates thought, is not itself a mode of thinking, and its objects, whilst not entirely unreal or fictitious, occupy a level between being and not being; they 'partake in' or 'copy' real Ideas or Forms more or less fully, but they always include an incalculable, material, evil element, whereas real being is free from imperfection or any unintelligibility. The Ideas constitute a rational organic system, the object of non-sensuous thought, and every member of the system derives its being and intelligibility from an ultimate principle which P.

calls 'the Good' or 'the idea of the Good'; in other words, all that really is has the unity of perfect purpose, and every member of it is, and is knowable, because it plays its proper part in contributing to the good of the whole. P.'s meaning is doubtless most easily grasped if we personify the Idea of the Good as God; but it is not clear that he made this identification himself.

P. agrees with Socrates that to impart knowledge is impossible, and in two dialogues he represents the process of learning as 'reminiscence' (or 'recollection') of knowledge gained in a state of existence before bodily birth. He consistently maintains that the life of the soul neither begins nor ends with the body, soul being akin to the eternal Ideas and being, not an effect of inanimate things, but the very principle and cause of life; in certain passages, however, he regards spirit and appetite as due to the conjunction of soul with body, and attributes deathlessness to reason only. In several dialogues there occur 'myths,' in which he depicts the fate of the soul between its successive incarnations; and in them we find the notion of transmigration, the soul passing at its next birth into the body of man or some other animal whose character is like its own.

Certain statements of Aristotle's are usually taken to imply that, in his later oral teaching, P. represented his Ideal Theory in a more mathematical form, akin to Pythagoreanism: and this is certainly true of the earliest successors to the leadership of his school, Speusippus (*q.v.*), Xenocrates (*q.v.*), and others. The school was from its locality known as the *Academy*. For a time its interests were chiefly mathematical and scientific; later, it developed a critical and even sceptical tendency.

Neo-Platonism.—Far more important, however, than the Academy is the *Neo-Platonic* movement of the III. to V. cent's A.D., the final effort of philosophy. Its greatest name is PLOTINUS (b. in Egypt *c.* 204 A.D.), who is said to have gone to Persia and studied Oriental philosophy, taught in Rome from 244 A.D., and died about twenty years later. His doctrine is at once scientific philosophy and mystical religion. Central in it is his conception of God, the absolute and perfect One, superior to all positive statements that we can attempt. The One, though immutable, yet 'shines forth' or 'overflows,' first as Intelligence, which involves the diversity as well as unity of subject and object,—and here Plotinus regards the Ideas as the real archetypes of the sensible world in the divine mind,—and more remotely as Soul, which again is a single world-principle but is pluralised in individual souls. Last comes Matter, but the material sensible world does not really exist in its own right, but is only '*our* view of the Intelligible World.' The aim of the soul is to free itself from the illusions of sense, and by virtue, abstinence, and love of beauty to rise to an ecstatic condition of 'contact' or direct communication with God. Of the later members of the school the most famous are PORPHYRY OF TYRE (233–*c.* 303 A.D.), a disciple of Plotinus in Rome, best known for his work on logic; JAMBLICHUS, a Syrian (died *c.* 330 A.D.), who wrote rather fantastically in favour of an eclectic polytheism; HYPATIA, who taught at Alexandria and was killed by the Christians in 415 A.D.; and PROCLUS, a Lycian (410–85 A.D.), who wrote on philosophy and math's, and taught in the Academy at Athens.

(1) PLATO.—All the dialogues have been eloquently translated by B. Jowett. Davies and Vaughan's trans. of the *Republic*, and Church's trans. of the *Euthyphro, Apology, Crito*, and *Phædo*, under the title of *The Trial and Death of Socrates*, are handy and useful. In general, Adam, *The Religious Teachers of Greece*; Benn, *The Greek Philosophers*, vol. i.; Bosanquet, *Companion to Plato's Republic*; Caird, *The Evolution of Theology in the Greek Philosophers*; Gomperz, *The Greek Thinkers*, vols. ii., iii.; Grote, *Plato and the other Companions of Socrates*; Nettleship, *Lectures on Plato's Republic*; Pater, *Plato and Platonism*; D. G. Ritchie, *Plato*; A. E. Taylor, *Plato*; Zeller, *Plato and the Older Academy*.

(2) NEO-PLATONISM.—Bigg, *Neo-Platonism*; Caird, as above; Whittaker, *The Neo-Platonists*.

PLATONIC LOVE, spiritual affection between the sexes.

PLATTE, NEBRASKA (40° 50′ N., 99° 40′ W.), river, U.S.A., formed by union of N. and S. Forks; joins Missouri.

PLATTSBURG (44° 42′ N., 73° 27′ W.), city, New York, on Lake Champlain, U.S.A.; lumber manufactures. Pop. (1910) 11,138.

PLATTSMOUTH (41° N., 95° 48′ W.), city, Nebraska, U.S.A., at junction of Platte and Missouri; railway-car shops. Pop. (1910) 4287.

PLATYELMIA, a subdivision of the animal kingdom and a group of flat, wormlike animals, including forms having more or less flattened oval bodies with distinct segmentations; of widely varying forms and habits; generally divided into three classes: Planarians, Cestodes (tape- or ribbon-worms), and Trematodes (flukes). Latter two are parasitic.

PLATYHELMINTHES, FLAT-WORMS, Worms, generally with a flattened body, the majority of which occur as parasites within other animals, although some are found living independently in water or on land. They possess no blood system, and the food canal is either absent or without posterior opening. The Flat-Worms form a phylum which includes the Turbellarians, the Trematodes (with Liver-Flukes), and the Tapeworms (*qq.v.*).

PLATYPUS, see ORNITHORHYNCHUS.

PLATYRRHINI, or PLATYRRHINE APES, a group of PRIMATES (*q.v.*).

PLAUEN (50° 26′ N., 12° 7′ E.), town, on White Elster, Saxony; cotton goods. Pop. (1910) 121,104.

PLAUTUS, T. MACCIUS (*c.* 250–184 B.C.), Rom. comic poet and dramatist; b. Sarsina, Umbria; pioneer of Rom. lit.; after employment (exact nature unknown) in theatre, became successively merchant, bankrupt, servant in mill, and playwright. Of the numerous comedies attributed to him, 31 are probably genuine; we possess 20 whole plays and numerous fragments. P. borrowed plots from Gk. New Comedy, and adapted them to suit Rom. audience; uses familiar New Comedy characters—roguish slave, parasite, etc.; lacks finer touches of Terence (*q.v.*), but is robust and distinctively Roman; differs from Terence in free use of lyrical monologues; imitated by many writers, including Shakespeare and Dryden. Most famous plays are *Aulularia, Captivi*, and *Menæchmi*.

Translations, by Riley, Sugden, Collins.

PLAYFAIR, JOHN (1748–1819), Scot. mathematician: b. Forfarshire; studied at St. Andrews; prof. of Natural Philosophy, Edinburgh (1805). Pub. *Elements of Euclid, Outlines of Natural Philosophy*, besides important papers.

PLAYFAIR OF ST. ANDREWS, LYON PLAYFAIR, BARON (1818–98), Liberal statesman; P.C., 1873; Postmaster-General, 1873–74; pres. of Commission which made report on Civil Service, 1874; Chairman of Ways and Means, etc., 1880–83.

PLAYS, see DRAMA, STAGE.

PLEADINGS, in Eng. law, the name given to certain documents which must be prepared for trials at law, and which contain either (1) Statement of Claim, or (2) Defence (other p. can only be delivered by special leave of the court). The purpose of these p. is to enable the parties to know exactly what are the matters in dispute, and what facts must be proved at the trial. They are also useful in determining whether the dispute is a pure point of law to be decided by a judge without the aid of a jury, or whether it is a question of fact to be decided by a jury. The record of matters in dispute is settled by the p., and it is of the utmost importance that there should be certainty as to these matters, for decisions upon them

made by a final court cannot be upset or even re-opened by any subsequent proceedings.

PLEBEIANS, see ROME (HISTORY); PATRICIAN.

PLECTROPHENAX, see EMBERIZIDÆ.

PLEDGE, see PAWNBROKING.

PLÉIADE, see RONSARD, FRANCE (FR. LITERATURE).

PLEIADES (Gk. myth.), seven sisters of Hyades; pursued by Orion, they besought Zeus for help and he changed them into stars; situated in constellation Taurus, the P. are the most famous star cluster in the heavens.

PLEISTOCENE (Gk. *pleistos*, 'most'; *kainos*, 'recent'), in geol., the lowest division of Post-Tertiary formation, in which most of the fossil remains belong to existing species, although those of P. mammals contain a few extinct forms. From the fossils it is gathered that great climatic changes took place on earth during P. era. Also known as GLACIAL and DRIFT period, owing to number of icebergs then.

PLENIPOTENTIARY, see AMBASSADOR.

PLESOSAURIA, extinct Reptile (*q.v.*).

PLEURA, see RESPIRATORY SYSTEM.

PLEURISY, inflammation of the *pleura*, or lining membrane of the lung cavity, caused by certain specific organisms. The chief varieties of p. are *dry p.*, in which there is inflammation of the pleura with a fibrinous exudation of lymph, tending to form adhesions, and *p. with effusion*, when an effusion of fluid varying in amount up to a gallon takes place after the inflammation. The onset is usually quite sudden, with a stitch-like pain in the side, increased on taking a deep breath, the patient has a dry cough, and the temperature may rise to 100° or a little over. In p. with effusion the pain gradually becomes less, the patient feels uncomfortable and has difficulty, because of the weight of the fluid, in lying on the unaffected side. Characteristic physical signs can be made out in both varieties on careful examination by a physician. The treatment in dry p. is to strap the affected side with adhesive plaster so as to limit the movements of breathing, apply locally a linseed poultice or an ice-bag to relieve pain, and administer a purgative. If effusion takes place, iodine is painted on locally as a counter-irritant, and saline purgatives (*e.g.* Epsom salts) given to get rid of the fluid, while tonics are useful. If good progress is not being made by these methods, the fluid is drawn off by puncturing the chest with an aspirator (an instrument which is a combination of a hollow needle and a syringe), which usually at once relieves distressing symptoms.

When a patient has sweatings, shiverings, and irregular rises of temperature, and the p. does not clear up, the disease is probably *Empyema* (q.v.), the fluid having become purulent, which is a serious condition requiring surgical treatment.

PLEURONECTIDÆ, see FLAT-FISHES.

PLEURO-PNEUMONIA, a specific, highly-contagious disease prevalent amongst cattle in Western Europe, U.S.A., S. Africa, and Australia. It affects the pleura and lungs, the latter finally becoming consolidated, and causes enormous loss of life.

PLEVNA (43° 27′ N., 24° 35′ E.), town, on Tutchinitza, Bulgaria; here defence and final surrender of Osman Pasha took place during Russo-Turkish War, 1877; woollens, silks, wines, live stock. Pop. 21,150.

PLEXUS, see NERVOUS SYSTEM.

PLIMSOLL, SAMUEL (1824–98), Eng. politician; secured the passing of the Merchant Shipping Act (1876), by which a Brit. merchant ship is prevented from sailing if deemed unsafe by Board of Trade. All such vessels bear a *Plimsoll mark* on the sides (circle crossed by a line at the centre), below which she must not sink when loaded.

PLINLIMMON, PLYNLIMMON (52° 28′ N., 3° 47′ W.), mountain, Wales (2465 ft.).

PLINY.—(1) CAIUS PLINIUS SECUNDUS, called 'elder' (*c.* 23–79 A.D.), Rom. writer; b. in N. Italy; ed. Rome; served in German campaign under Pomponius; became pleader, but retired to estate at Novum Comum (modern Como) and devoted himself to literature; most prolific writer; besides many treatises wrote *History of German Wars*, and brought up to date *History of Rome* by Aufidius Bassus (31 books). His *Historia Naturalis* shows encyclopædic knowledge; though inexact scientifically, is of great use regarding nomenclature and popular contemporary ideas; shows more signs of painstaking compilation than of original research; procurator in Spain, 71; guardian of younger Pliny (*q.v.*); killed by eruption of Vesuvius. (2) **Pliny**, CAIUS PLINIUS CÆCILIUS SECUNDUS (61–*c.* 115 A.D.), called 'younger' in contradistinction to his uncle and father by adoption; b. Novum Comum; ed. in rhetoric under Quintilian; practised as pleader and endeavoured to check prevailing system of bribery and flattery; military tribune in Syria, 83; consul, 100; friend of Trajan and Tacitus; his correspondence with emperor, during his proprætorship of Bithynia (103–5), regarding treatment of Christians, indicates moderation and fairness; delicate in health; married twice; no issue. His *Letters*, in 10 books, are written in best Ciceronian style; chiefly valuable for glimpses of life of upper classes in Rome. During his year of consulship P. wrote panegyric on Trajan; it is strained in style, and is very much inferior to his letters.

PLIOCENE (Gk. *pleion*, 'more,' *kainos*, 'recent'), in geol. the uppermost division of the Cainozoic or Tertiary strata, which was divided by Sir Chas. Lyell into four groups: Eocene, Miocene; Older and Newer Pliocene (or Pleistocene). Each is characterised by a different proportion of fossilised remains of existing species. The P., sometimes referred to as the *Crag Period*, consists of irregular beds of sands and gravels of about 120 ft. thickness and is arranged as follows:—

Name.	Composed of
Cromer Forest Beds	Silts, clays, and sands.
Chillesford Beds	Sands and clays.
Norwich Crag	Gravels, sands, and loam.
Red Crag	Red shelly sands.
Lenham Beds	Sands.
St. Erth Beds	Clays and gravels well seen near St. Erth, Cornwall, and consisting of coralline crag shells, sands, and clays.

Life of the P. period included *Flora*—ivy, maple, elm, mangolia, laurel, beech, poplar, and lime trees; and *Fauna*—mastodons, elephants, rhinoceri, horses, giraffes, bears, apes.

PLOCEIDÆ, Weaver Birds (*q.v.*).

PLOCK, PLOTSK.—(1) (*c.* 52° 50′ N., 20° 50′ E.) province, Russ. Poland; area, 3641 sq. miles; drained by Vistula and tributaries; produces grain. Pop. (1910) 700,000. (2) (52° 45′ N., 19° 40′ E.) town, capital of above, on Vistula; exports grain. Pop. (1910) 30,960.

PLOËRMEL (47° 55′ N., 2° 23′ W.), town, capital, Morbihan, France; slate quarries; trade in cloth. Pop. (commune) 9600.

PLOESCI, PLOYESHTI (44° 56′ N., 26° 14′ E.), town, capital Prahova, Rumania; petroleum refineries. Pop. (1911) 49,256.

PLOMBIÈRES (47° 58′ N., 6° 30′ E.), watering-place, department Vosges, France; mineral springs.

PLÖN (54° 9′ N., 10° 25′ E.), town, Schleswig-Holstein, Prussia. Pop. 3800.

PLOTIDÆ, Snake Birds (*q.v.*).

PLOTINUS, see PLATO (NEO-PLATONISM).

PLOTSK, see PLOCK.

PLOUGH, the p. is an implement made entirely of iron, and consisting essentially of a *beam* to which are attached the *coulter*, a knife which makes the preliminary cut in the soil, the *share*, which separates the sod from the underlying soil, and the *mould-board*, which throws the sod over in such a way that its upper side is turned down. The beam is continued in front, and is used for attaching the horses; behind are the *stilts*, by which the ploughman guides the p. The p. is usually driven by a pair of horses, but *steam p's* are in use. The function of ploughing is to turn over

the sod and present a surface of free soil for sowing; at the same time it keeps the soil broken up and loose in texture.

PLOVER FAMILY (*Charadriidæ*).—The Plovers are in general small, graceful birds, with long legs, usually partially webbed feet, and often long bills. In habit they are mostly waders, seeking their food amongst the aquatic insects and larvæ, worms, and molluscs which frequent the shallows of sea or river. They have long, pointed wings, are excellent fliers, and are so given to migration that at one part of the year or another every land knows them. Most lay four spotted eggs in a simple nest or mere excavation on the ground. Of the 200 species known, eight are resident in, while twenty-five are regular and nineteen irregular visitors to, Britain. The true Plovers, with short bills and three or four toes, include the Golden Plover (*Charadrius*), the American Kill-Deer Plover (*Ægialitis*), a rare straggler to British shores, the Dottrels (*Endromias*), the crested Green Plovers (*Hoplopterus*), all with three toes, and the four-toed and crested Common Lapwing or Peewit (*Vanellus*).

The members of another group possess long bills and four toes, of which at least two are united by a web; such are the Long-Legged Plovers or Stilts (*Himantopus*) and the Avocet (*Recurvirostra*), both with exceedingly long legs, the latter with an up-curved 18-inch long bill, formerly a common Brit. visitor; the Curlews and Whimbrels (*Numenius*), with long down-curved bill; the thick-set short-legged Oyster-Catchers or Sea-Pies (*Hæmatopus*); the Sandpipers, with short, straight, hard-tipped beak, including the Common Sandpiper (*Totanus*), and the Ruff (*T. pugnax*), noted for its courtship dances, and so called on account of the collar of feathers assumed by the male during the breeding season.

In another section of the family all the toes are quite free to the base, no trace of webbing being present. Here are classed the short-billed Turnstones (*Strepsilas*), so called from their habit of overturning stones on the seashore for the sake of the sand-hoppers lurking beneath; the long, slender-billed Woodcock (*Scolopax*) and Snipe (*Gallinago*), both of which may be reckoned as residents in the Brit. Isles as well as winter visitors from Scandanavia, the former particularly interesting on account of its peculiar grave aspect, the eyes being set far back in the head, its extraordinarily sensitive bill, and its habit of carrying the young; the latter on account of the 'drumming' sound caused by the vibration of the tail feathers of the male as it drops to earth. Both form a simple nest, that of the Woodcock being lined with dead leaves.

PLÜCKER, JULIUS (1801–68), Ger. mathematician and physicist; b. Elberfeld; ed. Bonn, Heidelberg, Berlin, and Paris. Prof. of Math's, Halle (1834), Bonn (1836–47); prof. of Physics, Bonn (1847–68). His mathematical researches were entirely geometrical; physical researches included discovery of magnecrystallic action, properties of magnetic and diamagnetic bodies, and spectroscopy of gases.

PLUM (*Prunus domestica*), a Rosaceous tree cultivated for its fruit, and growing best on a somewhat calcareous, well-drained soil. The fruit is known technically as a drupe, and consists of a seed (kernel) enclosed by a stony endocarp, a juicy mesocarp, and a membranous epicarp.

PLUMBAGO, see CARBON, GRAPHITE.

PLUMULARIA, see under HYDROMEDUSÆ.

PLUNKET, OLIVER (1629–81), R.C. abp. of Armagh, 1669; executed at Tyburn, July 11.

PLUNKET, WILLIAM CONYNGHAM PLUNKET, 1ST BARON (1764–1854), Irish lawyer; b. Enniskillen. Graduated at Dublin, and called to the Bar; K.C., 1797; sat in Irish Parliament; Solicitor-Gen. and Attorney-Gen. for Ireland in Eng. ministry, 1803–5; eloquent Prot. advocate of Catholic Emancipation; peer and chief justice, 1827; Lord Chancellor of Ireland, 1830–41.

PLUNKETT, SIR HORACE CURZON (1854–), Irish politician; promoted Agricultural Co-operative movement in Ireland; founded Irish Agricultural Organisation Soc., 1894; vice-pres. of new Irish Agricultural Council, 1899–1907, when he was forced to retire by Nationalist party; author of several works on Irish economic problems.

PLURALISM, philosophical doctrine that reality consists of plurality of beings.

PLUTARCH, PLOUTARCHOS (*c.* 46–120 A.D.), Gk. biographer; b. Chæronea, Bœotia; ed. Athens; lectured on philosophy in Rome; honoured by Trajan with consular rank, by Hadrian with procuratorship of Greece. P.'s best-known work is his *Parallel Lives*, in which he gives, side by side, biographies of celebrated Greeks and Romans, similar in character or circumstance, *e.g.* the lives of Alexander the Great and Cæsar form one book. Four single lives are appended. This work shows evidences of wide knowledge and painstaking research; facts are generally accurate; of great value to posterity. Besides this, some sixty essays on various themes (such as *On the Education of Children, On the Genius of Socrates*) are grouped under title of *Opera Moralia*.

P. belonged to no school of philosophy, but was an independent thinker. His knowledge of literature was tremendous, as may be seen from numerous quotations in *Moralia*. His style is cumbrous and involved.

Edition of *Moralia* by Wyttenbach (*q.v.*) is still classic. Langhorne's translation of *Lives* is most popular.

PLUTO, HADES (classical myth.), god of underworld; s. of Cronos; bro. of Zeus and Poseidon, with whom he divided the world; called Hades in early times—'the invisible' or 'the all-embracing'—while *ploutōn* merely meant 'wealthy' (hence Lat. variant *Dis*); P. carried off Persephone, dau. of Demeter; judge of the dead; worshipped especially at Elis.

PLUTO MONKEY, see under CERCOPITHECIDÆ.

PLYMOUTH (50° 22′ N., 4° 9′ W.), seaport, naval station, municipal, parliamentary, and county borough, Devonshire; situated at head of P. Sound, between estuaries of Plym and Tamar; connected with Stonehouse and Devonport, and constitutes with them the 'Three Towns.' Few traces of antiquity are left except citadel; town is well built, with many fine structures, including Guildhall, Municipal Buildings, Museum, Charles Church, St. Andrew's, R.C. Cathedral, and many educational establishments; on Hoe is statue of Drake, monument in memory of Armada, and tower of Smeaton's lighthouse. At Stonehouse are Marine Barracks, Naval Victualling Yard, and Naval Hospital; Devonport contains important dockyards; 'Three Towns' are protected by line of fortifications. Shipbuilding and fishing are chief industries; manufactures chemicals.

P. took prominent part in history; Pilgrim Fathers left here for America, 1620; among many famous men connected with town are Drake, Raleigh, Hawkins, and Grenville. Pop. (1911) 112,042.

PLYMOUTH (41° 14′ N., 76° W.), town, on Susquehanna, Pennsylvania, U.S.A.; coal mines. Pop. (1910) 16,996.

PLYMOUTH (41° 54′ N., 70° 53′ W.), township; county-seat of Plymouth county, Massachusetts, U.S.A., on Plymouth Bay; has good harbour, town hall, court-house, Pilgrim Hall (containing relics of Pilgrim Fathers), and National Monument; celebrated as landing-place of Pilgrim Fathers (1620); first permanent settlement in New England. Manufactures include woollen goods, silks, cordage, and rubber goods. Pop. (1910) 12,141.

PLYMOUTH BRETHREN, Christian sect founded by Rev. J. N. Darby (1800–82) in 1830; Darby founded congregations in Switzerland, France, elsewhere on Continent, and in England; but several schisms took place in Eng. congregations, and now the sect is in six divisions. P. B. object to an official ministry and regard infant baptism as non-essential.

PLYMPTON (50° 23′ N., 4° 2′ W.), town, Devonshire, England, including villages of P. St. Mary and P. Earle; stannary town; has ruined castle and monastery; Reynolds' birthplace. Pop. 4990.

PLYNLIMMON, see PLINLIMMON.

PNEUMATIC DISPATCH, transport of written documents through tubes by compressed air or vacuum. Chiefly used in post offices and for transmitting telegrams from central to suburban offices, or from one department to another in same building. The conveying pipe is of lead, about 1½ inches to 3 inches in diameter, and the dispatches are contained in a case of rubber. Behind this, compressed air is admitted and a velocity of 25 miles per hour has been attained. P. D. was introduced in 1858 by Clark, who laid tube between International Telegraph Co.'s offices and London Stock Exchange. There are now *c.* 60 miles of p. tubes in England, 40 miles being in London.

PNEUMATIC GUN, a gun which under pressure of expansive force of air discharges heavy explosives, or even projectiles loaded with high explosives.

PNEUMATIC SCHOOL, see MEDICINE.

PNEUMATIC TYRE, see TYRE.

PNEUMATOLYSIS, the effects produced on masses of rock by the discharge of certain vapours from igneous rocks. Such vapours include carbonic acid, hydrogen, nitrogen, hydrochloric acid, and fluorine. P. is generally found most active in lava flows, and in such its action continues long after an eruption.

PNEUMATOMACHI (Gk. *Pneumatomachoi*, Strivers against the Spirit), sect of IV. and V. cent's which denied divinity of the Holy Spirit.

PNEUMOCOCCUS, see PARASITIC DISEASES.

PNEUMONIA, inflammation of the lung tissue proper, due to specific micro-organisms, occurs in two forms, termed, according to the distribution of inflammation, lobar or croupous pneumonia and lobular or broncho-pneumonia. In ACUTE LOBAR or CROUPOUS PNEUMONIA the changes in the lung may be regarded as in three stages—*congestion*, in which the blood-vessels are much distended, but with the air-cells still containing air; *red hepatisation*, in which the air-cells are filled with a fibrinous exudate with blood corpuscles and epithelial cells, which coagulates, consolidating the lung; *grey hepatisation*, in which resolution changes take place in the exudate, which eventually becomes absorbed.

The onset of an attack is sudden, there is headache and rigor, the temperature rising to 103° or 104°. The face is flushed, and there is often herpes at the mouth. There is pain at the affected side, a short cough, rapid, shallow breathing, soon accompanied by rusty-coloured tenacious sputum, and the urine is scanty and high coloured. The ratio of pulse to respiration is 2 to 1 instead of the normal 4 to 1. Characteristic physical signs can be made out on examination by a physician. About the 7th or 8th day the fever terminates by crisis, falling to normal in a few hours, accompanied by perspiration, and there is general improvement, the pulse and respiration becoming normal. The treatment of acute lobar p. is absolute rest, plenty of fresh air, ice poultices over the chest to relieve pain, and to support the patient's strength by milk, soups, and similar light nourishment. Stimulants, of which strychnine and digitalis are the best, may be given if required. Sleeplessness is relieved by removing the cause if possible (*e.g.* pain or high fever), or hypnotic drugs—trional, paraldehyde, or, in the early stages, opium—may be administered by the physician. A vaccine treatment has been employed with some success.

ACUTE LOBULAR or BRONCHO-PNEUMONIA comes on more gradually than the lobar form and runs a different course, while it is due to catarrhal inflammation of the small bronchi spreading to the neighbouring air-cells. The fever is remittent, there is cough, difficulty in breathing, and a frothy sputum. The pulse is rapid, but pulse-respiration ratio is not altered to the extent it is in lobar p., while the physical signs, which can, of course, only be made out on careful and skilled examination by a physician, differ widely from those of the lobar type. An attack is very frequently secondary to an acute infection (*e.g.* measles, typhoid fever), or chronic debilitating conditions (*e.g.* chronic heart disease or Bright's disease). The treatment is practically the same as in lobar p., but stimulants are given from the beginning, while a steam tent for children, or opium, in the form of Dover's powder, are valuable for relieving the pain. Coughing may be very distressing, and may have to be relieved by stimulating expectorants or emetics.

CHRONIC INTERSTITIAL PNEUMONIA is a rare condition, consisting in a localised or diffuse increase of the fibrous tissue of the lung, occurring in connection with occupations in which dust is habitually inhaled (*e.g.* coal-miners, stone-masons, millers, jute workers) or after syphilis or repeated attacks of pleurisy. The symptoms resemble those of chronic phthisis, with progressive weakness and deficient expansion of the affected side, and the diagnosis is difficult. It is treated by respiratory exercises for the better expansion of the lung, painting iodine on the chest as a counter-irritant, and administration of potassium iodide.

PNOM-PENH (11° 40′ N., 104° 40′ E.), town, capital Cambodia, Fr. Indo-China, on Mekong; exports rice. Pop. 54,621.

PO (44° 55′ N., 12° 28′ E.), river, Italy; rises in Monte Viso; flows N.E. and E., through Piedmont and Lombardy, and enters Adriatic by numerous mouths; length over 400 miles; navigable from Casale Monferrato; chief tributaries, Dora Riparia, Ticino, Addo, Oglio, Sesia, Tanara.

POACHING, see GAME LAWS.

POCAHONTAS, see under INDIANS, RED.

POCHARD, see under DUCK FAMILY.

POCKET GOPHERS, POUCHED RATS (*Geomys* and *Thomomys*), small Rodents with cheek-pouches, lined with hair, opening on the cheek outside the mouth. In this respect they resemble the POCKET MICE (*Perognathus*) and KANGAROO RAT (*Dipodomys*), and all are American; but while the Gophers always live underground, the others are found on the surface.

POCOCK, SIR GEORGE (1706–92), Brit. admiral; nephew of George Byng; commander in the East Indies from 1757 to 1760; took Havana after protracted siege, 1762.

POCOCKE, EDWARD (1604–91), Eng. Orientalist, of remarkable erudition; chiefly distinguished for his works on Arabic subjects; first holder of Laud's Arabic Chair at Oxford (founded 1636).

PODESTA (Lat. *potestas*, power), Ital. official whose functions may range from the judicial to the supreme administrative and military.

PODGORITZA, PODGORICA (42° 27′ N., 19° 23′ E.), town, Montenegro, on Moraca; active trade; near remains of ancient Dioclea. Pop. 10,000.

PODICIPEDIDÆ, Grebes (*q.v.*).

PODIEBRAD, GEORGE OF (1420–71), king of Bohemia; as head of nationalists captured Prague from empire, 1448; app. regent of Bohemia, 1451; was prominent reformer and faced by enmity of pope; elected king, 1458; d. during imperial invasion aided by Catholics; national hero.

PODOLIA, one of most fertile of Russ. governments; situated in S.W. Russia. Area, *c.* 16,240 sq. miles; capital, Kamenetz-Podolsk; drained by Dniester and Bug. Pop. (1910) 3,743,700.

PODOLSK (55° 25′ N., 37° 30′ E.), town, on Pakhra, Moscow, Russia; limestone quarries. Pop. 4000.

PODOPHYLLIN, drug, consisting of a resin in yellowish-brown powder obtained from the root, or the powdered root itself, of the Amer. May-apple (*Podophyllum peltatum*) of natural order *Berberidaceæ*, with a bitter taste and disagreeable smell; used medicinally as a biliary stimulant and purgative, particularly in disorders of the liver.

PODOSTOMATA, see PYCNOGONIDA.

POE, EDGAR ALLAN (1809–49), Amer. writer;

b. Boston; s. of Eng. actress and an Amer. actor; adopted by rich merchant, John Allan; sent to Virginia University; left to his own resources, owing to dissipation; of indulgent and reckless habits, which reduced him to abject poverty. His weird and fantastic genius found lasting expression in his *Poems* and the *Tales of Mystery and Imagination.*

POERIO, ALESSANDRO (1802–48), Ital. patriot and poet; killed in battle for the liberation of Venice. His poems, often reprinted, contain some rousing songs of freedom.

POETRY.—Perhaps no definition has occasioned so much controversy and given so little satisfaction as the definition of poetry. Critics usually muster round one of two opposing standards. They accept as a view-point either form or content, and between such diametrically opposed bases of criticism there can be no agreement. The Gk. tendency was to regard the matter or content as of prior importance, and this view is upheld by Aristotle in his *Poetics*, a magnificent treatise on the art of p. The Romans, on the other hand, tended to regard p. as a mechanic art, and the *Ars Poetica* of Horace is mainly devoted to points affecting metre and *diction.* The Fr. school was for long trammelled by formalism, as is well illustrated by Boileau's treatise on Poetics. But no true understanding of p. can be reached until form and content are regarded as complementary and not independent.

There are certain qualities that are characteristic of the highest p. when regarded from the point of view of subject-matter, and among these the qualities of elevation and expansion stand conspicuous. Elevation is exhibited in divers ways, in sublime thoughts, sublime actions, and sublime forms. Expansion is manifest in wider sympathies, ecstatic emotions, and subliminal feeling. These characteristics explain why it is that imagination and symbolism are such potent factors in p.; they are gates to elevation and expansion. Thus, too, are the religious, philosophic, and metaphysical tendencies of p. explained. From the standpoint of form there are many adventitious accompaniments of p., but only one essential, and that is recurrent *rhythm.* There are, indeed, prosodists who insist that metre is essential to p., but such a view would exclude the whole of Hebrew p., the whole of Teutonic p. (Old German, Old English, and Icelandic), and much modern p. classified as *vers libre.* The rhythm in p. is marked in various ways. It may be restricted and systematised to form metre, or it may be given a loose rein and only marked by such devices as alliteration, parallelism, repetition, and rhyme.

The evolution of the various species of p. is best studied from the history of Gk. lit., because the lit. of Greece was a natural and independent growth, uninfluenced by extraneous models. P. in its embryonic state arises from religious worship, veneration of heroes, and instruction in conduct. This stage precedes the *ballad* stage, at which the veneration of heroes has reached a high degree of development. Succeeding the ballad stage is the age of the *epic*, where the various heroic ballads are woven into a unity round one central idea. Thus, the central idea of the *Iliad* is the wrath of Achilles, round which are gathered the exploits of the heroes who fought at Troy. The central idea of the *Odyssey*, the other great epic of Greece, is the return of Odysseus, and by this central idea are unified the many adventures of the hero. *Didactic* p. rises out of the old instruction verses. Thus Hesiod's great poem, *Works and Days*, is based on old charms and old proverbs relating to man's conduct and work. So far p. has been purely objective in character; subjectivity and analysis of emotion belong to an advanced state of culture. Thus, *lyric*, a highly subjective form of verse, is posterior to the epic, and its complexity of thought has its counterpart in the complexity of the metrical scheme. Last of all is evolved the *drama*, with its balance of subjectivity and objectivity, of psychology and action.

There is a conspicuous difference between classical and modern **prosody.** Ancient metre is based on *quantity*, and modern metre is based on *accent. Metre* is thus the grouping of longs and shorts or the grouping of accented and unaccented syllables. Accent did, indeed, play some part in ancient prosody, but it was subsidiary. Normally a long is equivalent to two shorts, and thus the *dactyl* (–◡◡) and *anapæst* (◡◡–) are balanced feet. Other balanced feet are the *spondee* (––) and the *pyrrhic* (◡◡), but these are incapable of forming a metre themselves, and must occur in combination with other species of feet. The feet which occur most frequently are the *iamb* (◡–) and the *trochee* (–◡), in which the proportion is 1 : 2 and 2 : 1 respectively.

In ascending **rhythms** the light syllable or syllables come first; in descending rhythms the heavy syllable comes first. Thus the rhythm of the iambic and anapæstic foot is ascending, and the rhythm of the trochee and dactyl is descending. Ascending rhythms are more stately than descending rhythms.

There are besides these a number of complex feet, e.g. *bacchius* (◡––), *choriamb* (–◡◡–), etc., but these are probably the invention of the later grammarians, and all classical metres can be analysed into spondees, iambs, dactyls, and anapæsts. Ancient epic was couched in the dactylic hexameter, which admitted spondees in all feet except the fifth. The *elegiac verse* was the next metre which was evolved. It consists of a hexameter followed by a pentameter or interrupted hexameter. It is thus admirably suited for the expression of meditation. Moreover, it is a miniature stanza, and thus heralds the elaborate stanzaic lyrics of later development. The dialogue of drama shows a preponderance of the iambic foot (the foot which occurs most frequently in ordinary speech). The chorus and other meditative portions are expressed in the more intricate metres.

In the transition period, when the quantitative system was fast disappearing, and the accentual system was gradually forming, rhyme was invented. **Rhyme** thus served as an indicator to separate lines which could no longer be distinguished by quantity and could not yet be distinguished by accent. In the hands of the Provençal poets the rhyming schemes became very elaborate, as was natural in a language so rich in rhymes. The Fr. poetry of a later development was governed by a rigid formalism, and the laws formulated by Boileau shackled Fr. verse until the emancipation of recent years. Old English p. was a system of verses or lines, with a strong middle *cæsura*, each section of the line having two stressed syllables and of these four stressed syllables three were alliterated. In Orm's *Ormulum* and Layamon's *Brut* we see this Old English tradition yielding to rhyme and metre. In the first decade of the XIII. cent. the Old English system disappeared, but in 1340 there was a revival of the native verse, and the greatest poet of the revival was Langland. Eng. p. then became shattered by the Fr. system of syllabic uniformity. Chaucer, however, released Eng. p. from bondage, and his work was completed by Spenser and Shakespeare.

Descriptive Poetry.—Species in which the primary object is to paint the appearance of inanimate nature and the elements. Its appeal is limited, since it lacks the fervour of the lyric form, and the link with humanity which makes didactic poetry attractive. The highest achievement in this kind in Eng. poetry is *The Seasons* of James Thomson (*q.v.*). Much of the verse of Wordsworth and Burns is also descriptive.

Didactic Poetry.—Name given to that kind of verse which is of an instructive or moral character. Amongst Gk. authors it is represented by the works of Hesiod, Nicander, and Empedocles; amongst the Latins by Lucretius and Vergil's *Georgics.* In French, examples are Boileau's *Art Poétique* and *Epistles*; in

German the writings of J. P. Uz and J. J. Dusch. In Eng. poetry Langland's *Piers Plowman* is a didactic allegory, and other early works come under the definition in a minor degree. Tusser's *Hundred Pointes of Good Husbandrie* (1557) is a notable example of its class. The *Botanic Garden* of Erasmus Darwin (1731–1802) comes under the category, while the poetry of Pope, Gay, James Thomson, Crabbe, Cowper, and Wordsworth is to a large extent didactic.

Pastoral (Lat. *pastor*, a shepherd).—The pastoral as a form of lit. includes poems, plays, operas, etc., dealing (generally artificially and often allegorically) with the joys and sorrows of shepherds and shepherdesses, or country life in general. It is derived from Gk. *idylls* (*e.g.* Theocritus) and Latin *eclogues* (Vergil's *Bucolics*); was revived at Renaissance and became popular in Italy (Sannazaro's *Arcadia*, Tasso's *Aminta*, Guarini's *Pastor Fido*, etc.), France (d'Urfé's *Astrée*), Spain (Cervantes' *Galatea*), and Britain. Among finest Eng. p's may be cited Spenser's *Shepherd's Calendar*, Sidney's *Arcadia*, Fletcher's *Faithful Shepherdess*, Jonson's *Sad Shepherd*: those of Herrick and other XVII.-cent. lyrists; Pope's *Pastorals*, Gay's *Shepherd's Week*, Ramsay's *Gentle Shepherd*. Since XVIII. cent. p. is practically obsolete, country scenes now being described by poets and others in more natural realistic fashion. In elegies, however, and kindred compositions, a pastoral element is still sometimes introduced.

Greg, *Pastoral Poetry* (1906).

POGGENDORF, JOHANN CHRISTIAN (1796–1877), Ger. physicist; b. Hamburg; apothecary's assistant; prof. of Physics at Berlin; made valuable discoveries in electricity.

POGGIO BRACCIOLINI (1380–1459), Ital. scholar; b. Terranova, Florence; studied Latin under John of Ravenna; visited numerous convents in Europe in search of classical MSS., and recovered Quintilian, Lucretius, Silius Italicus, Vitruvius, etc.; published a famous *Liber Facetiarum*, a collection of jests and anecdotes particularly directed against monastic life, and written in Latin of doubtful excellence.

POGLIZZA (43° 30′ N., 16° 45′ E.), mountainous region, Dalmatia, Austria; formerly seat of a small republic.

POIANA, a carnivore; see under CIVET FAMILY.

POINCARÉ, RAYMOND (1860–), Pres. of Fr. Republic; b. Bar-le-Duc; studied law with success; deputy at 27; Minister of Public Instruction, 1893, 1895; Minister of Finance, 1894, and again in 1906; elected Vice-Pres. of Chamber of Deputies; Senator, 1903; Premier and Minister for Foreign Affairs, 1911–13; elected Pres., 1913 (first election of premier in power); m. Henriette Benucci. During Balkan crisis came to fore as excellent and far-seeing diplomatist; clever writer; author of *Études et figures politiques* and *Causes littéraires et artistiques*; member of Académie Française, 1909. His bro., **Jules Henri** (1854–1912), was a distinguished physicist and astronomer, chevalier of the Legion of Honour, and author of *Les Méthodes nouvelles de la méchanique céleste*; another brother, **Lucien** (1862–), became inspector-general of public instruction, 1902.

POINT DE GALLE, see GALLE.

POINT PLEASANT (38° 49′ N., 82° W.), town, capital of Mason County, on Ohio River, W. Virginia, near mouth of Kanawha; here Virginians defeated Indians, 1774; coal and slate are mined in vicinity; manufactures bricks and tiles. Pop. (1910) 2045.

POISON, a substance which by internal or external use injures or destroys life; it may be local or general, acute or chronic; its effect may be modified by idiosyncrasy, and by habit (*e.g.* opium, arsenic, etc.).

SYMPTOMS include derangement of circulatory, nervous, muscular, and digestive systems; the latter often accompanied by stomachic pains, vomiting, diarrhœa.

TREATMENT embraces evacuation and cleansing of stomach, use of emetics (mustard, zinc sulphate, ipecacuanha), antidotes, etc.

Common Poisons (*treatment in brackets*).

(1) CORROSIVES—
- Corrosive sublimate (white of egg).
- Mineral acids and oxalic acid (chalk, lime-water).
- Caustic alkalies (dilute vinegar, olive oil).
- Carbolic acid (emetic—weak alkali, white of egg —keep warm).

(2) IRRITANTS—
- Arsenic (emetic—freshly precipitated ferric hydroxide—white of egg).
- Phosphorus (emetic—Fr. turpentine).
- Lead salts (emetic—Epsom salts).
- Copper salts (white of egg).

(3) NEUROTICS—
- Prussic acid, and the cyanides (emetic—artificial respiration).
- Opium and morphine (emetic—atropine subcutaneously—artificial respiration).
- Strychnine (emetic—chloroform or chloral).

(4) GASEOUS POISONS—
- Chlorine, sulphur dioxide, oxides of nitrogen, ammonia, carbon monoxide, carbon dioxide, coal gas, hydrogen sulphide, chloroform vapour (plentiful respiration of air or oxygen).

(5) MICRO-ORGANIC POISONS—
- Ptomaines, toxines.

The evidence of poisoning in a dead body depends upon the characteristic post-mortem appearances which certain poisons, *e.g.* corrosives, cause in the alimentary canal and elsewhere; upon the results of the chemical analysis of the contents of the stomach and bowels and of other tissues; and upon the results of experiments upon animals with the substances obtained from the stomach, bowels, and other tissues, or with the suspected food, when more conclusive evidence is difficult to obtain.

There are certain circumstances which point to a case of poisoning, and upon which the evidence of poisoning in a living person largely depends: the suddenness of the onset of symptoms (although violent symptoms may come on very suddenly in certain diseases, *e.g.* apoplexy), the fact that the symptoms usually follow the taking of food or drink, the finding of poison in the remains of food or drink, or in vomited matter from the affected person, suspicious conduct of individuals with easy access to the affected person, *e.g.* nurse or relatives.

It is a felony to administer a poison or other destructive thing with intent to murder, or in order to overcome or stupefy a person for the purpose of committing an indictable offence, and a misdemeanour to administer a poison or other noxious thing with the purpose of injuring or annoying a person. Registered chemists and druggists, pharmaceutical chemists, or legally qualified apothecaries, veterinary surgeons, or dealers in patent medicines are alone permitted by law to sell or dispense poisons. By the Pharmacy Acts of 1868 and 1908, two groups of poisons are scheduled; those in Part. I. are only allowed to be sold to persons known to, or introduced by persons known to, the seller, and the quantity of the poison sold, the purpose for which it is to be used, with the date and the name and address of the purchaser, must be entered in a register kept for the purpose; the name of the article, the word 'Poison,' and the name and address of the seller must be affixed to the box containing the poison. For those poisons included in Part II. no entry in the register is required, but on the box containing any of them must be affixed the name of the article, the word 'Poison,' and the name and address of the seller.

POISSON, SIMEON DENIS (1781–1840), Fr. mathematician; b. Pithiviers, Loiret; entered École Polytechnique, Paris, 1798, where he studied math's under Lagrange: became prof. there (1806), succeeding J. Fourier. Author of many important

works on mathematics and mathematical physics, including various memoirs on celestial mechanics, theory of attraction, and especially the theory of electricity and magnetism; wrote *Traité de mécanique*, and *Théorie mathématique de la chaleur*.

POISSY, ancient *Pinciacum* (48° 56′ N., 2° 1′ E.), town, Seine-et-Oise, France, on Seine; distilleries. Pop. 8000.

POISSY, COLLOQUY OF (1561), summoned by Catherine de' Medici to arrange service in which Catholics and Huguenots might join; utterly failed, and increased religious bitterness.

POITIERS (46° 34′ N., 0° 22′ E.), town, Vienne, France; gave name to countship from VIII. to XV. cent.; scene of battle, 1356, in which the Black Prince defeated King John II. of France; in later times it became a Huguenot stronghold. P. is an episcopal see, and has a fine Transitional cathedral dating from XII. cent.; other interesting old churches are those dedicated to St. Radegonde, St. Jean, and St. Hilaire. Fine public buildings are the Palais de Justice, formerly a ducal palace, and the Hôtel de Ville; seat of univ., founded 1431; has numerous educational establishments, fine library, museums, and several learned associations. Rom. remains include baths, amphitheatre, etc. Pop. (1911) 41,242.

POITOU (46° 30′ N., 0° 30′ W.), ancient province, France (capital, Poitiers); now included chiefly in Vienne, Deux-Sèvres, and Vendée.

POKER, card-game of Amer. origin, played without partners; player on dealer's left puts in stake, the *ante*, double of which must be put in by those who wish to play. Five cards are dealt, and players have option of discarding any or all their cards, and drawing a like number from the pack, in order to form combinations, which rank as follows: pair, two pairs, three of a kind, straight (sequence, irrespective of suit), flush (all of one suit), full house (threes and a pair), straight flush (sequence of one suit), royal flush (straight flush headed by ace). Players bet against each other; there is a great deal of 'bluff.' The joker is sometimes used.

POLA (44° 52′ N., 13° 50′ E.), seaport, principal naval station, and important commercial centre of Austria-Hungary, in peninsula of Istria; possesses remarkably fine harbour, defended by fortifications. Among notable features are famous Rom. remains, Cathedral (XV. cent.), Franciscan Convent (XIII. cent.), and town hall (XIV. cent.). Pop. (1910) 70,499.

POLAND, former country of Europe, now included in dominions of Russia, Austria, and Germany. In early times P. was inhabited by several Slavonic tribes, among which the Poliani attained pre-eminence. P. first appears as an important state about the X. cent., records previous to this date being so interspersed with legend as to have little hist. value. In reign of Mieczylaw, or Mieszko I., Christianity was introduced, and the suzerainty of the Emperor Otho was acknowledged; Mieczylaw was succeeded in 992 by his son, BOLESLAS I., under whom the country became a united state; Boleslas greatly increased his dominions by various conquests, and was recognised as king by Emperor Otho III. After his death in 1025 a time of disorder ensued, ending with the accession of his son Casimir in 1040; in Casimir's reign a great number of foreign ecclesiastics settled in the country; he died in 1058, when his s., BOLESLAS II., became king. Boleslas succeeded, in the course of a brilliant military career, in regaining Silesia and other provinces which had been lost in the years following the death of Boleslas I.; in 1079 he quarrelled with and killed Stanislaus, bp. of Cracow, in consequence of which Gregory VII. laid him under papal interdict and absolved his subjects from their homage and fealty; his subsequent flight to Hungary was followed by his death in 1081, when his bro. Wladislaus assumed control, though he had to content himself with only a ducal title, the country continuing as a duchy for over two cent's from this time.

Under BOLESLAS III. (1102–39) the Prussians were defeated, and Pomerania incorporated in Polish dominions; he encouraged Christianity, in which he was supported by Otho, bp. of Bamberg. After his death Silesia was practically severed from P. in the division of his dominions among his sons; under CASIMIR II. (1177–94) all the various parts except Silesia were reunited, and a constitution was framed; he died in 1194, when the succession was disputed and the country again subdivided, while Pomerania established its independence. About this time there occurred war against the Prussians, and afterwards against the TEUTONIC KNIGHTS, who seized various territories in Lithuania and Podlachia and settled there. In 1241 occurred an invasion of Mongols, who inflicted severe defeat on Poles at *Liegnitz*, but soon afterwards left the country. Various regions were transferred to Brandenburg during this period, and in reign of BOLESLAS V. (1242–79) numbers of Jews and Germans established themselves in P.

Under WLADISLAUS I., *Lokietek* (1305–33), P. was again united and various reforms were carried out; kingly title was revived in 1320, when Wladislaus was crowned with consent of pope; and successful war was waged against the Teutonic Knights. Wladislaus was succeeded in 1333 by his son, CASIMIR III., under whom further reforms were inaugurated, while the country became once more a prosperous and powerful state; wars were waged against Tartars, Lithuanians, and Wallachians, and Galicia was annexed to P.; with Casimir's death in 1370 the *Piast* dynasty came to an end, after having ruled for over five cent's. He was succeeded by his nephew, Louis the Great of Hungary, who died without male issue in 1382; his dau., JADWIGA, became queen in 1383, and in 1386 married JAGIELLO, Grand-Duke of Lithuania, thus uniting Lithuania and P. (which, however, were again separated in following reign), and founding the *Jagiellan* dynasty. Jagiello reigned as WLADISLAUS II.; he encouraged Christianity, and defeated Teutonic Knights at *Grünewald*, 1410; he was succeeded in 1434 by his son, WLADISLAUS III., who was elected to Hungarian throne, and was killed at *Varna* in 1444. CASIMIR IV. then became king, again uniting Lithuania and Poland; he obtained West Prussia and suzerainty over Prussia proper from Teutonic Knights by Treaty of Thorn, 1466. After his death in 1492 three of his sons reigned in succession. Under John Albert and Alexander, the Polish Diet became increasingly powerful, and Lithuania was more firmly united to P.

Under SIGISMUND I. (1506–48) and his son, SIGISMUND II. (1548–72), P. may be said to have reached its apogee; former defeated Wallachians, and acquired suzerainty over Moldavia, but lost Smolensk to Basil of Russia; he opposed Reformation, which, however, spread greatly in country under Sigismund II.; the latter captured Livonia from Knights Sword-Bearers; under him Lithuania and P. were inseparably united, and the state of which Warsaw now became capital was one of most powerful in Europe. With his death the Jagiellan dynasty ended, and monarchy was made elective. Henry of Valois was first king elected, but he presently gave up his claim on becoming king, as Henry III., of France, and was succeeded in Poland by STEPHEN BATHORI (1575–86), who waged war against, and defeated, Ivan IV. of Russia, and subdued the Ukraine Cossacks; in his reign numbers of Jesuits settled in country, and gradual decline of Reformed religion began. His successor, SIGISMUND III. (1586–1633), was son of John of Sweden; he persecuted Protestants, and formed alliance with Sweden, but failed to establish his claim to Swed. crown. His sons, WLADISLAUS IV. (1632–48) and JOHN CASIMIR (1648–68), warred against Sweden, Russia, and Turkey; in 1655 P. was invaded by Charles X. of Sweden, who took Cracow and Warsaw and compelled John Casimir to fly to Silesia; in 1657 Brandenburg succeeded in throwing off the Polish yoke, and in 1668 the king abdicated.

His successor, MICHAEL WISNIOWIECKI (1669–73), warred against Turks, who were eventually defeated by John Sobieski. At Michael's death JOHN SOBIESKI was elected king; he gained brilliant victory over Turks at *Vienna*, 1683, but his reign was disturbed by quarrels among nobles. After his death in 1696, Elector Frederick Augustus of Saxony became king as AUGUSTUS II.; he regained Ukraine from Turks; made treaty with Russia, and warred against Charles XII. of Sweden, who secured his deposition and election of STANISLAUS LESZCZYNSKI to Polish throne; but after Charles's defeat at *Pultowa* in 1709, Augustus was reinstated; his reign is also marked by persecution of Protestants and by beginnings of Polish dependence on Russia; he died in 1733, when the election of his son, AUGUSTUS III., was secured by Russ. influence, which further increased during this reign. Augustus III. was succeeded by STANISLAUS AUGUSTUS PONIATOWSKI in 1764; in his reign various reforms which had been effected by the Czartoryscy party were repealed through Russ. influence, against which the patriotic insurrection known as Confederation of Bar was unsuccessfully directed in 1768; in 1772 occurred the FIRST PARTITION of P., at whose expense Russia, Austria, and Prussia then extended their dominions. Diet then made great effort to reform constitution and to make monarchy hereditary; Russia, however, interfered, and was joined by Prussia in invading P., and by a SECOND PARTITION in 1793 both these powers obtained further territories.

The Poles, led by KOSCIUSZKO, rose in rebellion in 1794, and the invaders were at first defeated, but were presently joined by Austria, whose support changed the aspect of war; patriots were finally defeated by the capture of Warsaw by the allies; and by the THIRD PARTITION, 1795, the rest of the country was divided among the three great powers, and P. as a separate political unit ceased to exist. In 1807 Napoleon created the *Duchy of Warsaw*, which, however, came to an end in 1813. In 1815 the distribution of P. was altered, and some of the central provinces were organised as a kingdom to be ruled by Tsar of Russia as an independent state; risings occurred in 1830, 1846, and 1863, all of which were put down; since the suppression of the insurrection of 1863 the new kingdom of P. has been deprived of its separate government, and has lost even nominal independence.

Language and Literature.—Polish language belongs to Slavonic group, and is flexible and highly synthetic. Early lit. includes a few ballads and proverbs in the vernacular, dating from pre-Christian times, and a number of Lat. chronicles of later date; to the XV. cent. belongs the *Historia Polonicæ* of Dlugloszi, while Laski, who compiled the old Polish laws, and the astronomer COPERNICUS, are among the great names of the early XVI. cent.

First great age of Polish lit. begins about 1548; chief poetic forms were then the idyll and satire, and the period is perhaps best represented by JAN KOCHANOVSKI (1530–84), who wrote a wonderful series of elegies called the *Treny*, and Szarzynski, who first composed sonnets in Polish tongue; while SKARGA (d. 1612) is a well-known rhetorical writer, the product of the Jesuit counter-Reformation which dominated the intellectual life of P. from the beginning of the XVII. cent. till about 1760. The *Jesuit* or *Macaronic period* produced few literary monuments of importance; artificiality was a leading characteristic of the writers of this time, many of whom mixed the Polish and Lat. languages in extraordinary fashion in their works; and the only literary exercise which flourished was eloquence. From about 1760 onwards Polish lit. shows influence of Fr. writers; the drama now became an important literary form, Boguslawski being the best-known dramatist of the time; poetry showed a tendency to lapse into the mere making of rhymes, though Krasicki's plays, satires, and other works, and Wegierski's satirical poems gained their authors some reputation.

Greatest literary epoch, known as the *romantic period*, dates from 1820–50; to this era belong MICKIEWICZ, the greatest national poet, whose *Romanticism*, *Pan Tadeusz*, *Wallenrod*, and other poems are marked by enthusiasm for popular superstitions; KRASINSKI, whose work is tinged with sadness; and SLOWACKI, whose chief quality is brilliance of diction, while influence of Shakespeare and Byron is plainly seen in his poems. The playwright Fredro also flourished at this time, and produced a number of excellent comedies. The *Ukraine* school includes Zaleski, who wrote lyrical poems, Malczewski, author of *Marya*, a popular poem, and other writers. Among modern novelists is SIENKIEWICZ, whose *Quo Vadis* and other novels have been translated into most European languages.

Szujski, *History of Poland* (1865–66); Morfill, *Poland* (1893) and *Early Slavonic Literature* (1883).

POLAND, RUSSIAN (*c.* 50° to 55° N., 17° 30′ to 24° E.), was established as a separate kingdom under Russ. Tsar in 1815, but was deprived of its separate constitution after the rebellion of 1830, when it became a province of Russia; and another rising in 1863 was suppressed with such severity that the last trace of independent nationality disappeared. The country was then divided into the existing provinces of Kalisz, Kielce, Lomza, Lublin, Piotrkow, Plock, Radom, Siedlce, Suwalki, and Warsaw; the Russ. language was enforced, and the estates of the nobles were given to the peasants. R. P. has an area of 49,018 sq. miles; surface generally is a rolling plain, with a hilly forested region in S.; watered by Vistula, with its great tributary Bug, and other streams; crossed by several canals. Chief towns are Warsaw (capital), Lodz, Sosnowice.

The government is incorporated in that of Russia. Education is in a backward condition; Warsaw is seat of Univ. The principal faith is Rom. Catholicism, but Jewish, Gk., and Prot. religions are also represented. R. P. produces cereals, potatoes, and other crops; large area under wood; horses, cattle, sheep, goats, and pigs raised; minerals include coal, iron, tin, zinc, sulphur, malachite; manufactures cottons, woollens, leather, sugar, spirits, beer, flour, chocolate, etc. Pop. (1910) 12,129,200.

POLAR LIGHTS, see AURORA BOREALIS AND AUSTRALIS.

POLAR REGIONS.—From the chronicle of Alfred the Great we learn that Othere and Wulfstan made voyages in the Arctic Ocean, probably round the north coast of Lapland, but their exact route cannot be determined. In the X. and XI. cent's Norsemen made various voyages of discovery in the Far North. In 1001 Eric 'the Red,' an Icelander, made a settlement on the west coast of Greenland. Cabot in 1497 discovered Newfoundland and Labrador, subsequently Gaspar Cortereal attained a lat. of 60° N. But Arctic expeditions were comparatively sporadic until the XVI. cent., when the minds of the adventurous were fired by the idea of a North-East or a North-West Passage in the rich countries of the East, for, according to current beliefs, America and Asia were a geographical unit. The original motive of Polar exploration was therefore commercial and not scientific, and the direction was not due N., but either N.E. or N.W. In 1553 Sir Hugh Willoughby, in search of the N.E. Passage, discovered Novaya Zemlya, but he and his party ultimately perished. In 1556 Stephen Burrough discovered the Kara Strait, and in 1580 the Yugor Strait was discovered by Pet and Jackman. In 1585 Davis discovered Davis Strait and attained a lat. of 72° 41′ N. Barents discovered Bear Island and Spitzbergen in 1596, and was the first European explorer to winter in the Arctic regions. In 1607 Henry Hudson (*q.v.*) touched Cape Hold and discovered Hakluyt Island. In 1610 he tried the N.W. Passage and discovered Hudson Strait. Hudson Bay he believed to be a part of the Pacific Ocean (this was refuted by Button in 1613). In 1615 Baffin found the outlet in Baffin Bay and recorded some invaluable

observations. On his return journey he discovered Jones Sound and Lancaster Sound. In 1631 Fox and James explored the coast of N. America and reached Peregrine Point in the Fox Channel. The quest was then abandoned for over a century.

Peter the Great gave an incentive to Russ. exploration, and in 1725 gave Bering the conduct of an exploring expedition. On reaching Kamchatka, Bering discovered that America and Asia were not continuous. In 1741 he crossed the Sea of Okhotsk and reached the northern coast of America, but died in Bering Island. Phipps sailed in 1773 to Spitzbergen and attained a lat. of 80° 48′ N. Subsequently Scoresby registered important geographical observations in San Mayen Island and the east coast of Greenland (1822).

In 1818 John Ross, with the *Isabella* and *Alexander*, set out to explore the regions discovered by Baffin and abandoned for over a century. In 1819 Parry, in command of the *Hecla* and *Griper*, located N. Devon, Cornwall and Bathurst Islands, and Cape Walker, and Banks Land. In 1821, commanding the *Fury* and *Hecla*, he sailed up Fox Channel and named the Fury and Hecla Straits. In 1829 Ross sailed up Regent Inlet to the Gulph of Boothia, which he named after Felix Booth, a distiller, who financed the expedition. J. C. Ross, his nephew, explored King William Land and discovered the North Magnetic Pole (1831).

In 1845 Franklin started on his ill-fated voyage. He sailed in command of the *Erebus* and the *Terror*, seeking a N.W. Passage, *via* Lancaster Sound and Bering Strait. The ships were last seen in Baffin's Bay. In 1848 the first of the many search expeditions was dispatched. In 1859 M'Clintock found traces of the expedition and a MS. recording the route of the vessels and the death of Franklin in June 1847, on King William Land. The crew of the *Erebus* and *Terror*, under Captain Crozier, had started for the Great Fish River, and their remains were found near Adelaide Peninsula by Dr. Rae. Dr. Hayes in 1831 reached a lat. of 81° 35′ at Cape Lieber. Captain Hall, with the *Polaris*, reached 82° 16′ lat. and named Polaris Bay. In 1875 the great Nares expedition started with the *Alert* and *Discovery*. The *Alert* wintered off Grinnell Land in a lat. of 82° 24′ N. The sledge party under Markham reached 83° 20′. Lockwood of the Greely expedition in 1881 reached Lockwood Island (83° 24′ N.), the Farthest North till the voyage of Nansen. There were 25 explorers in this expedition, of whom 18 perished.

Lieut. Peary in 1892 crossed the north of Greenland to Independence Bay. In 1893 Nansen started on his voyage in the *Fram*, which reached a lat. of 85° 57′, and Nansen on foot, reached a lat. of 86° 14′. In 1897 a balloon expedition, under André, Strindberg, and Fraenkel, perished in search of the North Pole. Captain Cagni in 1900 reached 86° 33′. (In 1903 Amundsen started on an expedition to survey the region of the North Magnetic Pole and accomplished the North-West Passage entirely by water, a feat not accomplished by M'Clure in 1850.)

The year 1909 witnessed the culminating event of N. Polar exploration. Lieut. Peary, in the *Roosevelt*, with six colleagues and a large party of Eskimos trained during his long sojourns in the Far North, taking 133 dogs and 19 sledges, started in 1908 for the Pole. His method of advance was original, and aimed at saving the strength of the leaders for the final stages. A pioneer party, lightly equipped, marched a day ahead and cleared the route for the main party. Companies at various stages returned with the empty sledges and exhausted followers. Prof. Marvin was drowned while crossing a big *lead*—the only fatality of the expedition. Peary hoisted the Amer. flag at the Pole on April 6, 1909. Dr. Cook alleged that he had gained the Pole a year before, and at first received due honour for it; but his proofs were discredited.

Antarctic Exploration.—The Antarctic region was not explored for centuries after the Arctic had been an object of research and adventure. The idea of a rich and wealthy southern continent was in the minds of the early southern explorers—an idea that was doomed to have a rude disillusioning. The pioneer of Antarctic exploration was Captain Cook, who reached a lat. of 71° 10′ S. in 1774. Cook discovered and named S. Georgia and the Sandwich group. In 1819 William Smith discovered the S. Shetlands. But the next great expedition was sent out by Russia under Fabian von Bellingshausen. He reached lat. 69° 53′ S. and named Peter I. Island. In 1823 Weddell reached lat. 74° 15′ S. In 1830 Biscoe discovered Biscoe Island and sighted Graham Land. In 1839 John Balleny named and discovered Balleny Islands. Dumont d'Urville's expedition (1838–40) discovered Zoinville Land, Louis Philippe Land, Adélie Land, and Côte Clairie.

In 1840 J. C. Ross's great expedition sailed to the south with the *Erebus* and *Terror*. To mark the British occupation Ross named the Possession Islands and Victoria Land, which he skirted from Cape North to Cape Crozier. He discovered the marvellous ice barrier which rises precipitously out of the sea to the height of 200 feet, and which was subsequently the base of the British and Norwegian expeditions. He named Mt. Erebus (12,922 ft.), and Mt. Terror (10,900 ft.), and located the S. Magnetic Pole (lat. 75° 5′ S., and long. 154° 8′ E.). Ross reached a lat. of 78° 9′ 30″. In 1898 Captain de Gerlache spent the winter within the Antarctic Circle, his ship, the *Belgica*, being ice-bound. This was the first winter sustained by man within the Circle. In 1898 C. E. Borchgrevink made an expedition to Victoria Land in the *Southern Cross*.

In 1901–4 the British National Antarctic expedition, led by Captain R. F. Scott in command of the *Discovery*, followed the Ross Barrier eastward and named Edward VII. Land. Captain Scott and Sir Ernest Shackleton (3rd officer of the *Discovery*) attained with sledges a 'Farthest South' of 82° 17′. In 1901 the German Antarctic expedition, in the *Gauss*, sailed southward. New land was discovered and named Kaiser Wilhelm II. Land. An extinct volcano (1200 ft.) in the new territory was named Gaussberg. In 1901 the Swedish expedition sailed in the vessel *Antarctic* and made valuable geographical discoveries, proving the continuity of Oscar II. Land, Louis Philippe Land, and Graham Land. The *Antarctic* was lost in 1903, but the crew was rescued. In 1902 the Scot. National Antarctic expedition in the *Scotia* explored Weddell Sea. The expedition returned in 1904.

A great advance south was made in 1907 by Sir Ernest Shackleton, in command of the *Nimrod*. His route was *via* the Beardmore Glacier to King Edward VII. Plateau. He attained a 'Farthest South' of 88° 73′ (within 111 miles of the Pole). In 1910 two vessels were equipped for expeditions—the *Terra Nova*, a British vessel commanded by Captain R. F. Scott, and the *Fram*, a Norwegian ship commanded by Captain Roald Amundson. Amundsen started a few months later than Scott. His vessel was originally equipped for northern exploration, and the announcement in October 1910 of an Antarctic expedition occasioned much surprise. Amundsen indeed had started his career as an explorer in the Antarctic regions, having joined the expedition commanded by de Gerlache in the *Belgica* in 1897. In 1903 Amundsen, in command of the *Gjöa*, had set out on a northern expedition, and relocated the North Magnetic Pole. He was the first to sail the North-West Passage. Peary's successful expedition to the North Pole caused Amundsen to abandon his projected Arctic expedition and seek the great Southern Unknown.

Framheim, Amundsen's headquarters and base, was situated on the shores of the Bay of Whales. The Polar party, consisting of 5 men, 52 dogs, and 4 sledges, started on Oct. 20, 1911. Amundsen's route was entirely new. The journey during the first month was comparatively easy. On Nov. 19 a camp was made at a height of 4500 ft., and on Nov. 20 the descent of a dangerous glacier was made. On Nov. 25 mountain ranges were sighted to the east with peaks of 15,000 ft.

and upward. The ranges were named Queen Maud Ranges. On Nov. 30 the ascent of the Devil's Glacier was commenced. On Dec. 6 the last dépôt was made at a lat. of 87° 40′ S., when the greatest height (10,750 ft.) was reached. This was the most arduous stage in the march. The ice was hollow, and resounded to the tread, hence the region was named the Devil's Dancing-Room. The Pole was reached on Dec. 14, 1911. The Polar camp was named Polheim, and the vast plateau in which the Pole is situated was called King Haakon VII. Plateau. On Dec. 16 observations were carefully taken and registered. On Jan. 25, 1912, the Polar party reached Framheim without casualty, with 2 sledges and 11 surviving dogs.

The chief geographical results of the expedition were: (1) the discovery of the South Pole; (2) the discovering that the great Ross Barrier terminates in a bight (lat. 86° S., long. 163° W.), between the range running S.E. from South Victoria Land and range running S.W. from King Edward VII. Land (the barrier is thus a vast glacial mass, floating in great bay between South Victoria Land and King Edward VII. Land); (3) the discovery of the probable connection between South Victoria Land and King Edward VII. Land; (4) the discovery of the great range of Queen Maud Mountains, which appears to be a continuation of Queen Alexandra Ranges, and whose peaks reach an altitude of 15,000 ft. An expedition also left the *Fram*, under Lieut. Prestrud, and surveyed the Bay of Whales and the Ross Barrier.

Captain R. F. Scott set out to discover the South Pole and to make a scientific and geographical survey of the South Polar regions. His company therefore included several scientific experts. Captain Scott's vessel, the *Terra Nova*, sailed into Robertson Bay and landed a geological party at Cape Adare, and then landed the Polar party in M'Murdo Sound. Captain Scott's first task was to station a dépôt E.S.E. of Hut Point, the winter quarters of the previous expedition. On Feb. 8, 1911, Captain Scott proceeded south, but owing to the severity of the climatic conditions and the loss of several ponies, the party was forced to return to the main base, after depositing a ton of stores at 'One-Ton Camp.' On visiting Hut Point, Scott learned of the arrival of the *Fram*. In November, Captain Scott, accompanied by Dr. Wilson, Captain Oates, Lieut. Bowers, and Petty Officer Evans, pushed southwards and reached the South Pole on Jan. 18, 1912. On the return journey he and his four companions perished. Seaman Evans died from concussion on Feb. 17, 1912; Captain Oates, who had been failing for some time, rather than be a drag upon his comrades, on March 17 walked from the tent and perished; Captain Scott, Dr. Wilson, and Lieut. Bowers died from exposure on March 29.

A great field is yet open to scientists in order to bring those vast Polar regions into the realms of knowledge. Amundsen's project of using aeroplanes in the work of discovery in the Arctic and Antarctic Circles may be realised in the future with great success. No fields have witnessed greater 'hardihood, endurance and courage,' nobler sustenance of defeat and worthier merit of victory, than the North and South Polar regions.

POLARISATION.—It has been explained (see LIGHT) that a ray of light consists of a vibration which passes along a line in the luminiferous medium, or ether, and that this vibration takes place in a direction perpendicular to the direction of the ray. The phenomenon of polarisation, now to be explained, may be most readily understood from the following analogy. Imagine a string, a few yards in length, stretched horizontally between two rigid supports, and let a point on the string be slowly pulled downwards through a short distance and then suddenly released. A wave will be seen to travel along the string—that is, each point in succession along the string will experience a vibration in a vertical direction. Suppose now that we construct a rectangular frame on which wires are strung parallel to each other and so close together that the string, if passed through between two adjacent wires, may be just able to vibrate freely. Holding the frame in a position so that the wires are vertical, cause the string to vibrate as before. The wave will pass along the string and through the frame. But if the frame be held in a vertical plane so that the wires are horizontal, the wave will be stopped when it reaches the frame. If, by some suitable mechanism, the string could be maintained in a constant state of vibration so that a regular succession of waves passed along it, then on gradually turning the frame from the first position (with the wires vertical) into the second position, we should see the waves gradually extinguished by the frame.

In the case of light, if we pass a ray through a plate of tourmaline, placed perpendicularly to the ray, and then through a second plate placed parallel to the first, two positions of the latter may be found: one in which it allows practically all the incident light to pass, another (in the same plane) in which it allows none of the incident light to pass. The explanation is that the first plate of tourmaline stops all vibrations in the ray except those which take place in a particular plane, and these it transmits. The transmitted ray is then said to be *polarised*. The second plate allows the polarised ray to pass if the axes of the two plates are parallel to each other, but stops the ray if they are at right angles. In addition to tourmaline, certain other crystalline substances are capable of polarising light, and of these Iceland spar (a crystalline variety of calcium carbonate) is the most notable.

Polarisation of a ray may also be produced by its reflection from a polished surface at a particular angle of incidence. It is found that when polarised light is passed through a tube containing a solution of cane sugar, the plane of polarisation is rotated through an angle which depends on the strength of the solution, and this has been developed into a method (*saccharimetry*) for determining the proportion of cane sugar in any given sample.

POLE, REGINALD (1500–58), cardinal; s. of Sir Richard Pole and Margaret, dau. of the Duke of Clarence, the bro. of Edward IV. and Richard III.; ed. at Salisbury, and in 1517 was app. prebend of Salisbury. On the divorce of Henry VIII. P. was against the king, and therefore obliged to go abroad; cr. cardinal, 1536, and legate of Viterbo, 1541; prominent at Council of Trent, and on the accession of Mary returned to England as papal legate, becoming abp. of Canterbury, 1556.

A man of gentle temperament, he had no part in the Marian persecution. Pope Paul IV., an old enemy, summoned him to Rome on an almost forgotten former charge of heresy. He died soon after.

Lee, *Reginald Pole.*

POLE, RICHARD DE LA (d. 1525), the 'White Rose'; nephew of Edward IV. of England, and inheritor of pretensions to crown; supported by Fr king during reign of Henry VIII.; slain at Pavia.

POLE, WILLIAM (1814–1900), Eng. engineer and musician; b. Birmingham; worked under Stephenson and Rendel; prof. of Engineering at London Univ., 1859–67; pub. *The Philosophy of Music*, 1879.

POLECAT, see WEASEL FAMILY.

POLE-VAULTING, sport in which jumper endeavours to leap over bar with aid of pole, which he drops when in mid air; if bar is displaced, vault is foul.

POLICE.—The modern p. force in England was established by Sir Robert Peel, in 1829 (hence the vulgar use of the words 'peeler' and 'bobby'). Previous to that date the arrangements for maintaining public order were in the hands of the sheriffs, and were grossly inadequate. Each county in England now controls its own p. under a joint committee of the county council and the county justices of the peace. The *Metropolitan Police Force* (which consisted in 1911 of 31 superintendents, 604 inspectors, 2620 sergeants, and 16,506 constables—total 19,761) is not under the control of the London County Council, but under the direct authority of the Home Office.

The City of London has its own p. under the Lord Mayor and Corporation, and this force has 1 assistant commissioner, 3 superintendents, 5 chief inspectors, 23 inspectors, 23 sub-inspectors, 96 sergeants, and 1029 constables. In Ireland there are two bodies of p.—the *Dublin Metropolitan Force* and the *Royal Irish Constabulary*, the latter a semi-military organisation. Local Watch Committees app. by the town council control the p. in ordinary municipal boroughs.

POLIGNAC, old Fr. family of the Velay. In XVII. cent. Scipion Sidoine Apollinaire Gaspard, Vicomte de P. (d. 1739), and Cardinal Melchior de P. (1661–1742) were famous.

POLIGNY (46° 49′ N., 5° 43′ E.), town, Jura, France; ruined castle. Pop. 3800.

POLITIAN, POLIZIANO, ANGELO (1454–94), Ital. man of letters; b. Montepulciano; sent by impoverished mother to Florence, where he studied under Argyropoulos, Kallistos, Landino, and Ficino; commenced translation of *Iliad* into Latin hexameters, a work which attracted the attention of Lorenzo de' Medici; app. prof. of Classics at Florence, and was recognised as first scholar of his day. P. was, in addition, pre-eminent among Neo-Latin poets. After Lorenzo's death, he was badly treated, and did not long survive his patron. Among P.'s pupils were Linacre and Reuchlin.

POLITICAL PHILOSOPHY is distinct from, though related to, both political history and political science. Of these the former treats of unique series of events in the order of their occurrence; the latter generalises (*e.g.* about types of constitution, the relations of the different branches of government, the rise and treatment of colonies, etc.), but still deals solely with actual political development and institutions. But generalisations about what has been and is in human society necessarily drive us to ask how far what has been and is now is desirable or good, a question that can be answered only by bringing the actual to the test of the ideal. Thus arise the problems of p. p., which considers, not any particular State, but the State in general, seeking for truths that must hold good for any State and for all citizens, so far as it and they are what they profess to be. We may say with rough accuracy that p. p. has three main questions to answer: (1) What is the end of the State, its purpose and use when it performs its proper functions? (2) What is the nature of political obligation? Why should I not only be a citizen in fact (which I cannot well avoid being), but act as a good and loyal citizen? (3) On what principles and within what limits should the State use force upon its members to compel them to behave in certain ways?

The answer given to the first of these questions dominates the answers to the second and third. The anarchist, insanely optimistic about human nature, holds that the State serves no good purpose and has no just claim to obedience, government being simply force exercised by external authority, unnecessary and even pernicious. Less violent individualists regard the State and Government as necessary, but necessary evils. Necessary, because men are more secure as citizens of an organised society than they would be outside it; but evil, because they are less free. Regarding each man's individuality as self-contained, they take government to be inevitably an impairment of it, and liberty to be irreconcilable with law. Hence they tend to limit the purpose of the State and the sphere of its activity very strictly: it is there to see fair play between citizens, to protect life and property, and to give security against foreign aggression. Earlier writers like Locke supported their view by representing the State as originating in contract: men found the inconveniences of living without organisation and government so great that they deliberately entered into agreements with one another, and entrusted power to chosen governors to wield for the good of the consenting parties. This unhistorical notion of an original social contract (used by other writers for very different purposes) is generally accompanied by the dangerous dogma that every man in virtue of being a man, and antecedently to being a citizen, has certain natural rights which he can justly require the State to recognise under threat of rebellion; in itself, however, it has had its use as a demand that government should justify itself by its works and a protest against unreasoning claims of force or mere tradition. Later individualists have for the most part agreed with Bentham that this talk of natural rights and an original contract is 'nonsense upon stilts'; but the differences between the mode of thought of the writers, such as Locke, and that of the Utilitarians and other XIX.-cent. individualists, although important, are not so fundamental as their agreement about the opposition of liberty and law and their consequent jealousy of the State's activity.

Neither practical experience nor theoretical reflection has sustained this favourite opposition of the individualists. The one has discovered by actual trial that the health of the body politic is not improved by unregulated competition among its members; the other has shown that the supposed complete liberty of the isolated man is purely negative and worthless, and that valuable liberty—liberty to grow better—always involves law and restraint of casual or unworthy impulses in the interests of reasonable development. There has therefore been a return to the more generous conception of the State and its purpose that we find in Plato and Aristotle. The State on this view is not an artificial but a natural thing, natural in one sense because men are by nature members of some kind of society from the outset, and the development of looser forms of social union with the fully organised State is not brought about by the deliberate resolve of a moment, but by the steady, slow pressure of necessity: natural in another and more important sense, because man can make the best of his nature only in and by the aid of society, so that the State, whilst owing its gradual organisation in the first place to men's need of security, has for its final purpose to enable them, not to live merely, but to live well.

The State is essentially the co-operative spirit of men, or their common will, expressing itself in an external organisation, and its duty, like theirs, is quite generally to promote good life or welfare. So far as it does its duty, its laws are consonant with and even necessary to our liberty, being expressions of what in our most reasonable moments we really want to have performed; and our obligation to obedience is simply one aspect of our general duty to seek good, and not evil. If the State fails utterly to perform its duty, then rebellion is both inevitable and right; but as a rule any organisation of society is better than none, and at any rate where there is a chance of procuring improvement by constitutional means, rebellion can seldom be justified.

But if welfare is essentially spiritual (see ETHICS), how can the State promote it? For the distinctive instrument of the State is force, the welfare of the spirit, free activity; force can constrain the external act, but not the agent's temper and motive. It has been said that the right use of force is to restrain other force that is opposed to freedom, and this is certainly the first principle of State action. But force opposed to freedom need not be violence; for example, insanitary housing, unduly low wages, and the like, are not, as a rule, the consequences of choice (as ruin may be of gambling), but forcibly diminish, if they do not necessarily destroy, the welfare of those who suffer from them. In improving such conditions of life, the State gives its citizens a better chance of welfare, though it cannot force welfare upon them.

Since voluntary well-doing is incomparably more valuable than constrained obedience, the State should forcibly compel or restrain only when certain kinds of behaviour are so necessary or so injurious that they

must be procured or prevented immediately. Taxes, for instance, cannot be collected by voluntary subscription. But there are regions of human activity in which the external act, if unwillingly performed, has no value at all; thus it is self-contradictory for the State to attempt to compel citizens to be religious, since saying 'Amen' is worthless unless one means it. In general, when it can afford the slower process of moulding opinion and sentiment and disposition, this is better than enforcement of external conduct; and here the State can do much by encouragement and discouragement without compulsion. For example, without enforcing further education on adults, it can provide libraries, museums, art galleries, and the like without treating gambling or ordinary sexual immorality as crimes, it can refuse to recognise gambling debts or promises which are contrary to the interests of public morality.

T. H. Green, *Lectures on Political Obligation*; Bosanquet, *Theory of the State*; J. S. Mackenzie, *Introduction to Social Philosophy*; M'Kechnie, *The State and the Individual*; Ritchie, *Darwin and Hegel*; Sidgwick's *Elements of Politics*; Dunning, *History of Political Theories*; Pollock, *Introduction to the History of the Science of Politics*; Gierke, *Political Theories of the Middle Ages*; Graham, *English Political Philosophy*; Sidgwick, *Development of European Polity*; Ritchie, *Natural Rights*; L. Stephen, *English Utilitarians*; Dicey, *Law and Public Opinion in England during the XIX. Cent.* The student wishing to enter on the history of the subject might start with Pollock's *Introduction*, and read therewith Plato's *Republic*, Aristotle's *Politics*, Macchiavelli's *Prince*, Milton's *Tenure of Kings and Magistrates*, Hobbes's *Leviathan*, Locke's *Treatises on Civil Government*, Rousseau's *Social Contract*, Burke's *Reflections on the French Revolution*, Bentham's *Fragment on Government*, Mill's *Liberty*, Spencer's *The Man* versus *the State*, and then Green and Bosanquet as above.

POLK, JAMES KNOX (1795–1849), 11th Pres. of U.S.A.; Speaker of House of Representatives, 1836; gov. of Tennessee, 1839; Pres., 1845, to settle question of Oregon boundary; agreed to abate original claim of U.S.A.; war with Mexico, 1846–47, resulted in annexation of New Mexico and California; refused re-election, 1848; strongly democratic and upholder of states' rights.

POLLACK, Lythe (*Gadus pollachius*), handsome green member of Cod family, without barbel and with projecting lower jaw; common inshore amongst rocks on Brit. coasts; used for food.

POLLAN, see under Salmon Family.

POLLENTIA, modern Pollenza (44° 25′ N., 8° E.), ancient town, on Taranus, Luguria, Italy.

POLLINATION, the transference of pollen grains to the ovules, in Gymnosperms, or to the receptive part of the carpels in Angiosperms, is a necessary preliminary to fertilisation. This may be accomplished by the wind (*anemophily*), by animals (*entomophily, ornithophily*), or by water (*hydrophily*); of these the first is almost certainly the most primitive. Among the best-known anemophilous types are Coniferæ (*Pinus*), catkinate forms (alder, birch, hazel), and grasses, all characterised by absence of bright coloration, odour, or honey, by production of vast quantities of light pollen, and by provision of a large stigmatic surface for its collection. Insect-pollinated (entomophilous) flowers are usually attractively coloured and possess nectar; many have an agreeable scent (*e.g.* lavender). In more highly evolved types many adaptations to ensure cross-p. are noticeable (*e.g.* primrose), as this is believed to result in the production of more robust offspring, although in some forms the plants are normally self-pollinated.

POLLIO, GAIUS ASINIUS (76 B.C.–*c.* 5 A.D.), Rom. orator, poet, and soldier; patron of Vergil and Horace. Vergil's fourth and eighth eclogues were addressed to him. His orations, tragedies, and histories are no longer extant.

POLLOKSHAWS (55° 50′ N., 4° 18′ W.), town, Renfrewshire, Scotland; incorporated in Glasgow, 1912; cotton-spinning and weaving. Pop. (1911) 12,932.

POLL-TAX, the compulsory contribution from each person of a portion of his wealth at the demand of the government. It is a tax per head, irrespective of income or property, and the levying of it in England in the XIV. cent. was the immediate cause of the Peasant Revolt (1381). Since that year no poll-tax has been attempted in England. It is levied on natives in some British colonies.

POLLUX, see Castor and Pollux.

POLO, equestrian game popular in almost all English-speaking lands except Scotland; played for many cent's in Oriental countries, Persia, Tibet, Japan, under similar rules; first played by Europeans in Calcutta, 1863; spread with extraordinary rapidity. Except that it is played on horseback, p. closely resembles hockey (*q.v.*); stick used is about 4 ft. long with 8-inch cross-head; dimensions of field, 300 by 200 yards; distance between goal-posts, 22 ft.; four players on each side; height of ponies must not exceed 14 hands. These animals, when well trained, exhibit an almost human intelligence and command high prices; the best are trained in India. Hurlingham is the centre of p. in Britain.

Dale, *Polo* (1905).

POLO, MARCO (*c.* 1254–1324), Venetian traveller; when seventeen years old accompanied his father and uncle on journey to China (Cathay), where they had previously penetrated on trading expedition and had been kindly received by Kublai Khan, who had asked them to return bringing with them a number of European teachers and priests. The route followed was across Khorasan, over Pamir plateau and across Desert of Gobi, of which P. gives a graphic description. Kublai became attached to P. and entrusted him with various diplomatic and public duties; was unwilling to let him return to Europe, but fortunately P. was sent in retinue of the bride-elect of the Khan of Persia, and reached Europe, 1295; took part in war between Venice and Genoa, 1298, captured and imprisoned; told story of his journeyings to fellow-prisoner, Rusticiano of Pisa, who wrote them down.

The work is in two parts: a personal prologue giving P.'s reasons for journey, and a description of various states of Asia with special reference to dominions of Kublai Khan. The chapters vary in length, and bear more resemblance to occasional jottings than to systematic narrative.

Marco Polo (1903), edit. by Yule and Cordier.

POLONNARUWA (8° N., 80° 59′ E.), ruined city; ancient capital of Ceylon.

POLOTSK (55° 29′ N., 28° 47′ E.), town, Vitebsk, Russia, at junction of Volota and Dvina; taken by Russians from Poles, 1579 and 1685. Pop. 21,000.

POLTAVA—(1) (50° N., 34° E.) government, S.W. Russia, level and undulating; drained by Dnieper; very fertile; one of leading agricultural provinces of Russia; distilleries, flour-mills, tobacco factories; several important fairs. Pop. 3,580,100. (2) (49° 33′ N., 34° 38′ E.) capital of above, on Vorskla; flour-mills. Pop. (1910) 61,300.

POLTERGEIST, Ger. word (literally 'noisy spirit') applied to the movement of objects by no known agency. It is allied, therefore, to the physical phenomena of spiritualism. There have been many alleged instances of p., but instances are naturally difficult to prove. A typical instance of p. is the throwing about of furniture, crockery, etc., when there is no person present who is obviously doing it. Some stories may be legendary or due to exaggeration, but in at least some others the hypothesis of fraud or mechanical contrivance seems ruled out. Such a case was one at Worksop in 1883, which was investigated by Podmore, and also by Andrew Lang, who inclined to believe there was something in it. Naturally the majority of cases occur among those who are but imperfectly educated, but there are other cases besides

A great difficulty, as with all psychic phenomena, is of course that evidence is not always near enough the time to be of first-rate value. According to one theory these phenomena are due to a sort of power emanating from some one at a distance. See also PSYCHICAL RESEARCH.

POLYÆNUS, 'THE MACEDONIAN' (fl. II. cent. B.C.), rhetorician; collected *Strategemata*, or maxims of strategy, which he dedicated, c. 163, to Marcus Aurelius and Lucius Verus.

POLYANDRY, see POLYGAMY.

POLYANTHUS, flower possibly evolved from primrose, from which it differs in having the umbels carried on a stalk.

POLYBIUS (*c.* 204–122 B.C.), Gk. historian; s. of Lycortas of Megalopolis; among the 1000 Achæans sent to Rome on account of abstinence of Achæan League from aiding Rome against Macedonia; detained in Rome in household of L. Æmilius Paulus, 167. P. won friendship of Scipio the younger, through whom he obtained access to Roman archives; returned to Megalopolis, 151, but spent little time in his native city; joined Scipio's African expedition, 147, and saw Carthage destroyed, 146; returned to Greece and negotiated with Romans for merciful terms for revolted cities of Achæan League; travelled with Scipio to Egypt, and in 134 accompanied him to Spain to reduce Numantia; at some time visited Gaul and Atlantic coast. Five of forty books of history remain, and some fragments; style is ponderous and wearisome, but evidences of painstaking research are plentiful; account of Romans important; *Selections*, edit. by Strachan-Davidson (Clarendon Press).

POLYBORINÆ, CARACARAS, see HAWK FAMILY.

POLYCARP (69–155 A.D.), one of so-called 'Apostolic Fathers' (*q.v.*); little known of his life, but he must have been bp. of Smyrna for about 50 years. Irenæus (*q.v.*) relates that when a boy he had listened to the discourse of P., who had conversed with St. John. He was the uncompromising opponent of the Marcionite and Valentinian heresies of his time; a very devout man, though not an original thinker. He visited Rome about 150 to settle the controversy about the date of Easter. An elaborate account of his martyrdom and heroism has been preserved in the *Letter of the Church of Smyrna*.

Lightfoot, *Apostolic Fathers*; Swete, *Patristic Study*.

POLYCELIS, a Turbellarian worm (*q.v.*).

POLYCHÆTA, see under CHÆTOPODA.

POLYCLADIDA, a group of Turbellarian worms (*q.v.*).

POLYDACTYLISM, see under TERATOLOGY.

POLYERGUS, see SLAVE-MAKING ANT.

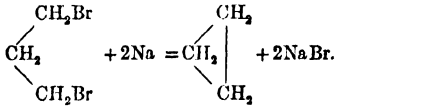
POLYGAMY, custom by which a man may have several wives; distinguished from Polyandry, the possession of several husbands by a wife; allowed among people of India and Africa and all Muhammadans; in Britain and U.S.A. it is punishable as bigamy; the Mormons of U.S.A. abolished bigamous marriage in 1890.

POLYGENIST, a believer in the theory that living things developed from more than one origin (cf. MONOGENIST).

POLYGLOTT, the technical name for a book which contains parallel versions of the same text in various languages. P. editions of the Bible are common. The Genoa Psalter (1516) embraces Hebrew, Latin, Greek, Chaldee, and Arabic.

POLYGON, a plane figure of many angles and sides; usually restricted to figures of more than four sides. P. of five sides is termed a *pentagon*, of six sides a *hexagon*, and so on. Similar p's have angles equal, each to each, and sides about equal angles proportional. Areas of similar p's are to one another as squares of homologous sides. Regular p's have all sides equal.

POLYGONACEÆ, herbaceous dicotyledons, with mainly trimerous, though occasionally (*Polygonum*) partly pentamerous floral symmetry; leaves characterised by possession of a membranous, sheathing stipule termed the ochrea; includes rhubarb, dock, and sorrel.



POLYHEDRON, a solid bounded by many faces or planes. Polyhedra are classified according to number of *faces*. If faces are similar and equal regular polygons, solid is a regular p. Only five regular polyhedra exist, as is easily proved by examining the number of ways in which a solid angle may be formed out of the plane angles of various regular polygons, remembering that the sum of the plane angles forming a solid angle is less than four right-angles. The regular polyhedra are: (i.) *tetrahedron* (4 faces), (ii.) *octahedron* (8 *faces*), (iii.) *icosahedron* (20 faces)—all of which have equilateral triangles for faces; (iv.) cube (6 square faces), (v.) *dodecahedron* (12 faces)—faces of which are regular pentagons. Euler's theorem proves that if F is the number of faces, E of edges, and V of vertices in any polyhedron, then $E+2=F+V$.

POLYHYMNIA, see MUSES.

POLYMETHYLENES, a series of synthetic hydrocarbons, chiefly liquid, to some of which the terpenes are related. They consist of from three to nine *methylene* (CH_2) groups joined together in a ring, and are isomeric with the olefines, from which they differ by being saturated. *Trimethylene* (or cyclopropane) is somewhat unstable, combining with bromine to form the open chain compound 1·3 dibromopropane; *tetramethylene* is more stable, *penta-* and *hexa-methylene* are very stable, forming no addition products with bromine. These facts are accounted for by Baeyer's 'strain theory,' which shows why a 5- or 6-membraned ring is more stable than a ring containing fewer carbon atoms.

Methods of formation:—

(1) Action of sodium on dihalogen paraffins, *e.g.*—

(2) Addition of hydrogen to unsaturated cyclic hydrocarbons, by the catalytic action of finely divided nickel at 180° to 250° C. (Sabatier and Senderens), *e.g.*—

Benzene. Hexahydrobenzene.

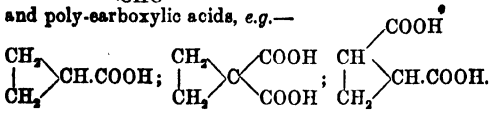
(3) Formation and reduction of corresponding ketones, *e.g.*—

Calcium adipate. Ketopentamethylene.

Cyclopropane:  ; B.P. −35° C.

Cyclobutane:  ; B.P. 11–12° C.

Cyclopentane:  ; B.P. 50–51° C.



Cyclohexane (hexahydrobenzene):  ; B.P. 80–81° C.

Cycloheptane (suberane):  ; B.P. 117° C.

Cyclo-octane: $CH_2—CH_2—CH_2—CH_2$ / $CH_2—CH_2—CH_2—CH_2$; B.P. 146·3–148° C.

Cyclononane: $CH_2—CH_2—CH_2—CH_2$ / $CH_2—CH_2—CH_2—CH_2$ $>CH_2$; B.P. 170–172° C.

Derivatives: (1) alcohols, $>CH.OH$; (2) aldehydes, $>C<^{H}_{CHO}$; (3) ketones, $>CO$; (4) mono-, di-, and poly-carboxylic acids, *e.g.*—

Trimethylene-carboxylic acid. Trimethylene 1·1 dicarboxylic acid. Trimethylene 1·2 dicarboxylic acid.

Derivatives of hexahydrobenzene, *e.g.* the hexahydrophthalic acids, show similar isomerism.

POLYMORPHA, a sub-order of Beetles distinguished by their clubbed antennæ, serrate along inner margin; include Whirligig Beetles (*Gyrinidæ*), carnivorous forms, with paddle-like hind-limbs, which perform mazy dances on the surface of ponds; the Carrion and Burying Beetles (*Necrophorus*), the latter known for their habit of digging a grave beneath small dead vertebrates, so that they may afterwards enjoy an undisturbed feast; the familiar Lady-Birds (*Coccinellidæ*), valuable on account of the plant-destroying insects they devour; the Borers (*Anobium*), the larvæ of which bore into wood; they include the so-called 'Weevil,' which is responsible for weevilly ship biscuits; the larva of *A. paniceum*, also known as the Book-Worm; the cause of 'worm-eaten' furniture (*A. striatum*); and 'Death Watches' (*q.v.*). Click Beetles (*Elateridæ*), so called because when lying on their backs they can with a click jerk themselves in the air. The larvæ of some are known as 'Wire-Worms.' American Fire-Flies (*Pyrophorus*) belong to this family. While amongst *Malacodermidæ* the phosphorescent Glow-Worms and European Fire-Flies (*Luciola*) are placed. The family *Buprestidæ*, also grouped amongst P., is of interest because the metallic green and bronze wing-covers of its members are used as ornaments and for embroidering dresses.

POLYNESIA (*c.* 20° N. to 25° S., 120° to 180° W.), name given to islands of Pacific, which lie between 120° and 180° W. There are many groups, most important being the Samoan, Tonga, Sandwich or Hawaiian, Marquesas, Manahiki, Gilbert, and Ladrones groups; total area, *c.* 11,000 sq. miles.

The inhabitants are known as POLYNESIANS, and are remarkably homogeneous in type in spite of the distance of the islands from each other and the large area over which they are scattered. Their origin remains obscure, although some ethnologists consider that they belong to the Indonesian subdivision of the Caucasic section of mankind. They at all events differ considerably from both Malayan and Papuan races. They are generally of fine stature and physique, although these vary on the different islands. Their colour ranges from light to dark copper, and their hair is generally straight and very dark. Those inhabiting coral islands where natural resources are not great are more industrious than those who live on the more fertile volcanic islands; they are generally distinguished by considerable intelligence. Manners and customs are everywhere similar; religion generally polytheism; and the system of Tabu, whereby any person or thing could be rendered sacred, was the principal method by which chiefs exercised their authority. Christianity has now been introduced in most of islands. See OCEANIA, PACIFIC.

Grey, *Polynesian Mythology*.

POLYP (Lat. *polypus*, from Gk. *polupous*, many-footed), name applied on account of their many tentacles to individuals, whether solitary or colonial belonging to the groups Hydrozoa and Actinozoa of the stinging animals, Cœlentera. 'The Polyps' was once used as a name for the Hydroid class of Zoophytes.

POLYPEMON, see PROCRUSTES.

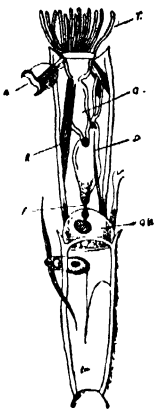
POLYPLACOPHORA, a sub-class of GASTEROPODA (*q.v.*).

POLYPROTODONTIA, a sub-order of the MARSUPIALS (*q.v.*).

POLYPTERUS, one of the two living genera of Crossopterygian fishes, found only in rivers of Western Tropical Africa. The body is covered with rhombic ganoid scales, there are numerous dorsal fins, and the air-bladder, which is double, is used as a lung. Nine species of P. are recognised, the best known being the Bichir (*P. bichir*). They live on muddy bottoms, rising occasionally to gulp air, and are esteemed as food.

POLYPUS, a genus of Cephalopoda (*q.v.*).

POLYPUS, pendulous, non-malignant overgrowth of mucous membrane, occurring in the nasal passages, uterus, intestine, and other situations; removed from the nose and uterus by twisting and tearing through the pedicle.



POLYTECHNIC, an institution to foster art and science. The Fr. *École Polytechnique* was founded by the National Convention to counteract the exaggerated importance attached to philosophy and lit. This institution became largely a training-ground for artillerists and engineers. In Switzerland the Zürich *Polytechnikum* gives training in sciences bearing on manufactures and trades. The polytechnica of Germany (especially Charlottenburg) are famous for their size, completeness, and thoroughness. The problem of co-ordinating such institutions and the univ's is engaging more and more attention. The first p. in England, established in William IV.'s reign, gave instruction in general science, with popular lectures. In 1880 it was reopened as an educational institution for artisans, with classes in science, art, and lit., a gymnasium, library, etc. It had a marked religious side, but services were optional. Other institutions have been opened in London under this name, and supported from funds under the City Parochial Charities Act, 1883, the Technical Instruction Act, 1889, the Local Taxation Act, 1896, and the Education Act, 1902. One of Besant's novels, *All Sorts and Conditions of Men*, emphasised the needs of East London, and outlined a scheme for a 'Palace of Delight.' This idea took hold, money was promised, particularly £7000 yearly by the Drapers Company, and the 'People's Palace' was instituted. Its educational side became known as the East London Technical College, which is now a recognised school of London Univ. The aim of these institutions is technical instruction, and the study of science, art, lit., and general subjects, and the work has been greatly assisted by London Univ.

POLYXEMUS, a Millipede, see MYRIAPODA.

POLYZOA, or BRYOZOA, SEA MOSSES, etc., a phylum or sub-kingdom of the animal kingdom, including small seaweed-like colonies commonly cast on shore after a storm. The colonies may be flat and encrusting, spread over a surface of seaweed, like the Sea-Mat (*Flustra*), or growing like miniature bushes or trees. This appearance is due to an external skeleton (really the cuticle), usually whitish on account of the lime it contains, and sometimes so massive and solid that it resembles coral (*Retepora*, *Porella*). The animals themselves are sheltered by small cups in the skeleton, within which they can altogether withdraw. When expanded they can be seen by the microscope to be small transparent sac-like creatures, surmounted by a crown of ciliated tentacles which waft food to the mouth lying in their midst; and also act as respiratory organs. The disc on which mouth and tentacles are placed is known as the lophophore.

P. are exceedingly simple creatures, without head,

heart, or vascular system, and with only a single ganglion to represent the nervous system. The food canal is U-shaped, the hinder end opening near the mouth. P. are mostly marine organisms, but a few forms are confined to fresh water. They live chiefly between tidemarks, fixed to or encrusting stones and seaweeds, and feeding on minute organisms, such as diatoms and Protozoa.

POLYZOA, *Bugula avicularia* (Sedgewick, *Text-Book of Zoology*). *T*, tentacular crown; *R*, retractor muscle; *D*, alimentary canal; *F*, funiculus; *A*, avicularia; *O*, œsophagus; *Ov*, ovicells.

The Phylum Polyzoa is divided into two classes: (1) ECTOPROCTA, in which the vent opens outside the crown of tentacles; containing by far the greater number of Polyzoa; (2) ENTOPROCTA, in which the vent opens within the crown of tentacles; containing a comparatively few small species.

POMBAL, SEBASTIÃO JOSE DE CARVALHO E MELLO, MARQUESS OF (1699–1782), Portug. diplomatist and statesman; reorganised finances, founded industries, encouraged colonisation; remedied distress after Lisbon earthquake, 1755; put down revolts and expelled Jesuits.

POMEGRANATE (*Punica granatum*), tropical tree which bears a fruit with an extremely tough, leathery pericarp. This is packed with a large number of red or purple seeds with succulent coats. The fruit, which is about the size of an orange, has never become popular in Britain. The tannin found in the rind is used in the manufacture of morocco leather.

POMERANIA, POMMERN (*c.* 53° 50′ N., 15° E.), coast province, Prussia; area, 11,631 sq. miles; surface flat, forming part of great N. German plain; eastern part has belonged to Brandenburg since 1648, whole to Prussia since 1815; capital, Stettin; important agricultural district, with rearing of cattle, horses, poultry; produces rye, potatoes; manufactures spirits, sugar, tobacco, leather. Pop. (1910) 1,716,921.

POMERANIAN DOGS, see DOG FAMILY.

POMEROY (39° 6′ N., 82° 3′ W.), city, Ohio, U.S.A., on Ohio; salt-works; coal mines. Pop. (1910) 4023.

POMFRET, see PONTEFRACT.

POMMERN, see POMERANIA.

POMONA, MAINLAND (59° N., 3° 10′ W.), largest of Orkney Islands; surface hilly and mostly moorland; chief industries, stock-raising and fishing; contains towns of Kirkwall and Stromness; famous antiquarian remains. Pop. (1911) 14,767.

POMONA (34° 5′ N., 117° 48′ W.), city, California, U.S.A.; fruit-growing region; canneries. Pop. (1910) 10,207.

POMPADOUR, MARQUISE DE, JEANNE ANTOINETTE POISSON LE NORMAND D'ÉTIOLES (*c.* 1721–64), mistress of Louis XV.; paternity claimed by Poisson and Le Normand; brought up by latter; m. Le Normand d'Étioles, 1741. A born *fille de plaisir*, she set herself to win the king; laden with riches; centre of literary coterie; ruled France till death; name associated with Louis Quinze modes. *Life*, by Williams (1903).

POMPEII (40° 45′ N., 14° 30′ E.), former town, Italy, at foot of Mt. Vesuvius, on Bay of Naples; said to have been founded by Oscans in late VII. or early VI. cent. B.C.; captured by Romans, 80 B.C., after belonging in turn to the Etruscans and Samnites. For about 160 years P. was a prosperous Rom. town and a favourite seaside resort of the upper classes; but in 79 A.D. it was overwhelmed by volcanic ashes during the historic eruption of Mt. Vesuvius, which destroyed also the neighbouring town of Herculaneum (*q.v.*). For cent's it was entirely lost sight of, but in 1592 some remains were discovered by Fontana when constructing an aqueduct here; and a century and a half later these were realised to be part of P. Excavations were begun in 1748, and since 1870 have been carried on with great regularity, so that now a large part of the town is exposed to view. It is regularly laid out and surrounded by walls, in which are eight gates. In the W. is the Forum, surrounded by colonnades (except in the N.) and by various important buildings; these include—the temples of Jupiter, Vespasian, and Apollo on the N., E., and W. respectively; the Macellum or market, the shrine of the Lares, and the building of Eumachia on the E., several halls on the S., and the great Basilica on the W. In S. of town is another open space called the Triangular Forum, containing an old Doric temple, and with the Great and Little Theatres and the Gladiator's Barracks on the E.; while to N. of Great Theatre are Temples of Æsculapius and Isis. Other temples are those of Fortuna Augusta and Venus Pompeiana to N. and S.W. of Forum respectively. There are thermæ to N. of Forum and in the E. part of the town; and the great amphitheatre stands in S.E. corner just within the walls. Private houses include the villas which belonged to Cicero and Diomedes. Great number of beautiful works of art have been discovered, including wall-paintings and statues.

Pisa and Mackenzie, *Pompeii* (1910).

POMPEIUS, 'POMPEY,' Rom. plebeian *gens*; noted members were—(1) **GNÆUS,** consul, 89, f. of (2) **Gnæus,** POMPEY THE GREAT (106–48 B.C.), who aided Sulla against Marius; repelled Lepidus, 77; defeated Marians in Spain, 76–71; put down revolt of Spartacus, and became consul, 71. Sent with extraordinary powers to suppress piracy, 67, he cleared the Mediterranean in 40 days; conquered Mithradates, and annexed Syria and Palestine, 66–63; finding bitter jealousy in Rome, formed coalition ('first triumvirate') with Cæsar and Crassus; defeated by Cæsar at *Pharsalus*, 48; murdered in Egypt by Achillas. His sons, **GNÆUS** and **SEXTUS,** were defeated by Julius Cæsar at *Munda*, 45.

POMPILIDÆ, see WASPS.

POMPONAZZI, PIETRO (1462–1525), Ital. philosopher; studied med. and philosophy at Padua; distinguished Aristotelian scholar; denied that immortality follows from Aristotle's doctrines.

PONANI (10° 47′ N., 75° 58′ E.), seaport, at mouth of Ponani, Madras, India. Pop. 10,500.

PONAPE, see CAROLINE ISLANDS.

PONCE (18° N., 66° 41′ W.), seaport, Porto Rico; sugar. Pop. (1910) 63,444.

PONCHIELLI, AMILCARE (1834–86), Italian musical composer; wrote *Gioconda*.

POND, JOHN (*c.* 1767–1836), Eng. astronomer; app. astronomer royal, 1811; began reforms in connection with practical astron.

PONDICHERRY, PONDICHÉRY (11° 56′ N., 79° 53′ E.), capital, Fr. India, on Coromandel Coast; chief industry, weaving. Pop. 50,000; territory (1911), 184,840.

PONIATOWSKI, JOSEPH ANTHONY (1763–1813), Polish prince and patriot; commander-in-chief against Russia, 1792, and assisted in Napoleonic campaigns; appointed commander-in-chief of new duchy of Warsaw; distinguished in last Napoleonic invasion of Russia.

PONIATOWSKI, STANISLAUS (1677–1762), Polish general and statesman; adopted by P. family; f. of King Stanislaus II. of Poland, Casimir, chancellor, Michael, abp., and Andrew, soldier, who was f. of Napoleon's marshal P.

PONIATOWSKI, STANISLAUS (1754–1833), nephew of Stanislaus II. of Poland, during whose reign he held high civil and military office; secret adviser of Tsar Paul I.; f. of PRINCE JOSEPH MICHAEL XAVIER FRANCIS JOHN (1816–73), author of operas.

PONSONBY, JOHN (1713–89), Irish politician;

one of 'undertakers' who managed Ireland, 1756–67 s., WILLIAM, cr. baron, 1806; s., GEORGE, lord chancellor of Ireland, 1806.

PONTA DELGADA (37° 40′ N., 25° 32′ W.), chief town, island of São Miguel, Azores. Pop. 18,500.

PONT-À-MOUSSON (48° 54′ N., 6° 2′ E.), town, on Moselle, Meurthe-et-Moselle, France; blast-furnaces. Pop. 14,000.

PONTANUS, JOVIANUS (1426–1503), Ital. humanist and poet; b. at Cerreto, in Spoleto; succeeds best in Lat. verse, e.g. *Urania, De Hortis Hesperidum, De on Cjugale Amoer.*

PONTARLIER (46° 54′ N., 6° 21′ E.), town, Doubs, France, on Doubs; absinthe distilleries. Pop. 9000.

PONT-AUDEMER (49° 20′ N., 0° 29′ E.), town, on Rille, Eure, France. Pop. (commune) 6300.

PONTECORVO (41° 28′ N., 13° 42′ E.), town, on Garigliano, Caserta, Italy. Pop. (commune) 12,000.

PONTEFRACT, POMFRET (53° 42′ N., 1° 19′ W.), town, W. Riding, Yorkshire, England; has ruined castle (built *c.* 1080) where Richard II. was killed, 1400; castle was several times besieged during Great Rebellion; there are two churches, dating from Norman times; market gardens and nurseries; trades in grain; manufactures Pomfret cakes (P. lozenges) from liquorice. Pop. (1911) 15,960.

PONTEVEDRA.—(1) (42° 30′ N., 8° 30′ W.) maritime province, Spain, in Galicia; mountainous. Pop. (1910) 496,292. (2) (42° 28′ N., 8° 35′ W.) seaport, capital of above, on Bay of P.; trade in grain. Pop. (1910) 24,218.

PONTIAC (*c.* 1712–69), Indian chief of Algonquin tribe of the Ottawas; assisted French in defence of Detroit and defeat of Braddock, 1755; discontented under Brit. rule and organised risings of 1763; Detroit, forewarned, stood siege of five months and was then relieved. P. showed wonderful ability, procuring food for besiegers by promissory notes written on bark, signed with symbol of otter; submitted, 1766; his murder caused Illinois War.

PONTIAC (42° 38′ N., 83° 19′ W.), city, on Clinton, Michigan, U.S.A.; trade in wool and agricultural produce. Pop. (1910) 14,532.

PONTIFEX (cf. Pontiff), Rom. high priest. Rom. college of priests was composed of *pontifex maximus, rex sacrorum, flamines, pontifices minores,* and vestal virgins.

PONTINE MARSHES (41° 25′ N., 13° 5′ E.), large marshy region, Rome province, Italy, extending along Mediterranean coast.

PONTIVY, formerly NAPOLÉONVILLE (46° 5′ N., 2° 59′ W.), town, on Blavet, Morbihan, France. Pop. 9500.

PONT-L'ABBÉ (47° 50′ N., 4° 10′ W.), town, Finistère, France, on inlet of sea; exports vegetables. Pop. 6500.

PONTOBDELLA, see under LEECHES.

PONTOISE (49° 3′ N., 2° 6′ E.), town, Seine-et-Oise, France; ancient *Briva Isarœ*; trade in grain; former capital of Fr. Vexin. Pop. 8500.

PONTOON, see RAFTS (or PONTOONS), BRIDGES.

PONTREMOLI (44° 23′ N., 9° 52′ E.), town, Massa e Carrara, Italy. Pop. (commune) 14,500.

PONTUS, geographical division of Asia Minor. Originally the Black Sea and its coasts were all named P. by the Greeks, but in Macedonian period term meant district south of Euxine, north of Anti-Taurus and Paryadres, east of Bithynia and west of Armenia, and was never extended to conquests of its rulers over southern Asia Minor. Kingdom was founded early IV. cent. B.C. by Mithradates I., from dominions of Seleucidæ. Mithradates VI. was defeated by Pompey, 65 B.C., when P. was annexed to Bithynia; Roman province of Pontus Polemoniacus formed, 63 A.D.

PONTYPOOL (51° 42′ N., 3° 3′ W.), town, on Avon, Monmouthshire, England; iron and tinplate manufactures. Pop. (1911) 6452.

PONTYPRIDD (51° 36′ N., 3° 21′ W.), town, Glamorganshire, Wales, at junction of Rhondda and Taff; ironworks; coal and iron mines. Pop. (1911) 43,215.

PONY, see under HORSE FAMILY.

PONZA (40° 50′ N., 12° 57′ E.), small island, Italy, chief of a group in Mediterranean; ancient *Pontia.* Pop. 4600.

POOLE (50° 43′ N., 1° 58′ W.), seaport, Dorsetshire, England; flourishing coasting trade; china- and pipe-clay; oyster-beds. Pop. (1911) 38,886.

POOLE, MATTHEW (1624–79), Eng. Nonconformist divine.

POONA, PUNA (18° 31′ N., 73° 55′ E.), city, Bombay, India; capital of Deccan division, and of P. district; was capital of the Mahrattas; annexed by Britain, 1817; important military station; residence of gov., June–Sept.; contains two colleges and numerous schools; silk, cotton, and jewellery manufactures. Pop. (1911) 158,856.

POOR CLARES, see CLARE, ST.

POOR LAW, law by which state provides for poor. Until 1601 almsgiving was regulated by charity only, though usually performed through medium of Church, which had received power by Act, 1553, to distrain on neglect of this religious duty. Overseers of poor were appointed from early in Elizabeth's reign; before close of reign *poor rates* were levied. Famous Act of 1601, summarising Elizabethan legislation, remained in force till Poor Law Amendment Act, 1834; it provided that *overseers of poor* with consent of justices of peace might levy taxes on propertied people of parish in sufficient amount to provide work for able-bodied, and funds for impotent, poor, and with consent of lord of manor, build houses on common for housing poor, and that parents, grandparents, and children of poor person should, if able, be compelled to support him. Corruption of overseers and increase of destitution through economic changes led to Gilbert's Act, 1783, for building *workhouses* and appointing *guardians*; before this Act a workhouse had been built at Bristol, 1697. A commission (app. 1832) led to Poor Law Amendment Act, 1834, which provided for appointment of three *Poor Law Commissioners* with supreme control over local relief, power to form Unions (united parishes for poor relief purposes), etc.; *Poor Law Board* established, 1847, replacing commissioners; superseded, 1871, by Local Government Board. The State, under Act of 1834, must relieve destitute. Liability of relatives still exists as in 1601, though only enforced where pauper is unable to work. A person deserting wife or legitimate family, who are thereby thrown on parish, becomes liable to punishment as rogue and vagabond. After affiliation order, the father may be compelled to contribute to support of a bastard; mother is otherwise responsible. By General Order, 1882, casual pauper must obtain signed order for admission into *casual ward* from relieving office, except in case of emergency, but Metropolitan Houseless Poor Act, 1865, still remains in force. *Outdoor relief* is given in certain cases under Orders of 1844 and 1852. Special Metropolitan Poor Acts were passed, 1867, 1869. Persons chargeable to rates may be removed to their place of settlement. By statute, 1865, residence for one year gives status of irremovability. Royal Poor Law Commission (app. 1905) issued in 1909 two Reports (Majority and Minority), agreeing as to the deficiencies of system, but differing in policy and principle. Up to 1913 neither of these Reports had led to legislative action. The Majority Report urges the creation of new local 'Public Assistance' Authorities and Committees; the Minority Report advocates the distribution of Poor Law Administrative duties among existing local bodies. Recent social legislation—Old Age Pensions Acts, Labour Exchanges Act, National Insurance Act, etc.—is exercising a profound influence on Pauperism and Poor Law Problems.

POORE, RICHARD (d. 1237), bp. of Chichester, 1214, Salisbury, 1217, Durham, 1228; commenced building of Salisbury Cathedral.

POPAYAN (2° 23′ N., 76° 35′ W.), town (and department), Colombia, on Cauca; founded, 1537; bp.'s see; cathedral and univ. Pop. 18,724; (district) 190,000.

POPE, see PAPACY.

POPE, ALEXANDER (1688–1744), Eng. poet; b. London (May 21); f. a well-to-do R.C. linen-draper; a studious, precocious, hunchbacked boy, with long arms, bright eyes, and beautiful voice; ed. privately, owing to religion; showed poetic bent from age of 8—'I lisped in numbers, for the numbers came.' His first work of note, *Pastorals* (written at 16), was published in 1709. *Essay on Criticism* (1711) gained him entrance to Addison's circle. *Rape of the Lock* (1712), a mock-heroic poem, won him instant fame. *Windsor Forest* appeared, 1714. Swift introduced young P. to his distinguished friends and clubs. P.'s translation of the *Iliad* came out, 1715–20. In 1718 he took Twickenham House, where he settled for life. Here he edited Shakespeare, translated the *Odyssey* (with Broome and Fenton, 1720–25), attacked his many enemies in the *Dunciad* (pub. 1728, with Lewis Theobald as hero), wrote *Essay on Man* (embodying Bolingbroke's philosophy, 1732–34), *Moral Essays*, *Imitations of Horace*, extended and reissued the *Dunciad* (1742, with Colley Cibber as hero), and edited (and doctored) his *Correspondence*.

P.'s physical deformity parallels and largely explains his defects of character: irritability, underhand ways, childishness, and moral infirmities. His life was 'one long disease.' He quarrelled with many of his friends (*e.g.* Addison) and treated most shabbily. P. polished the heroic couplet of Dryden to perfection; he made it a pointed rapier for satiric duels—light, glancing, piercing. He had an unlimited store of poetic diction, but a restricted vocabulary. He had wit unbounded, but not humour. He was a master of epigram. He is the prince of Society poets, elegant, artificial, brilliant. His rhythm is finished, but his closed couplet soon becomes tedious. He has the knack of making polished proverbs, with his common sense, gilt of phraseology, and metrical grace. Next to Shakespeare he is the most-quoted Eng. poet.

Sir Leslie Stephen, *Life* (1880); Dennis, *The Age of Pope* (1894).

POPE, JOHN (1822–92), Amer. general; successful as commander in Civil War, 1861 and early 1862; assumed command of army of Virginia in boastful spirit; signally defeated at *Bull Run*, Aug. 1862.

POPERINGHE (50° 52′ N., 2° 43′ E.), town, W. Flanders, Belgium; wool, linen, hop gardens. Pop. 12,000.

POPHAM, SIR HOME RIGGS (1762–1820), Brit. rear-admiral; energetic commander who promoted Brit. commerce; took part in occupation of Cape of Good Hope, 1806; reprimanded for action at Buenos Ayres, 1807; recovered prestige.

POPISH PLOT, see OATES, TITUS.

POPLAR (*Populus*), a genus of trees allied to willows (*Salix*), and included with them in Salicaceæ; several species—*P. tremula* (aspen), *P. fastigiata* (Lombardy p.), *P. alba* (white p.), and *P. nigra* (black p.) being the best known. The inflorescences take the form of catkins, the carpellary flowers being wind-pollinated. The timber, though used for scaffolding, is not of great value.

POPLAR, borough, on Thames, 3 miles E. of St. Paul's, London. Pop. (1911) 162,449.

POPOCATEPÉTL (19° N., 98° 40′ W.), volcano, state of Puebla, Mexico; one of highest peaks in N. America (17,880 ft.); immense crater yields sulphur.

POPPY (*Papaver rhœas*), a common cornfield weed; *P. somniferum*, the opium p. See OPIUM.

POPULATION, see CENSUS.

POPULONIUM (43° N., 10° 30′ E.), ancient seaport, Etruria, Italy.

POQUELIN, see MOLIÈRE.

PORBANDAR (21° 37′ N., 69° 48′ E.), chief town, seaport, P. state, Kathiawar, Bombay, India. Pop. 25,000.

PORBEAGLE, see under SHARKS AND DOG-FISHES.

PORCELAIN, see POTTERY.

PORCH, in architecture, an exterior appendage to a church or other building, making a covered approach or vestibule to a doorway.

PORCHARD, see under DUCK FAMILY.

PORCUPINE FISHES and **RABBIT FISHES** (*Diodontidæ*), globular or oblong fishes, armed with long projecting spines, movable or immovable; found in all but chiefly in tropical seas.

PORCUPINES, moderately large Rodents, protected by long, strong spines. The COMMON P. (*Hystrix cristata*) occurs in the countries round the Mediterranean Sea; the TREE P. (*Coendu*) is American.

PORDENONE (45° 57′ N., 12° 40′ E.), town, Venetia, Italy; cotton-mills. Pop. (commune) 12,500.

PORDENONE, IL (1483–1539), the name adopted by an Ital. painter of religious subjects, from his birthplace, near Pordenone, in Venetia.

PORFIDO ROSSO, see PORPHYRY.

PORGIES, see SEA BREAMS.

PORIFERA, see SPONGES.

PORISM, name given by ancient geometricians to a certain class of mathematical propositions whose object was to find what conditions will render certain problems indeterminate. Theorems were regarded as directed to *proving*, problems to *constructing*, and porisms to *finding*; so that p's are in a manner intermediate between problems and theorems. Playfair gives the definition—a proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate, or capable of innumerable solutions.

POROS (37° 30′ N., 23° 30′ E.), small island, Greece, in Gulf of Ægina; ancient *Calauria*.

PORPHYRY (Gk. *purple*).—(1) (Petrology) hard stone, resembling granite and known also as *porfido rosso antiquo*; red, with green, black, or white variations; polished and used for ornamental purposes; composition: felspar, hornblende, and oxidised iron; found in Egypt (where, near Siout, there was a dyke some 80 ft. thick), in East, and in parts of England, Ireland, and Germany. (2) (Geology) term used in reference to any unstratified igneous rock containing felspathic crystals or other minerals, *e.g.* felspar-p., claystone-p., porphyritic-granite, porphyritic-greenstone, quartz-p., augite-p., etc.

PORPHYRY OF TYRE, see PLATO.

PORPOISE, see DOLPHIN FAMILY.

PORSON, RICHARD (1759–1808), Eng. scholar; b. E. Ruston, Norfolk; protégé of village squire, who sent him to Eton, 1774; entered Cambridge Univ., 1778; Fellow of Trinity, 1782; prof. of Greek, 1792. He had great ability, a marvellous memory and power of concentration, but intemperance and poverty ruined him. His works include *Letters* on Hawkins's *Life of Johnson*, edition of plays by Æschylus and Euripides, *Adversaria* and *Tracts and Criticisms* (both posthumous).

Life, by Weston (1808), Watson (1861).

PORT, see WINE.

PORT ADELAIDE (34° 52′ S., 138° 35′ E.), the port of Adelaide, S. Australia, on Gulf of St. Vincent; silver- and copper-smelting works. Pop. 21,000.

PORT ARTHUR.—(1) (38° 48′ N., 121° 20′ E.) fortified town, Liao-Tung peninsula, Manchuria (*q.v.*); Chin. name, *Lu-Shun-Kau*; taken by Japanese from Chinese, 1894; leased to Russia by China, 1898; surrendered by Russians to Japanese, 1905, after 11 months' siege; terminus of Trans-Siberian Railway. Pop. 51,000. (2) (48° 30 N., 89° W.) port, Ontario, Canada, on Lake Superior; shipping trade. Pop. 7000.

PORT AUGUSTA (32° 35′ S., 137° 40′ E.), seaport, S. Australia, on Spencer Gulf; exports wool; large ostrich farm.

PORT BLAIR (11° 41′ N., 92° 43′ E.), port, Brit.

Indian penal settlement, S. Andaman, Andaman Islands. Pop. 18,500.

PORT CHESTER (41° N., 73° 40′ W.), village, summer resort, New York State, U.S.A., on Long Island Sound; planing-mills. Pop. (1910) 12,809.

PORT ELIZABETH (33° 57′ S., 25° 37′ E.), seaport and district, Cape Province, S. Africa, on Algoa Bay; college, library, museum, botanical garden, parks; important transit trade; exports wool, skins, feathers, mohair. Pop. (1911) 30,676; (white) 18,216.

PORT GLASGOW (55° 56′ N., 4° 41′ W.), seaport, on Clyde, Renfrewshire, Scotland; shipbuilding yards, engineering works. Pop. (1911) 17,749.

PORT HOPE (43° 58′ N., 78° 20′ W.), town, port of entry, Ontario, Canada, on Lake Ontario; trade in lumber. Pop. 6100.

PORT HURON (42° 59′ N., 82° 29′ W.), city, Michigan, U.S.A., at junction of Black and St. Clair; shipbuilding yards; lumber trade. Pop. (1911) 18,863.

PORT JACKSON (33° 52′ S., 151° 11′ E.), harbour, New South Wales, Australia; on its S. shore is Sydney (*q.v.*); naval station.

PORT JERVIS (41° 22′ N., 74° 46′ W.), city, summer resort, on Delaware, New York State, U.S.A. Pop. (1910) 9314.

PORT LOUIS (20° 10′ S., 57° 28′ E.), port, capital of Mauritius; see of R.C. and Anglican bp's; observatory; sugar. Pop. (1911) 50,060.

PORT MAHON, MAHON (39° 54′ N., 4° 19′ E.), fortified seaport, Spain; capital of Minorca, Balearic Islands; naval station; ancient *Portus Magonis*. Pop. 18,500.

PORT NATAL, see DURBAN.

PORT PHILLIP (38° 10′ S., 144° 50′ E.), bay, Victoria, Australia. Melbourne is at N. end.

PORT PIRIE (33° 10′ S., 138° 1′ E.), town, S. Australia, on Spencer Gulf; exports wheat. Pop. 8000.

PORT RICHMOND, former village, Richmond County, New York, on Staten Island; now part of New York City.

PORT SAID (31° 15′ N., 32° 18′ E.), seaport, Egypt, at entrance of Suez Canal; coaling-station. Pop. 49,884.

PORT SUDAN (19° 35′ N., 37° 12′ E.), town, Anglo-Egyptian Sudan, on Red Sea. Pop. 4600.

PORT TOWNSEND (48° 8′ N., 122° 43′ W.), city, port of entry, Washington, U.S.A., on Puget Sound; trade in lumber; magnificent harbour. Pop. (1910) 4181.

PORTADOWN (54° 26′ N., 6° 27′ W.), town, on Bann, County Armagh, Ireland; textiles. Pop. (1911) 11,727.

PORTAGE (43° 31′ N., 89° 22′ W.), city, Wisconsin, U.S.A., on Wisconsin; manufactures bricks. Pop. (1910) 5440.

PORTAGE LA PRAIRIE (49° 57′ N., 98° 20′ W.), town, Manitoba, Canada; trade in grain. Pop. 6100.

PORTALEGRE (39° 14′ N., 7° 26′ W.), city, P. district, Portugal; bp.'s see; woollens. Pop. 12,000.

PORTALIS, JEAN ÉTIENNE MARIE (1746–1807), Fr. jurist; assisted Napoleon in framing *Code Civil*; works include *Discours sur le Code Civil* and *De l'Usage et de l'Abus de l'Esprit Philosophique*.

PORTARLINGTON (53° 9′ N., 7° 11′ W.), town, on Barrow, King's and Queen's County, Ireland.

PORT-AU-PRINCE (18° 34′ N., 72° 20′ E.), capital and chief seaport, Haiti, on Gulf of Gonaïves. Pop. 100,000.

PORTEOUS RIOTS, disturbances in Edinburgh, 1736. **Captain Porteous** of the City Guard fired on a crowd who were making a demonstration on the escape of a prisoner, an act for which he was imprisoned; mob broke open Tolbooth prison and hanged P. in Grassmarket. The opposition which the Scot. M.P's showed against punitive legislation for this deed is historically significant. See Scott's *Heart of Midlothian*.

PORTER, see BREWING.

PORTER, DAVID (1780–1843), Amer. naval commander, forced Brit. ship *Alert* to surrender, 1812; inflicted great losses on Britain in Pacific, 1813; commanded Mexican fleet against Spain, 1829.

PORTER, DAVID DIXON (1813–91), Amer. naval commander; s. of David Porter (*q.v.*), served in Mexican and Civil Wars and received thanks of Congress and grade of rear-admiral for action on Mississippi, 1863; captured Fort Fisher, 1865, again receiving thanks of Congress; vice-admiral, 1866; superintendent of U.S. Naval Academy, 1866–69.

PORTER, ENDYMION (1587–1649), Eng. courtier; beloved by James I. for wit; accompanied Prince Charles and Buckingham to Madrid, 1623; adhered to Charles during Civil War, though disapproving of his measures; distinguished *dilettante*.

PORTER, FITZ-JOHN (1822–1901), Amer. general; distinguished as commander of V. corps in Civil War, but involved in disgrace by its inaction at *Bull Run*.

PORTER, JANE, (1776–1850), Brit. novelist, was b. at Durham. She wrote many books in an exaggerated romantic style, but her best romance, *The Scottish Chiefs*, in spite of numerous faults, is a spirited and thrilling picture of the times of Wallace.

PORTEUS, BEILBY (1731–1808), bp. of Chester, 1776, London, 1787.

PORTHCAWL (51° 28′ N., 3° 42′ W.), seaport, watering-place, Glamorganshire, Wales; exports coal, iron. Pop. (dist.) 3443.

PORTICI (40° 50′ N., 14° 20′ E.), town, fishing port, on Bay of Naples, Italy. Pop. 14,600.

PORTLAND.—(1) (43° 40′ N., 70° 20′ W.) town, Maine, U.S.A., on Casco Bay; stands on narrow peninsula; episcopal see of R.C. and Prot. Churches; has two cathedrals; many fine public buildings, including Federal and Cumberland County Courts, Observatory, Post Office, and Custom-House; many educational and philanthropic establishments; several beautiful parks; fine harbour; has great elevators belonging to Grand Trunk Railway; exports grain, flour, dairy produce, lumber, live stock, etc. Pop. (1910) 58,571. (2) (45° 31′ N., 122° 31′ W.) largest city in Oregon, U.S.A., on Willamette; contains Portland Univ. and other important educational institutions; commercial and railway centre and seaport; extensive docks; iron and woollen manufactures; exports wheat, flour, lumber, salmon. Pop. (1911) 207,214. (3) (38° 21′ S., 141° 32′ E.) seaport town, Victoria, Australia.

PORTLAND, EARLDOM AND DUKEDOM OF, Eng. honours. Earldom cr., 1633, for Richard, Lord Weston, favourite of Charles I.; extinct, 1688; granted, 1689, to Dutchman, WILLIAM BENTINCK, whose descendants still hold it, with dukedom, cr. 1716.

PORTLAND CEMENT, see CEMENT.

PORTLAND, ISLE OF (50° 32′ N., 2° 27′ W.), peninsula, Dorsetshire, England, in Eng. Channel; castle built by Henry VIII.; quarries of building stone, and a great breakwater; convict prison. Pop. (1911) 17,013.

PORTLAND, WILLIAM BENTINCK, 5TH EARL OF (*c.* 1645–1709), Brit. statesman; one of Dutchmen promoted by William III.; lieut.-gen. at *Battle of Boyne*, 1690; fought at *Landen* and *Namur*; ambassador to France, 1698, 1700.

PORTLANDIAN, or **PORTLAND BEDS**, subdivision of Jurassic system; the strata between Kimeridge Clay and Burbeck Beds; oolitic limestones, freestone, clays, and sands; fossils—fish, molluscs, and reptiles; well seen in Island of Portland, hence name.

PORTO ALEGRE (30° 1′ S., 50° 4′ W.), city, port, capital of state, Rio Grande do Sul, Brazil; bp.'s see; important commerce; exports hides, hair, wool. Pop. (1912) 100,000.

PORTO FARINA, GHAR-EL-MELA (37° N., 10° 20′ E.), decayed town, Tunis, at mouth of Mejerda; ancient *Bagradas*.

PORTO MAURIZIO (43° 53′ N., 8° 1′ E.), seaport

(and province), Italy, on Mediterranean; olive oil. Pop. (1911) 7850. Province, which adjoins France, has area of 455 sq. miles. Pop. (1911) 146,847.

PORTO NOVO (11° 30′ N., 79° 48′ E.), seaport, Coromandel coast, Madras, India; Hyder Ali defeated here by British, July 1781. Pop. 14,500.

PORTO RICO, PUERTO RICO (17° 48′ to 18° 31′ N., 65° 29′ to 67° 15′ W.), most easterly island of Greater Antilles group, W. Indies; area, 3606 sq. miles. Surface rises from coast to a ridge running N.W. and S.E., and having extreme height of over 3650 ft.; drained by many short rivers; upper part forested; flat coastal districts and river valleys very fertile and highly cultivated.

P. R. was discovered by Columbus in 1493, after which it became a Span. possession; various unsuccessful attacks were made upon it by Brit. forces between 1595 (when Drake and Hawkins were repulsed) and 1797; remained in the hands of Spain until 1898, although during practically the whole of the XIX. cent. it was the scene of constant rebellion against the mother-country; passed to the U.S.A. as a result of the Span.-Amer. War, 1898.

Principal towns are San Juan and Ponce. Chief products are coffee and sugar; tobacco, rice, fruits, and vegetables are also grown, and live stock raised; railway mileage, *c.* 220. Administration is carried out by Gov., nominated by Pres. of U.S.A., and assisted by Executive Council and House of Delegates. Education is free and obligatory; univ. at Rio Piedras. Principal religion is R.C. Pop., including whites, mulattoes, negroes, and Chinese (1910), 1,118,012.

Van Middledyk, *The History of Puerto Rico.*

PORTO TORRES (40° 50′ N., 8° 30′ E.), seaport, Sardinia, on Gulf of Asinara; ancient *Turris Libisonis.* Pop. 3800.

PORTOCARRERO, LOUIS MANUEL FERNANDEZ DE (1635–1709), Span. cardinal (1669); abp. of Toledo, 1677.

PORTOVENERE (44° 5′ N., 9° 50′ E.), small seaport, Italy, on Gulf of Spezia (ancient *Veneris Portus*). Pop. 5300.

PORTRAITURE.—Coloured portraiture, except in its ruder forms on Egyptian mummy cases or on Rom. mosaics, was not much in vogue in ancient times. Sculptured busts, both Greek and Roman, are numerous and unrivalled. Mediæval art, dominated by the Christian conception, did not encourage p., though Ghirlandajo and some others introduced portraits incidentally into frescoes. The early Renaissance, in Germany and the Low Countries especially, revived p. (cf. works of Dürer, Cranach, Holbein, the Van Eyks). Courts and wealthy Flemish cities with purse-proud aldermen supplied a ready market for Moro, Rubens, Van Dyck, and Rembrandt. In Spain, Morales, Zurbaran, Velasquez, and Ribera, in France, Cousin, Rigaud, and, much later, Boucher, David, Greuze, and Gérard devoted their genius greatly to p. Reynolds and Gainsborough were the first great Eng. portrait painters; previously foreign artists had been employed. Among the principal later portraitists in Britain are Romney, Raeburn, Lawrence, Millais, Hole, Watts, Orchardson, and Herkomer; in U.S.A., Whistler, Sargent, and Shannon; in Canada, Wyatt, Eaton, and Williamson; and in Australia, Lambert in our own day. An interesting branch of p., miniature painting, was prevalent in the XVIII. cent., and is undergoing a slight revival.

PORT-ROYAL, PORT-ROYAL DES CHAMPS, famous Cistercian nunnery near Versailles, founded 1204; removed to Paris, and became prominent in XVII. cent. as Jansenist and educational centre; produced a noble type of spirituality; abolished, 1710. See ARNAULD, JANSENISM.

PORTRUSH (55° 13′ N., 6° 40′ W.), seaport, watering-place, County Antrim, Ireland.

PORTSMOUTH (50° 48′ N., 1° 5′ W.), seaport, Hampshire, England, on Portsea Island, at entrance of Portsmouth harbour; includes Portsmouth proper, Portsea, Landport, Southsea, and (on opposite shore) Gosport; noted for its magnificent harbour; greatest arsenal, strongest fortress, and principal naval station in U.K. At Portsea are the royal dockyards and naval establishments; close to it is the Spithead; birthplace of Dickens. Pop. (1911) 231,165.

PORTSMOUTH.—(1) (36° 46′ N., 76° 26′ W.) city, seaport, on Elizabeth River, Virginia, U.S.A.; navy yard; lumber, cotton. Pop. (1910) 33,190. (2) (43° 2′ N., 70° 49′ W.) city, port of entry, summer resort, New Hampshire, U.S.A.; excellent harbour. Pop. (1910) 11,269. **Treaty of Portsmouth** signed here—see JAPAN, p. 863. (3) (38° 41′ N., 82° 53′ W.) city, Ohio, U.S.A.; machinery, ironware. Pop. (1910) 23,481.

PORTSMOUTH, DUCHESS OF, LOUISE DE KÉROUALLE (1649–1734), Duchesse d'Aubigny, 1684; mistress of Charles II.; famed for gallantry and rapacity; mother of Duke of Richmond.

PORTUGAL (37° to 42° N., 6° 20′ to 9° 25′ W.), republic in extreme S.W. of Europe and Iberian Peninsula; bounded on N. and E. by Spain, W. and S. by Atlantic Ocean. P. consists of six provinces—Entre Minho-e-Douro, Beira, Tras-os-Montes, Alemtejo, Estremadura, Algarve; Azores and Madeira Islands are accounted integral parts of P.; length from N. to S., *c.* 350 miles; breadth, 138 miles; total area (of Continental P.), 34,250 sq. miles; including Azores and Madeira, 35,500.

Coast-line is *c.* 460 miles, with two large indentations—Bay of Setubal and estuary of Tagus. Cape da Roca is the most westerly point of P. **Surface** is generally mountainous, especially N. of Tagus; Serra do Gerez (4390 ft.), Serra de Nogueira (4331 ft.) in N.; Serra da Estrella (6532 ft.), highest mountains of P., in central region; Serra Gralheira (3681 ft.), Montemuro (4534 ft.), S. of the Douro; Serra de São Mamede (3363 ft.), N.W. of Alemtejo, and Serra de Monchique (2963 ft.), in extreme S. Immense plains stretch S. of Tagus; coastal districts generally flat (except near Lisbon and in S.) and marshy. Almost all geological formations are found in P.; about two-thirds belong to Archæan (granite, schist, gneiss, etc.) and Palæozoic periods: Cambrian and Silurian in region of Tagus and Douro; Carboniferous deposits in Alemtejo, etc.; extensive Jurassic rocks are found in Estremadura, Tertiary deposits in flat coastal regions and Tagus district. Principal rivers are—Tagus, Douro, Guadiana, Minho, Lima, Cavado, Mondego, Ave, Vouga, Homen, Sado, Tamenga, Sabor, Côa, Paiva, Ponsul, Ocreza, Niza, Caia, Cobres, Vascão, Oeiras; many navigable.

Climate is generally healthy and equable in elevated regions. Summers are tempered by sea-breezes; winters, short and mild; marshy districts unhealthy. P. is subject to heavy rainfalls (greatest in N. and Serra da Estrella); mean temperature of Lisbon, *c.* 61° F.; mean annual temperature of N., *c.* 59° F.; of S., *c.* 63° F. Flora is rich and varied; extensive forests of cork, pine, oak, Portug. cypress, etc., mainly in S.; large tracts of pasture-land; extensive moors of cistus; numerous fields of rhododendrons in Serra de Monchique. Fauna akin to that of Spain (*q.v.*).

History.—Like Spain, P. was in early times inhabited by Iberians and Celtiberians. Carthaginians made settlements on coast, III. cent. B.C.; P. came under Rom. rule, 138 B.C. (*Lusitania*); then successively taken by Alans, Suevi, Visigoths, V. cent., and Moors, VIII. cent.; partly recovered for Christendom by Ferdinand I. of Castile, and named *Portus Cale,* XI. cent. In 1095 P. became independent as hereditary fief of Count Henry of Burgundy; his son, ALFONSO I., assumed title of king, 1139, and conquered (with help of Eng. Crusaders) Lisbon, 1147, which became capital. The kingdom was gradually extended southward until Algarve was taken, 1251. In 1383 the male line of house of Burgundy became extinct with Ferdinand I., and the crown passed to JOHN I., his illegitimate son. From this time onward P. began to flourish; Portug. mariners, aided and encouraged by Prince Henry the Navigator, laid the foundation

of P.'s Colonial Empire and oversea trade; Ceuta taken, 1415; Madeira, 1420; slave trade begun, 1434. In reign of JOHN II. (1481–95), Cape of Good Hope was rounded by Dias, 1486, and Vasco da Gama discovered sea route to India, 1897. During reign of MANUEL I. (1495–1521) Brazil was taken (1500); Ascension and Madagascar discovered, 1501; Goa, 1510; Malacca, 1511; Ceylon, etc., and island of Ormuz (1515) in Persian Gulf. P. now controlled the Eastern trade and was at the zenith of her power.

In 1580 the illegitimate Burgundian line became extinct. Conquered by Philip II. of Spain, 1581, who claimed the crown, P. suffered severely through Spain's wars with Netherlands, etc. (see SPAIN). Revolution broke out, 1640, and Duke of Braganza was proclaimed king of P. as JOHN IV.; the struggle for freedom continued until 1668, when Spain was forced to recognise the independence of P. During succeeding reigns P.'s power declined, and a heavy price had to be paid for England's support against Spain and other foes. The famous Methuen Treaty was made between England and P. (1703), making the latter commercially practically dependent on the former. Great Government reforms were made by Pombal, the distinguished and powerful Minister of JOSEPH I. (1750–77); Lisbon partially destroyed by earthquake, 1775. When MARIA I. (1777–1816) ascended the throne, Pombal was dismissed. In the PENINSULAR WAR (*q.v.*), Portuguese were allied with Britain and Spain against Napoleon (1807–14). The royal family had fled to Brazil (*q.v.*) and when JOHN VI. became king of P. and Brazil, 1816, he remained in Brazil and appointed Marshal Beresford gov. of P. This caused the revolution of 1820, and in 1821 a Liberal Constitution was framed which John had to accept on his return, 1821. Bitter strife now ensued between Liberals and Reactionaries (led by John's bro., Miguel). Brazil established its independence under John's son, Pedro (1825), who, as PEDRO IV., resigned his claim to Portug. Crown in favour of his young dau., MARIA II. DA GLORIA, who ascended the throne, 1826, with her great-uncle, Miguel, as regent. In 1828 Miguel proclaimed himself king, and there followed a Civil War until 1833, when Miguel renounced his claim.

In 1836 Maria II. married Ferdinand, Prince of Saxe-Coburg-Gotha (FERDINAND II., d. 1885). PEDRO V. ruled, 1853–61, followed by LUIS I. (1861–89), during whose reign the various boundary disputes in Africa began. Britain claimed part of Delagoa Bay, which was eventually awarded to P. by arbitration, 1875; boundaries fixed in West Africa by Germany, France, and P., 1886; Macao ceded to P. by China, 1887; Nyasaland dispute with Britain, 1889; in 1891 Portug. Government withdrew claim, which caused great dissatisfaction throughout P. When CARLOS I. ascended the throne (1889) the financial condition of the country was deplorable; national bankruptcy ensued, 1892. Carlos attempted to improve matters, and made Franco dictator, whereupon the king and crown prince were assassinated, Feb. 1, 1908. MANUEL II. was proclaimed king; in 1910 a revolution broke out; the royal family fled to England; Lisbon was bombarded and P. was proclaimed a republic. In 1911 a Republican Constitution was adopted and formally recognised by Powers.

Language.—Portuguese (also spoken in Brazil) is a Romance tongue, akin to Span. Galician; influenced by Celtic, Frankish, and Arabic invaders; abounds in sibilants and nasal sounds.

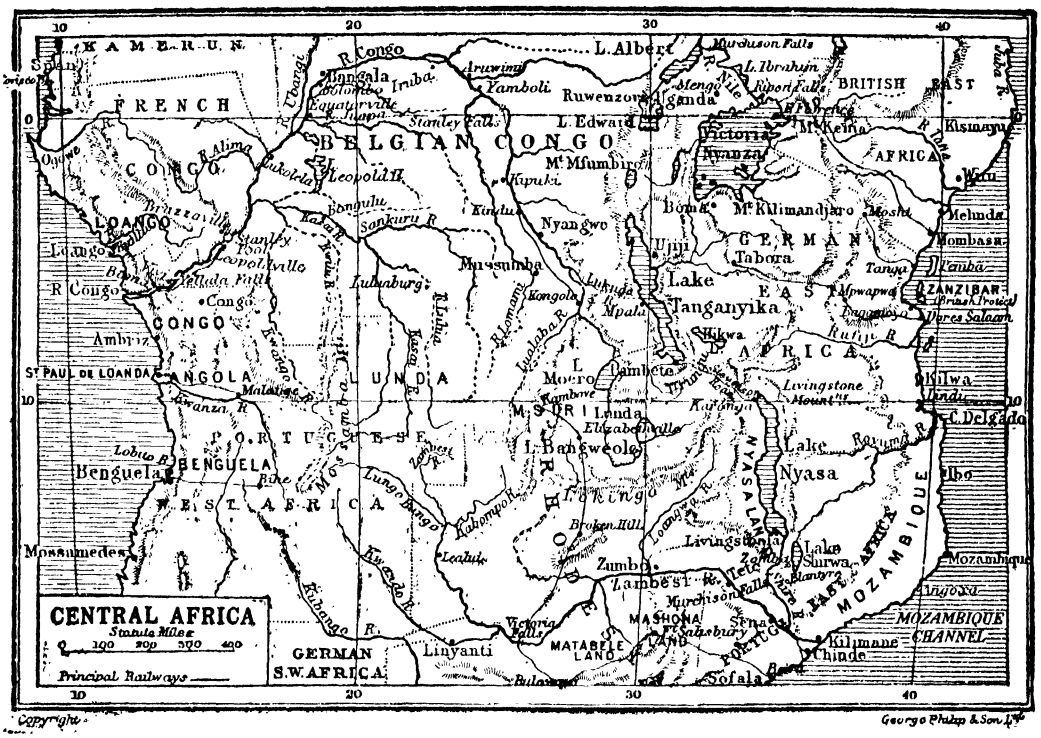
Literature dates from XIII. cent., when Portug. language attained literary form, thanks especially to King DINIZ (*c.* 1300), himself an accomplished poet. Provençal influence prevailed till Ital. models were introduced in XV. cent. through Spain. GIL VICENTE (1490–1536), who created Portuguese drama, the poet SÁ DE MIRANDA (1495–1558) and BERNARDIM RIBEIRO (*c.* 1500), writer of eclogues, ushered in classical age of Portug. lit., of which greatest figure is CAMOENS (1524–80), whose *Lusiad* ranks among world's greatest epics. Other poets and prose writers of this period are Antonio de Ferreiro, Côrte-Real, Pereira de Castro, Ferreira de Vasconcellos, João de Barros, Albuquerque, Francisco de Andrade. Coimbra Univ. became a great seat of the Humanists. Montemayor, Portuguese by birth, wrote his *Diana* in Castilian. Loss of Portug. independence (1581) was fatal to Portug. lit., which showed little sign of recovery until XIX. cent. The Portug. nun ALCOFORADO, GONZAGA, BOCAGE, and DE MACEDO, may, however, be mentioned. D'ALMEIDA GARRETT (1799–1834), DE CASTILHO (1800–75), and HERCULANO (1810–79) introduced Romantic movement; CASTELLO BRANCO and BRAGA, the literary historian, among recent writers have kept Portug. lit. alive.

Government.—Since 1911 P. has been a republic, with President elected for four years, and Congress, consisting of Senate (71 members, elected for 6 years), and National Council (164 members, elected for 3 years). P. is divided into 21 districts, each administered by gov. and local council (*Junta*), viz. Aveiro, Algarve, Braga, Beja, Bragança, Coimbra, Castello Branco, Evora, Guarda, Leiria, Lisbon, Porto, Portalegre, Santarem, Villa Real, Dianna do Castello, Vizeu, on Portug. Continent; Madeira; and Azores (3).

Defence.—Military service is compulsory (Laws of 1887, 1911). From 16 to 20 youths undergo drill and rifle practice; at 20 they pass into active army; volunteers, supplemented (if necessary) by conscripts chosen by lot, serve 1 year; others receive preliminary training (15 to 30 weeks); then follow yearly courses of 2 weeks till men pass into reserve (at 30), and territorial army at (40), when periods of training are reduced. Peace strength is fixed at 30,000 men. The NAVY is manned from seafaring population by obligatory service. Ships are few and mostly old, comprising (1913) 1 battleship, 4 cruisers, some gunboats, torpedo-boats, etc.

Colonies.—Dependencies and colonies are: Cape Verde Islands, Portug. Guinea, Angola, São Thomé and Principe (islands), and Portug. East Africa, in Africa; Goa, Damão Diu (India), Macao (China), and part of Timor in Eastern Archipelago; total area, *c.* 805,000 sq. miles. Portug. colonies are administered by gov.-generals and gov's.

There is no State **religion**, but Catholicism is almost universal; there are 4000 to 5000 Protestants and several hundred Jews. P. is divided into 3 ecclesiastical provinces (including Azores and Madeira), with 3 sees: at Lisbon, Braga, and Evora. Monasteries were suppressed in 1834. Elementary **education** is nominally compulsory (since 1844), but from 70 to 80 % of population are illiterate. P. has a univ. at Coimbra (1290), schools of med. at Lisbon, Oporto, and Funchal, military and naval schools and conservatoire of music at Lisbon, polytechnica at Lisbon and Oporto, besides schools of commerce, agriculture, and various other institutions.



Of the TOWNS, chief seaports are Lisbon (capital), Oporto, Setubal, Funchal (Madeira), Ponta Delgada (Azores), Tavira, Faro; largest inland towns, Braga, Coimbra, Evora, Covilhã, Elvas, Portalegre. Total RAILWAY mileage (1912) 1900 miles, of which about one-third belong to State.

Principal **products** are: wheat, maize, rye, potatoes, tomatoes, oranges, lemons, figs, and other fruits, timber, olives, and vine. Wine-making is an important industry; famous port-wine district is Alto Douro; important cattle-rearing in the north; sheep and goats in the mountainous regions, and swine in the south; valuable fisheries (tunny, sardine, oyster, whiting, etc.). Large tracts of country are waste land. Chief exports are: wine, cork, cottons, fish, fruits, copper, timber, olive oil. P. is rich in minerals, viz. copper, antimony, iron, lead, tin, wolfram, manganese, salt, etc.; also marble, gypsum lime, and petroleum; coal is scarce, which accounts for many valuable mines not being worked. Other chief

industries are: cotton-spinning, weaving of woollens, cork-cutting, tanning, glass and earthenware, lace, paper, gold and silver filigree work, making of preserves, hats, etc. Exports are valued at over £8,000,000; imports over £15,500,000. Pop. (1900) 5,423,132; (1910) *c.* 6,000,000.

Baedeker, *Spain and Portugal* (1901); Koebel, *Portugal: its Land and People* (1909); MacMurdo and Monteiro, *History of P.* (1888, 3 vols.); Stephen, *Portugal* (Story of Nations: 2nd ed., 1903).

PORTUGUESE EAST AFRICA (10° 40′ to 27° S., 31° to 41° E.), Portug. territory on east coast of Africa; bounded by Ger. E. Africa (N.), Nyasaland, Rhodesia, Transvaal, and Swaziland (W.), Zululand (S.), Ind. Ocean (E.); area, 293,400 sq. miles; coast-line, 1400 miles, with several large bays (Delagoa, Sofala, Inhambane, etc). Colony is traversed inland by mountain ranges: Namuli Mts. in N. (8800 ft.); Gorongoza (6500 ft.) in centre; Libombo range in S. Coastlands are flat and swampy; immense forests in interior. Climate is unhealthy on coast; healthier inland.

Fauna includes lion, elephant, hyena, rhinoceros, zebra, buffalo, etc.; crocodiles, hippopotami; varied flora. Chief rivers are Zambezi, Limpopo, Rovuma, Save, Komati; mostly navigable. Principal ports are Lourenço Marques (capital), Guilimane, Chinde, Mozambique, Beira, Ibo, Inhambane.

Vasco da Gama visited mouth of Zambezi, 1498; Mozambique taken from Arabs, 1507; Portug. East African possessions received separate government, 1509; boundaries fixed by Anglo-Portug. agreements, 1890, 1891, and 1905.

Colony is divided into government districts, Lourenço Marques, Mozambique, Inhambane, Guilimane, Tete, and concessions of chartered companies; the Mozambique Co. administers the country between Lourenço Marques and the Zambezi (Manica and Sofala regions); Nyasa Co. controls northern region between Lake Nyasa and Ind. Ocean; Zambezi Co. develops Zambezi region. Railways run from Delagoa Bay to Transvaal; Beira to Rhodesia; Lourenço Marques to Swaziland; railway projected from Beira to Zambezi. Chief products are rubber, cocoa-nuts, sugar, ivory, beeswax, timber, skins; fish abound along coast; coal, copper, gold, malachite are found. Pop. *c.* 3,000,000.

Maugham, *Portuguese East Africa* (1906), *Zambezia* (1910); Reibeiro, *Annuario de Moçambique* (1908).

PORTUGUESE GUINEA (*c.* 12° N., 15° W.), colony of Portugal, Senegambia, W. African coast; area, 13,940 sq. miles; boundary was fixed by agreement with France, 1886; includes Bissagoz Islands; capital, Bolama; principal port, Bissau; produces rubber, ivory, hides, wax, ground-nuts, oil-seeds, mahogany, rice. Pop. *c.* 820,000.

PORTUGUESE MAN-OF-WAR, see under HYDROMEDUSÆ.

PORTUS (41° 45′ N., 12° 15′ E.), ancient harbour, Latium, Italy, at mouth of Tiber; constructed by Claudius; named by Nero, *Portus Augusti.*

PORT-VENDRES, ancient *Portus Veneris* (42° 33′ N., 3° 7′ E.), seaport, Pyrénées Orientales, France, on Mediterranean; exports wine.

POSEIDON (classical myth.), god of the sea in Gk. mythology and identified with the Roman god NEPTUNE. He was the son of Cronus, and when new order was established Zeus became lord of heaven, Poseidon of the sea, and Hades of the under-world. He is represented in art as driving a sea-chariot and bearing a trident.

POSEN.—(1) (52° 16′ N., 16° 50′ E.) province, Prussia; area, 11,190 sq. miles; surface generally flat, with one or two points rising to 600 ft.; drained by Warthe and other streams; was formerly part of Poland, but after partitions of 1772 and 1793 came to possession of Prussia; included in duchy of Warsaw, 1807; restored to Prussia, 1815; manufactures sugar, beer, paper, machinery; sheep raised. Pop. (1910) 2,099,831. (2) (52° 24′ N., 16° 51′ E.) fortified city, capital of above, on Warthe; was residence of the early Polish rulers; flourishing commercial centre in Middle Ages; seat of R.C. archbishopric; contains cathedral, town hall, and royal palace; agricultural implements; liqueurs. Pop. (1910) 156,691.

POSITIVISM, any system confining philosophy to data and methods of natural sciences, and opposed to *à priori* assumptions. See COMTE, AUGUSTE.

POSSESSION (Law), originally, the condition of mastery over a material thing, giving the power to deal with it at pleasure to the exclusion of other persons. Hence it was detention, or use. This power of use or detention became ownership under certain conditions, or the legal authority over an estate. So now possession may be either *actual*, where a person enters upon lands or tenements by inheritance; or *in law*, when lands, etc., have been bequeathed or inherited, but have not been actually entered upon.

For P. in sense of being controlled by spirits, see DEMONOLOGY, EXORCISM.

POSSNECK (50° 43′ N., 11° 38′ E.), town, Saxe-Meiningen, Germany, on Kotschau; flannel. Pop. (1910) 12,430.

POSTAL SERVICES.—In ancient Egypt, Assyria, Persia, Greece, and Rome, 'swift runners,' relays of men and horses, conducted primitive postal services. Some Gk. states possessed postmen (*hēmerodromes*, 'daily messengers'). Under the Rom. Empire a *cursus publicus* (public postal system) was established with offices (*stationes*) and postmen and postmasters (*stationarii, mancipes cursus publici* or *mancipes mutationum*). All over the Rom. world were to be found couriers' horses (*veredi*), couriers (*veredarii*), and the *judices curiosi*, who exercised police control. This elaborate system was solely for State use, and might not be employed by individuals until Diocletian granted private posting facilities. Rome never conceived the idea of utilising this important opportunity of revenue, but her system was of the greatest speed and excellence.

The Rom. organisation disappeared in the West on the barbarian conquest of the Empire, but survived in the Byzantine Empire. Charlemagne vainly attempted to revive it in the West. An international postal service was carried out in the Middle Ages by religious orders, whose various cells kept up communication with each other, the scholars of univ's, trade guilds, and merchants. The Univ. of Paris had organised an excellent service by 1464, when Louis XI. promulgated an edict by which the FR. ROYAL POST, for use of individuals as well as State, was established. The two services, however, ran side by side till 1696, when the State took charge of all private letters. Besides the excellent Prussian service of the Teutonic Knights, emperors of the Holy Roman Empire restored the Rom. *cursus publicus* in their Ital. and Ger. dominions. Germany had also from XIII. to XVII. cent. the 'drovers' post'; herdsmen and butchers were almost *ex officio* postmen.

The family of TAXIS organised the posts of the Empire. Francis, count of Thurn and Taxis, became captain and Master of the Posts in 1500, and undertook the service of Netherlands, Empire, and Spain, 1505, Rome and Naples, 1516. His nephew, Johann Baptista von Taxis, was appointed Postmaster-General of all Charles V.'s realms, 1520, and the position was made hereditary in the Taxis family, 1615. Despite the agitation of minor states of Germany the Taxis retained the privilege, confirmed by treaties of 1815 after reconstitution of the Empire; but sold their right to Prussia, 1867, for 3 million thalers, having carried out their task in an exemplary manner for 3½ cent's. Brandenburg had established a State postal service, 1646, which spread all over Germany in the first half of XIX. cent., before the purchase of the Taxis rights.

British Postal History.—The early history of the Brit. postal service is obscure. Expenses of *nuncii* (messengers), who carried government letters, are entered in Exchequer accounts from earliest times. Under Edward II. regular 'posts' (the Rom. *stationes*) were established. The system of employing casual messengers seems to have endured down to Henry VIII.'s time. The office of Master of the Posts is first mentioned, 1512, apparently lately introduced (see *Letters and Papers, Henry VIII.*, i. *passim*). Brian Tuke, who as king's sec. paid the postmaster in 1512, was made 'Gov. of the King's Posts,' 1517. Tuke in 1533 informed Cromwell, who was dissatisfied with the posts, that except the hackney horses between Gravesend and Dover, there were no regular posts in England as in France and other parts. Directed to establish posts where he thought expedient, he perfected the service between London, Calais, and Scotland. Elizabeth altered the title of Gov. of the Posts to Chief Postmaster.

The State for long had no monopoly, and Scot. services were separate; James I. regulated public postal charges, 1603, and the rate of speed at which letters were to be delivered, and in 1619 instituted the office of Postmaster-General for foreign parts. Charles I. in 1635 abolished private services. Attempts of the Common Council of London, 1649, and of John Hill of York during the Commonwealth to run a private improved service were stamped out by Parliament and Cromwell respectively. Hill opposed government monopoly, as against the 'liberty and birthright of every Englishman.' Similar attempts of Dockwra, under Charles II., and Povey, under William III., failed. An Act for Erecting and Establishing a Post Office, 1660, known as the *Post Office charter*, confirmed changes introduced during the Commonwealth.

The Post Office Act, 1710, brought the whole Brit. Empire under postal control of a *Postmaster-General*; this Act abolished the system of public horses, and provided for private persons receiving licence to keep post-horses. In 1784 John Palmer of Bristol induced Pitt to utilise newly introduced mail coaches, and provide armed convoys, this being the great age of highwaymen. The rise of railways in XIX. cent. exercised a profound influence on postal affairs. A Post Office Management Act, 1837, confirmed government monopoly, and decreed that although letters might be carried from friend to friend, if no fee were paid, no letters, even unpaid, except such as related to their goods, might be borne by common carriers or masters, crews or passengers of passenger vessels or barges.

In 1840 came the important reforms of ROWLAND HILL; two cent's earlier John Hill had shown that cheap rates of postage would increase profits, and in 1837 Rowland Hill published *Post Office Reform*, advocating prepayment of postage (adopted 1772 in Austria) by means of stamps and PENNY POSTAGE (a rate of 1d. for ½ oz., plus 1d. for each additional ½ oz.). A committee of the House of Commons made an enlightened report on these suggestions, predicting an improvement of revenue on their adoption, through increased use of the service, and emphasising the beneficial influence of cheap correspondence on civilisation. In spite of Government's reluctance, an Act of 1840 introduced penny postage, and ultimately increased postal revenue. Letters more than doubled in number the first year, as Hill had prophesied, but it took some years to abolish the deficit in revenue. This Act also suppressed the old system of *franking*, and introduced *Money Orders*, regularised by Money Order Act, 1848. *Book post* was inaugurated, 1885; *halfpenny postcards* issued, 1870; *Postal Orders* introduced, 1880; *Parcel Post* instituted, 1883; *Express Delivery Service* started, and *Express Messenger Co.* licensed, 1891; IMPERIAL PENNY POST was authorised, 1898, thanks to efforts of Sir J. HENNIKER-HEATON; extended to U.S.A., 1908.

Provident arrangements connected with the Post Office started with *Post Office Savings Banks*, opened 1861. Monopoly of electric TELEGRAPHS was granted to Post Office by Act, 1868, and lines of Electric Telegraph Co. were purchased, 1870; rate of 6d. for twelve words instituted, 1885. The Wireless Telegraph Act, 1904, placed WIRELESS TELEGRAPHY likewise under State control. The principle of government monopoly was also applied to TELEPHONES; by Telegraph Act, 1892, the Post Office worked and owned trunk lines, and was empowered to buy up lines of telephone co's, which had already (1881) been compelled to obtain licences from Post Office; National Telephone Company's lines purchased by Government, Dec. 31, 1911.

Espionage of Letters.—The Postmaster-General (P.M.G.) has the privilege of opening and detaining correspondence when so authorised by Sec. of State,

This right was assumed in early days of State provision for letter carriage. In XVII. and XVIII. cent's in France special officials were appointed to examine private correspondence. Napoleon revived *Cabinet noir*, which the restored Bourbons and Napoleon III. continued to utilise; prefect of police now has power to open correspondence. The Brit. system of espial was regulated by proclamation, 1663, and Post Office Act, 1710. As in France, this governmental right has been subject of much attack, notably in Mazzini's case, 1844. The system is much more employed in Russia, Austria, and Germany.

Postal Union.—The International Postal Union, formed by Treaty of Bern, 1874, now includes nearly every civilised country in the world; it holds quinquennial Congresses to settle international postal questions.

United States.—The p. s. has from first been carried on at a loss. Congress assumed direction in 1775; stamps were introduced 1847, made compulsory 1856; registration of letters 1855 (compensation for loss, 1897), effected in many districts at door of house, 1899; uniform 3 cents rate, 1863, reduced to 2 cents, 1885; money orders, 1864; express delivery in certain areas (10 cents extra), 1885; varying rates charged for four kinds of p. matter: (1) ordinary correspondence, (2) periodicals, (3) books and pamphlets, (4) other matter (parcels post matter), at rates (since 1913) varying with distance for from 5 to 12 cents per pound. POSTAL BANKS were authorised 1910, minimum deposit 1$, maximum 100$ per month, maximum balance 500$; certificates issued for deposits and surrendered on withdrawal; interest 2 % per annum.

Bennett, *Post Office and its Story*; Bowie, *Romance of the Post Office*.

POST-TERTIARY, see GEOLOGY.

POTASSIUM, K (kalium) = 39·10; metallic element of alkali group; occurs combined in many silicates; by the weathering of felspar, etc. The Stassfurt deposits include silvine, KCl, carnallite, $KClMgCl_2 6H_2O$, kainite, $K_2SO_4MgSO_4MgCl_2 6H_2O$. (For kainite, see MANURES.) P. compounds are an essential plant food, and wood ash contains p. carbonate (potash = ash from pot boiling). Metal was first obtained by Humphry Davy (1808) by electrolysis of potash (previously thought an element); now prepared by reduction of K_2CO_3 or KOH with carbon ($K_2CO_3 + 2C = 2K + 3CO$), magnesium, or aluminium, or by electrolysis.

Properties: Lustrous silvery white, crystalline, S.G. 0·862, brittle at 0° C., soft at 15° C., M.P. 62·5° C., B.P. 667° C.; vapour green, colours Bunsen flame lilac, spectrum contains a red and a violet line; quickly tarnishes in moist air, rapidly decomposes cold water; monovalent, and most electropositive of the well-known metals; hydroxide (KOH), a strong alkali. The salts are numerous and important; stable and soluble in water, the least soluble being $KClO_4$, $KHC_4H_4O_6$, K_2PtCl_6 (by which metal is estimated).

POTATO (*Solanum tuberosum*), a perennial vegetable, order Solanaceæ; first brought from America by Hawkins, Drake, Raleigh, and long grown as food for swine and poor folk. P's require a crumby soil and much farmyard manure, soot, and phosphates. In 1903–4 Findlay, a Fifeshire farmer, produced his El Dorado and obtained huge prices for single tubers, but disease-proof p's are as yet unknown. *Potato disease* appeared in England, 1845, caused the Irish famine of 1846–47, and has persisted since then; it is caused by a fungus, *Phytophthora infestans*, and results after prolonged rain or damp weather; symptoms are brown spots on the leaves; treatment consists in spraying with copper sulphate solution. P's are used in starch, sugar, and brandy manufacture.

Findlay, *The Potato: its History and Culture* (1906).

POTATO-BEETLE, see COLORADO BEETLE.

POTCHEFSTROOM (26° 30′ S., 27° 40′ E.), town, Transvaal; former capital of South African Republic. Pop. (1911) 12,449; 8107 white.

POTEMKIN, GREGORY ALEKSANDROVITCH, PRINCE (1736–91), Russ. statesman and general; favourite of Catherine II. (*q.v.*); retained power throughout life, skilfully managing her for his own ends; kept Prussia in check and won ports on Black Sea from Turkey; died during successful invasion of Turkey.

POTENTILLA, genus of plants, order Rosaceæ; common wayside plants are Creeping Cinquefoil (*P. reptans*), Goose-grass or Silverweed (*P. anserina*); flowers white or yellow.

POTENTIOMETER, instrument used for measuring the electromotive force between two points; a form of electrometer.

POTENZA (40° 39′ N., 15° 48′ E.), town, capital of P. province, Italy; ancient *Potentia*. Pop. 16,500; (prov.) 500,000.

POTEROO, RAT KANGAROO, see under MARSUPIALS.

POTI (42° 6′ N., 41° 41′ E.), seaport, Kutais, Russ. Transcaucasia, on Black Sea. Pop. 9000.

POTOMAC (38° 10′ N., 77° 10′ W.), river, U.S.A.; rises in Alleghany Mts. and, after forming boundary between Maryland and Virginia, falls into Chesapeake Bay; length about 400 miles.

POTOSI.—(1) (20° S., 65° 30′ W.) S.W. department of Bolivia, bordering Chile and Argentine Republic; mountainous; rich in metals. Pop. 364,689. (2) (19° 38′ S., 65° 25′ W.) city, capital of above; silver mines. Pop. 25,000.

POTOTAN (10° 50′ N., 122° 40′ E.), town, Panay, Philippine Islands. Pop. *c.* 30,000.

POTSDAM (52° 24′ N., 13° 3′ E.), town, on Havel, Prussia; capital of Brandenburg province; 17 miles from Berlin; Prussian royal residence; fine Brandenburger gate, Palace *Sans-Souci* (valuable pictures, beautiful grounds), New Palace, etc.; optical instruments, sugar refineries, breweries, etc. Pop. (1910) 62,243.

POTSDAM (44° 40′ N., 75° W.), village, St. Lawrence County, New York, on Racquette; sandstone quarries. Pop. (1910) 4036.

POTT, PERCIVALL (1714–88), leading Eng. surgeon of his time; surgeon to St. Bartholomew's Hospital (1749); introduced many important new surgical methods. A particular type of fracture of the ankle, and a tuberculous disease of the spine are named after him.

POTTER, ALONZO (1800–65), Prot. Episcopal bp. of Pennsylvania (1845); able as administrator and educationist. His bro., **Horatio Potter** (1802–87), was Prot. Episcopal bp. of New York. Alonzo's son, **Henry Codman Potter** (1835–1908), Prot. Episcopalian bp. of New York, 1887 (as assistant bp., 1883); prominent in social work.

POTTER, JOHN (1674–1747), bp. of Oxford, 1715; abp. of Canterbury, 1737.

POTTER, PAUL (1625–54), greatest of Dutch animal painters. The life-size *Young Bull* is the most celebrated of his pictures. His *Dairy Farm* was sold in London in 1890 for £6090.

POTTERY.—The art of fashioning rude clay urns, vases, and other earthen vessels evidently dates back to little after the first appearance of man, for traces of these vessels have been found in the tombs of the earliest prehistoric races. Indeed, wherever clay was to be found, the primitive savage appears to have been drawn by instinct to attempt the fashioning of it into shapes and figures with which he was acquainted, and it followed, as a natural consequence, that he should, in a little time, discover the use of this plastic material for domestic purposes. These earliest exam[illegible] been hardened by the heat of the sun, but when the properties of fire were fully realised the potter's art quickly developed, and we find in very early examples some attempt at decoration by means of incised lines forming zigzags and lozenges. In attempting, however, to trace the beginnings of pottery as a definite art we must turn to the ancient Egyptians.

We find there that the ceramic art had reached a high state of development as far back as the XVI. cent. Not only were the Egyptians then producing the fine red ware which is familiar to most visitors to museums, but they were making a kind of pottery from a substance consisting of a mixture of clay and sand, which was covered with a siliceous glaze, formed from oxide of copper, which produced beautiful colour effects. Likewise, with the Assyrians, the Babylonians, the Phœnicians, and the Romans, the potter's art reached a considerable state of development in the early stages of their civilisation. Of the Greeks, however, it may be said that down to the VII. cent. B.C. they showed little advance in the art, but a steady progress was maintained during the next 300 years, and by the IV. cent. B.C. it had reached its highest development. The most exquisite specimens of their work which have come down to us belong to this latter period, after which a marked decadence is to be observed. The early Gk. pottery consisted of plain baked earthen ware; later a brown glaze was used; subsequently a black pigment was employed to express upon the brown glaze the shapes of animals, and later of the human figure. Or, at another period, the rough clay vase was dipped in a solution of finer clay, known technically as 'slip,' which allowed the development of a more elaborate colour-scheme. The ceramic art reached a high state of development in Italy, France, and Germany during the XVI. and XVII. cent's; but in England, down to the beginning of the XVIII. cent., the native pottery ware was of a very rude character, which was probably due to the general employment of horn, or pewter, and other metals in the manufacture of articles of domestic use.

Pottery may be roughly divided under three heads: (1) EARTHENWARE, a material exposed only to a moderate heat in the process of baking, which can be scratched with a pointed instrument; (2) STONEWARE, a harder substance, baked at a great heat; and (3) PORCELAIN, including all the more delicate forms of pottery, which is fired at the highest possible temperature. The commoner sorts of clays are so impregnated with metallic ores and other foreign substances as to be useless except for the manufacture of bricks, tiles, etc. The purest kind of workable clay is that known as *kaolin*, or china-clay, which was first introduced into England in the early part of the XVIII. cent. It is found largely in China, also in France, Saxony, and the U.S.A., but its presence was not suspected in England until William Cookworthy discovered it in Cornwall about 1755. This clay consists of hydrated silicate of alumina, mixed with smaller proportions of lime, soda, and potash, and is derived from decomposed granitic rock. Another fine potter's medium is that known as *pipeclay*, or blue-clay, which is chiefly found in the neighbourhood of Poole, Dorset. The ingredients used in the mixing of porcelain clay vary in proportion in different countries and in different districts, but the following may be named as the chief constituent elements: kaolin, sand, pipeclay, chalk, ground flints, Cornish stone, and the calcined bones of oxen and sheep.

Process of Manufacture.—Having prepared his clay, the next work of the potter is to mould it into the required shape by means of the 'potter's wheel' (an instrument mentioned in Homer), which is said to have been invented by the Egyptians. A portion of the prepared clay is placed upon the wheel, or 'throwing-machine,' as it is also called, which is kept in rapid motion by hand, foot, or a machine-driven fly-wheel. Having roughly shaped his vessel, the thrower then passes it on to the turner, who smoothes down all roughnesses and inequalities, and then in turn gives it to the handler. Another method of manufacture is by pouring slip into moulds, which are often in several parts. Thus in making a china cream-jug there would probably be four moulds—one for the body, a second for the neck and lips, a third for the foot, and a fourth for the handle. Dishes, plates, saucers, and other flat ware are invariably made upon plaster moulds. The next process is by firing the moulded vessel in a kiln, or 'biscuit oven,' after which the baked article is allowed to cool and the glaze is then applied. The early Egyptian and Assyrian glazes were silicates of soda and lime, but these in time gave place to glazes produced from red and white lead, felspar, salt, and other materials. After glazing, the piece of pottery is placed in the glost-oven, in which the temperature varies according to the composition of the glaze and the kind of ware to be produced. After being removed from the glost-oven the article is in a finished state, or, if necessary, it may be enamelled in gold or some other colour.

Modern Porcelains.—A brief account must now be given of the development of the art of pottery amongst the Chinese, Japanese, and the peoples of the European continent—that is to say, we must now consider the rise and development of the porcelain industry.

CHINESE.—It is to the Chinese that we owe the invention of porcelain. While the early Greeks were producing their primitive earthenware vases the Chinese were manufacturing exquisite works of art in porcelain clay, and it is certain that the craft flourished in China under the Ming dynasty, which lasted from 1368 to 1644 A.D. Indeed, there is evidence to show that porcelain was being manufactured in China under the Tang dynasty (618 to 907 A.D.), and that it was a flourishing industry during the rule of the Sung emperors (960 to 1279 A.D.). The earlier examples of the art are now almost entirely lost to us, but there are in existence numerous examples of the XVII. and XVIII. cent's, at least, and at the present time excellent work is being manufactured, and the glorious traditions of the China we call Old Nankin is still preserved.

JAPANESE.—In the history of porcelain, Japan, although a long way after, is next in importance to China. Buddhism brought the Japanese knowledge of most of the arts, and they certainly learned the craft of porcelain manufacture from the Chinese. Though they had been making pottery from a comparatively early period, the first Jap. porcelains are believed to have been made about 1510 A.D. Europeans have little opportunity of comparing the early work of the Japanese in this medium with that of other nations, as most of the finest examples are still in Japan. Such specimens as are known to us are chiefly XVIII.-cent. work, and are called by the names of the districts in which they were made—Kaga, Kioto, Hizen, and Owari. The ware known as Satsuma does not, strictly speaking, belong to the porcelain class.

EUROPEAN.—Porcelain is believed to have been manufactured in Italy as early as the XV. cent., but the earliest examples which exist were manufactured about 1580 for Francis de' Medici, Grand Duke of Tuscany; after his death, seven years later, the industry appears to have languished. About a cent. later a small amount of porcelain was produced in Paris and Rouen, while in 1693 its manufacture was begun at St. Cloud, other Fr. towns shortly afterwards also engaging in the industry. A factory was established at Vincennes about 1745, in which Louis XV. eventually became a partner. Then in 1756, for want of space, the manufacture was transferred to Sèvres, and in 1759 the king became sole proprietor. The products of this noted factory have always been the fragile porcelains of the aristocracy, no attempt being made to cater for the requirements of the middle classes, and kings made presents to one another of Sèvres china, the nobility of Europe and leaders of society competing with each other in collecting examples of the work produced by the royal factory. All the earlier porcelain made at Vincennes and Sèvres was what is known technically as *soft porcelain*, and it was not until 1764 that the *hard* variety was first produced there. Saxony must be regarded as the real home of 'hard,' or true Chinese,

porcelain in Europe, and its invention was due to Johann Freiderich Böttger, who, in 1710, furnished Augustus II., king of Saxony, with the earliest example of what has since become known throughout the world as *Dresden china*. Every endeavour was made to keep the method of its manufacture a profound secret, but it was eventually betrayed, and factories for the making of Dresden ware came into existence in various places.

Amongst the most famous Eng. porcelain wares, each with its distinctive features, the following are the outstanding names: Bow, Chelsea, Staffordshire, Worcester, Derby, Crown Derby, and Lambeth. Eng. manufacturers have largely devoted themselves to the production of soft porcelain, and it was not until about 1768 that the making of hard porcelain was begun at Plymouth by Cookworthy, the discoverer of Cornish china-clay. The famous Bow works were established about 1740; those at Chelsea and Derby about five years later; and the manufacture of Staffordshire porcelain was begun at Longton Hall in 1752, Josiah Wedgwood's famous works being established at Burslem in 1759.

Walter, *History of Ancient Pottery* (1905); Benton, *History of English Earthenware and Stoneware* (1901); Franz, *French Pottery* (1906); Marryat, *History of Pottery and Porcelain* (1864); Shaw, *History of the Staffordshire Potteries* (1900); see also *Masterpieces of Handicraft* Series (Jack), including vols. on 'Japanese Porcelain,' 'Old Chinese Porcelain,' 'Royal Sèvres,' 'Old Bow,' 'Chelsea and Derby,' and 'Dresden Porcelain.'

POTTOS, African Slow Lemurs (*Perodicticus*), genus of Lemuroidea (*q.v.* under Primates) with short tail, short and nailless index finger; nocturnal and sluggish; found in West Africa.

POTTSTOWN (40° 13′ N., 75° 32′ W.), town, on Schuylkill, Pennsylvania, U.S.A.; iron and steel works. Pop. (1910) 15,599.

POTTSVILLE (40° 41′ N., 76° 17′ W.), town, Pennsylvania, U.S.A.; coal-fields. Pop. (1910) 20,236.

POUCHED MOUSE, Dormouse Phalanger (*Dromicia*), small marsupial (*q.v.*) related to the Flying Phalangers; nocturnal and arboreal; found in W. Australia, Tasmania, and New Guinea.

POUCHED RATS, see Pocket Gophers.

POUGHKEEPSIE (41° 38′ N., 73° 58′ W.), city, on Hudson River, New York State, U.S.A.; seat of Vassar Coll. (for women); iron and steel works; breweries. Pop. (1910) 27,936.

POULPE, an Octopus.

POULTICE, quantity of bread, linseed-meal, or other substance, mixed with hot water and spread on a cloth, applied to the skin in inflammation or sores, to reduce inflammation, soothe pain, or act as a counter-irritant.

POULTRY-FARMING is widely practised in Great Britain, but few farms are devoted entirely to poultry. The departmental system is found to be best, as the runs can thus frequently be changed without entailing waste of ground. Poultry-farming (which includes turkeys, ducks, and geese, as well as fowls) has three distinct ends — the production of eggs, the rearing of birds for the market, and the breeding of prize birds. The chief fowls suited to the Brit. climate are the following: (1) *Dorkings*, hardy and substantial birds, with white legs; (2) *Cochin-Chinas*, requiring careful attention; (3) *Brahmas*, Ind. birds of light and dark varieties; the plumage is heavy and the legs are thickly tufted; (4) *Malay*, Ind. birds with sparse plumage and of light build; (5) *Plymouth Rock*, an Amer. bird, stolidly built, with heavy chest; (6) *Minorcas*, a popular fowl of many varieties; (7) *Leghorn*, an excellent egg producer; (8) *Bantam*, dwarf golden-brown birds yielding small, finely flavoured eggs.

Scientific poultry-farming favours artificial incubation. The artificial process has three points of superiority—the chances of accidents to the fertile eggs during the hatching process are practically eliminated; the chickens are free from contagion and vermin; chickens reared in a scientifically constructed foster-mother escape the possibility of being trampled to death. Moreover, the progress of chickens kept in foster-mothers can be carefully examined, and only such foods are introduced as are suited to the various stages of development of the young chicks. The chickens are then transferred to cold brooders. The next stage is the transference of the chickens to the poultry-houses. These should be portable so that the ground can be changed from time to time.

Diseases.—Vermin is a great source of annoyance to the poultry farmer. Cleanliness should have scrupulous attention, and suitable preventatives should be employed. The chief internal parasite which attacks poultry is the worm *Sclerostoma syngamus*, causing *gapes*, a disease of the organs of respiration. The name is derived from the behaviour of birds attacked, which gape and stretch the neck owing to the contraction of the air-passage. A mixture of one part spirits of turpentine to two parts of olive oil should be applied to the affected parts. The birds should be placed in a new run to prevent the spreading of the disease. *Tuberculosis* is a fatal disease in poultry. Affected birds should be destroyed and a new coop procured. The mortality in cases of *fowl-cholera* is also very high, and in most cases destruction is advisable. The houses must be thoroughly disinfected. Another serious disease is *Avian diphtheritis* or *roup*. The characteristic symptom of the disease is the appearance of whitish growths about the mouth. These subsequently become tan, and the bird has great difficulty in breathing. A *pip* or scale forms on the tongue. Bacterial roup is generally fatal. Gregarious roup is a less fatal form of the disease. The best preventatives of disease are the use of disinfectants and the maintenance of cleanliness in the houses.

Poultry-farming has been developed to an enormous extent in U.S.A. In Denmark and Ireland co-operative principles are greatly promoting this branch of farming. Britain imports vast quantities of eggs and poultry from Denmark, France, Belgium, and Russia.

Weir, *Our Poultry and All about Them* (2 vols.).

POUND, the *pound sterling* was originally a pound weight of silver of the authorised standard, *i.e.* 11 oz. 2 dwt. fine metal, and 18 dwt. of alloy. In 1816 the gold standard was set up, and the sovereign has since been called a 'pound,' not because of its weight, but because it represents in value the old silver 'pound sterling.'

POUSSIN, NICOLAS (1594–1665), celebrated Fr. artist; b. in Normandy, settled in Paris, and d. in Rome. He was painter-in-ordinary to Louis XIII., and there is a fine collection of his pictures in the Louvre.

POUT, Bib, Pouting or Whiting Pout (*Gadus luscus*), a relative of the Cod and Haddock, with brown body marked with upright bands; abundant in the Channel and on most parts of the Brit. coast.

POUTING, see Pout.

POVOA DE VARZIM (41° 24′ N., 8° 38′ W.), seaport, watering-place, Oporto, Portugal. Pop. 13,500.

POWAN, see under Salmon Family.

POWELL, JOHN WESLEY (1834–1902), Amer. geologist; lost right arm in Civil War; app. prof. of Geol., Illinois Univ., 1885; conducted expeditions to Rocky Mts. and made geographical and geological surveys.

POWELL, VAVASOR (1617–70), Welsh Puritan preacher.

POWER TRANSMISSION, the transmitting of energy from a prime mover to machinery intended to use this energy. Four distinct methods of transmission are in general use—mechanical, pneumatic, hydraulic, and electrical.

Mechanical transmission is effected by a combination of ropes or belts, pulleys, shafting, and gearing. In rope-driving the ropes run in grooves in the rim of the

pulley, and are led to other pulleys on the distributing shaft. There may be a rope for each groove, or only one continuous rope driving a number of shafts from a common pulley. Manila or cotton ropes are mostly used, the latter being costlier, but usually more durable. Belts are very largely used for driving purposes, and are more flexible than ropes. When it is desired to transmit power from one shaft to another, gearing is used. If the shafts are parallel, the gear wheels are known as cog or spur wheels. When the shafts are inclined to each other so that they would meet if extended, the gear wheels are called bevel or mitre wheels, according to the angle; but if the shafts would not meet if extended, the wheels are called skew bevel wheels. Pitch chains may be used instead of belts, as in the case of cycles. It is possible to transmit power to distances of several thousand feet by means of wire ropes, but the greater efficiency and convenience of electrical t. has prevented developments in this direction.

Pneumatic transmission consists essentially of compressing air and transmitting it to motors placed where the work is to be done. It was employed in the construction of the Mont Cenis tunnel. The air was compressed by a series of water rams, and transmitted through pipes to the working faces, where it was used to drive drilling machinery. Pneumatic t. is used with success for haulage in mines, for working stone quarrying machinery, and for various purposes in iron working, steel bridge building, etc. It has been tried for tramways, tanks carried on the cars being filled with compressed air at central stations, but it has failed to compete with electric traction.

Hydraulic transmission is carried out by means of a central station where hydraulic pressure is produced, and a system of mains to distribute this pressure to machinery designed to use it. Where the demand for power is subject to sudden and large fluctuations, accumulators are employed to reduce the load on the central station pumps, and also to regulate to some extent the speed of the pumps under the constantly varying demand. The essential features of these accumulators are a cylinder, and a ram loaded to give the pressure in the mains. Frost is guarded against by covering all pipes not underground, and by raising the temperature of the water before pumping it into the mains, this being done by passing it through the surface condensers of the plant. Sometimes oil or glycerine and methylated spirit are mixed with the water to prevent freezing. Hydraulic pressure is employed successfully for hydraulic lifts, presses, and cranes, for hydraulic capstans for wagon haulage, for closing the bulkhead doors on ships, etc.

Electrical transmission has steadily gained ground on account of its efficiency and adaptability. Electric current is generated by dynamos at a central station and transmitted by cables to electric motors, which may be placed almost anywhere. Either continuous or alternating current may be used for short distances, but for long distance t. alternating current is used almost exclusively. In order to transmit electric

ılly

or otherwise the expenditure in copper for the cables would be prohibitive. It is difficult to produce continuous current at high voltages, the practical limit at present being usually about 3000 volts, although by placing the dynamos in series the pressure may be raised to 25,000 or more volts. On the other hand, voltages of 50,000 and over are obtainable with alternating currents, and such currents have the advantage of being easily transformed down to the voltage required for use. The usual method is to generate alternating current at high pressure, transmit it to sub-stations, and there reduce it to the working pressure by means of step-down transformers, and at the same time, if necessary, convert it into continuous current by rotary converters or motor generators. The usual pressure for lighting is about 220 volts, and for tramways from 400 to 500 volts. Either single-phase or polyphase current may be generated, three-phase current being the most generally suitable. Electricity has completely ousted all rivals for street tramways, and has proved itself superior to steam for surburban railways. In general the chief advantages of electrical t. are high efficiency, economy in space, and absence of heat, noise, or vibration.

POWIS, Barony, Earldom, and Marquessate of, Eng. honours. Welsh principality of P. was changed into Eng. barony, 1283; descended from Owen of Griffin to Cherletons (1313–1421), Greys (1421–1587). William Herbert, whose f. purchased the feudal lordship, was created baron, 1629; grandson, William, cr. earl, 1674, marquess, 1687; extinct, 1748. Henry Lord Herbert of Cherbury was created baron and Earl of P., 1748; extinct, 1801. Edward Lord Clive received same, 1804, having m. sister and heir of last earl; his s. took name Herbert; still held by descendants.

POWIS, EDWARD LORD CLIVE, EARL OF (1754–1839), Gov. of Madras, 1797–1803; distinguished in Mahratta War.

POWIS, WILLIAM HERBERT, MARQUESS OF (1629–96), Eng. courtier; imprisoned, 1679–84, on suspicion of complicity in Popish Plot; followed James II. to St. Germains; wife was governess of James II.'s children, 1688-91.

POWLETT, Paulet, Pawlett, Eng. family; originated in manor of Pawlett, Somersetshire. Chief members: Sir Amias, who had custody of Mary, Queen of Scots, at Tutbury and Chartley; John, cr. baron, 1627, Royalist; John, cr. earl, 1706, 1st lord of treasury, 1710–11, ancestor of present earl. Younger line produced marquesses of Winchester (*q.v.*) and dukes of Bolton (*q.v.*).

POYNTER, SIR EDWARD JOHN, Bart. (1836–), Eng. painter; known for book-designs, water-colour picture portraits, designs for Houses of Parliament, St. Paul's Cathedral, etc.

POZAREVAC, Passarowitz (45° 15′ N., 21° 10′ E.), town (and department), Servia; treaty between Turkey and Austria signed here (1718). Pop. 13,000.

POZOBLANCO (38° 22′ N., 4° 45′ W.), town, Cordova, Spain. Pop. 13,000.

POZZO DI BORGO, CARLO ANDREA, Count (1764–1842), Corsican politician; personal enemy of Napoleon; supported Paoli against Revolution; left Fr. for Russ. service and aided coalition against Napoleon; stirred Alexander to new war after Treaty of Tilsit, 1809; signed Treaty of Vienna, 1815, as Russ. ambassador.

POZZUOLI, see Puteoli.

PRÆCOCES, see under Ornithology.

PRAED, WINTHROP MACKWORTH (1802–39), Eng. poet; b. in London; won early distinction for contributions to the *Etonian* and *Quarterly*. His verse is of a light, brilliant nature, aiming neither at depth of feeling nor originality of thought.

PRÆFECT, see Prefect.

PRÆMONSTRATENSIANS, see Premonstratensians.

PRÆMUNIRE, the offence of introducing a foreign power into England. Acts of Edward I., 1350, and Richard II., 1392, were expressly directed against provision of ecclesiastical benefices to aliens, and the procuring of authority from Rome against the king in the form of bulls and excommunications.

PRÆNESTE, Palestrina (41° 51′ N., 12° 54′ E.), ancient town on site of modern Palestrina, near Rome, Italy; was celebrated for temple dedicated to Fortuna; took part against Rome in Latin War, but was overcome, 338 B.C.; sacked by Sulla for supporting Marius, 82 B.C.; in later times belonged to Colonnas, afterwards to Barberinis; remains of citadel exist; associations with Marcus Aurelius, Hadrian, and others. Modern town has cathedral. Pop. 7200.

PRÆSEPE, see Cancer.

PRÆTOR, Rom. magistrate; name of consuls in Twelve Tables; supposed to have been revived

when plebeians were admitted to consulship, the *p. urbanus*, who was to be patrician, assuming functions of consuls; in any case soon open to plebs. *Prætor peregrinus* was established *c.* 242 to decide suits between citizens and aliens or outsiders; judicial powers lost under Empire; in some ways superseded by prefect (*q.v.*).

PRÆTORIANS, members of Rom. *prætoria cohors*, bodyguard of emperor; term applied to force in prætor's army under Republic; organised by Augustus; became chief force in state; abolished by Constantine.

PRAGMATIC SANCTION, decree affecting Church or State. Famous P.S's were: (1) by Charles VII. of France, asserting rights of Gallican Church, 1437; (2) by Charles VI. of Austria, settling crown on his dau., Maria Theresa, 1713 (see AUSTRIA-HUNGARY).

PRAGMATISM, in philosophy, a school of thought emphasising practical consequences as tests for determining truth of philosophical conceptions; a reaction against absolutism of recent metaphysics; theory put forward by C. S. Pierce, 1878; developed by William James and F. C. S. Schiller. All thought is purposive and personal; no knowledge is determined exclusively by abstract intellectual considerations. The difference between two conceptions lies in the different consequences for life purposes involved in their belief. P. is connected with religion as justifying the will to believe. Humanism is the application of the pragmatic method to all the sciences. James, *Pragmatism.*

PRAGUE, PRAG (50° 5′ N., 14° 26′ E.), fortified city, Austria; capital, commercial, and industrial centre of Bohemia; beautifully situated on Moldau, P. has many interesting palaces, churches, monasteries, beautiful parks, and public gardens; Cathedral of St. Vitus (1344, unfinished), with royal mausoleum; Teyn (XV. cent.) and Nicholas Churches (XVII. cent.); Emaus, Capuchin, and Strachov monasteries; Royal Castle on Hradschin (hill); Waldstein, Belvedere, Kinsky, Clam-Gallas palaces; univ. (1348); museums, theatre, Pulverturm (1475), Karlsbrücke (1357–1503), —bridge with gate-towers and statues,—Rudolfinum (with art academy, concert hall, etc.), Jewish synagogue, town hall, and cemetery. Founded *c.* VIII. cent., P. flourished under Charles IV.; associated with Huss (*q.v.*); stormy history through religious and racial quarrels, Prot. *v.* Catholic, Czech *v.* German. Chief industries are machinery, chemicals, cotton, linen, gloves. Pop. (1910) 223,741. See BOHEMIA.

PRAHRAM, S.E. suburb of Melbourne, Australia. Pop. 43,000.

PRAIRIE DU CHIEN (43° 3′ N., 91° 10′ W.), city, Wisconsin, U.S.A., on Mississippi; woollen goods. Pop. (1910) 3149.

PRAKRIT, a term applied to the vernacular languages of India as distinguished from the literary Sanskrit. Sanskrit itself developed from the *Midland Primary P.*, but the other P's became corrupted or passed into a secondary stage known as *Secondary* P. These secondary P's in some cases became literary languages and came to be regulated by a definite grammatical scheme. Pali itself, the language of Buddhism, is a literary secondary P. Secondary P's in turn became corrupted into *Tertiary* P's, and so on. The P. lit. is for the most part devoted to the Jaina religion, but the flower of P. lit. is lyric. The finest lyric work is that of Hala. His *Sattasai* shows remarkable grace and beauty, and has been imitated in Sanskrit and the minor dialects. There are two famous epics in P., the *Ravanavaha* (which is similar in theme to the *Ramayana*) and the *Gaüdavaha.* P. is also employed in Sanskrit dramas for delineation of subordinate characters.

PRATICOLA, a genus of the THRUSH FAMILY (*q.v.*).

PRATINCOLES (*Glareolidæ*), a family of ten species of wading birds confined to the Old World. The Common Pratincole (*Glareola pratincola*), whose winter home is chiefly in Africa, is a rare spring and autumn visitor to Britain. This species occurs in summer in S. Europe, Central and S. Asia.

PRATO (43° 53′ N., 11° 5′ E.), town, on Bisenzio, Florence province, Italy; sacked by Spaniards, 1512; surrounded by walls; ancient castle; cathedral (built chiefly in XIV. cent.) contains many fine works of art; wool, straw-plaiting. Pop. 27,000.

PRAWN, small translucent Crustacea distinguished by the long spike (rostrum) projecting in front of the head; esteemed as food. See MALACOSTRACA.

PRAXITELES (fl. IV. cent. B.C.), Athenian sculptor; left reputation of perfect craftsmanship. Nothing of his work was supposed to remain, but in 1877 his statue of *Hermes with Dionysos*, one of the masterpieces of sculpture, was discovered at Olympia; characteristics—beauty, grace, absence of severity of age of Pheidias. Several supposed copies of P.'s work are extant, *e.g. The Satyr* of the Capitol, and *Aphrodite* (Vatican).

PRAYER, in general, is dealt with under RELIGION.

Prayers for the Dead are associated with belief in a state of purgation after death. They appear in the Jewish liturgy and in Christianity from earliest times, though reference in New Testament is doubtful. At the Reformation, together with belief in Purgatory, prayers for the dead were scouted by Protestants. They hardly occur in the Anglican Prayer Book, but are not forbidden by the Church of England.

PRAYER, BOOK OF COMMON, the liturgy of the Church of England, in use since the Reformation. Before then there was a large number of local Uses, the most important that of Salisbury (Sarum). All these were in Latin, and the Catholic Church had not one book, but several—a Missal for the Mass, Breviary for daily offices, Manual for other sacraments, and Pontifical for episcopal services. Hence one book to be used everywhere was a great simplification. Cranmer's Litany appeared in 1544, and an Eng. Communion Office in 1548; the entire Prayer Book in 1549—the *First Prayer Book* of Edward VI. The *Second Prayer Book* was published in 1552, with numerous alterations in a Prot. direction. After the Catholic reaction of Mary's reign the Elizabethan Prayer Book appeared in 1559, on the basis of the second, but with differences in the Catholic direction. After being suppressed during the Commonwealth it again came into use with the Restoration. Fresh alterations roused Puritan feeling, and the refusal to accept them caused the Ejection of the Two Thousand in 1662. Since then the Prayer Book has remained practically unchanged. The forms for the Anniversaries of the Martyrdom of Charles I., Gunpowder Plot, and Restoration were abolished in 1859. In 1871 a new Lectionary was substituted, also a shortened form of daily service.

Pullan, *History of the Book of Common Prayer* (1900); Procter and Frere, *New History of the Book of Common Prayer.*

PRAYING INSECTS, SOOTHSAYERS (*Mantidæ*), a family of Insects with about 600 species, belonging to the order *Orthoptera*; furnished with long bristly fore-legs, the resting pose of which gives rise to the popular name, and which seize insects for food, for Praying Insects are extremely voracious. They occur in tropical and sub-tropical regions, but *Mantis religiosa* is sometimes found in central France.

PRAYING WHEEL, used by Lamaist Buddhists, a machine with cylinder from which prayer on paper band is unrolled.

PREACHING, from very early times, has been a regular part of worship and form of instruction, though at some periods, particularly in the Middle Ages, it has fallen into disuse. Little is known of Christian p. until about 200 A.D. Then came Origen, and later, especially in the Eastern churches, p. developed much. Among the most famous preachers were the Cappadocian fathers—Basil of Cæsarea, Gregory of Nyssa, and Gregory of Nazianzus; then St. John Chrysostom and St. Augustine. In the Middle Ages came St. Bernard and the Franciscans and Dominicans. The Reformation brought about a great revival of p. Though Catholic France produced great pulpit orators in the XVII. cent., p. has been greater in Prot. than in

Catholic Churches. The XIX. cent. produced several great preachers in England.

PREANGER (7° 15′ S., 107° 30′ E.), residency of Java, Dutch East Indies; mountainous, volcanic; chief products—tea, coffee, cinchona; capital, Bandong. Pop. *c.* 2,220,000.

PREBENDARY, the holder of a stall or endowment in a Cathedral or Collegiate Church, entailing upon him the duty of conducting services but no cure of souls.

PRE-CAMBRIAN, the period of time before the formation of Cambrian strata. P. C. rocks are all of sedimentary origin, and consist of dolomites, conglomerates, sandstones, freestones, slates, and limestones; many show signs of a glacial epoch. Fossils are rare.

PRECEDENCE.—Precedence of members of the royal family depends on their relationship to the reigning sovereign, and not on their relationship to any of his predecessors. Ambassadors take p. immediately after the blood-royal; envoys and ministers accredited to the sovereign after dukes and before marquises. The five degrees of honour and p. among peers correspond with the titles—duke, marquis, earl, viscount, baron. Of those belonging to the same rank, seniority of creation settles the place in the scale of honour. Peers have p. according as they are of England, Scotland, Great Britain, Ireland, or the U.K. Place and office give the Lord Steward and the Lord Chamberlain of H.M. Household p. before all peers of their own degree. The younger sons of a higher rank precede even the eldest son of a lower rank—hence the younger sons of a duke precede elder sons of a marquis. All sons of viscounts and barons precede baronets; and eldest sons and daughters of baronets precede eldest sons of knights of any degree. But eldest sons of knights precede younger sons of baronets.

Official p. of a husband or father confers no personal p. on his wife or children, *e.g.* the Lord Chancellor or the Speaker of the House of Commons does not transmit any rank or place to his wife or children from his official position, but only from his personal rank. Unmarried women take precedency from their father. Married women share their husband's dignities, but can confer none of their own upon their husbands. Nor can the daughter of a peer, unless a peeress in her own right, transmit any rank or place to her children. Distinctions of birth, creation, or descent are a woman's own, and remain if she marry a commoner; but, if she marry a nobleman, she must take her husband's place in the order of precedency. The wife of the eldest son of any degree precedes the daughters of the same degree, and both of them precede the younger sons of the next higher degree. Thus the wife of the eldest son of an earl walks before an earl's daughter, and both of them before the wife of the younger son of a marquis; and the wife of a marquis precedes the wife of the eldest son of a duke.

The Abp. of Canterbury (and in Scotland the Moderator of the General Assembly in attendance at a royal function) takes p. next to ambassadors, and is followed by the Lord High Chancellor. Then come in p. the Abp. of York, the Prime Minister, the Lord Chancellor of Ireland, the Lord Pres. of the Privy Council, the high officers of the Royal Household, and the peers according to their degree. Bp's of the Church of England rank between viscounts and barons.

Burke's *Peerage.*

PRECESSION OF THE EQUINOXES, a motion discovered by Hipparchus about 150 B.C., consisting of a slow advance of equinoxes, owing to revolution of earth's axis round pole of ecliptic, a similar effect to the 'wobbling' of a peg-top. Period of precession is about 26,000 years, or 50·35 seconds of arc per annum.

PREDESTINATION, theological term for God's foreknowledge of the future, or of His destination of mankind to eternal bliss or woe. Two great controversies one between Augustine and Pelagius, the other between Calvin and Arminius, have been fought over p. Augustine and Calvin held that God had foreordained some to salvation and others to damnation.

PREDICABLES, classification of the relations the predicate may bear to the subject of a proposition. See LOGIC.

PREDICATION, the nature of the relation between subject and predicate of a proposition. See LOGIC.

PRE-EXISTENCE, DOCTRINE OF, existence of soul before union with body (cf. Pythagoras, Plato, etc.).

PREFECT, title of Roman official.—(1) *Præfectus urbis.* Official dating from time of kings; represented king or consuls in their absence. (2) Under republic new præfectures sprang up; e.g. *præfecti annonæ* supervised food supply; in subject Ital. towns *præfecti jure dicendo* represented *præfectus urbis.* (3) Under the Empire a new class of prætorian p's, commanders of imperial guard, sprang up; p's became permanent magistrates and system was extended to provinces. Fr. republic gave in 1800 name *præfectus* (*préfet*) to heads of provincial departments who took place of old *intendants*; app. by State they form connecting link between central and local government; large local powers, though partly controlled by *conseil de préfecture*; each *arrondissement* has *sous-préfet*, who is mere agent of préfet.

PREFERENCE, see TARIFF, PROTECTION.

PRÉFET, see PREFECT.

PREJEVALSKI, PRJEVALSKY (*q.v.*).

PREJEVALSKI'S HORSE, see under HORSE FAMILY.

PRELATE (Latin, 'dignitary'), term now used only ecclesiastically. In the Anglican Church p's are abp's and bp's. In R.C. Church abbots and heads of orders and officials of Rom. Curia are also called p's.

PREMIER, see PRIME MINISTER.

PREMONSTRATENSIANS, NORBERTINES, religious order founded at Prémontré, France (1119), by St. Norbert; in England called 'White Canons'; branch of Canons Regular of St. Augustine; although primitive rule has been modified, it is still strongly ascetic.

PRENZLAU, PRENZLOW (53° 20′ N., 13° 50′ E.), town, on Ucker, Brandenburg, Prussia; ironworks. Pop. (1910) 21,389.

PRE-RAPHAELITES, see under PAINTING.

PRERAU (49° 25′ N., 17° 25′ E.), town, Moravia, Austria; woollen cloth. Pop. (1911) 20,245.

PREROGATIVE, the right pertaining to certain offices, now commonly used in reference to the Crown. The royal p. is a power of the Crown that does not depend upon the sanction of Parliament, and includes the making of treaties with foreign sovereigns and States, the right of declaring war on foreign States, the creation of peers and regulation of order of precedence, the appointment of bp's of the Established Church, and the granting of pardon to persons convicted of crimes. As a matter of fact treaties and declarations of war are the work of the king's ministers, peers are made and bp's appointed by the Prime Minister, and the prerogative of pardon is only exercised on the advice of the Home Sec.

PREROGATIVE COURT, court where a will of one dying in province of Canterbury and leaving goods in another diocese was proved by abp. of Canterbury; similarly with province of York; jurisdiction transferred to Probate Court, 1857.

PRESBURG, see PRESSBURG.

PRESBYTER, office in the Christian Church, properly the same as *priest* (*q.v.*), but the word really means 'elder,' and is generally used in a non-sacerdotal sense of the elders of Judaism and of Christian officials. The system of Church government called *Presbyterianism* (government by elders), has only existed in its present form since the Reformation. Much controversy has raged round the position of p's in the Early Church. According to one view—the most probable—p. and bp. were originally identical, though until about A.D. 60 there was little systematic organisation. See also BISHOP, PRIEST.

ITERIANISM, see FREE CHURCHES.

PRESBYTERY (arch.), that part of a church to which priests alone have access, *i.e.* around the altar.

PRESCOT (53° 26′ N., 2° 47′ W.), town, Lancashire, England; manufactures watches. Pop. (1911) 8154.

PRESCOTT, WILLIAM HICKLING (1796–1859), Amer. historian; grandson of WILLIAM PRESCOTT (1726–95), distinguished officer in War of Independence; blinded in one eye by accident in youth and always laboured at great disadvantage; opened up new field of research by study of Span. history; pub. *Ferdinand and Isabella*, which had immense success (1838), *Conquest of Mexico* (1843), *Conquest of Peru* (1847), 3 vols. of *Philip II.* (1855–58), and *Charles V. after his Abdication* (1857); light, picturesque style, condemned by Guizot for lack of requisite passion; accurate in details as far as authorities then accessible permitted, but careless in hist. judgments. *Life*, by Ticknor.

PRESCRIPTION (Law), the rule that long usage makes good possession, founded on the legal assumption that an uninterrupted possession of anything for a sufficiently long period implies that no one disputes the right of the possessor to its enjoyment. Long possession supposes the acquiescence by all other claimants and a reason for that acquiescence. Negative p., implying undisturbed possession for a given time, gives a valid and unassailable title, for it deprives all claimants of the right to contest. Positive p. depends upon usage from time immemorial. Rights of common, of use of water, and of building lights are prescriptive.

PRESENTATIONISM, term used in several distinct senses, more especially for (1) the view that in perception we have direct apprehension of other real things; and (2) the view that the mind is nothing but a flux of presentations.

PRESIDENT.—(1) chief official of a body, *e.g.* Pres. of Board of Trade, pres. of a college. (2) head of a republic (*q.v.*). Pres. of U.S.A. has salary of 75,000 dollars, is commander-in-chief of army and navy, holds supreme executive power, chooses a Cabinet, retains office for four years. Fr. Pres. is elected for seven years by National Assembly, chooses his ministers, holds the right of pardon, appoints to military and civil posts; with Senate's consent he may dissolve Chamber of Deputies; salary is £24,000, with a similar sum for expenses.

PRE-SOCRATICS, see METAPHYSICS.

PRESS, FREEDOM OF THE.—The law allows to the press the liberty it allows to the individual. It permits a newspaper to publish what it pleases, provided it does not break the law of the land or infringe the rights of particular persons. It must not, for example, publish blasphemous, seditious, or treasonable matter, or commit a libel or publish matter that is the copyright of others. It is for a jury to decide whether or not any of these offences has been committed should the charge be made and defended. Lord Campbell's Libel Act of 1843 gave the present liberty to the press. Government licence and censorship prevailed until 1695, and until 1843 any political comment in the press hostile to the Government could be punished as a seditious libel. By the Libel Act of 1843, a defendant indicted for criminal libel can urge as a sufficient defence that the libel was true and published for the benefit of the public. Hence the widest range of expression and the freest comment are now permitted in the press on matters of political interest. But libels on particular persons, the publication of statements reflecting on the private life of individuals, are still forbidden, and the editor, printer, and publisher of any newspaper making such publication are liable to criminal prosecution, or a civil action for damages. The publication of obscene or blasphemous statements, or indecent pictures, is also a criminal offence. Every newspaper must be registered, with the name of its proprietor, at *Stationers' Hall*, and must state on each copy the place of its publication.

PRESSBURG, PRESSBURG (48° 10′ N., 17° 6′ E.), town, on Danube; was capital of Hungary, 1541–1784, and seat of Hungarian Parliament until 1848; has cathedral, old ruined castle, and town hall; manufactures furniture, tobacco, liqueurs. Pop. (1910) 78,223.

PRESTER JOHN, semi-mythical Asiatic potentate of Middle Ages; mentioned in chronicle of Otto, bp. of Freisingen, who was told by a Syrian bp. (1145) that John, a few years previously, was both king and priest of a Christian country between Persia and Armenia. A writing of 1165, describing this realm as El Dorado and Utopia combined, took the form of a letter from P. J. to the Gk. emperor; a further document takes form of letter of Pope Alexander III. to P. J., *c.* 1177. John was identified later with Ung Khan, king of Tartar tribe of E. Asia, converted to Christianity and slain in warfare with tributary potentate Genghis, 1203. Innocent IV. sent a missionary to Batu Khan, grandson of Genghis. He sought P. J.'s kingdom, but it had vanished. Another missionary, Rubruquis, similarly failed, 1253, but wrote valuable account of travels (printed in Purchas's *Collection*), and P. J. formed continual stimulus to mediæval exploration. He is identified by modern scholars with Gur Khan, founder of empire of Black Cathay in XII. cent.

PRESTON (53° 46′ N., 2° 42′ W.), town, at mouth of Ribble, Lancashire, England. Here Scots Royalists were defeated by Cromwell, 1648; town gave support to Old Pretender, 1715, and to Young Pretender, 1745. P. is important railway centre, and dredging of river has given strong impetus to shipping trade; manufactures cotton, has ship-building, machinery- and boiler-works; exports coal. Pop. (1911) 117,113.

PRESTONPANS (55° 57′ N., 2° 59′ W.), village, Haddingtonshire, Scotland, on Firth of Forth; scene of Jacobite victory over Royal forces (1745).

PRESTWICH (53° 32′ N., 2° 17′ W.), town, Lancashire, England; cotton manufactures. Pop. (1911) 17,195.

PRESTWICH, SIR JOSEPH (1812–96), Eng. geologist; awarded Wollaston Medal, 1849, for essays on geological subjects; prof. of Geology, Oxford, 1874–87; knighted, 1896.

PRETENDER, THE, see CHARLES EDWARD STEWART, PRINCE, and JAMES, THE OLD PRETENDER.

PRETORIA (25° 53′ S., 29° 6′ E.), city, South Africa, seat of administration of Union of South Africa, and capital of Transvaal Province; founded by Boers, 1855; named after M. W. Pretorius (*q.v.*); entered by Lord Roberts, 1900; after which it became Brit. headquarters in South African War, 1900–2; fine government buildings under construction; Prot. Episcopal cathedral; Univ. College; railway and distributing centre, in midst of rich mining and agricultural district. Pop. (1911) 48,609.

PRETORIUS, ANDRIES WILLIAM JACOBUS (1799–1853), Boer general; a leader in *Great Trek* from Cape Colony; settled in Natal, 1838; drove off Zulus and founded republic of Natalia, 1838; Britain sent troops to occupy Natal, which became Brit. colony, 1843; P. petitioned against misrule, 1847; headed Transvaal revolts, 1848 and 1851, and secured establishment of Orange Free State. His son, **Marthinus Wessel Pretorius** (d. 1901) became first Pres. of Transvaal Republic, 1857–60; Pres. of Free State, 1859–63; and Pres. of United S. African Republic, 1864; one of leaders in war against Britain.

PREVEZA, PREVESA (38° 56′ N., 20° 42′ E.), seaport, Albania, European Turkey, on Gulf of Arta. Pop. 7400.

PRÉVOST D'EXILES, ANTOINE FRANÇOIS, ABBÉ PRÉVOST (1697–1763), Fr. author; produced two hundred novels, but owes renown solely to *Manon Lescaut* (1733), a book unique in the century; it is a history of Parisian Bohemians by an accurate observer.

PRIAM (classical myth.), old king of Troy, father of

Hector, Paris, Troilus, Cassandra; only once mentioned in Homer—when he begs Hector's body from Achilles.

PRIAPULOIDEA, a class of unsegmented worm-like animals, with mouth and anus at opposite ends of body. They have a retractile introvert bearing the mouth at its tip, and live in mud and sand in the sea.

PRIBILOF ISLANDS (58° N., 170° W.), group of islands, Bering Sea, belonging to Alaska (U.S.A.), seal fisheries.

PRIBRAM (49° 42′ N., 14° 1′ E.), town, Bohemia, Austria; lead and silver mines. Pop. (1911) 13,328.

PRICE, RICHARD (1723–91), Eng. Nonconformist minister who wrote on morals, economics, and politics; wrote *Review of the Principal Questions in Morals* (1756), in many respects akin to thought of Cudworth (*q.v.*); strongly opposed war with America and welcomed Fr. Revolution. His sermon, *On the Love of our Country* (1789), provoked Burke's attack on him in *Reflections on the Revolution in France*.

PRICHARD, JAMES COWLES (1786–1848), physician and ethnologist; physician to Bristol Infirmary; app. (1845) a commissioner in lunacy; the founder, in England, of the sciences of anthropology and ethnology, in which he made valuable researches, recognising the unity of mankind differentiated by various causes into the various races, and showing the relation of Celtic to other European languages and to Sanscrit.

PRICKLY PEAR, see CACTUS.

PRIDEAUX, HUMPHREY (1648–1724), Anglican theologian and Hebrew scholar; dean of Norwich, 1702.

PRIEGO DE CORDOBA (37° 28′ N., 4° 14′ W.), town, Cordoba, Spain; oil and wine. Pop. 17,400.

PRIENE, ancient Ionian city, Caria, Asia Minor.

PRIEST, derived from *presbyter* (*i.e.* elder), an order in the Christian ministry, and also applied to ministers or officials of non-Christian religion. The idea of priesthood is difficult to define, but it might almost be said that a p. is a person who offers sacrifice; the word is generally used of some one who performs a sacred office, very often with the idea besides of divine sanction or authority. In early times religion and magic were intermingled, and the functions of p. and chief ruler were combined. Hence the survivals into historic times in both Greece and Rome. In neither case was there a priestly caste, but in Athens the king-archon performed priestly functions, and in Rome after the abolition of the kingdom the title of *rex* was retained by an official who performed certain sacrificial rites. But in later times in Greece and Rome priestly functions were performed by ordinary magistrates. There was no hereditary priesthood in Rome and not much of one in Greece. In Rome the priestly offices were of considerable political importance.

In ancient Assyria and Babylonia there were various officials who performed sacred rites, but some scholars would hardly call them all p's. In ancient Egypt p's tended to be, as in Rome, mere state functionaries. In India the priesthood, to which only Brahmans could be admitted, possessed greater power than almost anywhere else. The place of the priesthood in Jewish religion is peculiar, for the primitive Semites had no real priesthood, but a priesthood gradually grew up (see LEVITES) which had charge of the Temple sacrifices. Since the destruction of the Temple in A.D. 70 there have been no more p's in Judaism, and Christian priesthood has taken over some ideas from Judaism. In the *Epistle to the Hebrews* Christ is the High Priest, so it is contended by some there can be no priesthood among Christians, or that every layman is a p.—the extreme Prot. as opposed to the Catholic view. In Episcopalian Churches p. denotes a member of the second order of clergy, who, like p's of R.C. and Greek Churches, performs sacred functions not reserved for bishops.

PRIESTLEY, JOSEPH (1733–1804), Eng. scientist and Unitarian divine; studied Oriental and modern languages; devoted himself to chem.; became famous by his discovery of oxygen; sympathised with Fr. Revolution; his books and apparatus were destroyed by mob; migrated to America, 1794. P. was a great scientist, but in experiment rather than logical power. See Thorpe's *Joseph Priestley* (1906).

PRIM, JUAN, MARQUIS DE LOS CASTILLEJOS (1814–70), Span. general; distinguished in war with Morocco, 1860; assisted Serrano in revolution against Queen Isabella, 1868; pres. of council and marshal, 1869; assassinated.

PRIMATE, title in Rom. Empire, both civil and ecclesiastical; now only ecclesiastical; used of a chief bp. in West (like patriarch in the East). The Abp. of Canterbury is *P. of All England*; the Abp. of York, *P. of England*. The Abp. of Lyons is *Primat des Gaules*.

PRIMATES, an order of Mammals: LEMURS, MONKEYS, APES, and MAN. The order which, on account of its highly developed brain, and its watchfulness over offspring, is placed highest in the animal kingdom. The majority of Monkeys are familiar on account of their semi-erect gait, and their faces caricaturing the human countenance, but the less-specialised individuals, and the Lemurs, have little external resemblance to their man-like relatives. The following characteristics which P. have in common will serve, however, to distinguish them from the other orders of Mammals. The eyes, instead of lying at the side of the head, are in front, and look almost straight forward, and the eye socket, or orbit, is completely surrounded by a ring of bone. The brain cavity is large, and the cerebral hemispheres of the brain are often much convoluted. The limbs are long, and neither the thigh-bone nor the upper arm-bone is hidden in the body. Both hands and feet are grasping organs (except the human foot) and both have five digits, the great toe, at least, having a flattened nail, except in the Orang-Utan, where the nail is sometimes absent. Again, the thumb or the great toe, or both, lies away from and can be opposed to its fellow-digits; and, lastly, all the females, except the Aye-Aye, with inguinal mammæ, have at least two mammæ on the breast.

The P. are on the whole fitted for life in forest regions, where they are to be found in companies, climbing by hands, feet, and often tails, roosting in the trees, but seldom traversing ground. They live mainly upon fruits and leaves, but some devour spiders, insects, eggs, young birds, and even mammals.

P. are warmth-loving animals, found only in tropical and sub-tropical regions, although some venture among the snows of the Himalayas. They are scattered over both Old and New Worlds, but the inhabitants of the one differ in marked characters from the inhabitants of the other (see classification below). In Europe the only representatives are the Barbary Apes, which dwell on the rock of Gibraltar, but in prehistoric times even English forests resounded to monkey chatter.

The order *Primates* falls into the following natural groups:—

Sub-Order 1.—LEMUROIDEA, monkey-like animals with fox-like faces; orbit opens freely into temporal fossa; front teeth separated in the middle line; brain poorly convoluted: Lemur, Galago, Indri, Potto, Loris, etc.

Sub-Order 2.—ANTHROPOIDEA, Man and Monkeys; monkey-like animals with more or less flat faces; orbit separated from temporal fossa by bony partition; front teeth in contact in middle line; brain usually highly convoluted; falls into two groups:—

Group I. PLATYRRHINI, New-World Monkeys; broad internasal septum; nostrils directed outwards; no bony external auditory meatus; three premolars; tail usually prehensile. Family 1. *Callitrichidæ* (Marmosets), small, furry monkeys, with two molars on each side; claws on all digits but great toe, which has flat nail; tail bushy, non-prehensile; found in tropical forests of Central and S. America; feed on insects and fruit; 35 species in two genera: HAPALE

and MIDAS. Family 2. *Cebidæ* (75 species of Spider-Monkeys, Howlers, Squirrel-Monkeys, Capuchin Monkey, etc.), flat nails on all toes; three molar teeth on each side.

Group II. CATARRHINI, Old-World Monkeys; narrow internasal septum; nostrils directed downwards; bony external auditory meatus; two premolars; tail not prehensile, or absent. Family 1. *Cercopithecidæ* (174 species of Macacques, Mandril, Proboscis Monkey, Vervet, Barbary Ape; see CERCOPITHECIDÆ), with arms shorter than legs; hairs on arm all pointing towards wrist; usually good tail; bare, often coloured, patches on buttocks. Family 2. *Hylobatidæ* (16 species of Gibbons), with erect gait; arms reaching ground; hairs on arm all pointing to elbow; no tail; feed on fruits, young birds, insects, etc., in forests of South-Eastern Asia. Family 3. *Simiidæ* (3 species—Gorilla, Orang-Utan, and Chimpanzee), semi-erect gait; arms longer than legs; hairs on arm all pointing to elbow; no tail. Family 4. *Hominidæ* (Man), with erect gait; arms shorter than legs; soles of feet set flat on ground; great toe in line with other toes; no tail; large, highly convoluted brain.

PRIME MINISTER, PREMIER, chief minister of Brit. Government; position developed with party system, P. M. being at first unofficial head of party in power; recognised from Walpole's time; legal recognition of office, 1905. The Australian Commonwealth has a 'Prime Minister'; the Australian States have 'Premiers.' The Fr. *Président du Conseil* corresponds to Brit. Premier.

PRIMITIVE METHODISTS, see FREE CHURCHES.

PRIMROSE (*Primula vulgaris*), an abundant indigenous species, possessing a rosette of crinkled sessile leaves, and bright yellow flowers which appear in spring. The flowers are dimorphic, one type showing a long style with anthers inserted midway up the corolla tube; the other short-styled, with anthers at the top.

PRIMROSE LEAGUE, THE, Conservative association founded, 1883, in memory of Beaconsfield (the primrose being his favourite flower); chief promoters, Lord Randolph Churchill, Sir John Gorst, Sir H. D. Wolff; objects—to uphold religion, the Union, and Brit. imperial ascendancy; organised into different 'Habitations' (*i.e.* lodges); observes PRIMROSE DAY, April 19 (anniversary of Beaconsfield's death).

PRIMULACEÆ, herbaceous perennials, with pentamerous flowers, the five stamens being opposite the petals; ovary is formed by five carpels, with free central placentation; include primrose, cowslip, cyclamen, pimpernel, and water violet.

PRINCE (Lat. *princeps*, first, sovereign).—The principal uses of the word are: (1) Sovereign of a sub-state (principality), not a duchy or county, *e.g.* P. of Monaco; (2) members of royal family in most European countries. After XI. cent. Welsh kings were only known as p.; hence title P. of Wales, granted to king's eldest son, 1301; other children of Eng. sovereign were not called p's till reign of James I. Under Victoria all children of sons of queen received title p. (or *princess*), and in 1905 King Edward created Duchess of Fife *Princess Royal* and granted the style *princess* to her daughters. This use is probably derived from title *princeps juventutis*, bestowed on designated successor to Roman Empire.

PRINCE EDWARD ISLAND (46° 25′ N., 63° 30′ W.), province, Dominion of Canada, in Gulf of St. Lawrence, near New Brunswick and Nova Scotia; area, 2184 sq. miles; surface generally undulating; soil remarkably fertile; 85¼ per cent. of total area under cultivation. Settled by French early in XVIII. cent.; captured by British, 1758, and formally ceded to them, 1763; incorporated with Nova Scotia till 1768, when it became a separate province; name changed from ST. JOHN'S to Prince Edward Island, 1799; joined Canadian Federation, 1873. It produces heavy crops of cereals, fruit, and vegetables; live stock largely raised; dairy-farming carried on. Industries include tanning, manufacture of flour, tobacco, starch, soap, canning of meat, fish, and lobsters. The province has a Lieut.-Gov. and Legislative Assembly and is represented in Dominion Parliament. Capital is Charlottetown. Inhabitants are mostly of British descent. Education is free and nominally obligatory. Pop. (1911) 93,728. See CANADA.

PRINCES' ISLANDS (40° 52′ N., 29° 5′ E.), group of islands, in Sea of Marmora, Turkey; ancient *Demonesi*. Pop. 11,000.

PRINCETON (40° 18′ N., 74° 42′ W.), town, in Mercer County, New Jersey, U.S.A.; Washington here defeated British, 1777. Pop. (1910) 5136. **Princeton University** was evolved from Coll. of New Jersey, incorporated, 1746; opened at Elizabeth, 1747; removed to Newark, 1748, when Aaron Burr became pres.; removed to Princeton, 1754, but retained name College of New Jersey till 1896; gov. of New Jersey is chairman *ex officio* of the board of trustees.

PRINCETON (38° 21′ N., 87° 39′ W.), city, Indiana, U.S.A.; manufactures carriages, bricks and tiles. Pop. (1910) 6448.

PRINCIPAL AND AGENT.—In law the relationship of principal and agent largely resembles that of master and servant. Generally the agent does not make contracts on his own behalf, but is merely a conduit pipe and the representative of his principal, and therefore the latter alone is usually bound by the agent's acts, and the agent himself does not incur any liability.

PRINGLE, SIR JOHN (1707–82), Scot. physician; prof. of Moral Philosophy at Edinburgh Univ. (1734); physician to forces in Low Countries, then settled in London, receiving various court appointments as physician; pres., Royal Society (1772); author of various works, the most important on military med.

PRINGSHEIM, NATHANAEL (1823–94), Ger. botanist; prof. of Bot. in Jena and Berlin, and did valuable work in determining the sex history of plants.

PRINTING, the art of stamping impressions of letters, figures, characters, or other designs with ink or pigment on paper, parchment, or similar substance. When such stamping is done on cloth, the process is known as Textile p. P. may be said to be of three kinds: (1) COPPER-PLATE, the basis of which is a metal plate, generally copper, having the necessary letters or design sunk or engraved on its otherwise smooth surface (see ENGRAVING); (2) LITHOGRAPHIC p., in which a perfectly flat and polished stone surface is used; and (3) LETTERPRESS p., which is by far the commonest and most used process of the three. In this process raised letters are used, their surfaces inked, and the ink transferred to paper. P. from fixed type seems to have been used more or less in very early times, and the rudiments of letterpress p. were known to the ancients; p. with movable types was probably practised in China about the XII. or XIII. cent., while books were printed in Korea by means of movable types of clay or wood in the early XIII. cent. Cicero suggested in his *De Natura Deorum* that types might be made of metal, referring to them under the name of 'formæ literarum.' Indeed, it has been suggested that the ideas of the later printers originated in this suggestion. Vergil mentions that in his time it was the practice to brand cattle with letters of the owner's name.

All p. up to the XIII. cent. was, however, of the crudest nature; it was still carried on by impressions of letters by hand, printing-presses not being brought into general use until *c.* 1500.

Impressions were taken from single pieces of wood on which were cut in relief a variety of characters and letters. Some of the early books had each leaf printed from a single block, and printing was done on one side of the paper only. Indeed, up to comparatively recent times the printing of both sides of a sheet of paper was not accomplished. When a book was made, two sheets, printed on one side only, were pasted together and the volume bound up.

Johan Gutenberg of Strasburg, if not the actual inventor of movable type and printing-presses, certainly did a great deal to set printing on a firm footing. L. J. Coster started business between 1420 and 1430, at Haarlem; his first types were of wood, but later he used lead and tin. Perhaps the earliest specimen of ·ing with movable types was *Speculum Nostræ Salutis*, by P. Schoffer. Gutenberg entered into partnership, and his partner invented matrices for casting types. Gutenberg with Fust and Schoffer set up a printing-house at Mainz, and about 1455 they published a Lat. Bible, called sometimes 'the forty-two line Bible,' because each column had 42 lines. The first p. was done in type (*black-letter*) imitating the written hand of XV. cent.

P. now made rapid strides in Europe. Workmen left the original printing-houses and carried their art with them, either taking service with other employers or setting up business for themselves. P. was established at Naples in1465; at Rome by Sweynheim and Pannartz in 1467; at Venice and Milan in 1469; at Paris, 1470; at Nuremberg and Verona, 1472; at Oxford in 1478 (by Theo. Rood); and at Constantinople in 1490. After this the art spread to almost every continental city, and also to Russia and America.

The early type used was Gothic style, but Roman type introduced by Sweynheim and Pannartz at Rome in 1467 replaced it for general use, although Ger. printers still largely use Gothic type. The first book to be printed in Greek characters is believed to be one dated 1476, and printed at Milan, while the Pentateuch, dated 1482, was the first work to be printed in Hebrew. Some of the early printers other than those above mentioned were: the Aldi of Venice (1490–1597), Baden of Paris (1502–98), Plantin of Antwerp (1514–89), Wechel of Paris and Frankfort (1530–72), Elzevir of Leiden and Amsterdam (1588–1680), and Bodoni of Parma (1768–1813).

The first p. establishment in England was that set up by William Caxton in 1476. He founded a press in the precincts of Westminster Abbey—not in the abbey itself, as is often stated. The first book printed in English, however, was printed at Bruges in 1474, where in the following year was printed *The Game and Playe of the Chesse*. The first book printed in England was *The Dictes and Sayings of the Philosophers*, Nov. 1477. Between that date and 1491 over 70 books were printed in England, mostly works by such authors as Gower, Lydgate, Chaucer, and Malory. A censorship of p. was established in 1530 for England, and printers were so abused and imprisoned that for a time the art almost became extinct in England. In 1694, however, the censorship was abolished and a revival in p. followed. No radical improvements were effected until mid-XIX. cent., when machines to lighten labour were introduced; the improvements in speed and the introduction of machine p. rendered the daily newspaper a possibility.

Printing-Presses.—The first p.-press was probably some sort of contrivance used by Gutenberg, and no doubt it was constructed of wood. The presses used in the early part of the XVII. cent. were wooden ones, and resembled the old wine-press in design. An upright frame held in place a flat table of smooth wood or stone. The paper was held in a frame parallel to the table, and was screwed down upon the inked type resting on the table. Joseph Moxon wrote *Mechanick Exercises as applied to the Arte of Printing* (1683), and the existing kind of press was improved by Blaeu. The earliest illustration of a press, dated 1607, shows how primitive the press was. It remained in this state until the close of the XVIII. cent. In 1800, Charles Mahon, 3rd Earl of Stanhope, invented the iron p.-press. It had an upright frame, but in design was different from its predecessors, enabling a greater power to be obtained. With this press some 200 copies per hour, printed on one side, could be taken. In 1823 the Albion press was invented by R. W. Cope of London, and soon after, Clymer, an American, introduced the Columbian. Both these machines were capable of turning out 250 copies per hour printed on one side. In 1772 Adkin and Walker invented a rotary press, the forerunner of modern p.-machines. Several improvements were suggested by Wm. Nicholson of London, embracing cylindrical formes and inking devices. In this machine the type was fixed on one cylinder, while another roller, covered with leather, pressed the paper into contact. The paper was carried through the rollers—or 'fed'—with tapes moving to and fro. It was feared that the rotating movement of the rollers would tend to blur the impression of the type on the paper, but in actual practice it was found that it did not differ appreciably from the impressions obtained with flat press machines.

Probably the first newspaper to be printed by steam-driven p.-machine was the *Times* of Nov. 28, 1814, 900 sheets per hour being printed on both sides, but by two distinct operations. Small iron hand-presses are still used at the present day for pulling proofs, while small *platen* machines worked by treadle (or by power, when employed continuously) are used for printing cards, circulars, etc. The design of these machines is practically the same as the old Albion and Columbia machines, although minor improvements have been added as experience suggested. Single-cylinder machines are used where one side of the sheet only is to be printed, and machines which print both sides of the sheet are called Perfecting machines. The sheet is perfected before leaving the press, but is printed on both sides by different operations. Two-colour machines have only one cylinder, which, however, has two p. surfaces and two sets of inking apparatus. Rotary p.-machines are used for that class of work where rapid dispatch is required, as in daily newspapers and sometimes periodicals. The paper is contained on great reels, and is wound in at one end of the machine, only to issue from the other in printed, cut, and folded copies of the newspaper. The cycle of operations is too complex to give here.

Letterpress Printing is the process mostly used for general work. The letters of characters are cast on pieces of metal. Large lettering, however, such as posters and placards, is made of wood, carved in relief. A complete set of type is called a *fount*; each type is notched at one end so that the compositor may place it right way up without looking at the letter. The fount is contained in a tray or *case* which stands on a frame. The tray is divided into compartments, each of which contains type of a certain letter. These compartments are so placed that those types which are most often used are close to the compositor's hand. The chief heading of this article is in Clarendon capitals, and the subheading, 'Printing-Presses,' in Clarendon lower case; the body of the article in Roman, and the title *De Natura Deorum* in italics. The sizes of types in general use are:—

This type is called Pica.
" " " Small Pica.
" " " Long Primer.
" " " Bourgeois.
" " " Brevier.
" " " Minion.
" " " Nonpareil.

The three smaller types, Ruby, Pearl, and Diamond, are not in common use. The length of a line is measured by the number of *ems* that the line will take.

The compositor picks up the required letters, places them in a setting-stick, or kind of box-like arrangement which holds them in place; when sufficient lines have been arranged they are transferred to the galley, a brass tray with wooden sides. A proof is now 'pulled' by a hand-press and read over by a printer's reader, who corrects any errors and returns to the compositor for amendment. A 'clean proof' is then taken for the author. A very small number of

impressions is printed direct from the galley type, but if, on the other hand, a large number is required, the type is stereotyped, *i.e.* a paper mould of page is filled with molten metal. After use the type is 'broken up,' *i.e.* returned to the cases.

Textile Printing, the art of ornamenting woven fabrics by p. designs in colour. The art is of very ancient origin. The Chinese used engraved wooden blocks before any kind of p. was known in Europe, while, according to Pliny and some of the hieroglyphics of the tombs of Egypt, the ancient Egyptians also practised the art of p. on cloths, as the repeated designs found in tombs show. Other peoples familiar with the practice were the Incas, the Peruvians, and the natives of Chile and Mexico. Textile p. was introduced into England in 1675 by a Fr. refugee who started works at Richmond-on-Thames. The industry does not seem to have flourished greatly anywhere before the latter part of the XVII. cent. and the early part of the XVIII.; about this time a development took place, and works were erected in France, Germany, Switzerland, and Austria. Calico p. was commenced in Scotland in 1738, while Messrs. Clayton erected an establishment at Bamber Bridge, near Preston, which subsequently became famous. Textile p. is now done in all parts of the world and in many varieties of style; the French have always been the most artistic in design.

The design may be imprinted by stencil, wood blocks, or engraved plates or rollers. The ink is thickened and specially prepared to prevent its running and spoiling the design, while it is also rendered 'fast' to prevent washing out. The following are the styles most commonly in use:—

(1) Hand Block Printing.—This is the simplest and slowest process, but it is considered to give the most artistic results. Blocks are cut from special woods (as sycamore, plane, or pear-tree), a wood of even texture and of medium hardness being requisite. The wood is first cut into convenient sizes and planed perfectly smooth. The design is then drawn on its surface or imprinted with a transfer. The superfluous wood is then cut away, leaving the design in relief. As fine details either break away in working, or would soon wear away in practice, it is customary to build them up with strips of metal. If the finished pattern is to be in different colours, separate blocks are made for each part of the pattern having a different colour, and the printing is done by separate operations.

(2) Perrotine, or Block Printing by machinery, is a somewhat complex process, consisting of a kind of printing-press; the system was invented by Perrot of Rouen in 1834.

(3) Printing by Engraved Copper Plates was first invented by Bell in 1770, but is now obsolete in England, although still used in Switzerland in specially fine engraving work for handkerchiefs.

(4) Engraved Roller Printing, a process also invented by Bell in 1785. The actual invention was improved by Parkinson and used by Messrs. Livesey, Hall, Hargreaves, & Co., of Bamber Bridge, Preston, in the early days of textile p. This machine printed calico in from two to six colours at one operation, and was an ingenious arrangement. Modern machines of this type print in from two to sixteen colours, and are of essentially the same principle. A comparatively recent invention is the *Duplex* machine, which prints both sides of the cloth. In modern roller p. some 10,000 or 12,000 yards of cloth can be printed in a ten-hours' day by a single-cylinder machine. All manner of designs are used, from fine to broad effects, and great exactitude in the 'register' of the pattern is obtainable.

(5) Stencilling is a very old art in itself, and has been used for ages by the Japanese. The desired pattern is cut from a sheet of strong paper with a sharp knife. The sheet is then laid on the cloth, and the colour brushed through. A machine for stencil p. in one colour was patented by Sharp in 1894.

[illegible] has been tried in textile p., but is of little practical value. The chief cloths treated are calico, cotton, woollen, and silk.

E. A. Parnell, *Dyeing and Calico Printing* (1849); W. Crookes, *Dyeing and Calico Printing* (1864).

PRIOR, ecclesiastical title given to monastic officials, and then technically to one ranking immediately after the abbot; some orders called the head of a house 'prior.'

PRIOR, MATTHEW (1664–1721), Eng. poet. His early training was under the care of an uncle, a vintner in Channel Row. At his uncle's office he met the Earl of Dorset, who helped to finance him during his student days. Under Anne he rose to be an ambassador, but it is as a writer of light verse rather than as a diplomatist that he is remembered.

PRISCIAN, Priscianus, surnamed Cæsariensis (fl. VI. cent. A.D.), Latin grammarian; b. in Mauretania; lived in reign of Anastasius and taught rhetoric and grammar at Constantinople.

PRISCILLIAN (d. 385), Span. heresiarch; founder of heresy bearing his name; preached rigid asceticism, denouncing marriage; burned to death at Treves; followers afterwards persecuted; his views preached later by the Cathari.

PRISHTINA, Pristina (42° 30′ N., 21° 18′ E.), town, vilayet Kossova, European Turkey; occupied by Balkan Allies, 1912–13. Pop. 17,500.

PRISON, place of confinement for ill-doers. The aim of p's has varied considerably; originally mere detention of person wanted by justice; punishments were then death, fines *in re*, corporal chastisement, and torture. Humaner ideas suggested imprisonment. From then till last cent. the aim of imprisonment seems to have been slow torture; prisoners were treated like wild beasts, left in damp, disease-ridden, and filthy quarters, in rags and with insufficient food.

It is significant that the Fr. Revolution started by razing the most notorious prison of the time (the Bastille). John Howard, J. Neild, and Miss Fry drew public attention to the shocking state of p's, and a Prison Society was formed (1817). Differentiation of sex was the first object attained (1823), separate cells and the provision of occupation followed (1839). Mr. Crawford had been sent to America to report on the p's there (1834), and had suggested many improvements to a parliamentary Select Committee. In 1840 the first 'new model' p. was built at *Pentonville* on the separate cell system. Lately p. reform has taken a different direction, and save in cases of penal servitude the separate treatment has yielded to supervised common occupations. The theoretical aim of modern p's is not so much to inflict personal punishment as to remove the subject from his criminal surroundings, protect society from him for a time, and give him a chance of fitting himself out for honest livelihood on his release. It is as yet largely a theory, but progress is being made, especially in Belgium, towards its accomplishment. This is particularly the case with youthful offenders; 'Borstal' institutions and training-ships have replaced p's in numbers of these cases. The present system of p. discipline in Britain, with its wide use of ticket-of-leave, is based on the recommendations of a Departmental Committee in 1895.

PRISTIS, see under Rays.

PRITCHARD, CHARLES (1808–93), Brit. astronomer; schoolmaster and Savilian prof. of Astron., Oxford, 1870.

PRITTLEWELL, parish, Essex, England, in borough of Southend-on-Sea.

PRIVAS (44° 44′ N., 4° 37′ E.), chief town, Ardèche, France, on Ouvèze; iron-mines. Pop. (comm.) 7200.

PRIVATEER, war-vessel owned privately and licensed by 'letters of marque' from a government. See Declaration of Paris.

PRIVY COUNCIL, body of advisers of Brit. Crown. Its original was Great Council of Norman kings composed of magnates of realm. Great Council

became House of Lords of new Parliament and also developed into Privy Council, which existed as separate body (*consilium regis*) in XIV. cent. Instead of general body of tenants-in-chief the Council was composed in 1404 of 3 bp's, 9 lay lords, 6 knights, and 1 lesser councillor. Under Tudor and Stewart, 'King in Council' sought to exercise authority of king and council of early feudal times; lost power, 1640; Cabinet appeared in XVII. cent. and was organised by Charles II.; and various boards, *e.g.* Board of Trade, Board of Education, have assumed other functions of Privy Council. King in Council is still tribunal of final appeal (*Judicial Committee*). The rank of P.C. is a distinguished one (members being styled *Right Honourable*). Council includes certain Brit. colonial statesmen and administrators. All members are seldom summoned to Council meetings. Lord President of Council is important Cabinet minister. Ireland has its own P.C.

PRIZE OF WAR (Fr. *prise*, seizing, capture), property (especially vessels and their cargoes) captured and kept by belligerents, in accordance with international rights of war. Prizes may be taken from the enemy and from neutrals violating laws of neutrality (*q.v.*). *Prize money* is awarded to those who effect capture, and a Prize Court adjudicates on questions concerning such captures. The second *Hague Conference* decided to establish an *International Prize Court* (comprising 15 judges, one each from a number of European and other countries) to settle disputed cases; and by *Naval Prize Act*, 1911, endorsing the *Declaration of London*, the Brit. Prize Court is subordinated to this International Court. See also CONTRABAND.

PRIZE-FIGHTING, see BOXING.

PRIZREN, PERZERIN (42° 8′ N., 21° E.), chief town, Kossovo, European Turkey; seat of Roman Catholic abp. and Gk. bp.; active trade; former capital of Servian kings; manufactures glass and weapons. Pop. *c.* 60,000.

PRJEVALSKY, NIKOLAI MIKHAILOVICH (1839–88), Russ. Asiatic traveller and writer; sent out by Russ. Imperial Geographical Soc. and visited hitherto unexplored regions of Central Asia; made important geographical and scientific discoveries.

PROBABILITY.—(1) The usual definition of p., or *chance*, is as follows: 'If an event can happen in a ways, and fail in b ways, and all these ways are *equally likely* to occur, then the p. of its happening is $\frac{a}{a+b}$, and the probability of its failing is $\frac{b}{a+b}$.' Events are said to be *equally likely* when we have no reason to expect one any more than the other; *e.g.* drawing a ball from a bag containing only black and white balls in unknown proportions, there is no reason to expect one more than the other; so the drawing of a black ball and of a white one are equally likely, and the probability of drawing either is $\frac{1}{2}$. Again, if *in the long-run* events occur equally often, we may say they are equally likely; *e.g.* in tossing a coin, the ratio of the number of times *heads* occurs to that of *tails* is in the long-run little different from unity. So we get another definition, consistent with the first, that the p. of an event occurring is the ratio of the number of times in which the event occurs, in the long-run, to the sum of the number of times in which events of that description occur, and in which they fail to occur.

(2) If an event is certain, it will occur always, and its p. is 1. Hence, if p is the probability of an event occurring, $1-p$ is the probability of it failing. If the ratio of the p. of an event occurring to that of it failing is $a:b$, it is said that *the odds* are a to b *for* the event, or b to a *against* it, according as a or b is the greater.

(3) When different events are *mutually exclusive* (*i.e.* if one occurs, other can not occur), the chance that one or other of the different events occurs is the sum of the chances of the separate events.

(4) The p. of two independent events both happening is the product of the separate p's of their happening; *e.g.* the p. of throwing *heads* twice in two throws of a coin is $\frac{1}{4}$, for the p. of throwing heads each time is $\frac{1}{2}$. The odds, therefore, against two successive throws of heads is 3 to 1.

(5) If two events are dependent, the p. of the second being different when the first happens from when it fails, we get a similar result to that of (4). If p_1 is the probability of the first occurring, and, that having occurred, the probability of the second is then p_2, the probability of both happening is $p_1 \times p_2$; *e.g.* the chance of drawing two red balls in succession from a bag containing three red and five white balls is $\frac{3}{28}$. For the chance of drawing a red ball the first time is $\frac{3}{8}$, and, the ball drawn not being replaced, the chance of again drawing a red ball is $\frac{2}{7}$. Hence the p. of drawing both red balls is $\frac{3}{8}\times\frac{2}{7}=\frac{3}{28}$.

(6) The p. of a certain event happening being known in one trial, the p. of it happening once, twice, three times, etc., in n trials can at once be written down. For, p being the probability of the event happening, the probability of it failing is $1-p=q$. Hence, the probability of its happening r times and failing $n-r$ times *in any given order* is $p^r q^{n-r}$. But the total number of ways in which the event could occur exactly r times in n trials is ${}_nC_r$, and since these ways are all equally likely and mutually exclusive, the probability of the event happening exactly r times in n trials is ${}_nC_r p^r q^{n-r}$. So, expanding $(p+q)^n$ by the binomial theorem, the successive terms give the probability of the event happening exactly n times, $(n-1)$ times, $(n-2)$ times, etc., in n trials. From this we can get the most probable number of successes and failures in n trials by finding the greatest term in the expansion. Again, the probability of it happening *at least* r times in n trials is

$$p^n + np^{n-1}q + \frac{n(n-1)}{1.2}p^{n-2}q^2 + \ldots + \frac{\lfloor n}{\lfloor r \lfloor n-r}p^r q^{n-r},$$

e.g. (i.) The chance of throwing 10 with two dice is $\frac{1}{12}$. For the whole number of different throws is 6^2, and there are 3 ways of throwing 10. Hence the required chance is $\frac{3}{6^2}=\frac{1}{12}$. (ii.) In four throws with a pair of dice, the chance of throwing doublets at least twice is $\frac{19}{144}$. For in a single throw the chance of doublets is $\frac{6}{36}$ or $\frac{1}{6}$; ∴ chance of failing is $\frac{5}{6}$. Hence required chance is sum of first 3 terms of $\left(\frac{1}{6}+\frac{5}{6}\right)^4$, *i.e.* it $=\frac{1}{6^4}(1+4.5+6.5^2)=\frac{19}{144}$.

(7) **Inverse Probability.**—If it is known that an event has happened in consequence of a certain number of causes, the determination of the p's of the different possible causes is a problem in *inverse* p.; *e.g.* a purse contains 5 sovereigns and 2 shillings; a second, 2 sovereigns and 5 shillings; a sovereign has been drawn; find the chance that it came from the first or second purse. Considering a large number, N, of trials, the chance of the sovereign being drawn from the first purse is $\frac{5}{7}\times\frac{1}{2}\mathrm{N}=\frac{5}{14}\mathrm{N}$, and from the second, $\frac{2}{7}\times\frac{1}{2}\mathrm{N}=\frac{2}{14}\mathrm{N}$. Putting $\mathrm{N}=14n$, the chances are $5n$ and $2n$, and hence the p's are $\frac{5}{7}$ and $\frac{2}{7}$. Questions

relating to testimony may be solved by similar methods, but are of no practical value.

(8) **Local Probability.** — Most of the problems require the Integral Calculus, but a few may be solved by simple geometrical methods.

Whitworth, *Choice and Chance*; Bertrand, *Calcul des probabilités*; Todhunter, *History of Theory of Probability*.

PROBATE.—The proving of a will. The P. Registry is now at Somerset House. P., or Letters of Administration, cannot be taken out till a week after the testator's death, but must be taken out within six months, or the executors are liable to penalties. Where the will is not disputed, it can be proved cheaply by common form at Somerset House. To be proved in solemn form it must be done in court. P. (with Divorce, and Admiralty) is the Third Division of the High Court of Justice.

PROBATION, proof; a person app. to an office is on p. when the appointment is not finally ratified until there is assurance that the person so app. will give satisfaction. Under the Probation of Offenders Act, 1907, any person charged before a court of summary jurisdiction may be released on p., when the court thinks the charge proved, but that it is inexpedient to inflict punishment; the offender entering into a recognizance to be of good behaviour.

PROBOSCIDÆ, Elephants (*q.v.*).

PROBOSCIS, an elongated nose, such as that of Elephants or Tapirs, applied also to almost any elongated or protrusible mouth organ, as in many Worms, Butterflies, and Moths, etc.

PROBOSCIS MONKEY, see under Cercopithecidæ.

PROCAVIA, Conies (*Procaviidæ*, or *Hydracoidea*), a sub-order of small Ungulate Mammals confined to Syria, Arabia, and Africa. They are small, brownish-grey, rabbit-like animals, with short snout, ears, and legs, and very small tail. They live in the crevices of rocks and feed upon foliage and tree-shoots. Many are arboreal and expert climbers. Formerly known as *Hyrax* and *Dendrohyrax*, all are now grouped in genus *Procavia*.

PROCELLARIIDÆ, Petrel Family (*q.v.*).

PROCESSION, a number of persons going ceremonially in ordered array. P's have been common in both religious and secular life, especially the former; religious p's were a regular part of official Gk. and Rom. religion. Their beginning in the Christian Church does not date certainly farther back than IV. cent., though they may be older. The eucharistic p's are somewhat later. Processional litanies were early in use; these were penitential in times of disaster. Funerals were accompanied by p's as they are among nearly all churches to this day. At the Reformation p's were generally abandoned in the Reformed churches, but they continued to some extent in the Lutheran and Anglican churches. There has been a great revival of them in England since the Oxford Movement. Except in the burial service a p. is not enjoined in the Prayer Book and they are nowhere forbidden. The Rom. ritual has elaborate regulations for them.

PROCIDA (40° 56′ N., 14° 2′ E.), volcanic island, Italy, W. of Bay of Naples; ancient *Prochyta*. Pop. 14,600.

PROCLUS, see Plato (Neo-Platonism).

PROCOP THE GREAT (*c.* 1380–1434), Hussite leader; became general of Taborites on death of Zizka; spread terror over Europe; ruled Bohemia till death in battle of *Lipan*. With him fell his great general, Procop the Little.

PROCOPIUS (fl. VI. cent.), Byzantine historian; became chief adviser of Belisarius, *c.* 527, and went with him to African, Ital., and Pers. Wars, which he described; settled in Constantinople from 542 to death, about 562; chief works: *Books of the Wars*; the *Anecdota* or '*Secret History*,' a scurrilous attack on Justinian and Theodora; *The Buildings of Justinian*; chief source of history of time.

PROCRUSTES, Damastes, Polypemon, a robber of Attica who placed victims on a bed ('Procrustean bed'); if too tall he hewed off their limbs, if too short he racked them; Theseus slew him.

PROCTER, BRYAN WALLER, 'Barry Cornwall' (1787–1874), Eng. poet of little merit; fame rests on his personality; his friends included Lamb, Keats, Scott, Tennyson, Dickens. His dau. **Adelaide Ann** ? (1825–64) was also a poet.

PROCTOR, a shortened form of Procurator, meaning one who acts on behalf of another. In the Law Courts solicitors have taken the place of p's (who formerly were officers in ecclesiastical courts), but the King's P. survives to intervene in divorce cases, and prevent a decree being made absolute when collusion or concealment of facts has taken place. Univ. p's are masters of arts app. by the univ. authorities to preserve discipline in public places.

PROCTOR, RICHARD ANTHONY (1837–88), Brit. astronomer; wrote many books in popular style; greatest work, perhaps, *Old and New Astronomy* (unfinished at death; completed later by Ranyard).

PROCURATOR, literally one to whom a charge has been committed by another person; name of various officials in Middle Ages, and of administrator in certain religious houses. In Scotland the *p.-fiscal* is a public prosecutor app. by the sheriff.

PROCYON, see Raccoon Family.

PROCYONIDÆ, Raccoon Family (*q.v.*).

PRODUCTION, meaning the Production of Wealth, is one of the great divisions into which political economists arrange their subject, distinguishing it thereby from the Distribution of Wealth.

PROFIT-SHARING, a system of remuneration adopted by certain employers, who allocate a fixed proportion of the profits of industry—in addition to wages—to the working people engaged in the particular business. It has been tried with success in England by the South Metropolitan and other gas companies, and by Leclaire and Godin in France.

PROGLOTTIDES, segments of a Tapeworm.

PROGNOSIS, the forecast of the course and termination of a disease.

PROGRAMME MUSIC, in its highest sense, is any instrumental music, usually orchestral, which avowedly seeks to 'tell a story,' or depict certain definite scenes and emotions. In a lower sense it may be taken to include such music as Händel's imitation of the plague of flies in *Israel in Egypt*. Beethoven was the first great writer of p. m., though Haydn and Mozart often 'worked to a picture.' Mendelssohn's *Scotch* Symphony and *Hebrides* Overture, Schumann's *Carneval* and *Fantasia in C*, Liszt's *Mazeppa* and Symphonic Poems, and MacCunn's *Land of the Mountain and the Flood* overture are good examples. Recently Strauss, Debussy, and others have made p. m. something of a cult; but many of these modern efforts undoubtedly go beyond the legitimate sphere of music.

Prof. Niecks, *Programme Music in the Last Four Centuries* (Novello).

PROGRESSION (in math's), see Series.

PROHIBITION, see under Temperance.

PROJECTILES.—A knowledge of the properties of p. is essential to modern gunnery, which has now assumed the position of a science (*ballistics*, from Gk. *ballo*, throw). The projectile is the thing thrown: its path, the trajectory. Considering alone the action of gravity, acting vertically downwards, the trajectory is a parabola, the path to the highest point being exactly reproduced on the opposite side of the origin. But under the resistance of air the trajectory loses its symmetry, the descent from the highest point being sharper than the path to it. The resistance depends on the velocity, shape, size, and mass of the projectile, factors given or calculable from those given.

The earliest authority on p. was Tartaglia in *Nova Scientia* (1537); Galileo followed, but neglected the resistance of the air, and, indeed, this governing factor was not accurately investigated until 1864, when the

Rev. F. Basforth commenced to measure the resistances experimentally over long ranges. For velocities lower than 1000 ft. and above 1300 per second, the resistance, as Newton deduced, varies as the square of the velocity; but between these limits the resistance is very much higher. With projectiles of the same shape the resistance varies as the square of the diameter, but inversely with the weight.

The velocity of shot had been measured as early as 1742 by the *ballistic pendulum* of B. Robins, and nearly a century passed before the invention was superseded (see CHRONOGRAPH). The science is now so complete that time of flight, elevation, and penetration (factors included in tables drawn up for every weapon) can be computed as well as the charge, size of chamber, shape of projectile, length and thickness of weapon.

The part of ballistics which treats of the gun's properties is called *interior ballistics*. It has for its problems the pressure of the explosive gas and the strains produced in the gun. From one point of view the gun is merely a heat engine (see ENGINE), the cycle of operation being completed in a single stroke. Its problem is therefore the general one of thermo-dynamics (*q.v.*). The pressures inside the gun-bore were discovered by accurate experiments, and the first were carried out by Robins. The advantage of modern explosive charges, as compared with the abandoned black gunpowder, are the evolution of greater values of gas at an increased pressure and temperature. The charges are therefore smaller. Cordite is used in British ordnance.

Exterior and Interior Ballistics, Ingalls; *Ordnance and Gunnery*, Lessak.

PROJECTION.—If all the points of any figure be joined to any fixed point in space (O), the joining lines form a cone with O as *vertex*. The section of this cone by any plane gives a figure called the *projection* of the given figure. The plane cutting the cone is called the *plane of p.* Different positions of the vertex give rise to different types of p.: (i.) *Orthographic p.*—vertex is infinitely distant, so that projecting rays are parallel. (ii.) *Orthogonal p.*—rays parallel and perpendicular to plane of p. (iii.) *Projections of Sphere* (of great importance in map-making)—(*a*) *Stereographic p.*, vertex on surface of sphere; plane of p., the tangent plane at end of diameter through vertex. (*b*) *Globular p.*, vertex is at distance $\sqrt{2}\times$ radius from surface; plane of p. is perpendicular to diameter through vertex. (*c*) *Mercator's p.*, not true p. as in above (see MERCATOR). *Method of p.* is very useful in geometry.

The following elementary theorems are proved in most text-books (*e.g.* Salmon's *Conic Sections*, C. Smith's *Conic Sections*). A straight line is projected into a straight line. Any plane curve is projected into one of the same degree. Any tangent to one is projected into a tangent to the other. Any property of a given curve not involving the *magnitude* of lines or angles, but dealing merely with relative positions of points, lines, and the curve, will be true for the projected figure. Thus, since the tangents at the extremities of chords of a circle through a fixed point intersect on a straight line, the *polar* of the point, and since it can be shown that any conic can be projected into a circle, the theorem of poles and polars is true for all conics. Pascal's theorem, that the three intersections of the opposite sides of any hexagon inscribed in a conic are in a straight line, and Brianchon's theorem, that the three opposite diagonals of every hexagon circumscribing a conic intersect in a point, only require proving for the circle, and by p. they are easily seen to be true generally. Properties like the above, which remain true on p., are called *projective properties*. Some of these do involve magnitudes. Most important of these is: Cross ratios of pencils and ranges are unaltered by p. Angles constant in any figure are not in general constant in the p., but we have such theorems as the following: Any two lines at right angles to each other will be projected into lines which cut harmonically the line joining the two fixed points, which are the p's of the imaginary points at infinity on a circle.

PROKOPOVICH, THEOFAN (1681–1736), abp. of Novgorod, 1724, and reformer of Russ. Church.

PROLETARIATE, lower classes in a state; in Servius Tullius' time *proletarius* was a man valuable only as a begetter of offspring (*proles*).

PROLOGUE, term denoting a preface to a poem or a drama. The original p. in Greek was an integral part of the drama, but it has degenerated into a mere explanatory address to the audience.

PROME (18° 43′ N., 95° 15′ E.), district, Pegu division, Lower Burma. Pop. 375,000. Chief town, **Prome**, on Irrawadi; trade in rice; silk-weaving industry. Pop. 30,000.

PROMETHEUS (classical myth.), s. of Iapetus, a Titan, and Clymene, bro. of Atlas and Epimetheus; is represented as helping men against Zeus and teaching the arts; has been called the culture-hero of the Greeks; helped Zeus against the Titans; brought fire to mortals, and as punishment was chained to Mount Caucasus, where an eagle by day devoured his liver, which grew again by night; delivered by Heracles; subject of many legends (see Hesiod's *Works and Days* and Æschylus' *Prometheus Bound*). The Gk. legend of the theft of fire is analogous to many stories in all parts of the world.

PRONG-BUCK (*Antilocapra americana*), an antelope-like hoofed mammal, found only on the prairies of western North America, and distinguished from antelopes proper by its horns, with a short branch, which are shed annually.

PROOF-READING is the art of correcting errors of the compositor (and if necessary of the author) in order to make the printed sheet mechanically perfect. To facilitate proof-correcting there is a recognised system of signs, by which all the commoner errors are indicated. Corrections are marked in the margin. Proof-reading requires wide general knowledge, thorough understanding of typography, and keen vision.

PROPERTIUS, SEXTUS, (fl. 28–15 B.C.), Rom. poet; b. Assisium, Umbria; ed. Rome; joined literary coterie of which Mæcenas was patron; became friend of Vergil and Ovid; infatuated by courtesan whom he calls 'Cynthia'; parted by mutual infidelity. P. was greatest master of the elegiac metre; is imaginative, tender, brilliant in flashes, though his work is not consistent; wonderful descriptive power and command of language. Four books of his poems are extant, mostly love-poems interspersed with verses on political and historical themes. Best-known poem describes the appearance of Cynthia's ghost to the poet.

PROPERTY, see INHERITANCE.

PROPHET (Gk. 'one who speaks forth'), name given to a certain class of men, especially among the ancient Hebrews, and to some extent also in Christianity and elsewhere.

I. JEWISH.—The *Prophets* is given as a title to one portion of the Old Testament both in Hebrew and English. There are the four *Greater P's*—Isaiah, Jeremiah, Ezekiel, and Daniel; and the twelve *Lesser P's*—Hosea to Zechariah (*qq.v.*) in the Old Testament. The ordinary conception of a p. is that of one who foretells future events, but this is only one aspect of his work. It seems probable that the Old Testament p's were possessed at least of extraordinary insight and did sometimes foretell future events. In reaction from this, the tendency has been to emphasise exclusively the work of the p's as moral reformers—also a one-sided view. Rather should they be viewed fundamentally as those who spoke forth the will of God—His interpreters to His people. The constant refrain, 'The word of the Lord came unto me, saying,' shows that the p. did not regard his message as simply his own.

In early times the p. seems to have been a seer or visionary, one who in ecstatic frenzy uttered strange sounds, so we are told that he that was formerly called a seer

was now called a p. (*1 Samuel* 9⁹). Then from Samuel onwards the ecstatic element tends to disappear and the moral and spiritual to come uppermost. The great age of Hebrew prophecy, however, begins in the VIII. cent., with Amos, Hosea, Isaiah, and Micah, when Israel was threatened with Assyrian supremacy. The main task, at any rate, of these men was not to prophecy future events, but to speak to men of their own age—firstly, against prevalent moral and idolatrous corruption; secondly, to proclaim the greatness and love of God. Their work was continued by Jeremiah and others, and prophetic activity continued till the IV. cent. B.C. But the understanding of the work of the p's is intimately bound up with the hist. criticism of the Old Testament. The prophets' writings cannot be understood except by always keeping in sight the political history of their time. It is now known that the Law took its final shape after the p's had written. Owing to the sins of their time the work of the p's was bound to be largely denunciatory. It is a great mistake to think that Isaiah was primarily 'poetic,' as a certain school of critics have done.

II. CHRISTIAN.—P's in the Christian Church were very different from the famous names of Old Testament times. St. Paul mentions prophesying in *1 Corinthians* 12 as a special gift, and it seems to have been akin to preaching. A p. was one inspired by the Holy Spirit to speak certain things. We find continual warnings against false p's, either hypocrites, or, more often, those who were self-deceived, and would lead others astray. The *Didaché* (Teaching of the Twelve Apostles) is hostile to the p's, who in the III. cent. became extinct.

Burney, *Theology of the New Testament*; Robertson Smith, *Prophets of Israel*.

PROPITHECUS, see SIFAKAS.

PROSELYTE (Greek), literally a sojourner, now used only of a convert from one religion to another: in ancient Judaism there are (1) full p's, admitted by circumcision and baptism; and (2) p's of the gate.

PROSERPINE, called **Persephone** by the Greeks, was the dau. of Demeter. She was gathering flowers in the vale of Henna when Pluto, king of the underworld, carried her away. Her mother mourned her, and as she mourned the crops ceased. A reconciliation was brought about, by which it was agreed that during half the year P. should dwell with her mother in the land of the living, and during the other half she should dwell with Pluto among the dead.

PROSKUROV, PLOSKUROV (49° 25′ N., 27° E.), town, Podolia, Russia; active trade. Pop. 25,000.

PROSODY, the art of versification. Terms used are: *verse*, line of poetry; *stanza*, set of verses 'standing' together; *foot*, a single syllable, or a group of syllables; *accent*, stress of voice on syllable; quantity, time occupied in pronouncing a syllable, essential in classical, not in Eng. p.; *scansion*, act of counting feet in a verse; *metre*, measure of a verse; *alliteration*, recurrence of an initial sound in a verse.

Common feet in Eng. p. are *iamb* (⏑ –), *trochee* (– ⏑), *spondee* (– –), *dactyl* (– ⏑ ⏑), *anapæst* (⏑ ⏑ –).

Metres.—(1) Iambic Dimeter, *e.g.*—

Then sigh | not so.

(2) Iambic Trimeter, 'Ballad Metre,' 'Common Metre' (of hymns), *e.g.*—

Our hope | for years | to come.

(3) Tetrameter, *e.g.*—

She stole | along, | she nothing spoke.

(4) Iambic Pentameter, *e.g.*—

The ev | il that | men do | lives af | ter them.

(5) Alexandrine (6 feet), *e.g.*—

Without | a grave, | unknelled, | uncof | fined, and | unknown.

(6) 'Fourteener,' *e.g.*—

The king | is come | to mar | shal us | all in | his ar | mour drest.

See COUPLET, LYRICAL POETRY, SONNET, CÆSURA.

PROSPER OF AQUITAINE (390–465), ecclesiastical author and follower of St. Augustine, whom he defended in several writings; his most important work is his *Epitoma chronicon*.

PROSSNITZ (49° 29′ N., 17° 7′ E.), town, Moravia, Austria; cloth manufactures. Pop. (1910) 31,162.

PROSTATE GLAND, see REPRODUCTIVE SYSTEM.

PROSTITUTION may be defined as promiscuous fornication for the sake of gain. It is not to be confounded with *concubinage* or *adultery*, for the concubine may be the lawful, though unmarried, wife of a bigamous or polygamous husband, and adultery, being the violation of marriage, requires that one at least of the offending parties shall be married. From the earliest times of civilisation the prostitute, the woman who sells her body for the gratification of the man's sexual instinct, has been found in the world, and while common public opinion condemns the woman and holds her profession in disrepute it has not been strong enough to abolish p. or to attach infamy to the man for whom the prostitute caters. Over and over again the Christian Church and European governments have tried to check and to make an end of p., but without success.

Various reasons are offered for its persistence. P. is the only alternative in many cases to a life of hard and badly paid work. It promises degradation in exchange for purity, but it also promises luxury, ease, and indolence in exchange for the daily round of toil. Passion having made a mother of an unmarried woman, the difficulty of obtaining employment is so great that p. becomes the only means of obtaining a livelihood. A certain number of men and women are so over-sexed and so dominated by sex lust that they will maintain p. in spite of all morality and decency. These are the chief explanations offered. P. is defended by those who declare that man is a polygamous animal, and that since he must have an outlet for his lusts, it is better he should seek a prostitute than seduce his neighbour's wife. On the other hand, p. not only violates the Christian principles of marriage and personal purity, destroys the happiness of home life, and keeps all who practise it in under the ban of social order, it is also the fatal agency of venereal disease.

In continental countries, p., though forbidden, is tolerated by law, and its control is left in the hands of the police. Women are accordingly registered, and are required to live in certain houses and to be subject to medical examination. In Great Britain there is no recognition by law, and houses set apart for p.—houses of ill fame, or disorderly houses—are not permitted (by law) to exist. Neither is the prostitute allowed by law to solicit. In spite of the law, houses of ill fame abound, and thousand of prostitutes ply their trade in Brit. cities. The Criminal Law Amendment Act, 1912, aims at suppressing some of the worst features of what is known as the *White Slave Traffic* (procuring of girls for purposes of p.).

W. F. Amos, *State Regulation of Vice: The Social Evil* (1907).

PROTAGORAS, see SOPHISTS.

PROTANDRY, PROTOGYNY, see FLOWER.

PROTEACEÆ, natural order of shrubs and trees of W. Africa and Australia; includes Banksia (*q.v.*).

PROTECTION (Fiscal), the policy of excluding the produce of other countries (in the case of articles that can be produced at home) by means of high tariffs or import duties. The protectionist claims that his first principle is that of nationality or patriotism, the promotion of native industry; and John Stuart Mill said of such: 'Many of them have been led to it (protection) much more by consideration for the higher interests of humanity than by purely economic reasons' (*Principles*, bk. v. ch. 10). Next to zeal for the public welfare comes private interest as the argument for p. The special interest of certain classes of producers makes them zealous for p. Thus many agriculturists desire p. for corn, while manufacturers are against taxes on corn or on raw material, and desire p. against the foreign manufactured article. Yet a third body of protec-

tionists urges the raising of revenue, by 'making the foreigner pay,' as the chief ground for stringent import duties. As a political creed p. in Great Britain lost its followers under the free trade budgets that followed the repeal of the Corn Laws in 1846, and both political parties accepted Free Trade as the settled policy of the country until Mr. Joseph Chamberlain started his campaign for Tariff Reform in 1903. Taking Imperialism for his warcry, Mr. Chamberlain urged free trade within the empire and p. against the foreigner. Tariff Reform has become the chief item in the programme of the Conservative party. See FREE TRADE, TARIFF.

W. J. Ashley, *The Tariff Problem*; Rev. W. Cunningham, *Rise and Decline of Free Trade Movement*; L. G. Chiozza-Money, *Elements of the Fiscal Problem.*

PROTECTIVE COLORATION and RESEMBLANCE, schemes of colouring or peculiarities of shape which tend to render animals inconspicuous in their natural surroundings and thus protect them from the observation of their enemies. P. c. is exceedingly common and is all but universal among birds and fishes, the palor under-parts of the former and silvery bellies of the latter counteracting the effect of the shadow cast by strong overhead light, and merging the body as a whole into the monotone of an average background. Or there may be more patent general resemblances to environment, such as the tawny tints assumed by many desert animals, the greens of many arboreal forms, such as tree-frogs, tree-snakes, and parrots, the blue transparencies of pelagic organisms, or the varying coats of Arctic creatures, such as the Mountain Hare, the Arctic Fox, the Stoat, and the Ptarmigan, which change to white when snow covers the ground. Again, more particular resemblances to immediate environment are common, most wonderful of these being the colour-changes which many creatures, *e.g.* some Shrimps (*Hippolyte*), the Octopus, Plaice, Trout, the Chameleon, and several other Lizards undergo as they pass from one set of colour-surroundings to another.

The habitual resting-place is imitated in the Pine Lappet Moth, which merges with the bark of the Pine tree, in the peculiar Madagascar Weevil (*Lithinus*), which exactly resembles the grey and black lichen upon which it feeds, or in countless leaf-devouring Caterpillars.

Often resemblance in structure goes with similarity in colour: Stick Insects agree in shape as in tint with the dark twigs on which they rest, so do the looping Caterpillars of Geometrid Moths; a Bornean Praying Mantis (*Deroplatys*), and the Indian Leaf-Butterfly (*Kallima*), resemble withered leaves, the likeness in the case of the latter, with midrib, veins, and all, having deceived many acute observers.

PROTECTOR, Eng. title given to gov. or regent; held by Earl of Pembroke (1216), Dukes of Gloucester —Humphrey (1422), Richard (1483)—Duke of Somerset (1547), Oliver Cromwell (1653), Richard Cromwell (1658).

PROTECTORATE, term in international law for (1) overlordship of a civilised state over a barbarous or semi-barbarous state. These p's are a new international development, being entirely different from the well-known hist. feature of hegemony of one state over its equals. The subordinate states have varying amounts of autonomy, but foreign policy rests with protecting state. (2) Generally, overlordship of one state over another. Interference of other powers with a protected state frequently precipitates annexation.

PROTEIN, see DIETETICS.

PROTELES, see AARD-WOLF.

PROTEOMYXA, minute animals, parasitic in living organisms, or saprophytic, included in a sub-order of Amœba (*q.v.*), an order of primitive Protozoa. It comprises elemental forms which reproduce only by simple division, such as *Protogenes*, a marine creature found in the Mediterranean, 0·1 to 0·2 mm. in diameter, with fine pseudopodial rays which seize Protozoa or Diatoms for food. Or more complicated forms, which form cysts from which Amœboid individuals issue, such as *Vampyrella*, which inhabits the sea or fresh water, living on and penetrating algæ, furnished with fine direct pseudopodial rays. It measures 0·5 to 0·7 mm. **Protomyxa** belongs to a still more advanced type, for the cysts to which it gives rise produce minute flagellated individuals which later become amœboid. For an amœba, *Protomyxa* is large, 1 mm. across; it is furnished with many, much-branched pseudopodia and lives in the sea.

PROTESILAUS (classical myth.), first Greek to leap ashore at siege of Troy; slain by Hector.

PROTESTANT, name given to Reformed Churches in distinction to the R.C. or ancient Eastern Churches; because Luther and his followers 'protested' against a Catholic decree passed at the Second Diet of Spires, 1529. The Anglican Church is called 'Protestant' by Roman Catholics and by some of its own members, but others repudiate the term. See REFORMATION.

PROTESTANT EPISCOPAL CHURCH.—The Anglican Church in America before the Declaration of Independence was merely a group of local churches under the control of the Bp. of London. The first bp. was consecrated in 1787, but for some time, as it was largely identified with England, the Church made little progress. Several able men, however, were consecrated, particularly R. C. Moore, who became Bp. of Virginia in 1814; theological colleges were established and several new dioceses were founded. During the Civil War the Southern churches seceded for a time, but were soon reunited. The Church is now widely extended and has missionary dioceses in South America and the East. It is more democratic than in England, the parochial clergy being app. by laymen, who also share in Church government.

PROTESTANTENVEREIN, Ger. association, founded 1863, to promote unity among Protestants; great object, federation of Prot. churches; exercised some influence on State, but roused opposition of orthodoxy.

PROTEUS (classical myth.), 'the old man of the sea,' tender of Neptune's flocks; a prophet, he hated prophesying, and, to escape an inquirer, assumed various forms. When caught he resumed his true form and prophesied.

PROTEUS, a blind, newt-like amphibian, sometimes a foot in length, found in limestone water-caves of Carinthia and Dalmatia.

PROTISTA, comprehensive name applied to simplest unicellular forms of life, whether plant or animal. See ALGÆ.

PROTOBRANCHIA, an order of LAMELLIBRANCHIATA (*q.v.*).

PROTOGENES, an amœboid Protozoon; see under PROTEOMYXA.

PROTOGENES, a painter of ancient Greece, who flourished *c.* 300 B.C.; practised chiefly at Rhodes.

PROTOMYXA, an amœboid Protozoon; see under PROTEOMYXA.

PROTOPHYTA, term applied to simplest forms of plant life, *e.g. diatomaceæ, bacteria.*

PROTOPLASM is the living matter of organic things, plants, or animals. It is contained in cells (*q.v.*) which in animals may be naked or bounded by a delicate membrane, and in plants have strong walls of cellulose. To the naked eye and under a microscope of moderate magnifying power p. in its simplest known state, cytoplasm, appears to be a homogeneous, transparent, semi-fluid substance, but high magnification and the use of suitable staining materials reveal a complicated structure. This appears to differ in different cells and at different times, but in general it is fibrillar—interspersed with minute filaments of denser material; reticular—with a meshwork of delicate threads; granular—with exceedingly minute particles scattered in the substance; or alveolar—with a foam-like structure of liquid containing vacuoles round which the protoplasm streams.

The chemical composition of p. is complicated, for it contains albumens, fats, alcohols, compounds of iron, as well as phosphates of sodium, potassium, magnesium, and calcium. P., besides forming cytoplasm, builds the nucleus and other ingredients of a cell (*q.v.*), the unit of organic structure.

PROTOTHERIA, see under MAMMALS.

PROTOZOA (Gk. *protos*, first; *zoon*, an animal), the simplest animals: the most primitive of all animals, standing with the simplest plants (*Protophyta*) at the base of the tree of life. They are to be distinguished from other animals by the simplicity of their structure, for as a rule they consist of a single cell or bead of jelly-like protoplasm; even where many single cells are united into a colony, as in *Volvox*, each cell is similar to its neighbours and is more or less independent of them, a congregation very different from the tissues of cells which make up the bodies of other animals. So simple, however, is the structure of P. that it is almost impossible to distinguish them from the simplest plants.

The single usually microscopic cell of a protozoon consists essentially of a body-mass of protoplasm-cytoplasm, containing one or more nuclei, contractile vacuoles which eject waste products, food vacuoles with digestive ferments, and many small granules in the cell substance. So the cell is complete in itself, possessing the powers of life, of growth, and of reproducing its like, for when it has reached its maximum of size the cell splits into two (in *Amœba* the entire process lasts only 15 minutes), and each daughter cell is a new individual. In some higher forms, such as *Paramœcium*, a sort of conjugation and interchange of nuclear material takes place previous to division—a primitive sexual union; while in others, such as the Mycetozoa and Sporozoa, spore formation is the rule.

Even within the limits of a single cell there is much room for variation. Some forms have naked bodies, others have a rind of tougher protoplasm, some have skeletons of lime or silica, others build for themselves protecting shells of similar materials, of chitin, or of diatom valves and other débris. The simplest P. merely crawl over the substratum by a flowing motion of their bodies, which project into finger-like processes or *pseudopodia*; but others swim or glide with ease and rapidity by the action of one or a few whip-like filaments or *flagella*, or by the rhythmical movement of hundreds or thousands of *cilia*.

P. are found all the world over. Some occur in fresh-water pools, many in the sea, and such feed upon bacteria, diatoms, or even upon P. more minute than themselves. Others live upon decaying vegetation, absorbing the organic solutions resulting from the breaking down of tissues, while a few contain coloured grains (*chromatophores*, or *chromoplasts*), by the aid of which they can, like plants, utilise sunlight for the decomposition of carbon dioxide into usable substances. But many are parasitic, living in the bodies of larger animals, and even of man, feeding upon the ready prepared substances in which they lie, and so occasionally interfering with the health of their hosts, and sometimes causing death.

Apart from their relation to disease (see especially under TRYPANOSOMES and SPOROZOA) P. have little apparent economic significance. The Infusorians and Mastigophora, or Flagellates, however, purify waters by their destruction and assimilation of harmful bacteria, while the Foraminifera and Radiolaria of past ages have contributed to the building of great formations of limestone and chert.

The Phylum PROTOZOA is divided into four classes:—

Class I. SARCODINA, p., with naked bodies, which feed and move by means of indeterminate, changing lobes or threads (pseudopodia).

Class II. MASTIGOPHORA, or FLAGELLATA, p., with bodies naked or having a definite rind, which feed and move by whip-like filaments or flagella.

Class III. SPOROZOA, p., with bodies having definite rind, but without feeding or motile organs in the adult.

Class IV. INFUSORIA, p., with bodies having definite rind, which feed and move by means of numerous close-set short filaments or cilia.

PROUDHON, PIERRE JOSEPH (1809–65), Fr. writer and politician; of peasant origin; pub. *Qu'est-ce que la propriété*, 1840, followed by other socialistic writings; founded paper, *Représentant du peuple*, 1847; imprisoned for attacks on government, 1849, and abandoned political life; fled from new imprisonment, 1858, on account of attack on Church and institutions in *De la justice*.

PROVENCE, ancient province of France, bounded on S. by Mediterranean, E. by Alps and Italy, N. by the Dauphiné, and W. by Rhône and Languedoc. Earliest inhabitants were Iberians and Ligurians; c. 600 B.C. Gk. colony of Massalia (Marseilles) is said to have been founded; Romans entered Gaul c. 125 B.C., and later took possession of large portion of country, and founded *Provincia Romana* with Aix as capital; after Cæsar's conquest of Gaul in 50 B.C. Arles became leading town; P. was attacked by Visigoths and Burgundians in V. cent., and in VIII. cent. by Arabs from Spain; two cent's later region was overrun by Saracens; country was ruled by counts of P.; in 1245 P. passed into hands of Charles of Anjou, king of Naples, and was joined to France in 1486 under Charles XIII. District is remarkably rich in Rom. and mediæval remains, finest being at Aix, Arles, Avignon, Nimes, and Orange. At end of XVIII. cent. P. was divided up, and now forms departments of Bouches du Rhône, Var, and Basses Alpes, with portions of Alpes-Maritimes and Vaucluse.

Provençal Language and Literature.—Provençal is the language which was spoken in France south of the Loire during the earlier Middle Ages. It was called *Langue d'Oc* (see FRANCE: *Language*), and was spoken also in Catalonia, joined to Provence under Raymond-Bérenger (1092). The lit. of the *Langue d'Oc* was very different from that of the *Langue d'Oil*, because Rom. civilisation had left a deeper mark and Ger. and Norman invasions were less felt. Rom. learning revived in Toulouse, Bordeaux, Narbonne, and Arles; southern France (the eastern part under the counts of Toulouse and the western under the kings of England) enjoyed for many cent's more peaceful government than northern France; mild climate and frequent intercourse with Moors of Spain contributed to give the *Langue d'Oc* its harmony and colour, to which the name of *gaye science* or *gay savoir* is due. Poets of the north were called *Trouvères*, the Provençal poets *Troubadours* (*robar*, to find, invent). They were often nobles, even kings, sometimes poor vassals. Their chief subjects were love in all its phases, the joys of home, war, and sometimes personal satire; they composed *cansos* (songs), *pastourelles*, *tensons* (poetical dialogues), and *sirventes* (satires). Some Troubadours went from castle to castle, starting in early spring; they wore many-coloured dress, and carried a guitar or other instrument.

The Troubadours filled an important place in mediæval life. One of the best known is SORDELLO, of whom Dante speaks with admiration and Browning writes. Others are ARNAUD DE MARVEL, a serf, troubadour of Viscount of Béziers, who sang the charms of Adelaïde, dau. of Raymond V., Count of Toulouse; BERNARD DE VENTADOUR, GAUCELIN FAYDIT, and PIERRE VIDAL, also of humble origin; ARNAUD DANIEL, celebrated by Dante and by Petrarch, who calls him 'the great master of love'; PEYROLS D'AUVERGNE, who sang the Crusade; GUILLAUME IX., Count of Poitiers and Duke of Aquitaine, celebrated for his *Chant d'adieu* before starting for the Crusade (1108); the warrior BERTRAND DE BORN, who wrote bold *sirventes*, and encouraged the sons of Henry II. of England in making war against their father; and RICHARD CŒUR-DE-LION (1157–99), who learnt the *gaye science* in southern courts, and who, the story goes, was released after eighteen months' imprisonment in the castle of Dürrenstein,

being found by the troubadour BLONDEL, who went from castle to castle singing *Cœur-de-Lion's* songs.

None of those poets left masterpieces, therefore the *Langue d'Oc* could not become a literary language. Soon the religious war of the Albigenses broke out; North seized the opportunity to attack South; Raymond, Count of Toulouse, was defeated and all the country sacked; the Troubadours disappeared and Provençal poetry ceased. In 1323 Toulouse made attempt to recall it to life by instituting the *Jeux floraux*, the foundress of which is supposed to have been Clemence Isaure, about whom very little is known.

In the XVII. cent. the *Jeux floraux* formed an academy which exists to this day. It takes its name from flowers distributed to the laureates. This presentation, called *fête des fleurs*, takes place at Toulouse, May 3.

Towards the middle of the XIX. cent. there was a renaissance of Provençal language and poetry, under the association called FÉLIBRIGES, its members being the *Félibres*. The first impulse was given by Jasmino; founded, 1854, by Mistral (1830–), Roumanille (1818–91), Anselme Mathieu, Théodore Aubanel (1829–86), and others. It has made proselytes in Aquitaine, and fraternises with Catalonia, which is also experiencing a parallel renaissance.

Cook, *Old Provence* (2 vols.).

PROVERBS, BOOK OF, in the Old Testament is part of the 'Wisdom' Literature. The word 'Wisdom' is here used specially of a certain sort of intellectual acuteness. The interest of the Wisdom lit. is not so national as that of the 'Prophetic,' and is concerned largely with reflections on human nature. 'Proverb' in Hebrew is *māshâl* (also the equivalent of parable), and means a 'representative statement.' The book falls into eight divisions, viz.: (1) Chapters 1–9; (2) $10–22^{16}$; (3) $22^{17}–24^{22}$; (4) 24^{23-34}; (5) 25–29; (6) 30; (7) 31^{1-9}; (8) 31^{10-31}. All these 'differ in tone and subject.' (2), called the '*Proverbs of Solomon*,' forms the central portion of the book, and some, though hardly all, may be by King Solomon. The style of *Proverbs* is distinctive; some words and phrases are not found much elsewhere in the Old Testament. The date of the book is uncertain: (2) is certainly the most ancient, but the book as a whole suggests the greatest days of the monarchy. Chapters 1–9 are later, and in the opinion of several critics about the time of the Exile. 25–29 were added to the body of the book, and 30–31 seem to be still later and post-Exilic.

Driver, *Introduction to Old Testament Literature*; Martin, in *Century Bible*; Toy, in *International Critical Commentary*.

PROVIDENCE (41° 47′ N., 71° 27′ W.), capital, Rhode Island, U.S.A.; founded by Roger Williams, the apostle of religious liberty and founder of Rhode Island, in June 1636; became a city in 1832; stands on P. Harbour, an inlet of Narragansett Bay; built on hilly ground and laid out with less regularity than most Amer. towns; fine public buildings, including Federal Building, City Hall, State Capitol, various libraries; seat of Brown Univ. (under Baptist control; dates from 1764), whose buildings include an Observatory, Women's Coll., Natural History Museum, and several libraries; many schools and philanthropic establishments, the Athenæum and Rhode Island Historical Society buildings; R.C. cathedral; numerous beautiful parks. P., formerly a great seaport, is now more important as an industrial centre, deriving water-power from its rivers; manufactures gold and silver ware, locomotives and machinery, woollens, cottons, lace, etc. Pop. (1910) 224,326.

PROVINCE.—*Provincia* generally signified the territory governed by a Rom. magistrate vested with military authority (*imperium*); term originally applied to scope of a magisterial office. Under Republic, captured countries were made p's, under a gov. sent annually from Rome, with a *quæstor* for financial and mechanical purposes, and a staff; peaceful p's administered by prætors (proprætors), unsettled districts by consuls (proconsuls) with army. Provincials were frequently oppressed by rapacity of gov., Rom. money-lenders, and tax-farmers. Under Empire, conditions improved, gov's were paid a fixed salary, and were under imperial supervision; tenure of office lengthened; franchise given by Caracalla to provincials.

Provincia was specialised to mean Rom. p. in southern Gaul, part of later Provence (*q.v.*).

PROVINCETOWN (42° 3′ N., 70° 13′ W.), town, summer resort, Massachusetts, U.S.A., on Cape Cod peninsula; cod, mackerel and whale fisheries. Pop. (1910) 4369.

PROVINS (48° 33′ N., 3° 17′ E.), town, Seine-et-Marne, France; interesting features are XII.-cent. church of St. Quiriace and the Grosse Tour; mineral springs; flour-mills; extensive rose gardens in vicinity. Pop. 7700.

PROVISIONS OF OXFORD, see OXFORD, PROVISIONS OF.

PROVO (40° 10′ N., 111° 49′ W.), city, on Provo, Utah, U.S.A.; woollen manufactures. Pop. (1910) 8925.

PROVOST, ancient title of certain ecclesiastical and secular officers. It survives in Scotland, where the principal magistrate of a royal burgh (corresponding to the Eng. *mayor*) is called a p. or (in the case of Edinburgh, Glasgow, Aberdeen, Perth, and Dundee) 'lord p.' The governing officer of certain univ. colleges, notably Oriel, Queen's, and Worcester at Oxford, King's at Cambridge, and Trinity, Dublin, is also called p. In France in the Middle Ages the p. of Paris was a royal judge.

PRUDENTIUS, MARCUS AURELIUS CLEMENS (b. 348 A.D.), Lat. writer; b. Spain; wrote sacred verses; called by Bentley 'the Horace and Vergil of the Christians.'

PRUDNIK, see NEUSTADT.

PRUNING, removal of branches from fruit trees, so as to improve fruit-supply, or from hedges, etc., for ornamental purposes. *Winter p.* is done in Jan. or Feb., and the spur left must have one or two buds; red currant bears fruit on old branches; black currant and gooseberry on young shoots; raspberry old wood is cut away. Cherry, holly, ivy may be pruned in summer. When p. fails to make a tree bear fruit, root-pruning may effect a cure; fruit trees should be planted on a stone slab, else roots will grow downwards and thus be beyond reach of p.

PRURITUS, itchiness of the skin, due to various causes, *e.g.* nervous derangements, jaundice, eczema; improving on treating the cause; in obstinate cases, warm baths, sponging with weak carbolic lotion, and pilocarpine injected hypodermically, are beneficial.

PRUSSIA (49° 10′ to 56° N., 6° to 22° 30′ E.), kingdom of German Empire; mainly situated in great north Ger. plain; bounded N. by North Sea, Denmark, and Baltic; W. by Holland, Belgium, and Luxemburg; S. by Bavaria, Saxony, Austria, and several smaller Ger. states; E. by Russia. P. contains 13 provinces: West Prussia, East Prussia, Silesia, Pomerania, Posen, Brandenburg, province of Saxony, Schleswig-Holstein, and Heligoland, Hanover, Westphalia, Rhineland, Hesse-Nassau, Hohenzollern; and Berlin (*qq.v.*); total area, 136,616 sq. miles. Seaboard is c. 1000 miles—850 on Baltic, rest on North Sea. Baltic islands are Rügen, Fehmarn, Usedom, Alsen, Wollin; Frisian Islands (*q.v.*) in North Sea.

Surface is generally level; large stretches of moorland (Lüneburger Heide, in Hanover), sandy plains (Brandenburg), and marshland along coast. Mountains lie in S. and S.W.; Riesengebirge (with Schneekoppe, 5255 ft.), in Silesia; Hartz Mts. (with Brocken, 3750 ft.), in province of Saxony; Hunsrück, Taunus, Eifel, Westerland, etc., in Rhineland; and other ranges. Principal rivers are: Rhine, Vistula, Weser, Elbe, Oder, Havel, Saale, Ems, Pregel, Vechte, Niemann, Wippe, Trave; many navigable; numerous lakes, including Spirdingsee, Mauersee, Plauensee, Plönersee, Schwerinersee, Müritzsee; vast lagoons on coast—Kurische

Haff, Frische Haff, and Stettiner Haff. Climate is generally healthy; N.E. much exposed and coldest; **annual mean temperature of Berlin, 48° F.**; average annual rainfall is *c.* 21 in. P. has extensive forests of fir, spruce, larch, beech, birch, oak, etc., especially in Hesse-Nassau, Brandenburg, and Hohenzollern.

History.—P. was erected into a Prot. duchy, 1525; in 1618 the Elector of Brandenburg (Hohenzollern House) became Duke of P. (see BRANDENBURG, HOHENZOLLERN). FREDERICK WILLIAM (1640–88), the Great Elector, obtained at Peace of Westphalia the secularised bishoprics, Minden, Kammin, Magdeburg, Halberstadt, and secured Prus. sovereignty by Swedish-Polish War, 1655–60. During his reign P. became a well-organised state and important military power. His successor, Frederick III. (1688–1713), assumed title of king, 1701, as FREDERICK I. FREDERICK WILLIAM I. (1713–40) was a careful and thrifty monarch; he obtained Guelders and Limburg at Peace of Utrecht, and Swed. Pomerania and Stettin, 1720. FREDERICK II., *the Great* (1740–86), increased the possessions of P. enormously, annexing greater part of Silesia (without Danzig and Thorn), 1740–42; East Friesland, 1744; received West Prussia and Netze district at first Partition of Poland, 1772; his successor, FREDERICK WILLIAM II. (1786–97), lost many of P.'s valuable possessions on Rhine, but gained Slavonic territory at second and third Partitions of Poland, 1793, 1795. During the reign of FREDERICK WILLIAM III. (1797–1840) took place disasters of *Jena* and *Auerstädt*, and Napoleon entered Berlin, 1806. P. lost most of her territory west of Elbe, and greater part of Prus. Poland, 1807.

Then began a great national revival, and P. shared largely in Napoleon's overthrow and victory of *Waterloo*, 1814. At Congress of Vienna, 1815, she regained most of her old possessions west of Elbe, and part of Saxony, Rügen, Swed., Pomerania, etc. In FREDERICK WILLIAM IV.'s reign (1840–61) took place abortive revolution of 1848. Under WILLIAM I. (1861–88) Bismarck became Prime Minister (1862) and brought about the war with Austria, 1866, which gave P. Schleswig-Holstein, Hanover, Hesse-Nassau, Hesse-Cassel, Frankfort, Lauenburg, and made P. predominant Ger. state. After FRANCO-GERMAN WAR (*q.v.*) (1870–71), king of P. was elected Ger. Emperor, and military and commercial power of Ger. Empire was built up under Pruss. guidance. FREDERICK III. (1881) reigned only from March 9 to June 15, and was succeeded by WILLIAM I., 1881, who dismissed Bismarck (1890) and secured colonies and a great navy for Germany. See GERMAN EMPIRE.

Government.—P. is governed by a hereditary monarch and *Landtag* (Parliament), consisting of *Herrenhaus* (House of Lords), with app. life members, and *Abgeordnetenhaus* (Chamber of Deputies) of 443 members, elected for 5 years. Principal towns are: Berlin (capital), Cologne, Breslau, Frankfort-on-Main, Düsseldorf, Hanover, Essen, Magdeburg, Königsberg, Duisburg; Altona, Kiel, Danzig, Stettin, Swinemündel important seaports. Two-thirds of population are Protestant; *c.* one-third Catholics. Elementary education is compulsory from 6 to 14 and maintained by local taxation and State aid. P. has 10 univ's (see UNIVERSITIES), besides 5 technical high schools, mining, agricultural, forestry, art, music, and other schools.

Resources and Industries.—Total railway mileage is 24,000 to 25,000; over 20,000 miles State railway. P. is an important agricultural, mining, and manufacturing state. Principal products are cereals, beet, hemp, flax, potatoes, hops, oil-seed, live stock, timber, etc.; famous wines made in Nassau and Rhineland; valuable horses bred in East Prussia. P. is rich in minerals; zinc, iron, coal, copper, lead, cobalt, arsenic, sulphur, nickel, etc.; important mining centres are Westphalia, Silesia, Rhine province, Harz, Prussian Saxony, Brandenburg, Nassau. Manufactures include textiles, iron and steel goods, leather, glass, china, earthenware, chemicals, musical instruments, paper, etc.; celebrated Krupp cannon works at Essen; extensive breweries and distilleries; valuable salmon, herring, cod, oyster, etc., fisheries; many mineral springs. Pop. (1905) 37,293,324; (1910) 40,165,219. See GERMAN EMPIRE.

Baedeker, *Northern Germany*; Prutz, *Preussische Geschichte* (1899); Hodgetts, *House of Hohenzollern* (1911); Petre, *Napoleon's Conquest of Prussia* (1907).

PRUSSIAN BLUE, see FERROCYANOGEN.

PRUSSIC ACID, hydrocyanic acid, hydrogen cyanide, HCN, occurs free and combined in plants (*e.g.* bitter almonds); formed (1) synthetically, (2) by dehydrating ammonium formate: $H.COONH_4 = 2H_2O + HCN$, and (3) by distilling simple or complex cyanides with dilute acid. PROPERTIES: Colourless liquid, B.P. 26·1° C., burns with blue flame, soluble in water; very feeble acid, scarcely reddens litmus, salts decomposed by CO_2; acid and salts exceedingly powerful and rapid poisons. Constitution: $HC{\equiv}N$; with nascent hydrogen yields methylamine: $HCN + 4H = CH_3.NH_2$; forms cyanhydrins with aldehydes and ketones: $>CO + HCN = >C\begin{matrix}OH\\ \diagup\\ \diagdown\\ CN.\end{matrix}$

CYANIDES: Potassium cyanide, KCN: prepared by igniting ferrocyanide ($K_4Fe(CN)_6 = 4KCN + FeC_2 + N_2$) and by passing ammonia over a heated mixture of potassium carbonate and carbon: $K_2CO_3 + C + 2NH_3 = 2KCN + 3H_2O$. Colourless crystals, a reducing agent, but used chiefly in gold metallurgy. Silver cyanide, AgCN, a white precipitate; $KAg(CN)_2$, soluble. Complex cyanides: $K_4Fe(CN)_6$, $K_3Fe(CN)_6$. Organic cyanides or nitriles, R.CN, liquids, yielding carboxylic acids and ammonia by hydrolysis, *e.g.*—

$$CH_3.CN + 2H_2O = CH_3.COOH + NH_3.$$

Methylcyanide = Acetonitrile. Acetic acid.

Isocyanides or carbylamines: $R.N{\equiv}C$.

PRYNNE, WILLIAM (1600–69), Eng. Parliamentarian; barrister of Lincoln's Inn, but never practised; wrote numerous anti-episcopal pamphlets, and in 1632 *Histrio-mastix, or a Scourge for Stage Players*, a violent Puritan invective without any literary quality; punished by Star Chamber with fine, loss of both ears, and perpetual imprisonment; issued another pamphlet from Tower and was further fined, mutilated, and branded on cheeks with 'S. L.' (Seditious Libeller); released by order of House of Commons, 1641; returned to Parliament for Newport, Cornwall; imprisoned for attacks on Cromwell; worked for Restoration; ultimately Keeper of Records in Tower, and issued valuable calendars.

PRYTANEUM, place in Gk. community where sacred fire was kept alight; it was used as town hall on state occasions.

PRYTANIS (Gk. 'chief').—(1) Gk. magistrate; (2) member of Athenian Council of Five Hundred.

PRZEMYSL (49° 47′ N., 22° 47′ E.), fortified town, Galicia, Austria, on San; seat R.C. and Gk. bp's; trade in timber. Pop. (1910) 54,078.

PRZHEVALSK (42° 30′ N., 78° 30′ E.), town, Semiryechensk, Russian Turkestan. Pop. 8000.

PRZHEVALSKI, PRJEVALSKY (*q.v.*).

PSALMANAZAR, GEORGE (*c.* 1680–1763), Fr. impostor; after much travelling came to London, 1703; trans. Church Catechism into 'Formosan,' and wrote a *Hist. and Geographical Description of Formosa*, a work full of absurd imagining; lionised for a time, then, losing popularity, became tutor, clerk, fan-painter, hack journalist; Dr. Johnson admired and believed in him.

PSALMS, BOOK OF, in the Hebrew Bible begins the Hagiographa or Sacred Writings, forming the third part of the Hebrew Scriptures (the others being the Law and the Prophets). In Hebrew it is called *Tehillim*, i.e. 'Songs of praise.' Many Psalms are traditionally ascribed to King David, and others to his chief singers, to Solomon, etc. But the majority are doubt-

less of later date, both as regards language and reference. In the Hebrew the *Psalms* are divided into 5 books, containing respectively Psalms 1–41, 42–72, 73–89, 90–106, 107–150; but scholars consider the real division to be threefold, Books 2 and 3 being taken together, also 4 and 5. The middle group thus formed, 42–89, is distinguished by the use of the term *Elohim*, which seems to be a consistent alteration from the original Jehovah in the text.

The structure of the Psalms in Hebrew is rhythmical, but various attempts to discover metre in it have failed. For in Hebrew there is not such a clearly marked distinction as in English between poetry and prose. Rhythmical prose makes use of parallelism of clauses, and tries to get the number of syllables evenly balanced. The Psalms were used in the services of the second Temple, which was modelled on the first founded by David, who was thus looked up to as the writer of the Psalms. Many, however, are probably post-Exilic, and according to some scholars some contain reference to the Maccabees, and can therefore only be placed about the II. cent. B.C. The question whether the Psalms contain reference to contemporary historical events is one that is still hotly disputed. The LXX version of the Psalms is fairly literal. From it were derived (1) the Old Latin, the basis of the *Psalterium Romanum*; (2) *Psalterium Gallicanum*, which appears in the Vulgate. The *Psalter* has played a prominent part in Christian worship.

Cheyne, *Book of Psalms, Origin of the Psalter*; Kirkpatrick, in *Cambridge Bible*; Driver, *Parallel Psalter, Introduction to Literature of Old Testament*; Briggs, in *International Critical Commentary*; Barnes, in *Cambridge Biblical Essays*, and *Lex in Corde*.

PSALTERIUM, a division of the ruminant stomach; see under PECORA.

PSALTERY, see DULCIMER.

PSAMMETICHUS, see EGYPT (HISTORY).

PSARONIEÆ, see PALÆOBOTANY.

PSEUDOLAMELLIBRANCHIA, an order of Lamellibranchiata (*q.v.*).

PSEUDONYM, a pen-name; well-known p's are Mark Twain (S. L. Clemens), Max O'Rell (Paul Blouet), George Eliot (Marian Evans), Lewis Carroll (Rev. C. L. Dodgson), Max Adeler (Charles Heber Clark), Calchas (J. L. Garvin).

PSEUDONYMITY, see ANONYMITY.

PSEUDOPOD (Gk. *pseudos*, falsehood; *pous, podos*, a foot), an animal with pseudopodia, *i.e.* belonging to the Sarcodina class of the Protozoa. **Pseudopodia** (derivation, see *pseudopod*), blunt, mobile extensions of protoplasm which proceed from the body and play a great part in the life-activities of the simplest Protozoa.

PSEUDOSCORPIONIDÆ, see BOOK SCORPIONS.

PSITTACIFORMES, Parrot tribe (*q.v.*).

PSKOV (57° 51′ N., 28° 26′ E.), government, Russia, between Livonia and Smolensk; surface flat in N., hilly in S.; many lakes and marshes; largely forest-covered; unfertile; fisheries, flax industries, distilleries, tanneries. Pop. (1910) 1,354,800.

PSKOV (57° 51′ N., 28° 26′ E.), town, Pskov government, Russia, on Velikaya; abp.'s see; tanneries. P. was a member of the Hanseatic League; annexed by Moscow in 1510. Pop. (1910) 34,440.

PSOCPTERA, PSOCIDÆ, see BOOK-LICE.

PSOPHIIDÆ, Trumpeters (*q.v.*).

PSORIASIS, skin disease characterised by development of patches of dry, silvery scales on a red base, tips of elbows and lower part of knees being most commonly affected; treatment is, in acute cases, sodium salicylate or antimony wine; in chronic cases, arsenic, with local treatment of alkaline baths, removal of the scales by scrubbing, and application of chrysarobin ointment.

PSOROSPERMIASIS, rare disease caused by animal parasites, psorosperms, found in the liver, kidneys, and ureters.

PSYCHE (classical myth.), royal maid whose beauty aroused Venus's jealousy. Venus sent Cupid to inspire her with love for the meanest of men, but he fell in love with her. He warned her not to inquire who he was; she disobeyed, and Cupid deserted her. They were finally united in Elysium.

PSYCHICAL RESEARCH is a recent development of scientific or (as some would say) of pseudo-scientific thought. It is concerned with all those phenomena—thought-transference (or telepathy), hypnotism, clairvoyance, crystal-gazing, poltergeist, apparitions, etc.—which are not ordinarily explicable and the occurrence of which is often set down to fancy or superstition. The 'Society for P. R.' was founded in 1882, and similar organisations exist in America and elsewhere. Its object was to investigate these phenomena without presuppositions of any kind. It has examined a large mass of evidence and has at any rate done good work in exposing frauds. Telepathy at least seems to have been proved. There are many cases of a vision of a person at the point of death appearing to a friend, and the phenomenon does not seem adequately explained by hallucination. The investigation of other sorts of 'ghosts,' *e.g.* haunted houses, does not seem to have much result. Automatic writing is another psychic phenomena much studied. The receipt of messages by mediums from another world is still open to doubt.

See *Proceedings of S. P. R.*; Myers's *Human Personality and its Survival of Bodily Death*.

PSYCHOLOGY means by derivation the 'theory of soul.' But the term is not now usually so defined, and is indeed rather ambiguous. Problems such as that of the substantiality of soul, its existence before the birth and after the death of the body, and the like, which at one time were referred to the branch of Metaphysics then called *Rational Psychology*, are now generally termed simply speculative, or metaphysical. On the other hand, some popular writers, especially novelists, are apt to use the word 'psychological' more particularly for discussions of or stories about communications between the living and the spirits of the dead, and similar subjects. But most commonly by p. is meant an empirical study, scientific, or at any rate on the way to become scientific, in method, of actual mental activities and states. Objection has been taken to defining it as the science of soul or of mind, and to introducing the words 'mental' or 'psychical' into its definition, because, it is said, the existence of soul or mind is an unverified hypothesis. Again, to call it the 'science of consciousness' or of conscious processes has been considered inadvisable, because that prejudges the question of the existence of unconscious, and yet not merely physiological, factors of conduct. 'The science of behaviour' has been suggested as free from prejudice, but it may be questioned whether this definition is not too comprehensive, unless the word 'behaviour' be artificially restricted in meaning; and probably we cannot in the end avoid introducing 'mind' or 'mental' or some equivalent term into our definition of p., despite the difficulties raised by those terms themselves.

P. treats, we may say, of the behaviour of minds, or of the behaviour of living things so far as that behaviour depends on their exercise of mental activity in any degree. As an empirical study, it deals with mental behaviour as we find it actually occurring in ourselves and believe it actually to occur in others; as a positive study, it does not inquire into the validity of such distinctions as good and bad, true and false, but concerns itself equally with all manner of conduct, considering any act or state, not as having logical or moral value, but simply as an event in time whose conditions and consequences need to be assigned; and, finally, as a scientific study, it tries to start from accurate observation and analysis and to arrive at well-established general principles of mental behaviour.

The whole subject may be divided into departments in a variety of ways. For instance, we may distinguish the investigation of the human from that of the animal

mind; abnormal from normal human behaviour: within the latter, study of childhood or of adolescence from that of adult life; again, the study of individual differences, and the study of the behaviour of masses of men and of the characteristics of peoples (*Social P.* and *Folk-Psychology*). As a rule, when the word p. is used without any qualification, it refers to the study of the normal human being. Again, attention may be given mainly to the analysis, description, and explanation of a particular stage of mental behaviour, or to the development of mental behaviour; in the latter case we speak of *Genetic P.* *Physiological P.* studies the connection between mental and bodily processes, and is usually regarded as a special branch of the subject; but some more justly maintain that it is rather a supplementary method which may be pursued in different branches of the subject.

The psychologist must start, of course, with investigation of the normal adult mind, for until he has learned to reflect on his own activities and states he cannot consider those of other beings with profit. This process of reflection is technically called *Introspection*, a somewhat misleading name. It is fundamental in p., but it needs to be supplemented, first by the reports of others concerning the results of their reflection; secondly, by observation of the conduct of others and inference therefrom to the mental processes which occasioned and are occasioned by that conduct; and, thirdly, by examination of such products of mental activity as tools, works of art, and institutions, from which also we may be able to argue to the character of the activities that produced them. Each of these modes of procedure has its special difficulties. Reflection on our own activities and states is impeded by the transitory nature of its objects and their liability to change as soon as we begin to think about them. Communication of the results of reflection to others is impeded by differences of temperament and character and by ambiguities of language. Inference from the conduct or products of others to their thoughts, motives, purposes, or feelings becomes increasingly dangerous as they are further removed from us in interests and character or in stage of development; and yet in the investigation of the lower animals, where the difference and difficulty are greatest, it is upon such inference alone that we have to rely. In recent years the use of experiment in p. has been much extended, so that some speak of it as a special branch of the subject; but it is rather an application, requiring special knowledge and skill, of any of the above methods, or of them all in combination, under conditions which admit of accurate statement and produce more or less accurately measurable results.

The first aim in the investigation of mental behaviour must be to analyse its complexity in such a way as to make description as accurate and simple as possible. Ordinary language embodies a considerable amount of such analysis, when we speak of perceiving, thinking, feeling, desiring, will, and so on, as so many powers or faculties of mind. But this popular analysis is not very systematic; sometimes it duplicates what is really a single function, sometimes it omits, and sometimes it speaks as of a single function where several are involved. Nevertheless, it does imply that mental behaviour involves the activities of a subject which is aware of and acts upon objects, and it is thus superior to any theories which assume that p. is concerned with 'states of mind' rather than with functions of mind.

Yet the reaction against the unsystematic classification of popular thought led to the prolonged dominance of mechanical theories of this kind. It was supposed that any concrete 'state of mind' may be exhaustively described by the enumeration of a number of mental elements consisting in it, and the general tendency was to find these elements solely in sensations. External stimulation occasions the simple states of mind known as sensations (of colour, sound, movement, etc.); these may be retained and revived as less vivid images; and all other states of mind consist of varied combinations of these images, associated together according to a few ascertainable principles. A characteristic example of this *Associationist p.* was the assertion that our idea of space consists of series of motor sensations. The whole position is mistaken. Sensations in this sense are not states of mind, but qualities of objects as apprehended by mind in perception; and it is absurd to say either that space is, or is apprehended as, our experiences of our own movements. The real fact is that the infant's apprehension of spatial characters is extremely undeveloped, and that its motor activities and experiences are an important and perhaps necessary aid to improvement in this respect. The real problem is to assign exactly the conditions of this improvement in function, not to attempt to reduce one object to a multitude of quite different objects. Consistently carried out, the Associationist theory was bound to represent mental 'states' as wholly passive, the result of more elementary states miraculously combining themselves in manifold ways; actually, however, it almost always admitted by a back door some power of the mind to combine, compare, or discriminate between its sensations, and thus harked back to the notion of faculties which it began by condemning.

In more recent years psychologists have generally recognised that mental behaviour is predominantly purposive, not in the sense, of course, that it always makes to the fulfilment of ends consciously forethought and designed—for that would obviously be false of the behaviour of the lower animals and of small children, and indeed of much adult behaviour also, but in the sense that it does nevertheless make towards ends, the gradual attainment of which gives satisfaction, whilst obstruction and failure occasion annoyance, anger, or some kind of dissatisfied feeling. The recognition of this truth has been a great step in advance. On the other hand, it cannot be said that general agreement has been reached in the solution of the first analytical problem of p., which is usually stated as: What are the ultimate modes of being conscious, or the ultimate functions or faculties of mind? The commonest view is that we must in the first place distinguish three attitudes of the mind towards its objects: it is aware of or apprehends them (*Cognition*), is affected by them (*Feeling* or *Affection*), and strives to bring about some alteration in them, or in their relation to itself (*Conation*). It is usually added that most, if not all, concrete mental behaviour includes these three attitudes at once. On the other hand, some have argued that Feeling and Conation are so closely inbound with one another that they should not be called distinct functions; others, with more plausibility, that cognition is not an activity distinct from conation, but every awareness of objects is the issue of an impulse or volition, or generally of some conative process.

If the usual threefold division be accepted, we have to ask further whether within each of its heads there are irreducible modes of consciousness to be distinguished. Some writers distinguish, for example, under cognition, Perceiving, Imagining, Conceiving, Judging, Reasoning; others distinguish only *Simple Apprehension* or Awareness and *Judgment*. It is pretty clear that apprehending a present sensible object (*Perception*) and apprehending one that is not present (*Imagining* or, better, *Imaging*) are psychologically the same function, though there are physiological differences and usually differences also in the characters of the object apprehended. Some would say the same also of *Conception*, the apprehension of universals. On the other hand, Conception, Judgment, and probably Reasoning also, are inseparable in their development; and it should be added that they involve a power of comparison and discrimination, which specially deserves to be called ultimate, if any mental function deserves that title more than others. As to simple awareness of any kind, in the adult mind thought reacts so constantly on perception and other

modes of apprehension that it is difficult to discover indisputable instances of it. It may be doubted, in view of the present uncertainty, whether the search for irreducible faculties is profitable; it is at least possible that even the most primitive acts of perception involve some rudimentary kind of judgment, though it may express itself only in movements of approach and withdrawal.

In the further analysis of affection it is generally admitted that we have to distinguish feelings of pleasure and unpleasure, and probably there are also several other feelings on the same level as these. It is to such feelings that the term 'states of mind' may most justifiably be applied. The emotions too are to be reckoned here, and also moods. Most writers regard only a few *emotions* as 'primary,' *e.g.* fear and anger, and the rest as derivative or composite, *e.g.* admiration and reproach. But whilst it is true that such emotions as these latter are each akin to more than one 'primary' emotion, and do not arise until the primary emotions have been experienced, they are nevertheless unitary states of mind and not merely the presence of two or more primary emotions at once.

The further analysis of *Conation* is also matter of dispute. From one point of view, we may safely distinguish the two modes of appetite towards an object and aversion from it. From another, some maintain, whilst others with more probability deny, that the act of *volition* is capable of analysis. Here again it is probably more profitable, instead of contesting these points of analysis, which are often in the main verbal, to investigate the growth of mental behaviour from lower to higher stages (*e.g.* from the instructive and purely impulsive stage to that where deliberate volition appears), and to attempt to assign the conditions of this growth.

As soon as the psychological problem is stated in this way, it becomes apparent that we have to consider, not only the mind's powers of perceiving, feeling, willing, etc., at any moment, but in addition its power of benefiting by experience. Past is continually modifying present experience, even though the past be not recalled, and even when it can no longer be recalled. A man says that he sees a tree or hears a motor-car. He could not do this had he never met with them, and yet he need not now recall past occasions on which he did so. It is often said that he 'interprets' what he sees or hears as 'meaning' this or that; but the statement is misleading because it seems to imply, what is false, that he must first contemplate this white surface or that sound, and then by a separate act recognise it as paper or the sound of a motor-car. Another mode of statement is that as the result of growing experience there are gradually formed *mental dispositions* to behave in certain ways. The term is useful; ordinarily applied to affective and conative conditions (A. is well or ill disposed towards X., his disposition is to act in such and such a way), it is easily transferred to cognition also. The problem then becomes that of tracing the growth of special dispositions, and showing how they become differentiated or inter-connected.

Certain dispositions are evidently inherited. Action consequent upon the exercise of dispositions commonly inherited by all normal members of a species is usually called *instinctive*. It must be noted, however, that not only the reaction, but also the interest in and attention to a particular type of object, deserves to be called instinctive; *e.g.* the chicken would not peck at small objects on the ground unless it instinctively noticed them. Moreover, it has lately been argued with much force that a train of instinctive behaviour includes not only this preferential attention to certain objects and the consequent reaction, but also some special affective state; and the 'primary' emotions have been connected in this way each with a special instinctive tendency. There are, however, also certain *inherited tendencies*, of which that to imitate is the most important, which do not seem to involve specific emotions: and in addition we must recognise that individuals have *congenital dispositions* and capacities not common to the whole species. Musical capacity may serve as an instance.

If we survey the development of mental behaviour to the human stage from lower levels, it seems at first sight to have involved the acquisition of totally new powers (*e.g.* of judging, reasoning, willing); and in the small child also capacities seem after a time to appear which were not manifest before. But in observing the child's growth we are never really able to say, 'This is the moment at which a totally new power has first been exercised,' so gradual is the development; and perhaps, as has already been suggested, we ought throughout to think rather of a development of capacities out of more rudimentary forms in which we observers fail to recognise their existence. However that may be, it does not seem that in the history of the human race totally new powers have been developed, though many have been enormously heightened. There may be urged as exceptions certain kinds of artistic creation, of which the musical is the most notable, and the power of telepathic communication, if it exists, but too little is known about either to justify any definite assertion. Apart from the origination of new capacities, mental development presents two main features—increasing breadth and increasing organisation of interest. The growth of intellect is not only acquisition of new information, but also the systematisation of thought in such a way that what has been acquired can be effectively utilised, whether for practical or for theoretical purposes. The growth of feeling is exhibited in the formation of sentiments or complex emotional dispositions towards objects; thus a child learns to love his parents, his home, then perhaps his school, his country, or abstract objects such as truth and honesty, and throughout his growth the sentiment of love is a system which may issue in a variety of emotions—not only in the tender emotion or emotion of love, but in joy if the beloved object is pleased or honoured, in sorrow or anger if it is injured or despised, and so on. Lastly, on the conative side there can be traced a similar and closely connected growth and organisation of desires and purposes.

The main result of the study of *animal behaviour* has been to throw light on the importance of congenital instinctive dispositions as the basis of mental development. These dispositions and their modifications in response to varying circumstances are more easily observed in the lower animals than in human society, where they are almost from the outset altered by imitation and tradition and social influences generally.

The study of *abnormal* and *diseased state of minds* has given p. more problems than it has solved. The interpretation of these 'natural experiments' is usually very difficult, largely owing to the unreliability of patients' statements about themselves, which is specially marked in cases of hysteria. One result of this study has been to emphasise very strongly the influence of emotions and moods on thought and action. This has been brought out, for example, by cases of *alternating personality*, in which patients seem to lead two (or more) alternate lives, with different temperament and character and interests. As a rule, they do not remember their abnormal life in their normal periods, and often they also forget events of their normal in their abnormal conditions, though they either retain, or at any rate very rapidly regain, many dexterities, the power of speech, ability to recognise common things, and the like. It seems fairly well ascertained that in a great number of these cases the change of interest and memory rests on an extreme alteration of mood. How such alterations of mood are themselves produced is more doubtful; changes of organic sensibility are doubtless often an important contributing factor.

Obsessions or *Insistent Ideas* are also abnormalities

which seem frequently to arise from exaggerated emotional conditions, *e.g.* from extreme anxiety. When, as is frequently the case, they are ideas of action, they are interesting examples of impulsive tendencies, not, like instinctive behaviour, prompted mainly by perception, but guided by thought, and yet not voluntary. Thus a person may be impelled by the idea of killing another against whom he has no grudge, though all the time he does not wish to do so, and is tortured by the belief that he is going to commit the crime.

Closely related to certain parts of abnormal psychology is the study of *hypnotic phenomena*. This is a very promising field of research, but at present the interpretation of the facts, and even the exact statement of the facts to be interpreted, are very much disputed.

(1) Introductory survey: M'Dougall, *Psychology, the Study of Behaviour*. (2) General: Angell, *Psychology*; James, *Principles of Psychology*; Mitchell, *Structure and Growth of the Mind*; Stout, *Manual of Psychology* and *Analytic Psychology*. (3) Experimental: Myers, *Introduction to Experimental Psychology* and *Text-Book of Experimental Psychology*. (4) Physiological: M'Dougall, *Primer of Physiological Psychology*. (5) Social: M'Dougall, *Introduction to Social Psychology*. (6) Abnormal: Hart, *Abnormal Psychology*; Moll, *Hypnotism*; Störring, *Mental Pathology in its Relation to Normal Psychology*. (7) Educational: Loveday and Green, *Introduction to Psychology for Teachers*; Sally, *Teacher's Handbook of Psychology*; Welton, *Psychology of Education*. (8) Animal: Groos, *The Play of Animals*; Lloyd Morgan, *Animal Behaviour* and *Habit and Instinct*; Thorndike's *Animal Intelligence*.

PSYCHOPHYSICS, the study of the relations between physical stimuli and sensations, especially in respect of intensity. See WEBER'S LAW.

PTAH, see EGYPT (HISTORY).

PTARMIGAN (*Lagopus mutus*), a member of the Grouse Family, with the interesting habit of changing its brown coat to white in winter, is found on the mountains of Scotland and of Europe generally.

PTERIA, town in ancient Cappadocia; was massively built and strongly fortified. Here Crœsus was said to have been defeated by Cyrus (*Herodotus*, i. 76); ruins at Boghaz-Keui.

PTERIDOPHYTA, VASCULAR CRYPTOGAMS, the most highly developed group of flowerless plants, including all the existing Ferns, Horsetails, and Club-mosses, as well as a large number of extinct forms. They exhibit a characteristic alternation of generations, the sexual, termed the gametophyte or prothallium, bearing male and female organs, the antheridia and archegonia respectively, and the asexual, termed the sporophyte, arising from the fertilised egg, and in its turn producing asexual spores. These reproduce the sexual generation again, thus completing the cycle. The prothallium is always minute and insignificant, and may, as in the ferns, resemble a small thalloid liverwort, or be an underground, tuberous structure, as in Lycopodium. The antheridia are usually globular structures producing numerous motile sperms, and require the presence of water for their further function as fertilising agents. The archegonia are flask-shaped, and contain a single ovum. When mature they exude mucilage apically, this, owing to its chemical properties, attracting the sperms, one of which fuses with the ovum. The fertilised egg then surrounds itself by a delicate wall, and divides up, producing the stem apex, and the first leaf and root of the sporophyte. In addition, an organ termed the 'foot' is developed, which absorbs nutriment from the prothallium until the young structures are capable of self-support.

The mature stem varies considerably in the different groups, and may be aerial, creeping, climbing, or subterranean. On it are borne large numbers of adventitious roots and leaves, both of which are essentially similar in structure to those of flowering plants, and, together with the stem, are traversed by highly differentiated conducting strands or vascular bundles, which exhibit a concentric structure. The spores are borne in special receptacles, the sporangia, which may be developed on the backs of the ordinary vegetative leaves, or on specially modified leaves, termed sporophylls. The spores are usually of one kind, but in certain cases (*e.g.* Selaginella) are differentiated into large megaspores, producing female prothallia, and small microspores, producing male prothallia only.

The Pteridophyta are classified as follows: (1) LYCOPODIALES, including four orders—(*a*) *Lycopodiaceæ*, or *Club-mosses*, homosporous forms, mainly tropical in distribution, with small leaves and a dichotomously branched stem. The prothallia are subterranean. (*b*) *Selaginellaceæ*, heterosporous forms commonly grown in greenhouses. (*c*) *Isataceæ*, or *Quillworts*, heterosporous forms growing in deep lakes. (*d*) *Lepidodendraceæ*, extinct tree-like forms. (2) PSILOTALES, tropical forms intermediate in character between the Lycopodiales; and (3) SPHENOPHYLLALES, an extinct homosporous group, which were in their heyday during the Carboniferous and died out in the Permian. (4) EQUISETALES, including the *Horsetails*, plants with verticellately branched stems, and the *Calamariaceæ*, gigantic tree-like forms with secondary thickening, which flourished in Coal-Measure times. Equisetum bears its sporangia in cones at the apex of special fertile shoots. The spores produce green unisexual prothallia. (5) OPHIOGLOSSALES, forms allied to the ferns proper, and including two British genera, *Ophioglossum* (adder's tongue) and *Botrychium* (moonwort). As a rule only one leaf is produced annually, this showing characteristic division into a sterile and a fertile segment. The prothallia are subterranean. (6) FILICALES: this order includes all the true ferns, and is to-day the dominant group of flowerless plants. The leaves are usually very large in proportion to the size of the plant, and when young are folded in a crozier-like manner. They may bear the sporangia on special fronds, or on the backs of the vegetative leaves. The sporangia are often arranged in little groups, or sori, protected either by specialised outgrowths, as in the male fern, or by the inrolling of the modified leaf margin, as in the bracken. Vegetatively they show immense variety of structure, the filmy ferns of the tropics being extremely minute, whilst the tree-ferns attain a palm-like stature, and may be 70 or 80 feet high. The gametophyte is usually heart-shaped and green, and bears the sexual organs on the lower surface.

PTEROBRANCHIA, an order of HEMICHORDATA or ENTEROPNEUSTA, containing the genera *Cephalodiscus* and *Rhabdopleura*. These are small marine animals associated in colonies and protected by an external gelatinous or chitinous skeleton composed of tubes. *Cephalodiscus* colonies (some 9 inches long) occur in Antarctic and Pacific Oceans, off S. Africa, and in Magellan Straits; *Rhabdopleura* exceedingly small in the North Sea and Atlantic. They possess in common, short bodies, the collar on the anterior of which bears two or more paired, tentacle-bearing arms. There is a proboscis which builds the tubes wherein the animals dwell and is flattened into a disc at the base; there are never more than two gill-slits, and the short food canal is U-shaped, the vent opening near the mouth. In both genera the bodies are borne on long narrow stalks.

PTEROCLIDIDÆ, Sandgrouse (*q.v.*).

PTERODACTYLS, extinct Reptiles (*q.v.*).

PTEROPOD, Gasteropod Mollusc. See GASTEROPODA.

PTEROPODIDÆ, see FLYING FOXES.

PTEROSAURIA, extinct Reptiles (*q.v.*).

PTILORHIS, Rifle-Bird (*q.v.*).

PTOLEMAIS, ancient name for ACRE (*q.v.*).

PTOLEMIES, Macedonian rulers of Egypt (323–30 B.C.).—**Ptolemy I., SOTER**, became satrap of Egypt on division of kingdoms of Alexander the Great, 323; assumed title of king, 306; serious soldier and historian; abdicated, 285.—His s., **Ptolemy II., PHILADELPHUS**, developed resources of Egypt; court was one of most classically magnificent and vicious of history.

Rome claimed Egypt by bequest of Ptolemy X., Alexander II., but agreed, 51, to joint-rule of Ptolemy XII. and his sister Cleopatra, whom, after Egyptian custom, he was to marry; Ptolemy XII. d., 44; Cleopatra and her s. Cæsarion (putative child of Cæsar) perished during Rom. attack, 30; Cleopatra's dau. by Mark Antony left son, Ptolemy, who d. childless, 40 A.D. Egyptian blood, religion, and culture survived throughout this period, though there was heavy foreign infusion.

PTOLEMY, CLAUDIUS PTOLEMÆUS, famous astronomer, geographer, and mathematician, was a native of Egypt and worked at Alexandria, his first extant astronomical observation being in 127 A.D., his last in 151 A.D. His descent, place and date of birth, date of death are uncertain.

As an astronomer he is celebrated as the author of the *Megale Syntaxis*, more commonly known as the *Almagest* (after the title of the Arabic translation to the order of Caliph Al-Mamún, at Bagdad, *c.* 827 A.D.), a summary of his own and his predecessors' work. This is the main authority for the labours of Hipparchus and Eratosthenes. The *Ptolemaic system*, herein set forth, assumes the earth—a sphere, and stationary on its axis—at the centre of the heavens, with the planets, including the sun and the sphere of the fixed stars, revolving round it. To explain the apparent motion of these bodies P., following Apollonius, used a system of eccentrics or epicycles and deferents. The former theory was held till the publication of Copernicus's work; eccentrics were rejected by Kepler (*q.v.*). The *Almagest* contains also Ptolemy's important discovery of the moon's 'evection' and a catalogue of 1022 stars.

His *Geographike* was based on Marinus of Tyre and was only gradually corrected by the discoveries of the XV. and XVI. cent's. For this design his materials were very inadequate, namely, a few astronomical data and mainly travellers' estimates of distances. The following are the most evident errors: the length of the Mediterranean is one-third too great; Europe is too narrow between the Baltic and Black Sea; India is not shown as a peninsula; Ceylon is much too large; Asia is extended too far eastwards and joined to the south of Africa. This last point encouraged Columbus to sail westwards for the east coast of Asia, and spread the belief that Africa could not be circumnavigated. P.'s methods, however, are quite scientific. His mathematical skill is illustrated in the *Almagest*. With Hipparchus he founded and developed Plane and Spherical Trigonometry in a form unsurpassed for some 1400 years.

PTOMAINE, organic base or alkaloid formed by the action of putrefactive bacteria on organic matter; some of them are poisonous, and to them is due the poisonous action of putrefying sausages, tinned meats, etc.

PTYALIN, see DIGESTION.

PUBERTY, the period of life at which persons begin to be capable of begetting or bearing children; in temperate climates, the age of fourteen in males, and twelve in females.

PUBLIC HEALTH, LAW OF, requires that the State, either national or local authorities, shall prevent the pollution of rivers; define the proper construction of buildings—with a due regard to sewage and scavenging; ensure an adequate water supply; insist upon cleanliness in dairies, and bakehouses where food is prepared; and limit as far as possible the area of infectious disease. The Local Government Board is the central authority for the carrying out of all laws relating to Public Health in the U.K.

PUBLIC SCHOOLS, see EDUCATION.

PUBLIC-HOUSES, see LICENSING LAWS, INN.

PUBLICANI, Rom. tax-gatherers in the provinces. As the monopoly was frequently granted to the highest bidder, the publicani practised cruel extortion to secure personal profit. Hence the hatred they inspired among the Jews in New Testament times and the opprobrium of 'publicans and sinners.'

PUBLISHING, producing books or periodicals and issuing them for the market. Originally authors were to a great extent publishers and booksellers as well. Next change saw publishing booksellers contracting with authors and printers. To-day the division of labour usually is author, publisher (doing his own printing or contracting out), and bookseller. Periodicals of all kinds are usually written, printed, and published by the same firm, and put on market by a distributing agency. Bookselling has divided itself into wholesale and retail, of which former mainly deal with publishers. The beginning of last cent. saw this separation of production and distribution completed, and subdivision has since gone on the lines of specialism. Few publishers to-day publish indiscriminately, but have their own sphere or spheres of work; they tend to employ specialists as readers. In 1896 a Publishers' Association was formed, and in common with Booksellers' Association has put trade interest on a sound footing. Their last big fight was with Times Book Club (1905-9). Latest tendency is issue of cheap editions, both fiction and educative, to cope with large increase in reading public. See BOOK.

PUBNA, see PABNA.

PUCCINI, GIACOMO (1858–), Ital. composer; best known operas are *La Bohemie* (1896), *Tosca* (1900), *Madame Butterfly* (1904).

PUCK, ROBIN GOODFELLOW, fairy who plays practical jokes; figures in Shakespeare's *A Midsummer Night's Dream*, Jonson's *Masque of Love Restored*, Drayton's *Nymphidia*, Burton's *Anatomy of Melancholy*, Kipling's *Puck of Pook's Hill*.

PUDDING-STONE, CONGLOMERATE (*q.v.*).

PUDSEY (53° 47′ N., 1° 39′ W.), town, Yorkshire, England; woollen manufactures. Pop. (1911) 14,027.

PUDUKOTTAI (10° 23′ N., 78° 52′ E.), native state, Madras, India. Pop. 385,000. Capital, **Pudukottai.** Pop. 21,000.

PUEBLA.—(1) (18° 30′ N., 98° W.) state, Mexico, on southern part of Anahuac plateau; contains Popocatepetl. Pop. (1910) 1,101,600. (2) (18° 59′ N., 98° 2′ W.) capital of above; bp.'s see; cathedral; coll.; cottons and woollens. Pop. (1910) 101,214.

PUEBLO (38° 18′ N., 104° 40′ W.), city, on Arkansas, Colorado, U.S.A.; blast furnaces; iron and steel works; important industrial and commercial centre. Pop. (1910) 44,395.

PUENTE GENIL (37° 25′ N., 4° 45′ W.), town, on Genil, Cordova, Spain; olive oil. Pop. 13,200.

PUENTEAREAS (42° 10′ N., 8° 32′ W.), town, Pontevedra, Spain. Pop. 13,700.

PUERPERAL FEVER, term formerly applied to an acute disease affecting women at the lying-in period, now known to be a septicæmia due to septic infection by various organisms, and prevented, first by Semmelweiss (*q.v.*), by antiseptic methods; it now rarely occurs in midwifery practice. See MIDWIFERY, OBSTETRICS.

PUERPERIUM, see OBSTETRICS.

PUERTO CABELLO (10° 23′ N., 67° 52′ W.), seaport, Carabobo, Venezuela, on Caribbean Sea; exports coffee. Pop. 10,300.

PUERTO CORTES (15° 49′ N., 88° W.), seaport, Honduras, on Gulf of Honduras. Pop. 3000.

PUERTO DE SANTA MARIA (36° 37′ N., 6° 20′ W.), seaport, Cadiz, Spain, on Bay of Cadiz; exports sherry. Pop. 20,900.

PUERTO PRINCIPE, officially CAMAGÜEY (21° 23′ N., 77° 56′ W.), inland city, Cuba; chief produce —cigars, woods, sugar. Pop. 30,000.

PUERTO REAL (36° 30′ N., 6° 10′ W.), seaport, Cadiz, Spain, on Bay of Cadiz; ancient *Portus Gaditanus*; salt mines. Pop. 10,700.

PUERTO RICO, see PORTO RICO.

PUFENDORF, SAMUEL (1632–94), Ger. historian of institutions; followed Hobbes and Descartes; pub. *Elementa jurisprudentiæ universalis*, 1661; received as reward chair of Law of Nature and Nations at

Heidelberg; treatise *De statu imperii germanici*, 1667, got him into trouble; retired to Sweden and wrote chief work, *De jure naturæ et gentium*, 1672; historiographer of Elector of Brandenburg, 1686–94.

PUFF-BALL, see FUNGI.

PUFF-BIRDS (*Bucconidæ*), a family of about 50 species of Picarian birds found in Central and S. American forests; aboreal and insectivorous.

PUFFERS, see GLOBE-FISHES.

PUFFIN, see under GUILLEMOT AND AUK FAMILY.

PUFFINIDÆ, SHEARWATER FAMILY (*q.v.*).

PUGACHEV, EMEL'YAN IVANOVITCH (*c.* 1741–75), Russ. pretender; claimed to be Peter III., 1773; supported by enemies of Catherine II.; towns sacked and imperial army defeated; captured after bloody battle, 1774; executed.

PUG-DOGS, see DOG FAMILY.

PUG-MILL, see BRICKS.

PUGILISM, see BOXING.

PUGIN, AUGUSTUS WELBY (1812–52), Eng. architect, of Fr. parentage; known first for his decorations and sculpture at Houses of Parliament. Becoming a convert to Roman Catholicism, he devoted himself mainly to designing churches and other buildings for that communion.

PUKET (7° 55′ N., 98° 25′ E.), town, island of Junk Ceylon (Salang), belonging to Siam; tin mines. Pop. 33,000.

PULEX, see FLEAS.

PULICAT (13° 25′ N., 80° 21′ E.), town, Chingleput, Madras, India. Pop. 5700.

PULITZER, JOSEPH (1847–1911), Amer. journalist and newspaper proprietor.

PULKOVO, PULKOWA (59° 46′ N., 30° 20′ E.), village, St. Petersburg, Russia; noted observatory.

PULLEY, a wheel rotating on an axle. A groove is cut in the circumference and a rope passed over it. The wheel is called the sheave and the rope the tackle. A p. may be fixed or movable. Fixed p's are those in which the axle is fixed to some stationary spot. Movable p's are those in which the extremes of the axle are supported on a block of wood.

P's may be used either singly or combined. When the former they give no mechanical advantage, merely changing the direction of the force. When combined, however, they give a greater purchase and leverage, and may be used for such operations as raising weights, small boats, etc. There are many methods of combining p's, and theoretically the more p's used the greater the mechanical advantage, but in practice it is found that the friction is so great when a large number is used (the rope can never have perfect flexibility) as to counteract largely any advantage of more number.

P's are used also in engineering shops and factories. These kinds have a flat circumference over which a broad leather belt passes and transmits power from the engine to the loom or to other inactive machinery. These p. are generally made of metal, but the smaller varieties are of wood. See MECHANICS.

PULLMAN, formerly village, Illinois, U.S.A.; now a part of city of Chicago; car-works.

PULMONATA, an order of Gasteropod Mollusc. See GASTEROPODA.

PULQUE, a drink of Central America and Mexico; fermented from agaves and cacti.

PULSATILLA, PASQUE FLOWER (*Anemone pulsatilla*), plant of order Ranunculaceæ; mauve-coloured; poisonous.

PULSE, the throbbing of the arteries due to the additional quantity of blood forced through them by the contraction of the ventricles of the heart.

PULTENEY, WILLIAM, see BATH, WILLIAM PULTENEY, 1ST EARL OF.

PULTOWA, POLTAVA (*q.v.*).

PULTUSK (52° 43′ N., 21° 12′ E.), town, Russ. Poland, on Narev; woollens. Pop. 17,500.

PUMA, see under CAT FAMILY.

PUMICE, lava composed of silica and alumina, ejected by volcanoes; colours: grey, white, brown, or black; varieties: glassy, common, and porphyritic; hard, rough, and porous—floats in water; used for polishing wood, ivory, marble, etc., and for toilet.

PUMP, machine for raising fluids; the commonest, the suction p., consists of a piston working air-tight inside a barrel, and moved up and down by a handle attached by a rod. The piston has a valve opening upwards, and a similar valve is fitted at the bottom of the barrel, covering the mouth of a tube sunk into the water. As the piston is raised the air below is rarefied, and the atmospheric pressure on the surface of the water forces it to rise in the tube until equilibrium is regained. After some strokes the water gets above the piston, and being raised with it is discharged by a spout. Other p's are the force p., a more effective form of suction p.; the centrifugal p., in which water is driven by rotatory motion along the vanes of a wheel, from centre to circumference, thus gaining sufficient velocity to force it through the discharge pipe; and the air-p., which is used to exhaust the air in, or pump air into, a vessel.

See books by Davey, Innes, Björling.

PUMPKIN, popular name for GOURD (*q.v.*).

PUN, play on words alike in sound, but different in meaning, *e.g.* Hood's 'They went and told the sexton, and the sexton tolled the bell.' The p. is eschewed in modern wit. Noted punsters were Lamb, Sidney Smith, Hood, Hook, Wilberforce, Oliver Wendell Holmes.

PUNCH, or the *London Charivari*, is the most famous Eng. journal of humour. The first number appeared on July 17, 1841, Henry Mayhew and Mark Lemon being joint-editors. Among famous contributors have been Douglas Jerrold, Tom Hood, Albert Smith, Thackeray, and illustrators such as Browne, Leech, Tenniel, Du Maurier, Keene, and Furniss. It has been said that the height of a politician's ambition is to have a cartoon for himself in *Punch*. The humour is always kindly, clean, and essentially English.

PUNCTUATION, the art of dividing a sentence by conventional signs. The 'stops' are: full stop (.), colon (:), semicolon (;), comma (,). Other signs are: mark of interrogation (?); mark of exclamation (!), wrongly used when intended to point out a joke; brackets ([]), and dashes (— . . . —), used in parenthesis.

Rules for p. are useless; the sentences of good writers should be studied. See *The King's English* (1906).

PUNCTURE, see TYRE.

PUNDIT, a Brahman teacher; p's have done much in exploration for Ind. Government; in Kashmir a p. is a native official.

PUNIC WARS, wars between Romans and Carthaginians [*i.e.* descendants of Phœnicians (*Pœni*, adj. *punicus*)] in III. and II. cent's B.C.

First Punic War (264–241 B.C.) was occasioned by Carthaginian interference in Sicily. Fruitless fighting took place in Sicily, 263–257; Rom. naval victory at *Cape Ecnomus* and invasion of Africa, 256. Carthage was beaten, but reorganised forces, defeated Regulus near *Tunis*, 255, and drove Romans from Africa. War in Sicily, 254–242, wearied both parties; HAMILCAR BARCA commanded Carthaginians from 247. After destruction of Carthaginian fleet at *Ægates*, 241, Sicily surrendered to Rome.

Second Punic War (218–201).—Hamilcar Barca found outlet for his energy in Span. conquest, aided by his young son, the warrior HANNIBAL, and son-in-law, HASDRUBAL, who founded Carthagena. Hasdrubal made treaty with Rome as to boundary of his Span. dominion; Rome declared war on capture of *Saguntum* by Hannibal, 219. While Rom. armies set out for Spain and Africa, Hannibal marched over Alps into Italy; Carthaginan victories culminated at *Lake Trasimene*, 217, and *Cannæ*, 216. Fabian tactics of Quintus Fabius Maximus at last brought Romans victory of *Metaurus*, 207; Carthaginians departed, 203. The Scipios had conquered Spain, 206, and P. Scipio inflicted final defeat in Africa at *Zama*, 202.

Third Punic War (149–146).—Destruction of Carth-

age preached by the elder Cato and carried out by Scipio Æmilianus. Mommsen, *History of Rome.*

PUNISHMENT, the infliction of a penalty for the breach of a command or law. The three chief theories of the purpose of punishment by the State are that it is (1) retaliatory, (2) deterrent, (3) reformatory. See PRISON.

PUNJAB, PANJAB (*c.* 28° to 34° N., 70° to 78° E.), province of N.W. India; comprises 96,652 sq. miles of Brit. territory and 36,532 sq. miles of native states, all of which are, however, more or less under control of government of India; the Chief-Commissionership of Delhi (*q.v.*) enclosed in the Punjab is an imperial enclave. Surface slopes from N., which is occupied by foot-hills of Himalayas, and from the Salt Range Mountains on the S. (5000 ft.) to the great plain of the Indus and its five great tributaries, from which it receives its name, P. being Hindu for 'five rivers'; these are the Sutlej, Beas, Ravi, Chenab, and Jhelum; climate exceptionally hot and, except in the Himalayas, very dry, cultivation being rendered possible largely by means of irrigation, for which the rivers provide ample means.

P. was invaded by Alexander of Macedon in 327 B.C., by Mahmud of Ghazni in XI. cent., and by Timur towards close of XIV. cent.; was an autonomous principality from *c.* 1791 till death of Runjeet Singh in 1839, and after the war between Sikhs and British was annexed to Britain in 1849. In 1901 the region W. of Indus was separated from P. and became N.W. Frontier Province.

P. is administered by lieut.-gov., assisted by two commissioners and a legislative council. Chief towns are Lahore, Multan, Amritsar, Peshawar. Delhi (*q.v.*) is no longer under Punjab government. P. produces and exports grain, indigo, salt, spices, tea, tobacco; manufactures cottons, iron goods, leather, silk, shawls, etc. Inhabitants belong chiefly to Muhammadan, Hindu, and Sikh religions. Pop. (1911) 19,974,956.

PUNNA, see PANNA.

PUNSHON, WILLIAM MORLEY (1824–81), Eng. Wesleyan minister.

PUNTA ARENAS (9° 59′ N., 84° 46′ W.), seaport, capital of Punta Arenas, Costa Rica, on Gulf of Nicoya; exports coffee. Pop. 3700.

PUPPET, see MARIONETTES.

PUPPIS, see ARGO.

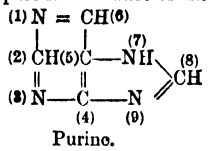
PURASATI, see PHILISTINES.

PURBECKIAN, a group of rocks; members of Jurassic system; well seen at Purbeck, Dorset—hence name; composed of argillaceous and calcareous shales, limestones, and marbles.

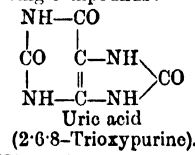
PURCELL, HENRY (1658–95), Eng. composer; b. Westminster; studied with Blow and others; app. organist of Westminster Abbey, 1680; of Chapel-Royal, 1682. Combining great technical skill with deep emotional expression and genuine inspiration, P. ranks as England's greatest composer; *Te Deum* and *Jubilate*, and *King Arthur*, best works; *Dido and Æneas* (opera); 12 sonatas for 2 violins and bass; besides anthems, songs, cantatas, etc.

PURCHASE SYSTEM, see OFFICERS.

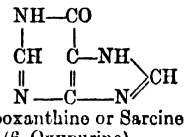
PURGATORY, in Catholic theology, the place where the souls of such as are not pure enough to go straight to heaven are purified. Belief in it is connected with the practice of Indulgences; it is mostly denied by Protestants.



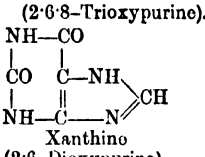
PURGSTALL, see HAMMER-PURGSTALL.



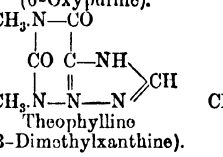
PURI, JAGANNATH (19° 48′ N., 85° 31′ E.), town and district, Orissa Division, Bihar and Orissa, India; contains famous temple of Jagannath. Pop. *c.* 40,000 (fluctuating); district, 1,120,000.



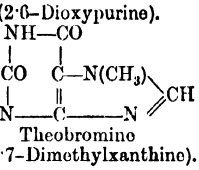
PURIFICATION, practice found in most religions of cleansing by ritual acts. Many different kinds could be enumerated. The idea attains to highest form in the Christian rite of baptism—*cf.* anointing, sacrifice, mutilation.



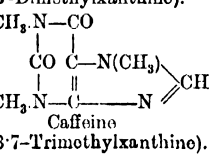
PURIM, feast of the Jews on 14th and 15th of the month Adar, traditionally observed in commemoration of their delivery from Haman, during the reign of King Artaxerxes, the account of which is contained in the *Book of Esther*. Its real origin is obscure, but it was probably adopted by the Jews during the captivity from the Persians, who themselves borrowed and modified an ancient Babylonian festival. It is connected by Dr. Frazer with the festival of the dying god in Western Asia.



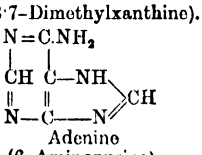
PURINE, $C_5H_4N_4$, name given by E. Fischer to the parent substance of the following compounds:—



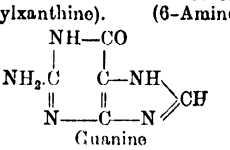
Purine.



Uric acid (2·6·8–Trioxypurine).

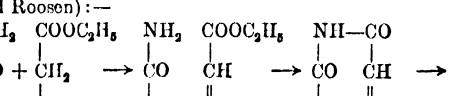


Hypoxanthine or Sarcine (6-Oxypurine).

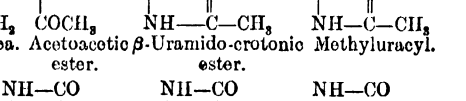


Xanthine (2·6–Dioxypurine).

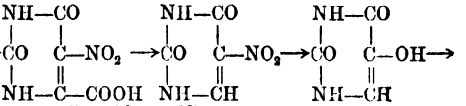
Theophylline (1·3-Dimethylxanthine).



Theobromine (3·7-Dimethylxanthine).

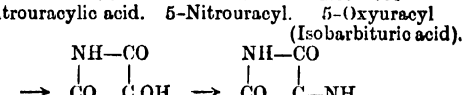


Caffeine (1·3·7-Trimethylxanthine).

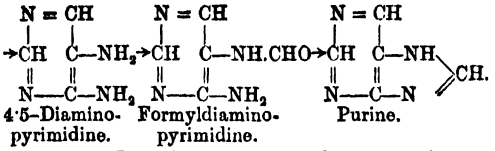


Adenine (6-Aminopurine).

Guanine (2-Amino-6-Oxypurine).



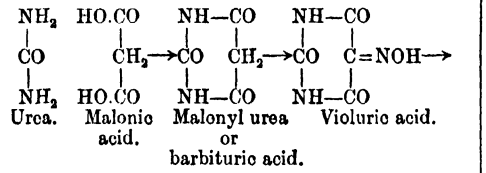
Purine has been synthesised from 5-nitrouracyl, obtained as an intermediate product in the synthesis of uric acid from acetoacetic ester and urea (Behrend and Roosen):—



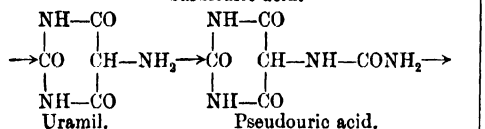
Urea. Acetoacetic ester. β-Uramido-crotonic ester. Methyluracyl.

Nitrouracylic acid. 5-Nitrouracyl. 5-Oxyuracyl (Isobarbituric acid).

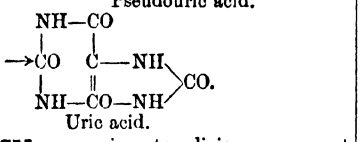
Isodialuric acid. Urio acid.



SYNTHESIS OF PURINE.



5-Nitrouracyl. 2·4-Dichloro-5-nitropyrimidine. 2-Chloro-4-amino-5-nitropyrimidine.



Purine, M.P. 217° C., is stable, and neutral to litmus, but is both basic and acidic.

The work of E. Fischer upon the purin derivatives is noteworthy, *e.g.* the synthesis of uric acid from malonic acid and urea:—

PURITANISM, name given to religious movement of XVI. and succeeding cent's, averse to Catholicism and ritual.

PURLEY, see TOOKE, HORNE.

PURNEA (25° 46′ N., 87° 30′ E.), district, Bhagalpur Division, Bihar and Orissa, India. Pop. 1,875,000. Capital, PURNEA. Pop. 14,300.

PURPLE EMPEROR, see LEPIDOPTERA.

PURPLE MEDICK, see LUCERNE.

PURPURA, a condition in which there are purple spots on the surface of the body due to extravasations of blood into the skin, accompanied sometimes by similar extravasations into mucous membranes and internal organs. It is not a disease, but a symptom of pathological change, due to one or other of several causes: (1) constitutional changes, *e.g.* heart disease, scurvy, Bright's disease, severe debility; (2) certain fevers, especially typhus and cerebro-spinal; (3) certain drugs and poisons, *e.g.* iodides, copaiba, quinine, snake venom; (4) nervous conditions, *e.g.* locomotor ataxia, myelitis, cerebro-spinal meningitis; (5) associated with arthritis; (6) *p. simplex,* a mild form for which no cause can be given, and *p. hæmorrhagica,* a more severe form of the same type.

The treatment is to look after general hygiene; iron and arsenic are valuable, and ergot and turpentine for severe bleeding. Calcium chloride is advised, to increase the coagulability of the blood.

PURPURA, a Mollusc; see under GASTEROPODA.

PURULIA (23° 19′ N., 86° 24′ E.), town, Chota Nagpur division, Bihar and Orissa, India. Pop. 18,000.

PURVEYANCE, Eng. legal term for royal right (abolished in 1664) to impress goods or labour at valuation fixed by appraisers.

PUSA (26° 10′ N., 85° 43′ E.), village, Darbhanga district, Tirhut Division, Bihar and Orissa, India; Government agricultural station. Pop. 5000.

PUSEY, EDWARD BOUVERIE (1800–82), Anglican divine; ed. Oxford; Regius prof. of Hebrew, 1829; leader of High Anglican movement; aimed at restoring Catholicism in Anglican Church, though not a ritualist. A learned man, he was hardly a great thinker, but an able controversialist, and learned in ecclesiastical antiquity; wrote *Doctrine of the Real Presence,* and *What is of Faith as to Everlasting Punishment. Life,* by Liddon (1899).

PUSHKAR (26° 30′ N., 74° 36′ E.), town, Rajputana, India; place of pilgrimage. Pop. 4000.

PUSHKIN, ALEXANDER (1799–1837), famous Russ. poet and novelist; b. Moscow; entered lyceum, Tsarskoe Selo, near St. Petersburg, 1811; received post in Ministry of Foreign Affairs, 1817; killed in duel in St. Petersburg. P. wrote excellent lyrics; greatly influenced by Byron; *Eugene Onegin, Poltava* (narrative poems); *The Captain's Daughter, History of the Revolt of Pugachev* (prose works); *Boris Godunov* (tragedy); *The Prisoner of the Caucasus.*

PUSHTU, PUKHTU, language of Pathans, Afghanistan; derived from Zend and mixed Arabic, Persian, Hindustani.

PUTEAUX (48° 50′ N., 2° 18′ E.), town, Seine, France, on Seine; iron manufactures. Pop. 29,000.

PUTEOLI (c. 40° 48′ N., 14° 8′ E.), ancient town, on site of modern POZZUOLI, Italy; colonised by Romans, 194 B.C.; became important trading centre and port of Rome; in later times it was sacked at different dates by Visigoths, Vandals, Ostrogoths, Saracens, and Turks; contained temple dedicated to Augustus, remains of which form part of modern cathedral; there are also remains of the columned temple of Serapis and of fortifications, baths, amphitheatre, and private houses; has medicinal springs, which were known in Rom. times. Modern town has arsenal. Pop. 24,000.

PUTNAM (41° 55′ N., 71° 55′ W.), city, Connecticut, U.S.A., on Quinebaug; cotton and woollen goods. Pop. (1910) 6637.

PUTNAM, ISRAEL (1718–90), Amer. general; famous for adventures with Indians in early years; fought against England in War of Independence; sought to entrench Bunker's Hill, and after defeat occupied Prospect Hill, 1775; distinguished under Washington.

PUTNAM, RUFUS (1738–1824), Amer. general and settler; rose during War of Independence; co-founder of Ohio Company, 1786, and established settlement at Marietta, Ohio, 1788.

PUTNEY (51° 28′ N., 0° 13′ W.), suburb of London; part of Wandsworth borough; P. Bridge is starting-point of Oxford and Cambridge boat race.

PUTORIUS, Weasel (*q.v.*).

PUTTENHAM, GEORGE (d. 1590), reputed author of *Arte of English Poesie.* The treatise is divided into three parts—the first dealing with the history of poetry, the second with rules of prosody, and the third with style.

PUTTING THE WEIGHT, sport; 16-lb. iron ball thrown from shoulder with one hand; competitor stands in 7-foot square or throws from mark; at the Olympic Games, 1912, throw of 50 ft. 4 in. was registered.

PUTTKAMMER, ROBERT VON (1828–1900), Pruss. statesman; Bismarck's right hand in conservatism and bureaucracy; suggested order of 1882, directing state officials to support government; forced to retire, 1888–89.

PUVIS DE CHAVANNES, PIERRE CÉCILE (1824–98), Fr. painter, noted for mural decorations, especially in the Sorbonne and Pantheon, Paris.

PUY, LE, see LE PUY.

PUY-DE-DÔME (45° 45′ N., 3° 10′ E.), central department, France; area, 3090 sq. miles; surface generally mountainous, reaching extreme height of 6186 ft. in Puy-de-Sancy; watered by Allier, Cher, Dordogne; chief town, Clermont-Ferrand. Produces wine; has large deposits of coal; silver lead mined; many mineral springs. Pop. (1911) 525,916.

PWLLHELI (52° 53′ N., 4° 26′ W.), seaport, Carnarvonshire, Wales; fisheries. Pop. (1911) 3791.

PYÆMIA, see SEPSIS.

PYAPUN (16° 16′ N., 95° 40′ E.), town (and district), Lower Burma, on Pyapun. Pop., town, 6000; district, 230,000.

PYAT, AIMÉ-FELIX (1810–89), Fr. publicist, dramatist, and politician; took prominent part in July

Revolution and in Fr. literary life of time of George Sand; opposed romanticism as conservative movement.

PYATIGORSK (44° 5′ N., 42° 10′ E.), town, watering-place, Terek Territory, Russian Caucasia; sulphur springs. Pop. 21,000.

PYCNOGONIDA (Gk. *puknos*, thick; *gonu*, the knee), SEA-SPIDERS, PANTOPODA, PODOSTOMATA; spider-like marine Arthropods with (except in the case of an Antarctic species) four pairs of long legs into which the food-canal runs. They clamber upon seaweeds and zoophytes near the shore, but some large forms occur at great depths in the sea. See ARACHNIDA.

PYGMALION (classical myth.) made an ivory statue of a girl. In answer to his prayer, Aphrodite breathed life into the statue and P. married the maid. W. S. Gilbert called her GALATEA in his comedy without classical authority.

PYGMY, term used for human races of small stature, *i.e.* about 4 or 4½ feet. They are found in various parts of Africa and in the Malay Archipelago. The former are sometimes called *Negrilloes*, the latter *Negritoes*. According to some ethnologists they are the remains of a primitive race whence on the one side the African negroes, on the other the Malay races are descended. Though this theory is unproven, it has much to recommend it. P's vary in colour, generally dark brown. They are fairly intelligent and are of a refined disposition. They shoot with arrows, but have little agriculture, living mostly in the forest. They practise polygamy, but are devoted in family life. P. have several times been brought over to England and exhibited.

PYLE, HOWARD (1853–1911), noted Amer. artist; famous as illustrator and decorative painter.

PYLOS, modern NAVARINO (36° 54′ N., 21° 43′ E.), ancient town, Messenia; home of Neleus and Nestor; fortified by Athenians under Demosthenes, 425 B.C.

PYM, JOHN (1584–1643), Eng. statesman; agitated for execution of penal laws against Catholics, 1621–25; pressed for Act for redress of grievances, supported Petition of Right, impeachment of Mainwaring for royalist speech, and joined attack on Buckingham, 1628; led opposition in Short Parliament, 1640; drew up with St. John petition for new Parliament to be summoned; member of committee to enquire on state of kingdom, Nov. 10; carried up impeachment of Strafford to Lords, Nov. 11, 1640; moved impeachment of Laud. P. enunciated attitude towards Crown in statement 'that to endeavour the subversion of the laws of this kingdom was treason of the highest nature'; on these lines conducted impeachment of Strafford, 1641; supported Root and Branch Bill, member of committee of defence, unmasked army plots, helped to prepare Grand Remonstrance, and secured exclusion of bp's from Lords, 1641. P. was impeached, Jan. 3, 1642, with other 5 members; king's attempt to carry out arrest failed. P. was a member of committee of public safety which organised the revolution; effected alliance with Scotland; a Puritan, but noted for good temper and reasonableness. His constructive ability secured success to the revolution.—Wade, *John Pym.*

PYRAMIDS, structures of stone or brickwork, standing on a square base and tapering upwards to an apex. Commonly erected in ancient times to the memory of some dead ruler. The Egyptians were particularly noted as pyramid-builders, and about forty p's, erected between 4000 B.C. and 2000 B.C., still stand in Egypt. In most cases they are built over a chamber containing the sarcophagus of a king. Limestone was the chief material used, but huge blocks of granite formed the outer casing. In every instance the four points at the base were so placed as to face the four points of the compass. An intricate passage was left during the raising of each pyramid, leading to the central chamber. The best-known group of pyramids is that of Gizeh, a few miles north of Cairo. There are eleven in this group—that of Cheops, which is 450 ft. in height, and contains over 80,000,000 cubic ft. of masonry, being the largest and most imposing in the country. The pyramids suffered considerably from the Arab spoliations in VII. cent. A.D.

See books by Perrin, Day, Proctor, Flinders-Petrie.

PYRAMUS AND THISBE (classical myth.), lovers who met clandestinely. One night T., arriving first, saw a lioness and fled, dropping her cloak; P. arrived to find it blood-stained, and thinking T. dead, slew himself. T. returning saw his corpse, and in despair killed herself.

PYRAZINE ($C_4H_4N_2$), solid; M.P. 55° C.; smelling like heliotrope. P's—

$$HC\cdot N\cdot CH$$
$$HC\cdot N\cdot CH$$

are feeble bases, with neutral reaction, resembling the pyridines—

$$HC:CH\cdot CH$$
$$HC:N\cdot CH$$

PYRAZOLE ($C_3H_4N_2$), colourless needles; M.P. 70° C.; weak base, forming unstable salts. Constitution: CH—CH ‖ ‖ N CH; gives pyrazole silver, $C_3H_3AgN_2$, with ammoniacal silver nitrate. Pyrazoline, CH—CH_2 ‖ | N CH_2 NH, and pyrazolone, CH—CH_2 ‖ | N CO NH, are related.

Dimethylphenylpyrazolone, CH_3—C = CH | | CH_3—N CO is *antipyrine*. N—C_6H_5

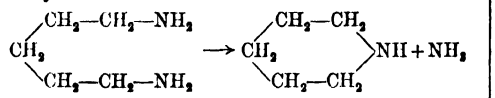
PYRENEES (42° 45′ N., 0°), great mountain chain stretching from S.E. corner of Bay of Biscay eastward to Mediterranean along borders of France and Spain, with total length of c. 280 miles. Western part has height of 3000–4000 ft.; in centre, highest points range from 9500 to 11,168 ft., and include Monte Aneto (11,168 ft.) and Mont Perdu (10,994 ft.); eastern part has elevation of 9500 to 2000 ft. at extreme eastern end. The P. are an intensely folded range of comparatively recent elevation, and are poor in minerals; the crystalline core comes to surface in Monte Aneto, while Mont Perdu is of cretaceous formation. There are many passes and tracks, while railways pass along coast at either end.

Belloc, *The Pyrenees.*

PYRÉNÉES-ORIENTALES (42° 35′ N., 2° 30′ E.), S.W. department, France; area, 1598 sq. miles; extends from Mediterranean inland along N. side of Pyrenees; watered by Agly, Tet; chief town, Perpignan; has large deposits of iron ore; produces vines, mulberries, chestnuts, olives, timber; manufactures wines. Pop. (1911) 212,986.

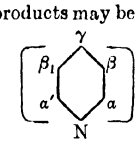
PYRETHRUM, genus of plants, order Compositæ; best-known species is Feverfew (*q.v.*).

PYRGI, ancient town, Etruria, Italy.



PYRGOS (37° 40′ N., 21° 26′ E.), town, Achæa and Elis, Greece. Pop. 13,700.

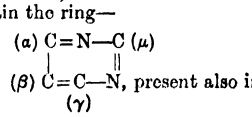
PYRIDINE (C_5H_5N), formed by the destructive distillation of coal tar and bone oil, is a colourless liquid with a pungent odour; B.P. 115° C.; soluble in water, alkaline in reaction; a tertiary base, forming salts, *e.g.* C_5H_5N, HCl, $(C_5H_5N)_2$, H_2PtCl_6, and giving with methyl iodide: C_5H_5N, CH_3I. P. is constituent of some alkaloids, or rather it is truer to say that the alkaloids are derivatives of the *p. bases*, which include p., quinoline, the isomeric, and isoquinoline; these bear the same relation to one another as benzene to naphthalene; they are among the most complex of



organic compounds, and their artificial production marks the highest achievement in organic chemistry. P. is very stable, but reduced by alcohol and sodium to hexahydropyridine or piperidine, $C_5H_{11}N$. P. is used to relieve asthma, as an antiseptic and a germicide, and to denaturise alcohol. In constitution, it may be regarded as a benzene with N replacing one CH; thus—

$$HC:CH\cdot CH$$
$$HC:N\cdot CH$$

established by the synthesis of piperidine from pentamethylene diamine—



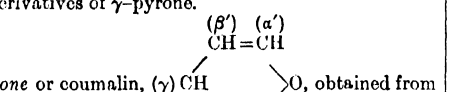
Monosubstituted products may be α, β, γ—

and disubstitution products—

$$\alpha\beta,\ \alpha\gamma,\ \alpha\beta_1,\ \alpha\alpha',\ \beta\beta_1,\ \beta\gamma.$$

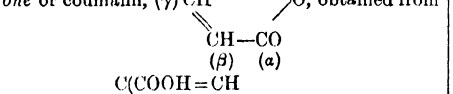
PYRIMIDINE ($C_4H_4N_2$), base with narcotic smell; M.P. 21° C.; soluble in water. P's, or metadiazines, contain the ring—

PYRITES.—Iron pyrites, FeS_2, is a yellow mineral occurring crystallised in the cubic system in quartz veins, slate, coal, etc.; probably formed by reduction of ferrous sulphate by organic matter. Often contains copper (copper pyrites), cobalt, nickel, arsenic, and gold. Found chiefly in Spain, France, and the United States, and used for sulphuric acid manufacture, being roasted in special burners, thus—



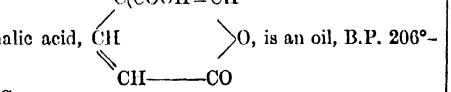
$$4FeS_2+11O_2=2Fe_2O_3+8SO_2.$$

PYRITZ (53° 10′ N., 14° 53′ E.), town, Pomerania, Prussia. Pop. (1910) 8676.

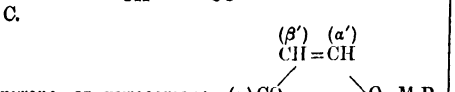


PYROMANCY, divination (*q.v.*) by fire.

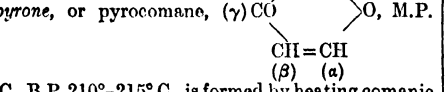
PYRMONT, see WALDECK-PYRMONT.



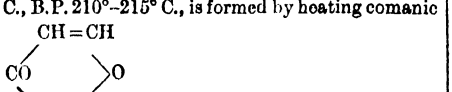
PYRONES [$C_5H_4O_2$ (α and γ)], coumarin, the odoriferous principle of tonka bean, woodruff, and 'new-mown hay,' is α-benzopyrone. Certain yellow vegetable dyes are derivatives of γ-pyrone.



α-pyrone or coumalin,

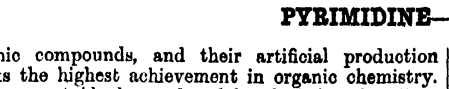


obtained from

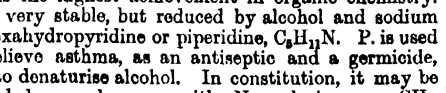


coumalic acid,

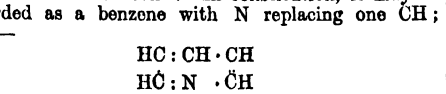
is an oil, B.P. 206°–209° C.



γ-pyrone, or pyrocomane,



M.P. 32·5° C., B.P. 210°–215° C., is formed by heating comanic acid,



α-pyrones are lactones of δ-oxydiolefinedicarboxylic acids, *e.g.*

; γ-pyrones anhydrides of diolefinedioxyketones, *e.g.*

Meconic acid (in opium) is oxy-γ-pyronedicarboxylic acid 3.2.6:

PYROPE, a variety of garnet found in certain rocks of Bohemia and Saxony; composed of silica, alumina, magnesia, and lime; varieties: fire garnet, carbuncle, Bohemian garnet, and hyacinth.

PYROSOMA, a genus of Tunicata (*q.v.*).

PYROTECHNY, see FIREWORKS.

PYROXENES, group of important rock-forming minerals, including augite, diallage, enstatite, bronzite, and hypersthene.

PYRRHULA, BULLFINCH; see under FINCH FAMILY.

PYRRHUS (c. 318–272 B.C.), king of Epirus; overran Macedonia; expelled, 286; led army to aid Tarentum, 281, and for first time Greeks came into conflict with Romans at battle of *Heraclea*, 280; victory of P. was dearly bought—hence expression, a *Pyrrhic victory*; further victories, 279, but decisively beaten at Beneventum, 275.

PYRROL (C_4H_4NH), liquid obtained from bone oil and coal tar; B.P. 131° C.; with hydrochloric acid colours wood red; feeble secondary base.

PYTHAGORAS OF SAMOS (VI. cent. B.C.), Gk. philosopher, of whose life little is known; settled at Crotona in Magna Græcia, and there founded an order or society. The first purpose of the order was ethical and religious, and in this it resembled the Orphic societies, which also represented dissatisfaction with the local cults of Gk. cities, and aimed at purification of the soul by abstinence and ceremonial 'mysteries.' But the order came into conflict with established political custom, and after a period of power was in V. cent. ejected from Crotona and in part dispersed through the Gk. world.

Of the teaching of P. himself little is certainly known; but he undoubtedly believed in transmigration of souls and inculcated abstinence from flesh; he seems to have preached a 'way of life' or 'way of purification'; and he was much interested in (and perhaps was the first scientific student of) harmonies and arithmetic. It may have been his discovery of the numerical values of musical intervals that led him to the theory that all things are ultimately numbers.

Of the **Pythagoreans** towards the end of V. cent. the most famous is the Sicilian PHILOLAUS, who wrote on numbers and on med., and seems at one time to have taught at Thebes. There are extant *Fragments* attributed to him, which, however, are probably not his. The later Pythagoreans very probably interpreted the doctrine that all things are numbers as meaning that things are composed of geometrical figures, though this view is disputed. Their cosmology also is interesting, because they did not regard the earth as in the centre of the cosmos, but held that the earth, sun, and all the heavenly bodies revolve round a central fire. The most notable of the IV.-cent. Pythagoreans was ARCHYTAS OF TARENTUM, the astronomer. In the I. cent. B.C. there arose a movement known as NEO-PYTHAGOREANISM, mainly religious in tendency, but philosophically more akin to Platonism than to Pythagoreanism. Especially notable is APOLLONIUS OF TYANA in the I. cent. A.D., a wandering magician, ascetic, and religious teacher, some of

whose reported sayings are curiously parallel to those of Christ. See METAPHYSICS.

Benn, *The Gk. Philosophers*, vol. i.; J. Burnet, *Early Gk. Philosophy*; Gomperz, *The Greek Thinkers*, vol. i.; Zeller, *Pre-Socratic Schools*.

PYTHAGOREANS, see METAPHYSICS.

PYTHEAS (fl. early III. cent. B.C.), Gk. navigator and astronomer; b. Marseilles; navigated North Sea as far as 'Thule,' perhaps island of Shetlands; penetrated into Baltic; knowledge of his travels preserved by other writers; nucleus of much myth, but has claim to astronomical discoveries; see paper by Sir Clements Markham in *Geographical Journal* (June 1893). See GEOGRAPHY.

PYTHIAS, see DAMON.

PYTHO, see DELPHI.

PYTHON (classical myth.), serpent formed from mud left by Deucalion's deluge; slain by Apollo.

PYTHON, see under SNAKES.

PYTHONOMORPHA, extinct Reptiles (*q.v.*).

Q, 17th letter of alphabet; originally a picture of a knee; Hebrew *qoph*, Greek, *koppa*; arrived in England in mid-XII. cent. and replaced O.E. *cw* (O.E. *cwyc*=quick); in Middle Scots *qu*=*hw* (Middle Scots *quhat*=O.E. *hwat*, modern *what*).

QARAITES, KARAITES, mediæval Jewish sect, so-called because of their emphasis on the sacred text as opposed to tradition; they arose in VIII. cent.; about 12,000 exist, mostly in Russia; they have a good reputation, and are favoured by the Russ. government.

QUADRATIC EQUATION, see EQUATION.

QUADRATRIX, curve with ordinates proportional to area (quadrature) of another curve. Most famous is that of Dinostratus $\left(\text{equation, } y=x\cot\frac{\pi x}{2a}\right)$, by which quadrature of circle can be effected.

QUADRATURE, finding a square of area equal to the area bounded by any lines, straight or curved; finding the q. of a circle is the old game of 'squaring the circle.'

QUADRUPLE ALLIANCE (1718) was made between the Triple Alliance (Britain, France, Holland) and Austria to counteract Span. schemes and to enforce terms of Treaty of Utrecht which related to Hanoverian Succession in Britain and Orleans Succession in France.

QUÆSTOR, Rom. official who had originally criminal, later chiefly financial, jurisdiction; nominated by consuls till middle of V. cent. B.C., when right of election fell to *comitia tributa*. Number increased from 2 to 4 (421 B.C.), 8 (*c.* 267), and to 20 by Sulla, 81 B.C.

QUAGGA, see under HORSE FAMILY.

QUAIL, see under PHEASANT FAMILY.

QUAIN, SIR RICHARD, Bart. (1816–98), Irish physician; practised in London; physician to Brompton Hospital for Diseases of Chest (1855); physician-extraordinary to the queen; an authority on heart diseases, and author of *Dictionary of Medicine*. His cousin, **Jones Quain** (1796–1865), was the author of the well-known standard *Elements of Anatomy*, and **Richard Quain** (1800–87), bro. of Jones Q., was pres. of Royal Coll. of Surgeons (1868), and endowed the Q. professorships of Bot., Eng. Language and Lit., Law, and Physics in Univ. Coll., London.

QUAKERS, name (at first nickname) of Society of Friends. See FREE CHURCHES.

QUARANTINE (Fr. *quarantaine*, '40 days'), the time during which those exposed to infection on a given date must wait without further exposure to infection, before it is known whether they have taken the disease or not. The time varies with each infectious disease. When a vessel arrives from a port where infectious disease is prevalent she is not permitted to land her cargo, nor is any one on board allowed ashore except at appointed places, and under special regulations. The vessel is 'in q.' and may be thus secluded for 40 days.

QUARLES, FRANCIS (1592–1644), Eng. religious poet; most voluminous in production; best work, *Emblems*; figures in Pope's *Dunciad*.

QUARRYING, known as early as 4000 B.C. Quarries from which stone for the Pyramids was cut are still to be seen near Cairo. Q. is practised on an extensive scale in Britain; Craigleith (sandstone), Aberdeenshire (granite); limestone quarried in N. Eng., and small marble quarries exist in Skye and parts of Ireland, but Italian marble is preferred. U.S.A. possesses supplies of stone for quarrying.

QUARTAN FEVER, see MALARIA.

QUARTER SESSIONS, COURT OF, in Eng. law, the court in which justices of the peace have their highest criminal jurisdiction. These sessions are held quarterly in the counties, and deal—without a jury—with all manner of crimes except treasons, murders, capital felonies, and felonies punishable by penal servitude for life. The chairman is elected by the magistrates themselves. The laws of vagrancy, the administration of the poor law and the laws relating to the highway are all under the jurisdiction of the court of quarter sessions. In all boroughs that have a separate court of quarter sessions the Recorder presides. Generally offences too serious to be dealt with at Petty Sessions and yet not grave enough for the Assizes are brought before Quarter Sessions.

QUARTER-STAFF, pole, 6 to 8 ft. long; grasped in middle by one hand and midway between middle and end by the other; weapon of mediæval Eng. peasants.

QUARTZ is silica $(SiO_2)_n$ crystallised in the hexagonal system; S.G. 2·65, hardness 7. The purest form is rock crystal; impure varieties are milk, rose, smoky, and amethystine q.; is a constituent of granite, etc., and itself forms a massive rock; sand and sandstone are chiefly q. grains. Q. is used for making spectacle lenses, pivots, balance weights, etc. Fused q. is made into fine threads for suspensions, and tubing and laboratory vessels, which stand sudden changes of temperature.

QUARTZITE, a sandstone generally found in such ancient rocks as the pre-Cambrian; specially large blocks have been found in Reading Beds.

QUARTZ-PORPHYRY, acid igneous rock containing crystals of quartz and felspar scattered in compact mass of same minerals, and occurring in intrusive lavas. Non-porphyritic varieties are known as felsite (*q.v.*); owing to earth movements, many of the q.-p's have become schistose, especially in Palæozoic rocks.

QUARTZ-TRACHYTE, see RHYOLITE.

QUATERNIONS.—A quaternion is the mutual relation of two *vectors* with respect to *quantity* and *direction*. The sum of a *scalar* and a *vector* is called a quaternion because it involves four independent numbers, such as the scalar and the three coefficients of the vector when that is resolved along three given directions. The quaternion analysis was invented by Sir W. R. Hamilton in 1843. The *tensor* of a vector α is the number of units contained in its length, and is denoted by $T\alpha$. The *versor* $U\alpha$ of a vector α is a vector of unit length having the same direction as α. Hence $\alpha=T\alpha.U\alpha$, and $T\alpha=T(-\alpha)$, $U\alpha=-U(-\alpha)$. More generally, n being a real scalar, $Tn\alpha=nT\alpha$, and $Un\alpha=U\alpha$ if $n>0$; $Tn\alpha=-nT\alpha$, $Un\alpha=-U\alpha$ if $n<0$.

The product of the length of one vector (α) into the length of the projection of another (β) upon it is denoted by $-S\alpha\beta$, and $S\alpha\beta$ is called the *scalar* of $\alpha\beta$. By similar triangles it follows that $S\alpha\beta=S\beta\alpha$. Further, $S\Sigma\alpha\Sigma\beta=\Sigma\Sigma S\alpha\beta$, and the function is doubly distributive. A unit of length having been assumed, let a vector be drawn at right angles to two given vectors α and β, so that rotation round this vector from α to β is positive, and let the length of this vector be numerically equal to the area of the parallelogram determined by α and β. This vector, called the *vector* of $\alpha\beta$, is denoted by $V\alpha\beta$. The axis of a rotation is the direction of advance of a right-handed screw turning in a fixed nut. We have $V\beta\alpha=-V\alpha\beta$, and further $V\Sigma\alpha\Sigma\beta=\Sigma\Sigma V\alpha\beta$.

The *product* of the vectors α and β is defined by the

equation $\alpha\beta = S\alpha\beta + V\alpha\beta$, and since both terms $S\alpha\beta$ and $V\alpha\beta$ are doubly distributive the product is also, $\therefore \Sigma\alpha\Sigma\beta = \Sigma\Sigma\alpha\beta$. But $\beta\alpha = S\alpha\beta - V\alpha\beta$, and so multiplication of vectors is not commutative. The product of a pair of vectors is a quaternion, since it is the sum of a scalar and a vector. Conversely, every quaternion may be expressed as the product of a pair of vectors. If q is a quaternion, Sq its scalar part and Vq its vector part, $q = Sq + Vq$. If α and β^1 are two vectors at right angles to one another and to Vq, so that $V\alpha\beta^1 = Vq$, and if $\beta - \beta^1$ is the vector parallel to α for which $S\alpha(\beta - \beta^1) = Sq$, then $q = \alpha\beta$. The sum of any number of quaternions is defined to be the sum of their scalar parts plus the sum of their vector parts. The product of a quaternion and a vector is distributive with respect to the scalar and the vector of the quaternion. Thus $\gamma q = \gamma(Sq + Vq) = \gamma Sq + \gamma Vq$; $q\gamma = (Sq + Vq)\gamma = Sq \,.\, \gamma + Vq \,.\, \gamma$. Hence $\gamma Sq = Sq \,.\, \gamma$. Consideration of three mutually perpendicular vectors ijk (with the right-handed notation) leads to the results $i^2 = j^2 = k^2 = -1$, $jk = i = -kj$, $ki = j = -ik$, $ij = k = -ji$, and we may deduce that multiplication of vectors, and hence of quaternions, is associative. Division of vectors may be reduced to multiplication, for $a^2 = S.a^2 = -(Ta)^2$; so that $\frac{-a}{(Ta)^2} = \frac{1}{a} = a^{-1}$. Thus $\frac{-a}{(Ta)^2}$ is the reciprocal of a. Hence the reciprocal of any product of vectors is the product of their reciprocals taken in the reverse order. The same applies to quaternions.

The *conjugate* Kq of a quaternion q is defined by $Kq = Sq - Vq$. So if $q = \alpha\beta$, $Kq = \beta\alpha$, and $qKq = Tq^2 T\beta^2 . = (Tq)^2$, Tq is the *tensor* of the quaternion. Again, $q = \alpha\beta = T\alpha \,.\, U\alpha \,.\, T\beta \,.\, U\beta = T\alpha \,.\, T\beta \,.\, U\alpha \,.\, U\beta = Tq \,.\, Uq$, where $Uq = U\alpha U\beta$, and is the *versor* of the quaternion. If $\pi - \angle q$ is the angle between α and β which is $\angle\pi$ and measured from α to β, $Sq = Tq \cos \angle q$, $TVq = Tq \sin \angle q$. The angle $\angle q$ is called the *angle* of the quaternion and is independent of any particular set of vectors. A plane at right angles to Vq is called the *plane* of the quaternion and UVq is called the *axis*.

Regarding a quaternion as an operator, it turns vectors *in its plane* through a given angle, and alters their lengths in a given ratio. For applications of quaternion analysis to geometry, statics, dynamics, electromagnetics, etc., see text-books: C. J. Joly, *Manual of Quaternions*; P. G. Tait, *Elementary Treatise on Quaternions*; Sir W. R. Hamilton, *Lectures on Quaternions* and *Elements of Quaternions*.

QUATRE-BRAS, see WATERLOO.

QUATREFAGES DE BRÉAU, JEAN LOUIS ARMAND DE (1810–92), Fr. naturalist; prof. of Anat. and Ethnology in Natural History Museum, Paris, 1856; expert anthropologist; works include *L'Espèce humaine* and *Crania Ethnica*.

QUATREMÈRE, ÉTIENNE MARC (1782–1857), Fr. Orientalist; proved that Coptic language is derived from ancient Egyptian.

QUEBEC (*c.* 44° 57′ to 53° N., 56° to 79° 30′ W.), eastern province, Dominion of Canada; lies along lower course of St. Lawrence R., and (since acquisition of Ungava, 1912) has area *c.* 800,000 sq. miles; surface generally undulating; drained by St. Lawrence and its tributaries; principal towns are Montreal and Quebec (capital). Much of surface is forested; produces cereals, tobacco, flax, hemp, fruits; live stock largely raised; dairy-farming carried on; minerals include gold, copper, lead, silver, platinum; manufactures textiles, leather, hardware, paper, etc.

First settled by French in XVI. cent., Q. was temporarily occupied by English, 1629–32; permanently taken by Britain, 1759.

Administration is carried out by lieut.-gov., aided by a responsible ministry and by Legislative Council and Assembly; Q. sends 24 Senators and 65 representatives to Dominion Parliament. Education is free and nominally obligatory; Montreal, Quebec, and Lennoxville are seats of univ's. Chief religions are R.C., Anglican, Presbyterian, Methodist. Inhabitants are mainly of Fr. extraction. Pop. (1911) exclusive of Ungava, 2,002,712. See CANADA.

QUEBEC (46° 48′ N., 71° 13′ W.), capital of Q. province, Canada, on St. Lawrence River; founded in 1608 by Fr. traveller, Samuel Champlain, who settled here with 28 followers; taken by British under Wolfe, who, like Fr. leader, Montcalm, fell during action, 1759; great Tercentenary Celebrations, 1908; three times capital of Canada. City consists of Upper and Lower Town; former includes walled city, and two suburbs, St. John and St. Louis, between walls and Plains of Abraham; monument marks place where Wolfe was slain; Lower Town is devoted to commerce. Q. is seat of Laval R.C. Univ., which dates from 1663; episcopal see of Anglican Church, R.C. archiepiscopal see; has R.C. archiepiscopal palace, Anglican and R.C. cathedrals; various philanthropic establishments, and several religious houses; excellent harbour; exports timber, lumber, grain, cheese, etc.; important railway centre; manufactures woollens, hardware, etc. Pop. (1911) 78,190.—Parker, *Old Quebec* (1903).

QUEDLINBURG (51° 47′ N., 11° 7′ E.), town, on Bode, Prussian Saxony; has interesting abbey church; vegetable and flower-seeds; iron- and brass-ware; founded by Henry the Fowler; was long a royal residence. Pop. (1910) 27,245.

QUEEN ANNE'S BOUNTY, see BOUNTY, QUEEN ANNE'S.

QUEEN CHARLOTTE ISLANDS (53° 50′ N., 132° 10′ W.), group, in Pacific, belonging to Brit. Columbia; inhabited by Haida Indians; coal mines.

QUEENBOROUGH (51° 25′ N., 0° 44′ E.), town, Isle of Sheppey, Kent, England; cement works.

QUEEN'S COUNTY (52° 58′ N., 7° 25′ W.), county, Leinster, Ireland; generally flat, rising in N.W. to the Slieve Bloom mountains; fertile, interspersed with large tracts of bog; agriculture and dairy-farming; pop. mostly R.C.; capital, Maryborough. Pop. (1911) 54,362.

QUEENSBERRY, EARLDOM, MARQUESSATE, AND DUKEDOM OF, Scot. honours. William, Lord Douglas, was cr. earl, 1633; his grandson, William, was cr. marquess, 1682, duke, 1684; marquessate and earldom still remain with Douglases; dukedom, by re-grant, 1706, passed in 1810 to Duke of Buccleuch, descendant of dau. of 2nd duke.

QUEENSBERRY, CHARLES DOUGLAS, 3RD DUKE OF (1698–1778), Eng. Lord Justice-General, 1763–78. Wife, KATHARINE, DUCHESS OF Q. (d. 1777), is the 'Kitty' of Prior's *Female Phæton*; of great beauty and political influence, and patron of literary men.

QUEENSBERRY, JAMES DOUGLAS, 2ND DUKE OF (1662–1711), first Scot to join William of Orange, 1688; instrumental in bringing about Anglo-Scot. Union; fell through implication in Jacobite plots, but reinstated, 1705, and received many honours.

QUEENSBERRY, JOHN SHOLTO DOUGLAS, 8TH MARQUESS OF (1844–1900), originator of '*Queensberry rules*' for boxers.

QUEENSBERRY, WILLIAM DOUGLAS, 4TH DUKE OF (1725–1810), called by Wordsworth 'degenerate Douglas'; career of unwearied debauchery; familiarly called 'Old Q.'

QUEENSCLIFF (38° 16′ S., 144° 40′ E.), seaport, watering-place, Victoria, Australia, on Port Phillip Bay.

QUEENSFERRY, SOUTH (55° 59′ N., 3° 23′ W.), seaport, Linlithgowshire, Scotland, on Firth of Forth; connected by ferry and Forth Bridge with **North Queensferry** (56° 1′ N., 3° 23′ W.), seaport, Fifeshire; near Rosyth Naval Base.

QUEENSLAND (10° to 29° S., 138° to 153° 30′ E.), second largest state of Australian Commonwealth, is bounded N. by Gulf of Carpentaria and Torres Strait, N.N.E. by S. Pacific, S. by New South Wales, W. by South Australia; area, *c.* 670,500 sq. miles; seaboard, *c.* 2250 miles. Surface is marked by Great Dividing Ranges, continued northward roughly parallel to the E.

coast, becoming lower towards the N., and spreading out westward into plateaux, very much as in New South Wales. The hill country falls to a coastal strip, *c.* 50 miles in width. Drainage is carried off in four different directions; northward to Gulf of Carpentaria go the Mitchell, Gilbert, Norman, Flinders, Leichhardt, and Albert rivers; eastward to Pacific, Burdekin, Fitzroy, Burnett, Mary, Brisbane; southward to Darling basin, Condamine, Warrego, Bulloo; westward to Lake Eyre, Georgina, Diamantina, Barcoo, Thomson. Chief towns are Brisbane, Rockhampton, Townsville, Maryborough, Gympie, Ipswich, Charters Towers, Toowoomba.

The northern part of Q. is chiefly of crystalline formation; in S.E. the primary rocks are overlaid by stratified rocks of slaty formation; and the S.W. region is chiefly of Secondary formation. Climate varies with latitude and height, N. being tropical and subtropical, S. having mean temperature of 67° Fahr.

Although discovered by Captain Cook in 1770, little was known of this part of Australia until it was partially explored by Surveyor-General Oxley, who discovered and named the river Brisbane in 1823. From this time onwards further explorations were carried out by various travellers. A branch convict settlement was established in Moreton Bay in 1825–26, but was subsequently given up. Q. formed part of colony of New South Wales till 1859, when, after years of disputation, it was constituted a separate colony, and obtained responsible government, Brisbane, the capital, being made a bishopric. In 1866 there occurred a financial crisis, from which, however, the country soon recovered. The discovery of gold in 1867 led to a great influx of settlers, and to an immediate increase in the prosperity of the colony; but labour strikes and destructive floods in 1890 and 1892 resulted in another financial crisis, and in 1893 several banks stopped payment; of these the National and the Royal were soon afterwards reopened, and in case of former further heavy losses again rendered reconstruction necessary in 1897. In 1900, Q. united with the other Australian colonies to form a federation. Dissatisfaction arising from indentured Kanaka labour in sugar plantations led to their repatriation, 1901–6. In recent years the prosperity of the state has greatly increased; and in 1905 it was announced in Parliament that for the first time for many years the revenue was in excess of the expenditure.

Q. has a gov., a Legislative Council of 42 members, app. by Crown, and an Assembly of 72 members elected by popular vote. There is adult suffrage for both men and women. Education is gratuitous and obligatory; a Univ. of Q. was founded at Brisbane, 1910. There is no State religion, the principal denominations in order of numerical importance being Anglican, R.C., Presbyterian, Wesleyan, Lutheran. Q. produces cereals, sugar-cane, cotton, tea, fruits, timber; sheep, cattle, and horses are extensively reared, and form one of chief sources of wealth. Minerals are of great importance, including gold, copper, tin, coal. Industries include manufactures of sugar, tobacco, leather, boots, spirits, flour, machinery, textiles, soap; and meat-preserving is largely carried on. Railway mileage exceeds 4000. The population is more mixed than in any other part of Australia, and includes English, Germans, Chinese, Japanese, Polynesians. Pop. (1911) 605,813.

Queensland Official Year-Book; Russell, *The Genesis of Queensland* (1888); Weedon, *Queensland, Past and Present* (1892).

QUEENSTOWN.—(1) (51° 51′ N., 8° 17′ W.) seaport, County Cork, Ireland; port of call for Atlantic mail steamers. Pop. 9000. (2) (42° 10′ S., 145° 35′ E.) town, Tasmania, Australia; smelting-works. Pop. 6000. (3) (31° 53′ S., 26° 52′ E.) town (and division) Cape Province, S. Africa, on Great Kei. Pop. (1911) 9016; division, 32,860.

QUELPART (33° 20′ N., 126° 30′ E.), mountainous, volcanic island, off S. coast of Korea, to which it belongs; fertile; populous. Pop. *c.* 110,000.

QUERÉTARO.—(1) (21° N., 99° 30′ W.) central state, Mexico, on the Anahuac plateau; area, 3556 sq. miles. Pop. (1910) 244,663. (2) (20° 36′ N., 100° 10′ W.) city, capital of above; cotton goods; scene of death of Maximilian of Austria, 1867. Pop. (1910) 35,000.

QUERFURT (51° 23′ N., 11° 36′ E.), town, province of Saxony, Prussia, on Querne. Pop. 5000.

QUERQUEDULA, Garganey, see under Duck Family.

QUESADA Y MATHEUS, JENARO DE (1818–89), 1st Marquis of Miravalles; Span. commander-in-chief; distinguished in Morocco War; put down Carlists and revolutionaries; made minister of war, marquis, and grandee, 1883.

QUESNAY, FRANÇOIS (1694–1774), Fr. court physician and political economist; founded physiocratic school of economics, based on natural law; showed primary importance of agrarian question and true nature of wealth; advocated benevolent despotism, and tax on property.

QUÉTELET, LAMBERT ADOLPHE JACQUES (1796–1874), Belgian astronomer and meteorologist; b. Ghent; app. director, new Royal Observatory, Brussels, 1828.

QUET'TA, Shalkot (30° 10′ N., 67° E.), capital of Brit. Baluchistan, N.W. of the Bolan Pass; occupied by a Brit. garrison; strongly fortified; connected with the railway system of India. Pop. 26,000. Quetta district has area 5130 sq. miles. Pop. 120,000.

QUEVEDO Y VILLEGAS, FRANCISCO GÓMEZ DE (1580–1645), Span. satirist; b. at Madrid. His thorough acquaintance with the inner mechanism of court life prompted him to write his great work, the *Política de Dios*, an attack on Philip IV. and an appeal for juster rule.

QUEZAL, see Trogons.

QUEZALTENANGO, ancient Xelahuh (14° 51′ N., 91° 35′ W.), town (and department), Guatemala, Central America; textiles. Pop. 35,000.

QUIBERON, BATTLE OF, 1759, episode of Seven Years War. Fr. plan was to unite Brest fleet under Conflans with Toulon fleet under La Clue, and invade England; Boscawen defeated La Clue at Lagos, Aug. 17, while Hawke kept watch off Brest and defeated Conflans in brilliant victory in *Quiberon Bay*, on south coast of Brittany, east of Lorient, on Nov. 20.

QUICHERAT, JULES ÉTIENNE JOSEPH (1814–82), Fr. historian and archivist; director of the École des Chartes; member of Society of Antiquaries; did important archæological work in France, and produced books which are contributions to hist. research and architecture.

QUICKSILVER, see Mercury.

QUIETISM, a development of religious life within the Catholic Church in France and elsewhere mainly in the XVII. cent., though anticipated before and continued since. It was partly due to St. Theresa, whom Quietists followed in her mysticism but not in her devotion to the Church. The essence of Q. was the disparaging of the Church and sacraments, and the attainment of immediate communion with God. Among its greatest exponents were Abp. Fénelon and Mme Guyon. It incurred the enmity of the Jesuits.

QUILIMANE, Kilmane (17° 50′ S., 33° 44′ E.), seaport, Portug. E. Africa, on Quilimane; trade in copra, rubber; unhealthy.

QUILL, technically the lower, hollow, horny portion, or calamus, of a feather, but from this applied to strong flight-feathers themselves, to the pens made from them, to spines like them, such as those of the Porcupine, and to many stalk- or reed-like objects.

QUILLER-COUCH, SIR ARTHUR THOMAS (1863–), Eng. poet and novelist; writes under pseudonym 'Q.'; chief works: *Troy Town*, *The Splendid Spur*, *The Vigil of Venus*; edit. *Oxford Book of Eng. Verse*; prof. of Eng. Literature, Cambridge, 1913.

QUILLOTA (32° 58′ S., 72° 51′ W.), town, Val-

paraiso province, Chile, on Aconcagua; copper mines. Pop. 12,000.

QUILON (8° 53′ N., 76° 37′ E.), seaport, Travancore, India. Pop. 16,000.

QUIMPER (48° N., 4° 4′ W.), town, capital of Finistère, France, at confluence of Odet and Steir; ancient capital of Cornouailles; bp.'s see; XIII.-cent. cathedral; potteries, sardines. Pop. 16,700.

QUIMPERLÉ (47° 53′ N., 3° 32′ W.) town, Finistère, France, at junction of Ellé and Isole. Pop. 7000.

QUINAULT, PHILIPPE (1635–88), Fr. dramatist; s. of Parisian baker; first heard at *Hôtel de Rambouillet* in comedy, *Les Rivales* (1653); wrote words for Lully's operas, *Atys* (1676), *Proserpine* (1680), *Roland*, etc.

QUINCE (*Pyrus cydonia*), a tree cultivated largely for its fruit, which has an extremely acid flavour. It differs from the apple in the larger number of seeds.

QUINCY.—(1) (39° 51′ N., 91° 20′ W.) city, Illinois, U.S.A., on Mississippi; flour, machinery, ironware. Pop. (1910) 36,587. (2) (42° 15′ N., 71° W.) city, on Massachusetts Bay; granite quarries; manufactures boots and shoes. Pop. (1910) 32,642.

QUINCY, JOSIAH (1744–75), Amer. lawyer and political writer; counsel for Capt. Preston, who fired on crowd in 'Boston Massacre,' 1770; covered with popular abuse, which changed to approval; encouraged separatists. His s. JOSIAH (1772–1864), politician, was extreme federalist; opposed admission of Louisiana to Union.

QUINET, EDGAR (1803–75), Fr. historian; prof. at Collège de France; wrote about poetry, history, religion, and travels; style recalls Châteaubriand (*q.v.*) by its vivid colour; inclined towards democracy and pantheism, and was deprived of chair. He tried, without much success, epic poem in *Napoléon* and again in *Prométhée*; afterwards wrote much-admired *Ahasvérus* in poetical prose.

QUININE, $C_{20}H_{24}N_2O_2$, the chief alkaloid in cinchona bark (from Peru, Jamaica, India, etc.), was first prepared by Pelletier and Caventou in 1820. It is extracted by dilute sulphuric acid, and separated from cinchonine and numerous other alkaloids by fractional crystallisation of the sulphate. Q. (M.P., anhydrous, 177°) crystallises with $3H_2O$; its chief salts are the sulphate, $(C_{20}H_{24}N_2O_2)_2$, H_2SO_4, $8H_2O$, and dihydrochloride, $C_{20}H_{24}N_2O_2$, $2HCl$, $3H_2O$. Solutions of salts have an intensely bitter taste, and give an emerald green colour with chlorine or bromine water and ammonia; dilute solutions show a light blue fluorescence. A valuable tonic and antipyretic, and an antidote to malaria. Q. is ditertiary base, since it forms the dimethyliodide $C_{20}H_{24}N_2O_2(CH_3I)_2$; a derivative of quinoline because it is oxidised by chromic acid to quininic acid = methoxyquinoline-γ-carboxylic acid.

QUINOLINE, C_9H_7N, colourless, highly refractive liquid, with characteristic smell, occurring in coal tar and bone oil; B.P. 239° C. Synthesised by Skraup's reaction from aniline, and glycerol, with sulphuric acid to dehydrate, and nitrobenzene to oxidise, thus:—

$$CH_2OH.CHOH.CH_2OH - 2H_2O = CH_2:CH.CHO$$
Glycerol. Acrolein.

$$C_6H_5NH_2 + OHC.CH:CH_2 = C_6H_5N:CH.CH:CH_2 + H_2O$$
Aniline. Acrolein-aniline.

Q. is sparingly soluble in water; a tertiary base forming salts, *e.g.* C_9H_7N, HCl, the platinichloride $(C_9H_7N)_2$, H_2PtCl_6, $2H_2O$, and the methyl iodide C_9H_7N, CH_3I.

QUINONES are benzene (or anthracene) derivatives containing two CO groups. Quinone consists of yellow needles, M.P. 116°, formed by oxidation of aniline, or hydroquinone.

QUINSY, popular name for acute tonsillitis (*q.v.*).

QUINTAIN, instrument used in tilting; post with movable cross-bar having board at one end and a bag of sand at the other; horseman aimed at board, and quickly got out of range of sandbag which swung round.

QUINTESSENCE, the fifth element, the substance of the heavenly bodies (Aristotle).

QUINTILIAN, MARCUS FABIUS QUINTILIANUS (c. 35–95 A.D.), Rom. rhetorician; b. Calagurris, Spain; ed. Rome; became distinguished pleader; instructed younger Pliny; favoured by Vespasian. His chief work is *Institutiones Oratoriæ* (commonly called *The Institutes*), a complete system of rhetoric dedicated to Marcellus Victorius; style clean and pure in spite of Silver-Age idioms; spurious works ascribed to him, such as *Declamationes* and *De oratoribus*. See RHETORIC.

QUINTUS CURTIUS, see CURTIUS.

QUIRINUS, see ROMULUS AND REMUS.

QUITO (0° 14′ S., 78° 50′ W.), capital, Ecuador, S. America, on a plateau of the Andes; seat of an abp.; cathedral; numerous churches and convents; astronomical observatory and univ.; cottons, woollens; ancient capital of Incas; taken by the Spaniards, 1534. Pop. 51,000.

QUO WARRANTO, writ demanding by what warrant a person holds an office; abused by Charles II. and James II. in depriving cities of their rights; by Judicature Act, 1884, Q. W. is a civil proceeding.

QUOITS, game played with heavy iron rings; object to encircle a peg fixed in ground at some distance; derived from discus-throwing.

QUORRA, part of Upper Niger.

R, 18th letter of alphabet; originally a picture of a lion; in modern English nearly silent, as in *girl, bird.*

RAAB, Hungarian GYÖR (47° 41′ N., 17° 40′ E.), town, on Raab, Hungary; occupies site of Rom. *Arrabona*; formerly fortified; XII.-cent. cathedral; manufactures machinery, agricultural implements; trade in grain, horses. Pop. (1910) 44,300.

RABAB, see REBAB.

RABAT (34° N., 6° 20′ E.), seaport, Morocco, at mouth of Bu Regreg; manufactures carpets; exports wool and hides. Pop. 29,000.

RABBA (9° 19′ N., 5° E.), decayed town, Nigeria, Brit. W. Africa, on Niger.

RABBI (Hebrew 'teacher'), Jewish title first given to Gamaliel (*q.v.*); now a teacher of the young, rather than a priest.

RABBIT (*Lepus* (*Oryctolagus*) *cuniculus*), relative of Hare, with smaller body, shorter ears, and characteristic habit of burrowing; found widely distributed in Old World, probably often through man's introduction, as in Australia and New Zealand. Unlike those of the Hare, its young are naked and helpless at birth.

RABBIT-FISH, see BURBOT.

RABBIT-FISHES, see PORCUPINE-FISHES.

RABELAIS, FRANÇOIS (*c.* 1483–1553), Fr. writer; b. in Chinon; soon showed his love for science; studied Gk. and Lat. authors, natural history, law, math's, and professed med. at the Univ's of Montpellier, 1530, Lyons, 1532; made remarkable anatomical discoveries; pub. two editions on Galen and Hippocrates; member of chief literary circle; went to Rome as medical adviser of Jean du Bellay, 1533. R. published *Pantagruel*, 1533, *Gargantua*, c. 1535 (et seq.); his other writings are of no intrinsic interest. He enjoyed the curacy of Meudon, 1550–52.

Many changes and phases in his life have caused wrong biographical presumptions; all that can certainly be said is that he was a monk without a calling, a learned medical man, and in his leisure hours a lively story-teller. The works which made his name took up little of his time. Those who knew him well called him a sober, estimable, and learned man. *Gargantua* and his fellows are giants performing the most extraordinary feats, lovers of pleasure and good cheer. Characteristics of R.'s style are frankness, wonderful power of expression (which is aided by vast vocabulary enriched by archaisms, *patois*, classicisms), pervading spirit of mockery, a simple broad humour, and indecency. There is nothing quite like R. in England, though many Eng. authors owe much to him. His influence was strong on Fielding, Smollett, and Swift. Sir Thomas Urquhart (*q.v.*) made a remarkable translation of R.

Sir W. Besant, *Rabelais* (1879); Tilley, *Rabelais* (Fr. Men of Letters); Millet, *Rabelais* (Grands Ecrivains Français).

RABIES, HYDROPHOBIA (*q.v.*).

RACCONIGI (44° 47′ N., 7° 39′ E.), town, Cuneo, Italy. Pop. 9400.

RACCOON DOG, see DOG FAMILY.

RACCOON FAMILY (*Procyonidæ*), a family of Carnivores whose members have clumsy bodies, short necks, and sharp muzzles. They include the carnivorous RACOONS (*Procyon*) of America, the beaver-like fur of which is much used by man; the vegetarian PANDA (*Ailurus*), found in the Himalayas above an altitude of 7000 feet; and the COATI and KINKAJOU.

RACE, CAPE, see NEWFOUNDLAND.

RACEMOSE, see FLOWER.

RACES OF MANKIND.—Mankind has been divided by modern ethnologists into these races: (1) NEGRO, or black; (2) RED INDIAN, or brown; (3) MALAYAN, and (4) MONGOLIAN, yellow; (5) INDO-EUROPEAN or CAUCASIAN; and (6) SEMITIC, white. The total population of the world is, according to estimation, 1623 millions, of whom 170 millions are Negro, 23 millions Red Indian, 50 millions Malayan, 655 millions Mongolian, 645 millions Caucasian, 80 millions Semitic. The race of many peoples, especially those of apparently Malayan or Negroid type, has not yet been determined, and the data upon which ethnological judgments should be made have not yet been definitely agreed upon, but it has been clearly demonstrated that neither geography nor language is a test of race.

One of the chief phenomena of history is the movement of peoples; the history of Europe has been that of the inflowing of Eastern invaders, a fact which gave rise to the old mystical belief in an hist. progression which followed the course of the sun from east to west; there are, however, instances of Eastward expansion. Colour is, on account of race-mixture, not a perfect test, but it appears to have taken as long ages to produce as other racial distinctions, and the world may be roughly ethnogeographically divided into (1) the *black* races of the tropics, (2) the *yellow* and *brown* men of Southern and Central Asia and of America, (3) the *white* peoples of temperate climes. The best test, however, is held to be the build of a man, especially with regard to the proportions of his skull. Universal tradition of common parentage is confirmed by modern science, though untold ages must be allowed for deep differentiation of present races to have taken place.

The chief reasons for believing in a common origin are: (1) physiological similarities and power of cross-breeding; (2) modern philology has resolved the thousand tongues of the world into a few parent speeches, though the search for one original language has been unsuccessful; (3) there are common phenomena of social development, so that every race has its Stone Age, etc. Comparative mythology, law, etc., give the same result as comparative philology. Before the era of Darwinism, the theories of *polygenism* and *monogenism* waged bitter war, the more so as the former contradicted the Biblical story. The new theory of the origin of species throws extra weight on to monogenist side, though the missing link has not been found—Dubois' *Pithecanthropus Erectus* not being generally accepted.

The earliest relics of man in Europe, found in Somme valley and at Taubach in middle of XIX. cent., proved that he existed in the Drift period (*Palæolithic Age*); later discoveries of Fraas were made at source of Schussen. Moreover, palæolithic implements are found in France, Britain, Russia, the countries of Southern Europe, North Africa, America, southern India. It is an old theory that man spread over the world from Asia; Asiatic fauna are found with remains of palæolithic man in Drift Beds. Dubois' discovery has led those who accept it to place the cradle of the race in Java and to trace the first migration therefrom. If so, man must have started on his wanderings when the Eastern Archipelago was part of the Asian mainland, when no Indian Ocean separated Asia from Africa nor Pacific Ocean lay between Asia and America, and when Java had land communication with Australia. Whatever part of the world may have been the cradle of the race, men must have separated under those conditions, for early man had no knowledge of navigation.

Neolithic, who followed Palæolithic, man, still exists. The Neolithic Age represents the stage in social development through which every race has not yet completely passed. Egypt, Babylonia, and Chaldæa, followed by 'Mycenæans,' were the first to emerge from Stone Ages into Copper, Bronze, and Iron Ages. From the civilised countries of the Mediterranean basin later **European civilisation** has descended. In the earliest writings of Egyptians and Greeks it may be seen that the great human races had already taken their later forms, and men were already speculating on their origin.

The **Negro race** may be subdivided into African negroes, Negritos, Melanesians, perhaps Papuans, Australians, and Tasmanians. The relation of these peoples is yet only matter of conjecture. Andaman tribes of Sea of Bengal represent, it is suggested, the primitive negro type. *African negroes*, whose home is south of Sudan, have spread all over Africa, Madagascar, and into West Indies, southern United States, and South America. They are possibly not indigenous African population, but conquerors of the Negritos (Span. 'little negroes') or *pygmies*, and made their entry into Africa through Arabia. Pygmies are believed to have occupied the whole equatorial region before the subsidence of the Indo-African continent cut them into two divisions, that of Africa and that of the Malay peninsula.

The **Red Indian race** is confined to America, and owes its name to the old error of Columbus in imagining the new continent to be the West Indies. Physical likenesses, among which is the strong resemblance of Eskimo to Japanese, and speech have led to the accepted opinion that Indians are Mongol peoples from Asia. Besides the fact that the ancient civilisations of Central America have to be accounted for, there was land communication between western America and eastern Asia before the comparatively recent subsidence of the 'Pacific continent.' Indians (*q.v.*), still numerous, have been driven into arctic and uncultivated regions of America.

The **Malayan race** inhabits the Malayan peninsula and 'Malaysia' (the East Indies). Believed until lately to be Mongolians, they are now considered a separate race of southern conquerors. It is suggested that they belonged to the same race as Polynesians, from whom they were separated at the subsidence of the Indian continent.

Mongolians probably made their early home on the tableland of Tibet, from which they soon spread over Mongolia, China, and Siberia, and ultimately over Central Asia, parts of Armenia, Caucasia, Irania, Russia, Finland and Lapland, Manchuria, Japan, Siam, Formosa, Korea, parts of Hungary and Balkan peninsula, Madagascar, and the Philippines.

To the **Indo-European** (formerly called CAUCASIAN, and lately INDO-GERMANIC) **race** belong most of the peoples of India and Europe, and in historical times it has colonised a large proportion of America, much of Africa and Australia. The Indo-European tongue comprises Sanskrit, Greek, Latin, Romance tongues, Persian, Slavonic, Teutonic, Celtic, etc.

Arabia or North Africa is assigned as the home of the **Semitic race**; thence it spread over Syria and Palestine.

RACHEL, ELISA (1821–58), Fr. actress; from 1838 onwards enjoyed phenomenal popularity in tragic parts such as Phèdre. *Adrienne Lecouvreur* was written specially for her.

RACHETIS, see RICKETS.

RACIBORZ, see RATIBOR.

RACINE (42° 48′ N., 87° 48′ W.), city, Wisconsin, U.S.A., on Lake Michigan; manufactures agricultural machinery. Pop. (1910) 38,002.

RACINE, JEAN (1639–99), Fr. dramatist; b. at La Ferté-Milon; ed. first at the coll. of Beauvais, then at Port-Royal. Verses on the king's marriage (1660) and convalescence (1663) won for him a pension and began his fame. *La Thébaïde* (1664), his first tragedy, and *Alexandre le Grand* (1665) recalled the style of Corneille. His masterpieces are *Andromaque* (1667), *Britannicus* (1669), *Bérénice* (1670), *Bajazet* (1672), *Mithridate* (1673), *Iphigénie* (1674), *Phèdre* (1677). R. had a perfect knowledge of Greek. His characters are true, and their passions are finely depicted, though his plays have preserved the manners and language of Louis XIV.'s court. *Les Plaideurs* (1668), imitated from Aristophanes' *Wasps*, is an amusing satire on the judges, advocates, and pleaders of his time, written in exquisite verses.

R.'s success made enemies for him. Pradon was induced to produce a *Phèdre* which threatened to supplant R.'s; but justice was soon done to R.'s beautiful work. But, discouraged by unjust criticisms, R. now underwent religious experiences, which resulted in retirement to Port-Royal. He married, and was made, with his friend Boileau, historiographer to Louis XIV. Madame de Maintenon begged him to write plays for her School of St. Cyr, and he wrote *Esther* (1689), which was acted several times before the court, and *Athalie* (1691), of greater force and character. *Esther's* charm lies in beauty of style and poetry of choruses. The authorities, however, decided that henceforth such things were not for schoolgirls. R.'s sensitiveness hastened his death. Literary troubles had hurt him deeply, and he incurred the king's displeasure by his Jansenistic ideas and sympathy with the people; R. is the greatest tragic writer after Corneille (whom he sometimes equals) of Fr. classical school.

Canfield, *R. and Corneille in England* (1904); Larroumet, *Racine* (Grands Ecrivains Français); Lemaître, *Racine* (Paris, 1908).

RACING.—Horse-racing was a highly credited sport among the ancient Greeks. There is mention of chariot-racing in Homer, and Pindar bestows on the subject the tribute of highest poetry. But in the modern sport the horses run single and are mounted. In Britain, Newmarket and Epsom are the oldest courses, dating from the times of James I. It was not, however, till the closing decades of the XIX. cent. that the turf became an object of universal interest in this country. King Edward VII. took an active interest in the sport and was himself a successful owner. There are now high-class race-meetings at Ascot, Ayr, Bath, Birmingham, Brighton, Carlisle, Chester, Curragh, Derby, Doncaster, Epsom, Folkestone, Gatwick, Goodwood, Hamilton Park, Haydock Park, Hurst Park, Kempton Park, Leicester, Leopardstown, Lewes, Limerick, Lincoln, Liverpool, Manchester, Musselburgh, Newbury, Newcastle-upon-Tyne, Newmarket, Nottingham, Phœnix Park (Dublin), Pontefract, Redcar, Salisbury, Sandown Park, Stockton, Warwick, Windsor, Wolverhampton, York.

The most fashionable meetings are the Ascot and Epsom. It was not till the XVIII. cent. that race-course regulations were specifically formulated with regard to weight of jockeys and stakes; in that cent. also 'handicap' races took the place of the old 'give-and-take' race; the object of the innovation being to equalise the weighting of horses. In the reign of George III. the tax of two guineas was first levied on every horse started. The breed was temporarily vitiated in recent years owing to the popularity of the two-year-old short race. This forced immature animals and preventative measures had to be taken. In the modern selling-races, the owner fixes the selling-price on entering the horse. Should the winner on being put to auction after the race realise a larger sum the difference is divided between the owner of the 'proxime accessit' and the general funds.

Meetings on the Continent are popular, but the 'turf instinct' is not so keenly developed as in Britain. The interest taken in the sport in the Brit. colonies, especially Australia and New Zealand, is intense, but the racing has not yet reached the high refinement of our 'drawing-room' sport. Steeplechasing was originally a race of hunting horses which tested both speed and jumping, and was run from one church

steeple to another. The first mention of the sport is of a steeplechase match in Ireland in 1752, and in Ireland to-day the sport is still much more cultivated than in Great Britain. The most important steeplechase is the Grand National, run in March at Aintree, a suburb of Liverpool. The most important race is the Derby, run at Epsom. The Derby of June, 1913, was sensational; a suffragette, Miss Emily Wilding Davison, stopped the King's horse, Anmer, and received fatal injuries, and Craganour, the first horse home, was disqualified for bumping, and a 100 to 1 "outsider," Aboyeur, won the race.

In U.S.A. racing dates from the XVII. cent., but first Jockey Club was that at Charleston, 1735. Thoroughbred stock has been much imported; but trotting races, where time is supreme test, excel in interest. National Trotting Association was founded, 1869, and since then trotting prizes have grown enormously. The mile record (Uhlan, 1912) is 1 min. 58 secs. In pacing it is 3 secs. lower. Flat-racing is almost all on prepared soil, not turf. Richest event is for two-year-olds, Futurity Stakes (run at Sheepshead Bay), which have exceeded $67,000. Withers and Belmont Stakes (May, Westchester Racing Association) are famous, but Brooklyn (Gravesend) and Suburban (Sheepshead Bay) Handicaps draw largest atttendances.

RACK, see TORTURE.

RACKAROCK, see BLASTING.

RACKETS, RACQUETS, wall-game, somewhat similar to Fives (*q.v.*), except that it is played with a racquet and not with gloved hand. The modern form of the game came into force some sixty years ago when the four-walled enclosure superseded the back- or one-walled court. Dickens paints an interesting picture of the debtors playing r. in the Fleet, but we can find no account of it before the XIX. cent.

The game is played by two or four persons, and, like fives, consists of fifteen points; the server or 'hand-in' is the only player who can score points; his opponent must first 'get him out,' *i.e.* win a stroke, then the positions are reversed. The dimensions of the court are usually 60 ft. long, 30 ft. broad, 40 ft. high; there is a 'cut line,' which corresponds in function to the net in tennis, on the front wall, 9 ft. 6 in. from the floor. Half-way up the court are the service-boxes, squares marked off against the walls. Behind the half-way line the court is divided into two. The racquet is lighter and shorter than a tennis one.

Standing in one of the service-boxes, the server delivers the ball so that it hits the front wall and drops into the opposite back court. In every case the ball must strike the front wall above the prescribed height and must be taken not later than first rebound. When the server wins a stroke he scores a point, when he loses one he is down and changes places with his opponent. The game is played at Oxford, Cambridge, and public schools.

RACOONDA, fur of Coypu (*q.v.*).

RADAUTZ (47° 50′ N., 28° 54′ E.), town, Bukovina, Austria. Pop. (1911) 16,543.

RADBERTUS PASCHASIUS, IX.-cent. Catholic theologian; wrote book on Eucharist.

RADCLIFFE (53° 33′ N., 2° 19′ W.), town, Lancashire, England; cotton. Pop. (1911) 26,085.

RADCLIFFE, JOHN (1650–1714), Eng. physician; ed. Oxford; practised med. there and afterwards at London, where he had great success, and entered Parliament; he founded two medical travelling fellowships in Univ. Coll., Oxford, and his executors also built the Radcliffe Observatory, Hospital, and Library at Oxford, and enlarged St. Bartholomew's Hospital, London.

RADCLIFFE, MRS. ANN (1764–1823), Eng. novelist; writer of mysteries—secret passages, etc.; works include *A Sicilian Romance* (1790), *Mysteries of Udolpho* (1795), *The Italian* (1797).

RADEBERG (51° 10′ N., 13° 55′ E.), town, Saxony, on Röder; manufactures glass. Pop. (1910) 13,413.

RADETZKY, COUNT, JOHANN JOSEF WENNEL ANTON FRANZ KARL (1766–1858), Austrian general; distinguished in Napoleonic invasions; helped to reorganise army; commander-in-chief of army of Italy, 1831; won high praise in campaign, 1834; field-marshal, 1836; evacuated Milan, 1848, but skilfully held Sardinians in check, and restored Austrian rule, 1849.

RADEVORMWALD (51° 12′ N., 7° 30′ E.), town, Rhineland, Prussia; hardware manufactures. Pop. (1910) 11,525.

RADHANPUR (23° 49′ N., 71° 39′ E.), native state, Bombay, India. Pop. 62,000. Capital, **Radhanpur**. Pop. 11,500.

RADIATA, old term introduced by Cuvier to include the Echinoderms, Cœlenterates, Entozoa, and Infusoria; now disused.

RADIATION is the term applied to the stream of energy which, in one form or another, can be emitted by a body, transmitted through the luminiferous medium or ether, and absorbed by another body. It may take a form which can affect the optic nerve, and we then know it as light. It may also produce an appreciable rise of temperature in a body which absorbs it, and we then call it radiant heat. It may take the form of electro-magnetic waves, such as are used in wireless telegraphy, and it is then termed Hertzian radiation. These are not distinct forms; they are only aspects of the same phenomenon which differ in respect of one common quality, viz. wave-length. The properties of radiation may be most clearly understood by reference to the two forms familiar in all experience, and with these we shall deal here. That radiant heat and light are identical in nature may be readily believed. They travel through space with the same speed, are reflected and refracted according to the same laws, and their intensity diminishes with distance according to the same law of the inverse square. We have, therefore, every reason for the belief that radiant heat, as well as light, is due to an undulatory motion in the ether.

The only difference between them is that of wave-length. The human eye is sensitive to light whose wave-length is more than $\frac{1}{33000}$ of an inch and less than $\frac{1}{67000}$. In this range we have all the colours of the visible spectrum, the violet rays having the least, and the red rays the greatest, wave-length. But the spectrum does not stop at either of these limits. For instance, a solution of quinine fluoresces strongly when placed beyond the violet end of the spectrum; and a thermopile, bolometer, or other microradiometer will show that heat not only accompanies colour in the visible spectrum, but also continues past the red end into the invisible ultra-red. In this way waves up to a length of $\frac{1}{1000}$ of an inch have been observed. (Beyond this length there is a gap in observed wave-lengths until we come to the shortest Hertzian wave produced, which is several inches long.)

Now these radiation waves are emitted by bodies in conditions which are determined chiefly by the temperature. Taking a body at ordinary air temperature and heating it gradually, we find that, to begin with, the radiation emitted consists of waves of greater wave-length beyond the visible part of the spectrum. As the temperature increases, waves of shorter wave-length appear, until when the body has attained a temperature of about 700° C., visible rays of red light appear. This is the temperature of dull red heat, as it is termed. At higher temperatures the wave-lengths are smaller, until when the highest attainable temperature has been reached (that of the electric arc) the radiation includes all known wave-lengths. The stream of radiation from a body, and also the energy of radiation of each particular wave-length, thus depends on temperature. As regards the total amount of energy emitted, different surfaces have, of course, different emissive powers at the same temperature, that of a carefully blackened surface being the highest and a highly polished surface the lowest. Different surfaces have also different absorptive powers, blackened surfaces

being again the highest. Hence, radiating and absorptive powers go together, this being true, however, only for each particular kind of radiation, *i.e.* for each wave-length.

Pressure of Radiation.—We have, however, to take a more general view of the matter. Suppose a body is placed inside a hollow sphere whose inner surface is maintained at a constant temperature. The body will ultimately acquire that temperature. When it has done so, it does not stop radiating or absorbing, but must be radiating as much as it absorbs in each second. Further, this statement must be true, not only for the total amount radiated or absorbed, but also for the radiation of each particular wave-length. Another conclusion is that the radiation at that temperature must be the same, both as regards total amount and amount for each wave-length in any other enclosure at the same temperature. From these results we conclude that in any enclosure at a constant temperature radiation must be .streaming in all directions, and that the amount of this stream for each wave-length depends only on the temperature. This is known as the *black body radiation* or *full radiation* for that temperature. Clerk-Maxwell showed in 1873 that, according to the electro-magnetic theory of light, radiation should exert a mechanical pressure on any surface upon which it falls perpendicularly, and that this pressure should be equal to the energy per unit volume of the radiation. The difficulty of proving this experimentally was not overcome for more than thirty years, when it was shown by Lebedew to exist. The pressure of radiation has been applied to explain the curious way in which the tail of a comet is always directed away from the sun.

Suppose a particle in the tail of a comet is cubical in shape. The sun's gravitational attraction will be proportional to its volume, *i.e.* to the cube of the length of an edge. The pressure of radiation will be proportional to the surface and therefore to the square of the length of an edge. If the cube is very small, the radiation pressure may be greater than the gravitational attraction, and the particle will tend to recede from the sun.

The pressure of solar radiation on the earth's surface is equal to the weight of about 100,000 tons. Radiation pressure may be viewed in the same way as the pressure of steam in the cylinder of a steam engine, and we may therefore apply to it the principles of thermo-dynamics. In this way it has been shown that the energy emitted by a radiating body is proportional to the fourth power of the absolute temperature. This, known as *Stefan's law*, had been previously deduced from the results of Dulong and Petit's experiments on the cooling of a body in a vacuum.

P. Phillips, *Radiation*; E. Edser, *Heat for Advanced Students* (chapters on radiation); E. Edser, *Light for Advanced Students* (chapters on the spectrum).

RADICAL, in Brit. politics, the name given to advanced section of Liberal Party (*q.v.*).

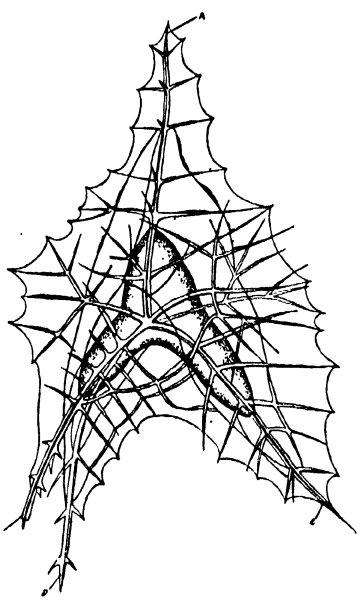
RADICAL or **RADICLE**, see CHEMISTRY.

RADIOACTIVITY.—The discovery in 1895 of the Röntgen rays (*q.v.*) led physicists to examine those substances which are phosphorescent after exposure to light, in order to ascertain whether they gave out rays with properties similar to the Röntgen rays. While so engaged, BECQUEREL discovered in 1896 that the double sulphate of potassium and uranium emitted rays which affected a photographic plate when wrapped in black paper, and also ascertained that all the compounds of *uranium* possessed this property. But further investigation showed that pitchblende (the mineral from which uranium is extracted) was more active in the above respect than could be accounted for by its uranium content, and this led to the belief that the action of uranium was due to some substance, present in minute quantity in uranium, to which the phenomenon was due. Monsieur and Madame CURIE undertook the search for this substance and, after most laborious work, extracted from pitchblende ore two new elements, *polonium* and *radium*. These elements are present in excessively minute quantities in the ore, several tons of which are required in order to supply a few grains of radium. The activity of the radium was found to be more than a million times that of uranium, and it is the principal radioactive substance known. It emits rays which can pass through metal and other substances which are opaque to ordinary light, can affect a photographic plate, can discharge the electricity of an electrified body, and can cause phosphorescence in bodies exposed to them. All this it does *spontaneously*; that is, external agencies such as heat, pressure, etc., have no influence in altering the emission of the rays. Any substance which emits rays in this manner is said to be *radioactive*.

The rays emitted by radium are of three distinct kinds, known as the α (*alpha*), β (*beta*), and γ (*gamma*) rays. The distinction between them can be demonstrated in various ways, but that which will be most readily understood is the action of a magnet. Suppose a small quantity of radium be placed at the bottom of a short cylindrical leaden tube, standing vertically, and that a strong magnetic force be made to act horizontally on the rays as they emerge from the upper end of the tube. It is then found that the α rays are very slightly deviated to one side of the vertical, the β rays are strongly deviated to the other side so as to describe circular paths, while the γ rays proceed vertically upwards without deviation. This difference in behaviour is connected with the fact that the α rays consist of positively charged corpuscles, the β rays are exactly similar to *kathode* rays (see RÖNTGEN RAYS), and therefore consist of negatively charged corpuscles, or electrons, while the γ rays are in reality Röntgen rays. They also differ in their power of penetrating metals. Roughly speaking, if the power in this respect of the α rays be represented by 1, that of the β rays is 100, and that of the γ rays is 10,000. The speed of the α rays is about one-fifteenth that of light, *i.e.* about 12,500 miles per second; that of the β and γ rays is nearly that of light.

In addition to these rays, radium also evolves a considerable quantity of *heat*. In one hour the amount evolved from a given weight of radium is sufficient to raise an equal weight of water from the freezing-point to the boiling-point. Lastly, there is given off a gaseous emanation which is itself radioactive. But the most interesting feature of radium is revealed when we study the later history of these rays and consider what is left behind after their emission. The facts may be briefly summarised as follows: The charges exhibited by radium form only a few of the stages in the process of atomic disintegration which, beginning with uranium, finally ends in lead. The atom of uranium first loses three α particles and radium is produced. These particles form what is known as *helium*, a gas which is found in ores containing uranium. The α particle is known to carry two atomic charges of electricity and its atomic weight is therefore 4, which is also the atomic weight of helium. Now the atomic weight of uranium is 238 (approximately), and if we subtract from this the equivalent of three helium atoms, *i.e.* 12, we get 226, which is the atomic weight of radium. Next, the radium atom passes through several further stages, including polonium, and in the course of these it loses four α particles. This would leave behind an element whose atomic weight would be 16 less than 226, and the atomic weight of *polonium* is, in all probability, very close to this figure. Again, the loss of one α particle by polonium would result in lead, whose atomic weight is 206.

No general theory of atomic structure has as yet been worked out which will fully account for this process of disintegration or explain the conditions in which a radioactive substance emits electrically charged particles. But the tendency is to suppose



that the electrons constituting an atom are in a state of rapid vibration or circulation about the centre of the atomic system: that they are therefore subject to accelerative forces and consequently radiate energy: that when this energy loss has become considerable, the system becomes unstable and a β particle is expelled, this expulsion producing the pulsational disturbance in the ether which we know as the γ ray or Röntgen ray. The α particles are expelled in proportion to the β particles.

In addition to uranium, radium, and polonium, other elements exhibit radioactive properties. Among these may be mentioned *thorium* and *actinium*. There is also reason to believe that all metals are more or less radioactive. Evidence has been obtained of the almost universal presence of radium in the earth's crust and in the atmosphere, and it is believed that the total quantity present is sufficient to account for the present temperature of the earth.

Detailed information on the subject may be obtained by consulting Rutherford's *Radioactivity*; Sir J. J. Thomson's *Electricity and Matter* (chaps. v., vi.).

RADIOLARIA, sub-class of the Sarcodina group of Protozoa, microscopically minute animals with a body which may be globular, disc-like, or elongated, but from which the flesh streams in long, fine, radiating threads or pseudopodia (hence the name 'Radiolaria'). These threads never form a network. R. are further characterised by the presence of a membranous 'central capsule.' Almost all are furnished with skeletons, generally composed of silica, and these are structures of wonderful complexity and beauty.

All R. are marine, and are to be found floating near the surface of the sea, where they drift at the mercy of wind and waves. A simple contraction of the flesh or sarcode, however, enables them to sink in the waters, and on the bottom they creep slowly by means of their pseudopodia. The deepest portions of the ocean are coated with ooze formed almost wholly of empty R. shells which have sunk to the bottom, and the oozes of past geological ages have consolidated to form the rocks known as Radiolarian Cherts. In spite of their small size these insignificant Protozoa, by reason of their multitude, form an important constituent in the food of minute pelagic animals. Examples are *Thalassicola* without skeleton, *Actinomma*, *Eucyrtidium*, and the colonial *Collozoum*.

RADIOLARIA, *Polyplecta Heptacantha* (after Haeckel, *Challenger* Report, 1882). *A*, apical horn; *B*, *C*, *D*, basal feet.

RADIOMETER, an instrument invented by Sir W. Crookes to show the effect of a rarefied gas on unequally heated surfaces. It consists of four small discs of mica mounted on the ends of arms, which project radially from a vertical rod. This rod is pivoted at top and bottom so that it can rotate upon its own axis. Each disc is coated with lampblack on one face, and the blackened faces are so arranged that when the rod rotates all the discs have either their blackened faces in front and their non-blackened faces behind, or *vice versa*. The system of discs, projecting arms, and rod are mounted within a glass bulb, in which the air pressure has been reduced to a very low amount, and the whole is placed on a suitable stand. When the instrument is exposed to radiation from any source (*e.g.* a ray of sunlight) the arms revolve.

Poynting and Thomson's *Heat*.

RADISH (*Raphanus sativus*), a cruciferous biennial which stores food in the root. This has a pungent taste, and is used in salads.

RADIUM (Ra=226), a chemical element obtained from pitchblende uranium ore. It is the most radioactive substance known, is phosphorescent, and a given quantity of it emits sufficient energy in an hour to raise the temperature of an equal quantity of water from the freezing to the boiling point. It disintegrates in process of time and produces helium. See RADIOACTIVITY, HELIUM.

RADNOR, EARLDOM OF COUNTY OF, Eng. honour; cr. 1679 for John Lord Robartes, field-marshal for Parliament, 1644; extinct, 1757. William, Lord Folkestone, was cr. earl, 1756; since held by his descendants, Pleydell-Bouveries.

RADNORSHIRE (52° 16′ N., 3° 15′ W.), county, S. Wales, bordering on Montgomery, Shropshire, Hereford, Brecon, and Cardigan; area, c. 470 sq. miles; surface generally mountainous, reaching extreme height of 2164 ft. in Forest of Radnor; drained by Wye and Teme, which form parts of S.W. and N.E. boundaries respectively, and by other streams; capital, New Radnor; there are mineral springs at Llandrindod and elsewhere; soil comparatively poor; corn is grown, and sheep are extensively raised; excellent fishing in the rivers. Pop. (1911) 17,504.

RADOM (51° 20′ N., 21° 10′ E.), government, Russ. Poland, bordering Austrian Galicia; drained by the Vistula; hilly and wooded in S.; fertile in centre; low marshy plains in N.; chief crops wheat, rye, barley; important iron industry; flour-mills, distilleries. Pop. (1910) 1,080,800. Capital, **Radom**, has pop. (1910) 40,800.

RADOMYSL (51° 15′ N., 29° 10′ E.), town, Kiev, Russia, on Teterev; tanneries. Pop. 12,200.

RAE BARELI (26° 14′ N., 81° 16′ E.), district, Lucknow division, United Provinces, India. Pop. 1,040,000. Capital, **Rae Bareli**. Pop. 16,000.

RAEBURN, SIR HENRY (1756–1823), Scot. portrait painter; b. in Edinburgh; received some training and practised his art there; went for study to Italy for two years; returned and settled in Edinburgh in 1787. His fine portrait of Lord President Dundas, painted that year, led to other commissions, and in course of time his sitters included nearly all the notable Scotsmen of the day; recent years have witnessed growing appreciation of his work; see Greig's *Raeburn* and Caw's *Raeburn* (Masterpieces in Colour).

RÆTIA, see RHÆTIA.

RAFF, JOSEPH JOACHIM (1822–82), Ger. composer. A prolific writer, he produced some important instrumental works, especially in chamber music and symphony.

RAFFLES, SIR THOMAS STAMFORD, Kt. (1781–1826), Brit. colonial gov.; sec. to gov. of Penang, 1807; his report decided East India Company to retain possession of Malacca; ultimately proved wise policy; suggested and organised occupation of Java, 1811; gov.-gen. of Java, 1811–16, and showed initiative and wisdom; pub. *History of Java*, 1817; lieut.-gov. of Sumatra, 1818–23; defeated Dutch ambitions in Archipelago by founding Singapore, 1819; founded Zoological Soc., London.

RAFTS OR PONTOONS when carried as life-saving appliances by vessels would not be lowered from davits, but would be thrown overboard or merely

allowed to float away when the ship sank. They are not recognised as part of the equipment of foreign-going ships, but may be placed on home-trade vessels. No definite form is specified, but the type used must be approved by the Board of Trade. They must have 3 cubic ft. of enclosed buoyancy per person carried. One pontoon described had a number of cylindrical metal cases placed side by side and enclosed in a wooden frame. When carrying 25 persons its platform was 9 in. above water-level.

Buoyant seats are carried on the decks of excursion steamers. These are double seats with metal tanks secured underneath, by means of which they are able to support a number of people when afloat.

RAGATZ (47° 1′ N., 9° 30′ E.), watering-place, canton St. Gall, Switzerland; mineral springs.

RAGLAN, FITZROY JAMES HENRY SOMERSET, 1ST BARON (1788–1855), Brit. general and diplomatist; distinguished in wars against Napoleon, losing arm at *Waterloo*; commander-in-chief of Crimean army, 1854, leading at *Alma*, *Balaclava*, and *Inkerman*; made field-marshal, 1854; d. before Sebastopol, heart-broken by censures at home.

Kinglake, *Invasion of the Crimea.*

RAGMAN ROLL, documents with signatures of Scot. nobles who swore fealty to Edward I. of England; only a copy remains.

RAGUSA (42° 37′ N., 18° 7′ E.), town, Dalmatia, Austria; surrounded by walls and fortified; episcopal see, has cathedral, built in XVIII. cent. to replace an older foundation; several interesting old churches; Dominican and Franciscan religious houses; among most notable buildings is the Rector's Palace, a Transitional structure of XV. cent.; after being subject to Venice and Hungary in succession, R. became an independent republic in XV. cent.; captured by France, 1805; ceded to Austria, 1814. Pop. (1911) 14,241.

RAGNARÖK (Ger. *Götterdämmerung*), the 'twilight of the gods,' end of the world, when the gods shall be killed.

RAGUSA (36° 56′ N., 14° 45′ E.), town, Syracuse, Sicily, on Ragusa; silks, woollens. Pop. 32,500.

RAGWORT (*Senecio*), composite plant with yellow florets; Common R. (*S. jacobæa*) is a Brit. weed.

RAHWAY (40° 36′ N., 74° 15′ W.), city, New Jersey, U.S.A.; carriage-works. Pop. (1910) 9337.

RAIA, see under RAYS.

RAICHUR (16° 12′ N., 77° 24′ E.), town, Hyderabad State, India. Pop. 22,500.

RAIFFEISEN, FRIEDRICH WILHELM (1818–88), Ger. economist; founder of 'R.' Banks, co-operative agricultural banks.

RAIGARH (21° 54′ N., 83° 25′ E.), native state, Central Provinces, India. Capital, **Raigarh.** Pop. c. 7000. Pop. of state, c. 183,000.

RAIKES, ROBERT (1735–1811), see under EDUCATION.

RAIL FAMILY, RALLIDÆ, a world-wide family of birds, including the common LAND-RAIL or CORNCRAKE (*Crex pratensis*), the MOOR or WATER HEN (*Gallinula chloropus*), with red and yellow bill and greenish legs, and the COOT (*Fulica atra*), a common pond bird easily distinguished by the white bald patch on its forehead. The Rallidæ are unready flyers frequenting well-vegetated localities, most species, apart from the Land-Rails, preferring the neighbourhood of lakes and rivers.

RAILWAYS.—Railways originated in the tramways used in the mining districts round Newcastle-on-Tyne for conveying coal from the pits to the Tyne. The date of invention of these tramways is not certain, but they were probably in use as early as the middle of the XVI. cent. The first rails were simply wooden beams, flanges being added later to prevent the wagons from leaving the rails. The wagons were drawn by horses, and one horse could draw a load of 42 cwt., as compared with 17 cwt. along the ordinary road. Up to the end of the XVII. cent. little or no advance was made in construction, but about 1700 the wooden beams were covered with a thin sheathing of iron in order to add to their life.

This sheathing was found to be incapable of resisting the weight of the loaded wagons, and about 1740, rails consisting entirely of cast-iron were substituted. This kind of r. became fairly general in mining districts, but it attracted little attention for general traffic, and, moreover, it had to face the opposition of those interested in the promotion of canals. A further improvement was made by placing flanges on the wagon wheels instead of on the rails, and trains of small wagons linked together superseded the single large wagon. The possibilities of the r. system gradually became realised, and efforts were made to utilise steam instead of horse traction.

In 1802 an engineer named Trevethick obtained a patent for a steam carriage, and in 1804 this, the first practical locomotive, was used for wagon haulage on the Merthyr-Tydvil Railway. This locomotive was to a certain extent successful, but it only could haul a load of 10 tons at a rate of about 5 miles an hour. No immediate improvements upon this invention were made, largely owing to the belief that locomotives with plain wheels running on plain rails could not draw heavy loads or ascend moderate inclines, and that cogged wheels and rack rails were necessary. In 1811 it was demonstrated on the Wylam Railway that the weight and friction of a locomotive were sufficient for the purpose, and from that time steady progress was made.

The present r. system may be said to date from 1821, when an Act was passed for the construction of the Stockton and Darlington Railway, which was opened in 1825. Carriages for conveying passengers were used for the first time on this r., and the locomotives could draw 90 tons at a rate of from 10 to 15 miles an hour. In spite of this success the general public remained indifferent or even hostile, and it was not until the Liverpool and Manchester Railway was opened in 1830 that the opposition was finally broken down. This line, which for that time was a great engineering triumph, was immediately successful, and other railways were quickly commenced.

During the years 1844–46 an absolute r. mania prevailed, and reckless speculation and over-competition resulted in the financial panic of 1847. The example of England was quickly followed by the United States, and with characteristic enterprise, the railway mileage increasing between 1840 and 1880 from 2818 to 87,801. R's were speedily opened on the Continent, many of them being constructed by Brit. engineers and largely by Brit. capital. France, Belgium, and Holland took the lead, Germany, Austria, and Russia being somewhat behind. Great r. developments were also made in the Brit. Colonies, Canada, Australia, and India, and in 1877 about 5000 miles of r. were in construction throughout the British Empire.

In the U.K. r's are owned by independent companies. They are constructed and worked according to Acts of Parliament, but the Government takes no part in initiating them or in providing the necessary capital. The promoters of a contemplated r. engage an engineer to make an exhaustive survey, and then proceed to ascertain the agreement or opposition of every proprietor whose land is involved. The claims for compensation of all proprietors and tenants are then settled, and any special stipulations for bridges, level-crossings, drainage, and other matters are arranged. The scheme is then submitted to Parliament in the form of a Private Bill. In the Act which authorises the scheme, the company is constituted a corporation, the members of it being responsible only to the extent of their shares. There are now in existence many statutes dealing with r. matters, and r. law has become extremely complicated. In 1844 an Act was passed giving the Government power to purchase all r's after they had been in existence for 25 years from that date, but in 1872 a Parliamentary Committee reported that the Act was then impracticable. Since then State

purchase has frequently been urged, but, owing to the enormous expense which would be involved and to other considerations, the proposal has not found favour.

The ideal r. line would be quite straight and perfectly level, but this is seldom if ever practicable. Elevations and depressions have to be negotiated, and while in some cases they may be avoided by means of curves, in others the constructor has to resort to cuttings, tunnels, and bridges. Efforts are made to arrange matters so that the earth excavated in cuttings shall be sufficient for the construction of the embankments, but this is not always possible. Small streams are conveyed through embankments by culverts of brick or masonry, bridges or viaducts being used for crossing rivers, roads, or deep narrow valleys. Bridges are also used to carry public roads over the line, or to carry one line over another. Level-crossings are now as far as possible avoided in thickly populated districts where the traffic is heavy, on account of their danger and general inconvenience for cross traffic.

Ferries are used to convey trains across stretches of water too wide to be bridged, such as the Great Lakes in N. America. When the levels are determined and the embankments and cuttings are complete, a special track is laid down to carry the line. This is formed of a layer of small stone, gravel, slag, and other material, called ballast. On this are laid the sleepers, which are transverse slabs to support the rails. Sleepers are usually made of wood, but steel is also employed, especially where wood is scarce or liable to be attacked by white ants. Before being laid down wooden sleepers are usually treated with creosote. The rails are of two chief types, the bull-headed rail and the flanged or Vignoles rail. Bull-headed rails are wedged in cast-iron chairs bolted to the sleepers, and flanged rails, which have a flat base, are attached to the sleepers by hook-headed spikes, the heads of which project over the flanges.

Rails formerly were made of iron, but steel of special toughness and hardness is now used. The distance between the two rails forming the line is called the *gauge*, that used in Britain being 4 ft. 8½ in., and known as the standard gauge. The old broad gauge of 7 ft. formerly used on the Great Western Railway was done away with in 1892. The standard gauge is not universal. It is fairly general on the Continent, but the normal gauge in Russia is 5 ft., and in Spain and Portugal 5 ft. 5½ in. In the Brit. Colonies the gauge is mostly 3 ft. 6 in.

The rate at which a line rises or falls from the horizontal is called the *gradient*, and is usually expressed by stating the amount of rise or fall occurring in a certain distance, such as 100 ft., or by the horizontal distance in which the difference in level amounts to 1 foot. Gradients may also be expressed in percentages. The load which an engine can haul over any stretch of line is determined by the steepest gradient, and this is therefore known as the ruling gradient. The adhesion between the wheels and the rails is lessened in wet weather, and the maximum gradient must be such as can be negotiated with a full load under all weather conditions. In theory gradients of 1 in 16 are possible, but practically 1 in 22½ is about the limit, and this is too great for general use. For the steep slopes of mountains rack railways are necessary. In these the engine is fitted with a cogged wheel engaging in a toothed rack along the line, and gradients of 1 in 2 are possible. For excessively steep inclines cable r. are employed.

In the U.K. curves are expressed by stating the length of their radius. The early main lines had few curves with a radius of less than a mile, but now curves are made with a radius of as little as 30 chains, or 1980 ft. The outer rail of a curve is placed at a slightly higher level than the inner one, to resist the tendency of centrifugal force to overturn a train rounding the curve.

Trains are transferred from one set of rails to another, as for instance from a main line to a siding, by *points*, or *switches*. At the junction of the four rails the inner two are tapered to a point, and fixed so far apart that if one point is pushed against the outer rail of the main line or of the siding, there is room left between the other point and the remaining outer rail to allow of the passage of the wheel-flanges on one side of the train. The opposite wheel-flanges travel along the other tapering rail, and thus take the required direction. Where a branch line leaves the main line, or where one set of rails crosses another set, check rails are placed to guide the wheel-flanges. Switches are usually connected with the signal cabins by means of iron rods passing over grooved wheels fixed on supports close to the ground, and are worked in conjunction with the signalling. Points may also be set by small hand levers, as in shunting yards.

SIGNALLING is done mainly by discs and *semaphores*, with lamps. The common semaphore signal is a movable arm working on a spindle, and fixed to an upright post so that it is horizontal and at right angles to the line. The normal or horizontal position indicates that the train must stop, and the arm is pulled down when the train may proceed. At night the movements of the arm are indicated by the colours shown by a lamp, usually red for stop and green or white for go ahead. In addition to the main or home signals there are also distant or cautionary singals, usually placed from 600 to 1000 yards before the home signals, the distance varying with the gradient.

Distant signals are worked in conjunction with the home signals, so that when the driver reaches a distant signal its position tells him how to expect to find the home signal, and accordingly he goes ahead or slackens speed ready to stop at the home signal. Distant signals are distinguished by their different shape, and they may also show a different colour. In order to prevent one train following another at a dangerously close interval, the line is divided into sections, and no train is allowed to enter a section until the preceding train has passed into the next section. These sections are called blocks, and the method of working is known as the *block system*.

The signal boxes are telegraphically connected, and are provided with indicating discs showing 'train on line' and 'line clear,' sometimes also 'line closed.' If a signalman were quite independent he might through oversight cause dangerous situations, by displaying signals over points not set accordingly, and to avoid this danger the points and signals are interlocked. The signalman is also automatically prevented from overlooking the setting of distant signals, and from showing conflicting signals simultaneously. Single lines are usually worked on the staff system. In the simple form of staff system the line is divided into blocks, each of which has staff assigned to it, and the possession of this staff constitutes the driver's right to pass through the section. There are many modifications of this system, to allow of several successive trains in one direction without any return train, and to ensure that the staff always shall be where it is required.

Signals and points are interlocked as in double lines. The actual work of moving signals and points is now frequently done by electricity or compressed air, the mechanism being controlled by small levels moved by the signalman. Many attempts have been made to eliminate the possibility of accidents due to mistakes by signalmen, and automatic electric systems, which do away with the signalmen altogether, are now in use to a small extent. In such systems the train itself works the signals, setting them to danger as it enters a section, and keeping them there until it leaves the section. In some cases each train has control over the following train, so that the driver of the latter cannot overrun the signals.

In foggy weather the ordinary signals are insufficient, and are supplemented by detonators placed on the line and exploded by the wheels, or by fog-horns blown

by men stationed at the distant signals. These methods involve some risk to the men employed, and are not infallible, but the automatic fog-signalling systems already tried have not proved completely successful.

Railway locomotives may be divided roughly into two classes—tank engines, in which the fuel and water are carried on the engine itself, and tender engines, with a larger quantity of supplies carried in a separate vehicle. There are various types of engines for passenger and goods traffic and for shunting purposes.

Vehicles for passenger traffic usually consist of first, second, and third class carriages, restaurant and sleeping cars. In Great Britain the second class is becoming obsolete, but on Continental lines there are frequently four classes. In the United States there is usually only one class, but extra charges for sleeping and other accommodation have much the same effect as different classes. In England sleeping-cars date from 1873, and dining-cars from 1879. In America and on the Continent such cars are often owned by an independent company, which takes the extra fares charged for use of the cars. Prominent among these companies are the Pullman Car Co. and the Compagnie Internationale des Wagon-lits. In Great Britain vehicles for goods traffic are called goods wagons or trucks, and in the United States, freight cars. Vehicles are joined together by couplers, which may be automatic and operated by the impact of two vehicles, or non-automatic and coupled by hand.

At one time trains were brought to a standstill by shutting off steam at a considerable distance from the desired stopping place, some assistance being given by feeble screw brakes on the guard's van and the engine. This process was dangerously inadequate for fast passenger traffic, and more powerful brakes affecting the whole length of the train came into use. Practically all passenger trains are now fitted with automatic continuous brakes, those most used being the vacuum automatic brake and the Westinghouse compressed air brake.

Railway lines are provided with stations at the termini and at suitable intermediate points. Large stations are subdivided into passenger and goods stations, the two usually being kept quite distinct, and are furnished with dépôts for locomotives, passenger carriages, and goods wagons. Passenger stations are on the main line itself, goods stations generally being approached by a branch line. The equipment of a passenger station consists of booking offices, refreshment and waiting rooms, left and lost luggage offices, inquiry office, etc. In Great Britain station platforms are not less than 2½ ft. above the rail, the standard height being 3 ft. In other countries the height is usually less, and in the United States the platforms are often at the rail level, or raised only a few inches.

At the close of 1909 the total railway mileage of the world was estimated at 625,698, the approximate figures being: Europe, 204,896; N. America, 277,015; S. America, 42,329; Asia, 61,800; Africa, 20,809; Australia, 18,849.

The mileage of Great Britain and Ireland at the end of 1910 was estimated at 23,387.

RAIMONDI, MARCANTONIO (*q.v.*).

RAIN, condensed vapour of atmosphere.

RAINBOW, caused by the sun shining on very small drops of water, the sun's rays being bent and split up into their primary colours on passing through such a drop. Sometimes several bows are seen, the brightest, called the Primary Bow, being red on its outer and violet on its inner edge. A larger and fainter bow (Secondary Bow), often seen outside the primary, is coloured red on its inner and violet on its outer edge. The primary bow subtends an angle of 41° at the observer's eye, and the secondary an angle of 52°.

RAINOLDS, JOHN (1549–1607), dean of Lincoln, 1593; of Puritan sympathies.

RAINY, ROBERT (1826–1906), Scot. Presbyterian minister; professor at New College, Edinburgh, 1862–1900; Principal, 1874 onwards; first Moderator of United Free Church.

RAIPUR (21° 11′ N., 81° 32′ E.), town, Nagpur, Central Provinces, India; grain, cotton. Pop. *c.* 33,000.

RAISIN, the sun-dried fruit of the grape vine (*Vitis vinifera*). The varieties known as *Valencia* and *Sultana* are the best known in England.

RAJAHMUNDRY, RAJAMAHENDRI (17° N., 81° 48′ E.), town, on Godavari, Godavari district, Madras, India.

RAJGARH (24° N., 76° 47′ E.), native state, Bhopal, Central India. Pop. 90,000. Chief town, **Rajgarh.** Pop. 5600.

RAJKOT (22° 18′ N., 70° 56′ E.), native state, Kathiawar, Bombay, India. Pop. 55,000. Capital, Rajkot. Pop. 37,000.

RAJMAHAL (25° 3′ N., 87° 53′ E.), village, Sonthal Pargauas district, Bhagalpur division, Bihar and Orissa, India, on Ganges; ancient capital of Bengal.

RAJPIPLA (21° 40′ N., 73° 30′ E.), native state, Rewa Kantha, Bombay, India. Pop. 120,000. Capital, Nandod.

RAJPUT, race of N. India, mostly of Hindu persuasion, but including a considerable number of Muhammadans. The Rajputs are a fine race and predominently fighters.

RAJPUTANA (26° 50′ N., 74° E.), region, India, including Brit. district of Ajmere Merwara and a number of native states of which the largest are Jodhpur, Bikanir, Jaisalmer, Jaipur, and Udaipur; total area, *c.* 127,535 sq. miles; surface crossed by Aravalli Hills; in N. are plains and desert lands, but the S. is fertile; drained by Banas, Chambal, and other streams; live stock raised. R. was included in dominions of the Moguls in the XVII. and early XVIII. cent's; it then came under control of the Mahrattas, after whose defeat by the British the different states became allies of Great Britain. Pop. (1911) 10,530,432.

RAJSHAHI (24° 30′ N., 89° E.), division and district, Bengal, India. Pop. (div.) 9,140,000; (dist.) 1,470,000.

RÁKÓCZY, FRANCIS I. (1645–76), Hungarian patriot; s. of George II. R. (see below); elected prince, 1652, but never secured throne.

RÁKÓCZY, FRANCIS II. (1676–1735), Hungarian patriot; s. of above; was brought up in Austria; imprisoned for plotting with France a Hungarian rising; escaped to Hungary, 1703, and led country against Austria; fled after eight years' fighting, 1711.

RÁKÓCZY, GEORGE I. (1597–1648), s. of Sigismund R. (see below); after death of Bethlen, 1629, and abdication of his s. Stephen, became Prince of Transylvania, 1630; went to war with Austria and won religious liberty for Hungary.

RÁKÓCZY, GEORGE II. (1621–60), Prince of Transylvania; s. of above; met with disaster in Thirty Years War; deposed by Turkey.

RÁKÓCZY, SIGISMUND (1544–1608), Hungarian patriot; supported insurrection of Bocskay, on whose death he was elected Prince of Transylvania, 1607.

RALEIGH (35° 48′ N., 78° 29′ W.), city, capital of N. Carolina, U.S.A.; cotton industries, iron foundries, machine-shops. Pop. (1910) 19,218.

RALEIGH, SIR WALTER (1552–1618), Eng. courtier, soldier, traveller, and author; b. Hayes, Devonshire; brought up in anti-Catholic, anti-Span. traditions; left Oxford to aid Huguenots, 1569; took part in rising of Netherlands against Spain; sailed in unfortunate voyage of half-bro., Sir Humphrey Gilbert, 1579; served in Ireland, 1580; became personal favourite of Elizabeth. R. planted Eng. flag in 'Virginia,' but failed in several attempts at colonisation; brought home hitherto unknown potato and tobacco plants; fought against Armada, 1588; fell from favour by marriage, 1593, but ultimately restored; expedition to Guiana, 1595; commanded in 'Essex' Cadiz expedition, 1596, and attack on Azores, 1597. Imprisoned on charge of treason, R. wrote in captivity part of projected *History of the World,* of no hist. value

but lofty prose; persuaded James I. to allow him to lead expedition to gold mine on Orinoco; failed to find mine, burned Span. town against king's orders and returned; executed.

Biographies by W. Stebbing, Martin Hume, Sir J. R. Rodd.

RALEIGH, SIR WALTER, Eng. man-of-letters; prof. of English at Liverpool, Glasgow (1890–1904), Oxford (1904–); wrote *The Eng. Novel* (1894), *Style* (1897), *Shakespeare* (E.M.L., 1907).

RALIK ISLANDS, see MARSHALL ISLANDS.

RALLIDÆ, see RAIL FAMILY.

RAM MOHAN ROY (1774–1833), Ind. theist; studied Oriental and Western languages; in 1830 founded Brahmo Somaj (*q.v.*); visited England, 1830.

RAMAYANA, see HINDUSTANI.

RAMBAUD, ALFRED NICOLAS (1842–1905), Fr. historian; associated with Lavisse in compilation of *Histoire générale*, both being Fr. pioneers of new Ger. hist. school; important books on Byzantine subjects, Germany, Russia, and Fr. history.

RAMBOUILLET (48° 40′ N., 1° 48′ E.), town, Seine-et-Oise, France; celebrated ancient château. Pop. 6200.

RAMBOUILLET, CATHERINE DE VIVONNE, MARQUISE DE (1588–1665), dau. of Ital. Marquis de Tisani. With her daughter, Julie d'Angennes, in their Paris salon, *L'Hôtel de Rambouillet*, she received select society of courtiers and literary men and women, and started *salon* movement of XVII. and XVIII. cent's; laid down canons of lit. and taste; poems by famous men offered to the dau., 1641, as *Guirlande de Julie*.

RAMEAU, JEAN PHILIPPE (1683–1764), Fr. composer and theorist; conductor of Opéra Comique and court composer, 1745; wrote *Treatise on Harmony*, *Nouveau système*, etc.; operas, *Hippolyte et Aricie*, *Castor et Pollux*, etc.

RAMESES, RAAMSES, RAMESSES, town, Goshen, Lower Egypt; built by Israelites; received name from Egyptian king, Rameses II.; site disputed.

RAMESWARAM (9° 17′ N., 79° 21′ E.), town, Madura district, Madras, India, on island of Rameswaram; place of pilgrimage. Pop. 7200.

RAMIE, also called RHEA, and CHINA GRASS; a valuable fibre derived from the inner bark of *Bœhmeria nivea*, a member of the Urticaceæ largely cultivated in China. The fibre is exceptionally long and tough, but the gum with which it is impregnated renders it unsuitable for certain types of work.

RAMILLIES (50° 40′ N., 4° 55′ E.), village, Brabant, Belgium; scene of Marlborough's victory over French, 1706.

RAMNAD (9° 22′ N., 78° 52′ E.), town, Madura district, Madras, India. Pop. 15,500.

RÂMNICU SARAT, RIMNICU (45° 28′ N., 27° 5′ E.), town (and department), Rumania, on Râmnicu; scene of defeat of Austro-Russian army by Turks in 1789. Pop., department, 137,000; town, 14,000.

RAMNICU VALCEA, RIMNICU (45° 14′ N., 24° 20′ E.), town, Valcea department, Rumania, on Aluta; trade in wine and salt. Pop. 7500.

RAMPARTS, see FORTIFICATION.

RAMPOLLA, COUNT MARIANO DEL TINDARO (1843–), Ital. cardinal and papal Sec. of State, 1885; resigned on death of Leo XIII.

RAMPUR (28° 48′ N., 79° 5′ E.), native state, United Provinces, India. Pop. (1911) 531,898. Capital, **Rampur,** on Kosila. Pop. (1911) 74,316.

RAMPUR BEAULEAH (24° 22′ N., 88° 39′ E.), town, on Ganges, capital of Rajshahi district, Bengal, India. Pop. 22,500.

RAMSAY, ALLAN (1686–1758), Scot. poet; b. at Leadhills, Lanarkshire; established as wig-maker in Edinburgh. He published *The Tea Table Miscellany* and *The Ever Green* collections of poems, but it is as the author of *The Gentle Shepherd* that he is chiefly remembered. The poem is a dramatic pastoral of the realistic type, and is a forerunner of the poetry of Burns. *Life*, by Smeaton (1896).

RAMSAY, ALLAN (1713–84), Scot. portrait-painter; s. of author of *The Gentle Shepherd*. From 1767 he was principal portrait-painter to the King.

RAMSAY, SIR ANDREW CROMBIE (1814–91), Brit. geologist; b. Glasgow; began life as a chemist, taking up geol. as a hobby; served in Geological Survey, 1841–81.

RAMSBOTTOM (53° 39′ N., 2° 19′ W.), town, on Irwell, Lancashire, England; iron foundries; cotton mills. Pop. (1911) 15,147.

RAMSEY (52° 27′ N., 7′ W.), market-town, Huntingdonshire, England. Pop. (1911) 5328.

RAMSEY (54° 19′ N., 4° 23′ W.), seaport watering-place, Isle of Man. Pop. 4700.

RAMSGATE (51° 20′ N., 1° 25′ E.), seaport, watering-place, Isle of Thanet, Kent, on North Sea. Pop. (1911) 29,605.

RAMUS, PETRUS (1515–72), Fr. humanist; b. Picardy, s. of charcoal burner; ed. Navarre; wrote treatise on logic; inclines towards rhetoric; denies fourth figure of syllogism; deduces figure from position of middle term.

RAMUSIO, PAOLO, RHAMNUSIO, RANNUSIO (*c.* 1443–1506), Venetian magistrate and jurist; pub. *De re militari* of Valturius, which he translated into Italian.

RAMUSIO, GIROLAMO (1450–86), bro. of above; translated Avicenna's works from Arabic into Italian, and wrote various treatises and verses.

RAMUSIO, GIAN BATTISTA (1485–1557), s. of Paolo; secretary of Venetian Council of Ten, 1533, and held various other offices in republic. Famous as editor of *Navigationi e Viaggi*, the Italian Hakluyt, pub. 1550–59.

RAMUSIO, PAOLO GIROLAMO GASPARE (1532–1600), s. of above; translated with amplifications part of chronicle of crusader Villehardouin into Italian.

RANAVALONA, QUEEN, see MADAGASCAR.

RANCHI (23° 22′ N., 85° 22′ E.), chief town of Chota Nagpur division, Bihar and Orissa, India. Pop. 25,970. Ranchi district has area 7128 sq. miles. Pop. 1,187,925.

RAND (*i.e.* low range of hills), popular and abbreviated name for *Witwatersrand*, rich gold mines W. of Johannesburg (*q.v.*), S. Africa.

RANDAZZO, ancient TISSA (37° 50′ N., 14° 57′ E.), town, Sicily, at foot of Mount Etna. Pop. (commune) 12,500.

RANDERS (56° 27′ N., 10° E.), town, Jutland, Denmark, on Gouden-Aa; manufactures gloves. Pop. (1911) 22,970.

RANDOLPH, EDMUND JENNINGS (1753–1813), Amer. statesman; delegate to Congress, 1779–82; gov. of Virginia, 1786–88; his draft of constitution for U.S.A. rejected; Attorney-Gen., 1789; Sec. of State, 1794; forced from office on account of intercepted letter disclosing private intrigue with France; suspected further of malversation of funds.

RANDOLPH, JOHN, OF ROANOKE (1773–1833), Amer. statesman; chairman of Committee of Ways and Means under Jefferson, 1801; acted part of republican free-lance; abolitionist, but states' rights man.

RANDOLPH, THOMAS (1523–90), Eng. ambassador; his dispatches from Scotland constitute an important hist. source for Elizabeth's reign; envoy to Russia, 1568; France, 1573, 1576.

RANDOLPH, THOMAS, 1ST EARL OF MORAY (d. 1332), Scot. patriot; nephew and follower of Robert Bruce; scaled and captured Edinburgh Castle from English, 1314; second in command at *Bannockburn*, 1314; defeated English at *Milton*, 1319; Regent of Scotland, 1329–32.

RANELAGH, London pleasure-gardens with concert-hall, etc., fashionable in XVIII. cent.; near Thames, Chelsea.

RANGE FINDER, TELEMETER, instrument for

finding the distance, or 'range,' of objects to be fired at. Its principle is based on trigonometry, and one or more telescopes are used, the range being recorded in metres or yards without any calculation. Many varieties are used for different purposes, *e.g.* navy, army, and harbour defence. In 1891 the Brit. Admiralty advertised for a r. f., and the winning instrument was that designed by Professors Barr and Stroud. A naval r. f. is made up of a tube with two telescopes, free to revolve about its longer axis. The type formerly used by the army was practically a box-sextant consisting of two instruments, used simultaneously in connection with a base of known length. Since 1908, however, this instrument has been superseded by the invention of Captain Marindin of the Black Watch. R. f's for harbour defence are adjusted for long-distance firing, and solve a triangle in the vertical plane, the base of which is the known height on the r. f. from the sea-level.

RANGIFER, Reindeer; see under Deer Family.

RANGOON (16° 53′ N., 96° 4′ E.), capital and chief port of Burma, on R. River; regularly laid out; has Anglican cathedral and other churches, and contains the sacred Shway-Dagon pagoda; has belonged to British since 1852; good harbour; exports rice, rubber, teak, cotton. Pop. (1911) 293,316.

RANGPUR, Rungpore (25° 45′ N., 89° 17′ E.), district, Rajshahi division, Bengal, India. Pop. 2,155,000. Capital, **Rangpur**, on Ghaghat. Pop. 16,300.

RANIDÆ, Frogs (*q.v.*).

RANJIT SINGH (1780–1839), Indian *Maharaja*; seized Lahore, 1799, Amritsar, 1802; by treaty, 1809, surrendered district south of Sutlej to Britain; established Sikh rule over whole Punjab.

RANKE, LEOPOLD VON (1795–1886), Ger. historian; b. Wiehe, Thuringia; became schoolmaster; pub. *Geschichte der Romanische und Germanische Völkerschaften von 1494–1535* (1824); became prof. extraordinary of History at Berlin Univ., 1825, and won distinction by original researches; *Fürsten und Völker von Südeuropa im 16 und 17 Jahrhunderts*, 1827, shows modern hist. methods; produced famous *Die Römischen Päpste, ihre Kirche und ihr Staat im 16 und 17 Jahrhunderts*, 1834–36, showing deep insight into ecclesiastical history, width of view, and excellent literary style; many other books, widely translated; *Französcsche Geschichte vornehmlich im 16 und 17 Jahrhunderts*, 1852–57, and *Englische Geschichte vornehmlich im 16 und 17 Jahrhunderts*, 1859–67 (trans., 1875), never superseded; ennobled, 1866.

RANNOCH (56° 37′ N., 4° 32′ W.), elevated moorland district, N.W. Perthshire; contains Loch Rannoch.

RANNUSIO, see Ramusio.

RANUNCULACEÆ, a natural order of herbaceous dicotyledons, many species being indigenous to Britain. The plants often possess underground parts stored with food, and many show palmatisect leaves (*Ranunculus bulbosus*), although in others (*R. hederaceus*) they are merely lobed. The flower, in the Buttercup, has five sepals and petals, and numerous spirally arranged stamens and carpels. Some forms such as Aconitum and Delphinium diverge considerably from this type, being zygomorphic, with petals represented by nectaries.

RAPALLO (44° 22′ N., 9° 13′ E.), seaport, winter resort, Genoa, Italy, on Gulf of Genoa; exports olive oil. Pop. (commune) 12,000.

RAPE (*Brassica napus*), a member of the Cruciferæ, allied to the cabbage. **Rape Oil** or **Colza** is derived from its seeds; when refined, light yellow, nearly odourless; S.G. ·915; uses—burning, lubrication, soapmaking.

RAPE, the carnal knowledge of a woman by violence and against her will. Formerly a capital offence, but now punishable as felony by penal servitude. In Britain consent of the female is no excuse if she is under 16.

RAPHAEL, SANTI, Raffaello Sanzio (1483–1520), the greatest Ital. painter of the Rom. school, was born at Urbino. His father was a poet and painter of some distinction, but he died when his son was only eleven years old. The boy studied under Timoteo Viti, and from him learned gentleness and grace of touch of his early paintings (e.g. *The Vision of a Knight*, in the National Gallery, and the *St. Michael* and *St. George* of the Louvre). At seventeen, R. went to study with Perugino of Perugia, then the most famous painter in Italy. R. quickly absorbed and translated the best qualities of his master's art, and in his *Crucifixion* and the *Conestabile Madonna* he exceeds the master. R.'s culminating work of this first period is the *Sposalizio* (1504). Here are harmonised, blended, and transformed the excellences of his first master Timoteo and of Perugino.

R. then proceeded to Florence. Here his genius became intoxicated with the artistic glories of the wonderful city. He studied reverently and tirelessly the art of Donatello, Michelangelo, Mantegna and Signorelli, and Fra Bartolommeo; but Leonardo inspired him most. Here his own genius began to manifest itself in its full splendour and maturity. He commenced that long series of Madonnas, whose tender loveliness and exquisite beauty have purified and inspired initiated and uninitiated alike. The most masterful work of his Florentine period was the *Entombment*, painted in 1507, for the chapel in the Duomo of Perugia; but though this work compels admiration for its magnificence of conception and perfection of execution, it does not reveal the characteristics of R.'s finest productions.

R. proceeded to Rome in 1508. Pope Julius II. committed to him the decoration of the Vatican Stanze. On the right wall of the Camera della Segnatura he represented the Church triumphant. On the left were depicted the great Athenian philosophers. On the two remaining walls he represented Apollo and the Muses with the poets of Greece and Rome, seated on the slopes of Parnassus, and Justinian and Gregory XI. as lawgivers. The whole is a perfect blending of the Pagan and Christian ideals. In the next hall, Raphael painted the expulsion of Heliodorus from the Temple of Jerusalem, and the pope and the cardinals kneeling at the altar where the miracle of Bolsena is performed. His fresco, the *Deliverance of St. Peter from Prison* is in some aspects the finest of the series. Under the patronage of Julius II. Raphael also painted the *Madonna della Sedia*.

In 1515 Raphael commenced his magnificent cartoons of the *Acts of the Apostles*, as designs for the tapestries of the Sistine Chapel. From this period, though his genius was fertile as ever, the master was constrained to leave the execution of his designs to his pupils. His last days were devoted to the great *Transfiguration* which Cardinal Giulio dei Medici had ordered for the Cathedral of Narbonne. He painted the upper half of the picture, but as he sketched the lower half the brush dropped from his hand, and he was removed to his bed of death. He was mourned by all Rome.

Raphael, Masterpieces in Colour Series.

RAPHIDIIDÆ, see Snake-Flies.

RAPPOLTSWEILER, Ribeauville (48° 12′ N., 7° 19′ E.), town, Alsace-Lorraine, Germany; trade in wine; manufactures textiles. Pop. (1910) 5945.

RARE EARTHS are oxides of the following metals: scandium (Sc=44·1), yttrium (Y=89·0), lanthanum (La=139·0), cerium (Ce=140·25), praseodymium (Pr=140·6), neodymium (Nd=144·3), samarium (Sm=150·4), europium (Eu=152·0), gadolinium (Gd=157·3), terbium (Tb=159·2), dysprosium (Dy =162·5), erbium (Er=167·4), thulium (Tm=168·5), neo-ytterbium (Yb=172·0), and lutecium (Lu=174·0).

They occur in rare and complex minerals in Scandinavia, Siberia, N. and S. America, etc.; such as cerite, gadolinite, samarskite, lanthanite, monazite; and are separated by fractional crystallisation, precipitation, etc., of their salts. Auer von Welsbach

divided didymium into praseo- and neo-dymium, and Crookes fractionated yttria into about eight slightly different components. It is consequently difficult to pronounce on the elementary nature of some of the rare earth metals, or to classify them in the periodic system. Ceria finds application in med., and, mixed with 99 parts of thoria, forms the material of the incandescent gas mantle.

RASK, RASMUS CHRISTIAN (1787–1832), Dan. philologist; b. near Odense; pub. admirable works on the Icelandic language, Anglo-Saxon grammar, Sanskrit, Persian, and Arabic; also an authority on Egyptian and Hebrew chronology.

RASPBERRY (*Rubus Idæus*), member of the Rosaceæ commonly cultivated for its fruit, which is, technically, an aggregate of drupes, or stone fruits; plant propagates largely by means of suckers, which produce new 'canes' some distance from parent stem.

RASPE, RUDOLF ERICH (1737–94), Ger. author; b. Hanover; d. Ireland; wrote inimitable *Adventures of Baron Munchausen*, besides poems and translations.

RASTATT (48° 52′ N., 8° 12′ E.), town, on Murg, Baden, Germany; scene of two peace congresses—between Austria and France in 1714, and between France and Germany in 1797–99; hardware, beer, tobacco. Pop. (1910) 15,199.

RASTENBURG (54° 6′ N., 21° 22′ E.), town, E. Prussia, Germany; manufactures flour. Pop. (1910) 11,949.

RATAK, see Marshall Islands.

RATEL, see Weasel Family.

RATHENOW (52° 37′ N., 12° 20′ E.), town, on Havel, Brandenburg, Prussia; spectacles and optical instruments. Pop. (1910) 24,906.

RATIBOR, Polish Racibórz (50° 6′ N., 18° 13′ E.), city, on Oder, Silesia, Prussia; steel and iron manufactures. Pop. (1910) 38,424.

RATIONALISM, in wide sense, revolt of individual reason against authority; narrower, the attempt to deduce geometrically all knowledge from certain elementary concepts (Descartes, Spinoza, Leibnitz). Kant denied validity of this mathematical method; rational concepts to yield new truths must be applied to matter of sense given in experience.

RATISBON, see Regensburg.

RATITÆ, Running Birds (*q.v.*).

RATLAM (23° 21′ N., 75° E.), native state, Malwa, Central India. Pop. 87,000. Capital, Ratlam. Pop. 37,000.

RATNAGIRI (16° 59′ N., 73° 20′ E.), district, Bombay, India. Pop. 1,200,000. Capital, Ratnagiri, on Arabian Sea. Pop. 16,500.

RATNAPURA (6° 40′ N., 80° 25′ E.), town, Sabaragamuwa, Ceylon. Pop. 4100.

RATON (37° N., 104° 30′ W.), city, New Mexico, U.S.A.; coal-fields. Pop. (1910) 4539.

RATS, see Mouse Family.

RATTAZZI, URBANO (1808–73), Ital. statesman.

RATTLESNAKE, see Snakes and Serpents.

RAU, KARL HEINRICH (1792–1870), Ger. political economist; prof. of Political Economy at Heidelberg, 1822–69; chief work, *Lehrbuch der politischen Œconomie*, 1826–37, one of ablest modern treatises.

RAUDNITZ (50° 25′ N., 14° 16′ E.), town, Bohemia, Austria, on Elbe; noted château. Pop. (1911) 9256.

RAUMER, FRIEDRICH LUDWIG GEORG VON (1781–1873), Ger. historian.

RAVELIN, see Fortification.

RAVELLO (40° 40′ N., 14° 40′ E.), small town, Salerno, Italy; XI.-cent. cathedral.

RAVEN, see under Crow Family.

RAVENNA (44° 25′ N., 12° 12′ E.), chief town, R. province, Italy; surrounded by wall with five gates; communicates with Adriatic Sea by Corsini Canal. R., an archiepiscopal see, has a large number of interesting churches, many dating from V. cent. Cathedral of St. Urso, originally built in IV. cent., was rebuilt in first half of XVIII. cent.; it has a baptistery and a Rom. bell-tower. Church of San Vitale, built originally in early VI. cent. and restored in late XIV. cent., has some Byzantine mosaics of great interest. S. Apollinare Nuovo was originally an Arian basilica, built by Theodoric the Goth, *c.* 504, and dedicated then to St. Martin; it also contains some remarkable VI.-cent. mosaics. Churches also ascribed to Theodoric are those of Santo Spirito and Santa Maria. Church of San Francesco dates from V. cent., and that of S. Apollinare in Classe, built in the VI. cent., is the largest Early Christian basilica in Italy; that of SS. Nazario e Celso, built *c.* 450, contains tomb of Galla Placidia. Many of the foregoing have campaniles, and several have baptisteries; and there are other churches of considerable interest.

R. was seat of government of Rom. emperors in V. cent., and was taken by Theodoric (*q.v.*) in 493; recovered by Rome in 539; subsequently belonged to Lombards and then to Franks, from whom it passed to pope. Pop. (1911) 71,690; (prov.) 248,645.

Gardner, *Ravenna* (Mediæval Town Series).

Ravenna, Exarchate of, lands of Byzantine empire in Italy, 568–751, ruled by exarch (new form of prætorian prefect), whose capital was at Ravenna. Exarch was appointed at close of VI. cent. to command all Rom. troops in Italy against Lombards; submitted to Lombard king, Astulf, 751; granted to Papacy by Pippin, 754.

RAVENSBURG (47° 46′ N., 9° 37′ E.), town, on Schussen, Württemberg, Germany; textiles. Pop. (1910) 15,594.

RAVI (32° N., 74° 50′ E.), river, Punjab, India; joins Chenab.

RAWALPINDI (33° 36′ N., 73° 3′ E.), division, Punjab, India. Pop. 562,000. Capital, **Rawalpindi.** Pop. (1911) 86,483.

RAWITSCH, Polish Rawicz (51° 37′ N., 16° 50′ E.), town, Posen, Prussia; snuff. Pop. (1910) 11,529.

RAWLINSON, SIR HENRY CRESWICKE (1810–95), Brit. soldier, archæologist, and politician; distinguished in Afghan War, 1842; consul at Bagdad, 1844; carried out Assyrian and Babylonian excavations.

RAWLINSON, SIR ROBERT (1810–98), Eng. engineer; began life as stone-mason, then engineer; app. to Sanitary Commission to inquire into condition of troops in Crimea.

RAWMARSH (53° 27′ N., 1° 21′ W.), town, Yorkshire, England; ironworks; collieries. Pop. (1911) 17,190.

RAWTENSTALL (53° 42′ N., 2° 18′ W.), town, Lancashire, England; cotton and woollen industries. Pop. (1911) 30,516.

RAY, JOHN, Wray (1628–1705), Eng. naturalist; the 'father' of Eng. natural history; famous for his contributions especially to the science of bot. He demonstrated the ascent of sap in plants; classified them according to their cotyledons; was also author of several zoological works, and emphasised the importance of anatomical characters in a natural classification, so that, along with his pupil Willoughby, he has been regarded as the founder of systematic zool. His merits are commemorated by the *Ray Society,* founded in 1844 for the publication of monographs on natural history.

RAY SOCIETY, see Ray, John.

RAYAH, a Christian subject living under Turk. rule.

RAYLEIGH, JOHN WILLIAM STRUTT, 3RD BARON (1842–), Eng. physicist; senior wrangler and Smith's prizeman; Cavendish prof. of Physics, Cambridge, 1879–84; Nobel prize, 1904; pres., Royal Soc., 1905–8; discovered argon (*q.v.*).

RAYMUND OF PENNAFORTE, see Canon Law.

RAYMUND IV. OF TOULOUSE, Count of Provence (d. 1105), prominent leader in First Crusade; disputed with Bohemund possession of Antioch, 1098; vainly sought to establish himself in rival city at Arca; refused offered dignity of advocacy of Holy Sepulchre, however, being unwilling to rule where Christ suffered; commenced conquest of Tripoli, afterwards Provençal countship.

RAYMUND, PRINCE OF ANTIOCH (1099–1149), selected by Fulk, king of Jerusalem, to marry infant heiress of Antioch, 1130; constant struggles against Gk. emperor; typical mediæval Fr. noble.

RAYNAL, ABBÉ DE, GUILLAUME THOMAS FRANÇOIS (1713–96), Fr. author; wrote on eve of Fr. Revolution with assistance of various noted men, *Establishments and Commerce of the Europeans in the Indias*, 1770, a compilation with political aim.

RAYNALD OF CHÂTILLON (d. 1187), second husband of Constance, princess of Antioch; defeated Saladin, 1177, and after many times breaking faith with him, suffered death at his hands.

RAYNAUD'S DISEASE, a disease usually affecting women in early adult life, of nervous origin, predisposed to by cold. It occurs in three stages: first, *local syncope*, temporary bloodlessness in the part, with pain and pallor; then *local congestion*, the part being blue from local congestion, painful, and cold; and lastly, *necrosis*, in which gangrene appears, and the dead part may become detached. The extremities are affected symmetrically by the disease. The treatment is to attend to the general health, induce local hyperæmia in the early stages by a bandage applied round the limb for a few minutes daily, while the electric current is of benefit.

RAYS (*Batoidea*), group of Selachian fishes (*q.v.* for general characters) with flattened bodies, large pectoral fins, ventral gill-openings, and often a long whip-like tail. Most common are the SKATES, found in temperate and colder seas, 9 species of which are British, best known being the Common Skate (*Raia batis*), up to 6 ft. long, and the Thornback (*R. clavata*), up to 3 ft. The STING RAYS and EAGLE RAYS—armed with a strong spine up to 6 or 8 in. long, placed at the base of the tail, and capable of inflicting grievous wounds—are represented by *Trygon pastinaca* and *Myliobatis aquila* respectively. Even an ELECTRIC RAY, *Torpedo hebetans*, with strong, muscular, electric battery hidden between head and pectoral fin, has not infrequently been found. The SAW FISHES (*Pristis*), however, are confined to tropical seas, where, with the strong flat-toothed blade which continues the snout, they do much havoc amongst their brethren.

RAZGRAD (43° 30′ N., 26° 30′ E.), town, Bulgaria; active agricultural trade. Pop. (1910) 13,975.

RAZINE, STEPHEN TIMOFEEVICH (d. 1671), Russ. rebel Cossack; seized Jaïk (Ouralsk), 1667, and pillaged ships navigating Volga and Oural; gathered large band of discontented men, and captured town after town; driven back from Simbirsk, 1670, and captured.

RAZOR, see CUTLERY.

RAZOR-BILL, see under GUILLEMOT and AUK FAMILY.

RAZOR-SHELL, see under LAMELLIBRANCHIATA.

RÉ, ÎLE DE, Rhé (46° 11′ N., 1° 25′ W.), island, Charente-Inférieure, France; unsuccessfully besieged by English, 1627. Pop. 14,500.

READE, CHARLES (1814–84), Eng. novelist; b. at Ipsden, Oxfordshire. His first works were dramatic, and include *Masks and Faces* (or *Peg Woffington*), *Christie Johnstone*, and *Peregrine Pickle*. His novels include *It's Never Too Late to Mend* (a study of prison life), *The Cloister and the Hearth* (his masterpiece, dealing with the life of the father of Erasmus), *Hard Cash* (a study of asylum life), *Put Yourself in his Place* (dealing with Trade Unionism). His novels nearly all deal with social problems, and are written with a purpose.

READING (51° 27′ N., 0° 59′ W.), county town, Berkshire, England, at junction of Kennet and Thames; has a Univ. Extension College; fine municipal buildings, several interesting churches, and the remains of a XII.-cent. Benedictine abbey; biscuit factories; iron foundries; occupied by the Danes in 871; by Parliamentarians in 1643. Pop. (1911) 75,214.

READING (40° 20′ N., 75° 58′ W.), city, on Schuylkill, Pennsylvania, U.S.A.; coal and iron region; railway workshops; large manufactures of iron and steel. Pop. (1910) 96,071.

REAL PROPERTY is distinguished from '*personal*' property by the fact that it can be recovered by law when in the hands of a false owner. Freehold estates, rights over minerals, and landed property generally is 'real' property. The greatest estate which a person can hold is the fee simple, and it arises where land is given 'to a person and his heirs.' In the strict eye of the law, all land in England is held either directly or indirectly from the Crown; but the owner of the fee simple is to all practical intents and purposes the absolute owner of the property. He is entitled to hold it for ever, for it is a legal maxim that 'there can be no reversion on a fee simple.' In the case of 'real' property, when the owner dies intestate it descends to the heir-at-law, whereas, with 'personal' property, the next-of-kin inherits. If the real estate is entailed it cannot be disposed of by the owner, but on his death becomes the property of his heir 'of the body begotten'; or, if it is entailed in special by a particular wife, then it becomes the property of his heir begotten by that particular wife.

REALISM (Modern), theory that reality exists apart from consciousness. R. in lit. is opposed to romanticism; it shows life as it is, not as an idealist wants it to be. Among realists are Zola, Guy de Maupassant, Tolstoi, Gorki, Upton Sinclair (in *The Jungle*). Ibsen's influence has given r. a strong position in modern drama.

REAPING-MACHINES have now almost completely replaced sickle and scythe as a means of cutting standing crops. The reaping-machine consists of a long iron comb carried horizontally a few inches above the ground, on which works a cutting knife which is like a very coarse saw with sharpened teeth. The comb holds the stalks in position, while the saw cuts them. In older forms the cut cereal was removed by a hand-rake, but now a *binder* is generally added to the reaper, and this automatically binds the cereal into sheaves and throws them out at the side of the machine.

REASON.—(1) mind as drawing or capable of drawing inferences; (2) mind as apprehending or capable of apprehending systematic truth; (3) mind as the source of system and order.

RÉAUMUR RENÉ ANTOINE FERCHAULT DE (1683–1757), Fr. naturalist and physicist; discovered production of steel from iron, iron tinning, production of opaque glass, artificial incubation, etc.; constructed thermometer (*q.v.*) with temperature scale bearing his name.

REBAB, RABAB, probably the oldest of stringed instruments. According to some authorities, it originated in Arabia, and was brought thence to Spain in the VIII. cent.; others suggest that by the conquest of Spain it became known to the Arabians. It was played with a bow, and but for the absence of deep curved indentations, and the peculiar form of the resonance box, might be regarded as an early violin. The r. subsequently developed into the *rebeck* (q.v.).

REBECK, REBEC, ancient stringed instrument of the violin kind played with a bow, in use during the Middle Ages; introduced by the Moors into Spain; rendered obsolete by violin. R. has a pear-shaped body with sound-holes, three gut-strings, and a bridge; chiefly used for accompanying singing and dancing. R. may be treble, alto, tenor, and bass.

REBELLION, in England 'The Great R.' is the struggle between Charles I. and Parliament; in Scotland 'The R.' means the Jacobite revolt of 1715 and 1745.

REBELLION, THE GREAT, see GREAT REBELLION.

RÉCAMIER, JEANNE FRANÇOISE JULIE ADELAIDE (1777–1849), Fr. leader of society; wife of banker, Jacques R.; presided over famous *Salon de l'Abbaye-au-bois*; reputation not of wit but physical

perfection and elegance and strong influence; celebrated portrait by David in Louvre.

RECANATI (43° 24′ N., 13° 31′ E.), city, Macerata, Italy; cathedral. Pop. (commune) 17,000.

RECEPT, see GENERIC IMAGE.

RECESSIVE CHARACTER, see MENDELISM.

RECHABITES, 'Sons of Rechab' (*Jeremiah* 35[6]), Total Abstinence Friendly Soc.

RECHBERG-ROTHENLÖWEN, JOHANN BERNHARD, COUNT (1806–99), Austrian statesman; minister of foreign affairs, 1859–64, and minister pres., 1859, at moment of great Austrian weakness; failed to carry emperor's scheme of Federal reform against Prussia, 1863; sought to detach Prussia from France; fell from power through short-sighted seconding of Prussian policy in Schleswig-Holstein.

RECIFE, PERNAMBUCO (8° S., 35° 53′ W.), city, seaport, capital of Pernambuco state, Brazil, on Atlantic; consists of three parts, Recife, San Antonio, and Boa Vista, separated by narrow channels and connected by bridges; contains government buildings, naval and military arsenals, hospital, theatre, observatory; manufactures cotton; exports sugar. Pop. 117,000.

RECKLINGHAUSEN (51° 40′ N., 7° 13′ E.), town, Westphalia, Prussia; collieries; manufactures linen. Pop. (1910) 53,701.

RECLAMATION OF LAND, see LAND.

RECLUS, JEAN JACQUES ELISÉE (1830–1905), Fr. geographer; for several years a prof. at Brussels. The greatest of his works is the *Nouvelle Géographie Universelle* in 17 vol's.

RECORD, name given in England to MS. document which has been the instrument of a legal or official transaction. These documents used to be known as the ROLLS from the fact of their being usually in the form of Rolls; this gave its name to their depository, now called the RECORD OFFICE (built on the Rolls estate, Chancery Lane, London, 1851), to their Keeper (the MASTER OF THE ROLLS), and to the publications of chronicles, etc., known as the *Rolls Series*. In the Advocates' Library, Edinburgh, the persevering searcher may still find publications under the heading 'Rolls.' Many r's formerly kept in the Tower of London, State Paper Office, and elsewhere have been moved to the R. Office, but the principle of centralisation has not been entirely adopted, and there are even provincial register houses like those of the Ridings of Yorks. Scotland has a General REGISTER HOUSE and several other repositories; Ireland has a Public R. Office and State Paper Office.

ARTHUR AGARDE (1540–1615), 'recordorum . . . diligens scrutator,' was the pioneer indexer of Eng. public documents. The rolls suffered general neglect until the XIX. cent. The work of the RECORD COMMISSION (1800–37), which printed in more or less correct form numerous important r's, is still useful, but being rapidly superseded by the usually minutely accurate editions of present R. Office officials. Reference can be made here to only a few of the numerous sorts of r. They are classified by Mr. Scargill-Bird, whose *Handbook* (3rd edit., 1908) is a necessary guide, as r's of (1) the superior courts of law; (2) special and abolished jurisdictions (*e.g.* Star Chamber); (3) duchy of Lancaster; (4) palatinate of Durham; (5) palatinate of Lancaster; (6) principality of Wales (including the palatinate of Chester); with (7) State papers and departmental r's.

The oldest r's are in one of the many branches of the 1st division, *i.e.* the 'Cartæ Antiquæ,' transcripts of CHARTERS from Ethelbert to Edward I. Birch and others have published the Saxon charters, and the R. Commission printed a *Calendarium Rotulorum Chartarum* of John, and a calendar of later charters bound up with their *Calendarium Inquisitionum ad quod damnum*, largely superseded by the R. Office Calendars of Charter Rolls commencing with Henry III. and Inquisitions *ad quod damnum* in the *Lists and Indexes* series. While many of the r's are being fully calendared, others are being merely made accessible by the *Lists and Indexes*; at the same time it may be noted that the *Calendars of State Papers* are by no means full, often omitting important facts.

Other forms of royal grant are CLOSE ROLLS (of which there are over 18,000) and PATENT ROLLS, which also contain miscellaneous orders by the king to individual subjects, towns, etc. These documents became the title-deeds of their possessors and copies retained by the Crown (on the rolls) became r's. The roll generally begins and ends with the regnal year. They have been printed almost to the end of the XV. cent., and the very full *Letters and Papers of Henry VIII.* contains those of his reign. Important for genealogy and topography are the Inquisitions *post-mortem*, made whenever a tenant-in-chief of the Crown died, the Proof of Age (*Probatio ætatis*) of the royal ward before he could receive his lands, the Fine Rolls, Subsidy Rolls, and similar feudal documents, all in process of being calendared.

The PIPE ROLLS (Henry I. to William IV.), many of the early ones of which are printed, were the final account of the Exchequer; there are also Exchequer Issue and Receipt Rolls. The *Taxatio* of Pope Nicholas (*c.* 1292), the *Inquisitio Nonarum* (XIV. cent.), and *Valor Ecclesiasticus* of Henry VIII., all printed by the R. Commission, are valuable r's of Church history. Parliamentary matter has been largely printed. The Record Commission published the *Rotuli Curiæ Regis* (5 Ric. I. to 56 Hen. III.) and the *Abbrevatio Placitorum*, but the vast bulk of judicial matter is even yet unlisted, except in a partial way in Boyd's MS. Indices and Plantagenet Harrison's extraordinary MS. 'Notes' (both at the R. Office). The Feet of Fines and RECOVERY ROLLS represent an extinct method of conveying land; in order to make the title of the grantee sure, a fictitious suit was brought (after payment of a fine to the king) by the grantor, against whom judgment was given.

Canada and Australia have their own repositories, but the same material is to be found in the Colonial Office at the R. Office. The U.S.A. have both States and Federal archives; r's before the separation are to be found both in the Eng. R. Office and in the States' archives, and the historian usually finds it more convenient to consult them in London than to travel from state to state. The *Archives Nationales* at Paris and the central Archives of Berlin have taken the lead in Europe in publishing historical sources. See ARCHIVES.

RECORDER, obsolete Eng. beak-flute, something like a flageolet, with six or seven holes. It is referred to in a famous scene in *Hamlet*.

RECOVERY ROLLS, see RECORD.

RECTOR, in Church of England a clergyman who enjoys the benefices of the parish where the tithes are not impropriate. In Scotland the name is given to the headmaster of academies or leading schools.

RECTUM, see DIGESTION.

RECURVIROSTRA, Avocet Bird; see under PLOVER FAMILY.

RECUSANT, in England, one refusing to attend Established Church; R.C. and Puritan r's were punished from Elizabeth's reign onwards; latter relieved by Toleration Act, 1089, former by Emancipation Act, 1829.

RED BANK (40° 20′ N., 74° 5′ W.), town, New Jersey, U.S.A. Pop. (1910) 7398.

RED CROSS, see AMBULANCE.

RED RIVER (31° 20′ N., 92° 30′ W.), river, rises in Staked Plain, Texas; flows through Texas, Arkansas, and Louisiana; joins Mississippi; length, 1200 miles; navigable to Shreveport.

RED RIVER OF THE NORTH (48° N., 96° W.), rises near source of Mississippi, Minnesota, U.S.A.; flows northwards, separating Dakota from Minnesota; traverses Manitoba, and falls into Lake Winnipeg; length, 750 miles.

RED RIVER SETTLEMENT (50° 20′ N., 98° W.),

Scot. colony; founded, 1812, on Red River of the north, near Winnipeg, Canada.

RED SEA (24° N., 38° E.), an extension of Ind. Ocean, passing north-westward, between Arabia and Africa, towards Mediterranean, with which it connects by Suez Canal; opens off Gulf of Aden by Strait of Bab-el-Mandeb; at N. end breaks into two arms, GULF OF SUEZ on W., GULF OF ARABIA on E.; water very salt, owing to great amount of evaporation; coral reefs along both shores; length, *c.* 1300 miles.

'RED SPIDER,' see under MITES.

RED WATER FEVER, see under MITES.

RED WING (44° 34′ N., 92° 31′ W.), city, on Mississippi, Minnesota, U.S.A.; flour-mills; exports wheat. Pop. (1910) 9048.

REDAN, see FORTIFICATION.

REDBREAST, or ROBIN, see under THRUSH FAMILY.

REDCAR (54° 37′ N., 1° 4′ W.), watering-place, Yorkshire, England. Pop. (1911) 10,509.

REDDITCH (52° 18′ N., 1° 56′ W.), town, Worcestershire, England; needles, fish-hooks. Pop. (1911) 15,463.

REDEMPTIONISTS, TRINITARIANS (*q.v.*).

REDESDALE, JOHN FREEMAN-MITFORD, LORD (1748–1830), Eng. lawyer; wrote valuable *Pleadings in Suits in the Court of Chancery by English Bill*, 1777; attorney-general, 1799–1801; speaker, 1801–2; chancellor of Ireland, 1802–6; lord of trade, 1808.

RED-EYE, see CARPS.

REDFERN, suburb of Sydney, New South Wales, Australia; iron and railway works. Pop. 26,000.

REDLANDS (34° 5′ N., 117° 20′ W.), city, California, U.S.A.; centre of orange-growing district; canneries. Pop. (1910) 10,449.

REDMOND, JOHN EDWARD (1851–), Irish politician; a clerk in the House, a barrister, then M.P.; leader of United Nationalists (1900); protagonist of Home Rule.

REDON (47° 39′ N., 2° 4′ W.), town, on Vilaine, Ille-et-Vilaine, France; emery paper. Pop. 6700.

REDONDA (25° 5′ N., 61° 35′ W.), small mountainous island, Brit. W. Indies; phosphate mines.

REDONDELA (42° 27′ N., 8° 40′ W.), seaport, Pontevedra, Spain; sardine and oyster fisheries. Pop. 11,100.

REDOUBT, see FORTIFICATION.

REDPOLLS, see under FINCH FAMILY.

REDRUTH (50° 13′ N., 5° 13′ W.), market town, Cornwall, England; tin mines. Pop. (1911) 10,815.

REDSHANK (*Totanus calidris*), a member of the Plover Family (*q.v.*), distinguished by bright red legs, yellow black-tipped bill, and noisy cry. It breeds in tussocky places inland, but in winter frequents the sea-coast. The Spotted R. (*T. fuscus*) is a spring and autumn visitor to Britain.

REDSTART, see under THRUSH FAMILY.

REDWING, see under THRUSH FAMILY.

REED, a division of the ruminant stomach; see under PECORA.

REED, JOSEPH (1741–85), Amer. soldier and politician; pres. of Pennsylvania Convention, 1775; adjutant-general of Washington, 1776; pres. of Pennsylvania, 1778.

REED INSTRUMENTS, distinguished from instruments in which the tone is produced by strings or by blowing into an open tube, are those in which the sound is obtained by means of a reed. In instruments like the clarinet and oboe the reed is placed within a tube; in those like the harmonium and concertina no tube is required. The two classes are known respectively as *beating* and *free reeds*.

REEDBUCK, see REITBOK.

REEF, see CORAL.

REES, THOMAS (1777–1864), Welsh Unitarian minister.

REEVE, HENRY (1813–95), Eng. writer; wrote foreign political articles for *Times*, 1840–55; edit. *Edinburgh Review*, 1855–95; edit. *Greville Memoirs*, 1865.

REEVES, JOHN SIMS (1818–1900), Eng. tenor; studied at Paris and Milan; best tenor of his time.

REFERENDUM, political system by which measures approved by the legislature are submitted to the electorate before they can become law. Advocates of the system claim that it is the only practical check upon single-chamber government, preventing the passing of hasty and ill-advised measures which might be pressed forward by a democratic legislature. Opponents urge that the position of parliamentary representatives would be degraded, and that the better class of men would withdraw from the political arena if such conditions obtained. In Switzerland, on the demand of 50,000 voters, or of eight cantons, any law passed by the Federal Parliament must be submitted to the general body of the people. Similarly, laws passed by the parliaments of the separate cantons may be, and in many cantons must be, referred to the cantonal voters. The system, in one form or another, has been employed in Switzerland for several centuries, but the modern institution dates from about the middle of the XIX. cent. The R. is embodied in the Constitution of the Australian Commonwealth, and alterations in the federal constitution must be submitted to the electors. The democratic schemes of a Labour Government were, in 1911, defeated in this manner. R. has been adopted by a number of Amer. states (and cities, for municipal affairs), and most of these have *Initiative* also, providing that legislature consider and in some cases submit to R. any law for which a certain percentage of voters have petitioned.

REFLECTION, see LIGHT.

REFORMATION, THE, one of the greatest movements which have affected all subsequent European history, must be viewed in close connection not only with what followed but with what went before. The mediæval Church was not only a great religious organisation, it was part and parcel of the whole fabric of the mediæval world.

The mediæval Church was, broadly speaking, compounded of three elements—early Christianity, the Roman Empire, and the barbarians; from the IV. cent. it had been coextensive with the Empire, and it had largely civilised the ruder northern races. It had become interwoven with the feudalism resultant on the clash of Roman and barbarian, it had risen to great heights of pretension and of power under Hildebrand, and again under Innocent III., but in the XIV. and XV. cent's a decline had set in. For seventy years the Papacy had been in 'captivity' at Avignon; it had been weakened by schisms and antipopes; the Councils of Constance, 1415, and Basel, 1431, had been futile. The close of the XV. cent. saw the dawning of humanistic culture, the rediscovery of the ancient classics, and mental awakening in various directions. But what threatened the Church more than all was the worldliness of its clergy. Granted that Prot. historians have often painted unfair pictures of the Middle Ages, it cannot be denied that the Church had reached a low ebb, not only of spirituality but even of morality. Its prelates were courtiers; many of its monks and even friars corrupt. Outwardly it was flourishing; schools and univ's, churches and shrines existed in abundance.

That a reformation of some sort was needed was frequently asserted—but none could bring it about. It is important to distinguish between the reform of morals and discipline, which it is universally agreed was necessary, and the reform in doctrine, which of course the R.C. Church would not admit. According to Protestants the abuses of the sacramental and sacerdotal system of Catholicism were inherent in that system itself. Now, widespread as was the corruption of the Church, definite doctrinal movements had only been spasmodic. Heresy had cropped up from time to time in the Middle Ages, particularly in the LOLLARDS of the later XIV., and HUSSITES of the XV. cent's, but no great impression had been made on Catholicism.

The importance of the R., however, was not only

religious but political. So much did religion and politics become intertwined, that some have said that the R. was essentially political rather than religious. And the history of the period is so complicated that it is hardly possible to give a connected story of it here, but the principal dates must be enumerated. The immediate cause of the outbreak of the German R. was the sale of indulgences, which provoked Luther's famous ninety-five theses, which he fastened to the church door of Wittenberg. But this did not at first set Europe aflame. It was two or three years before LUTHER (*q.v.*) became famous. In 1521 at the Edict of Worms he was outlawed. By 1524 Germany was becoming split into factions, and next year the peasants revolted and perpetrated great cruelties, for which an ample vengeance was exacted. Meanwhile, an independent Prot. movement had begun in Switzerland under the leadership of ZWINGLI. He had a strong following in Zürich and Bern, but ever since Switzerland has been divided.

In 1530 the CONFESSION OF AUGSBURG was drawn up in protest against Catholic doctrine and practice. The *Schmalkaldic League* was founded in 1531. Within a few years Protestantism had got a firm footing in Scandinavia. In both Denmark and Sweden episcopal government was retained. The R.C. Church was now realising the seriousness of its own position. The Emperor Charles V. showed some willingness to compromise, but he soon saw that his efforts in that direction were useless. The so-called *Counter-Reformation*—a reform movement within the Church, urged on by those who were eager to reform abuses, but intent on keeping the entire doctrinal and ecclesiastical fabric of Catholicism intact—came into being.

Just before the outbreak of the R. the fifth Lateran Council in 1513 had failed to carry through any reforms; now, a Council was summoned to meet at Trent in 1545. The Council migrated to Bologna in 1549; it went back to Trent, 1552, when it was suspended for ten years, finally closing, 1563. The COUNCIL OF TRENT carried through a number of reforms; the Church was purged, but there was no compromise or attempted compromise with Protestantism, and it was now obvious (even if it had not been so before) that the split in Western Christendom was irrevocable. After various disputes, the PEACE OF AUGSBURG of 1555 secured that the ruling prince in each Ger. state should determine its religion—the day of complete toleration was not yet.

The beginning of Fr. Protestantism was even before Luther. But the great leader was JOHN CALVIN, whose *Institutes of the Christian Religion* appeared in 1536. Calvin went to Geneva in 1541 where he remained till his death in 1564, and formulated not only a theology but an ecclesiastical state, both strong, but terrible. But the rigorous tyranny of Calvinism in Geneva was no worse than that of other states, and the execution of Servetus showed Calvin to be no more than a man of his time. The rise of the Fr. Protestants or HUGUENOTS caused a series of religious wars in France, 1562–98, which were brought to an end by the *Edict of Nantes* granting liberties to the Protestants; it was revoked by Louis XIV., 1685, a bigoted and in every way disastrous act.

The R. in England and Scotland cannot be here described in detail, but it must never be forgotten that the Eng. R. was less complete than elsewhere, the Anglican Church retaining more Catholic elements. See ENGLAND: *History*; SCOTLAND: *History*.

Though some districts, *e.g.* southern Germany, were won back for Roman Catholicism by the COUNTER-REFORMATION, others have never since acknowledged the claims of Rome.

In its broader aspects the R. can be viewed as part of the general upheaval on the break-up of mediæval ideas. The political effect was rather to strengthen absolutism than to encourage democracy. The rise of the Jesuits and the power of the Inquisition influenced Catholicism, and Protestantism in time has become modified. But even now we are too near to give a final verdict.

Cambridge Modern History, vols. i.–iii.; Creighton, *History of the Papacy*; Lindsay, *History of the Reformation*. For Eng. Reformation—Gairdner, *Lollardy and the Reformation*.

REFORMED CHURCH IN AMERICA, formerly called *The Reformed Prot. Dutch Church in North America*, was started by Dutchmen who settled in New England when a Dutch possession. After the Eng. conquest the Dutch Churches were unfriendly to the English establishment and got a charter, 1696. Though independent, it works closely with Ger. and other Prot. Churches. It has various institutions and activities and over 120,000 members.

REFORMED CHURCHES, those bodies of Continental Protestants who are not Lutheran, *i.e.* Calvinistic.

REFORMED EPISCOPAL CHURCH, offshoot in 1873 from Episcopal Church in U.S.A. in Prot. interest against High Church tendencies; now nearly 10,000 members.

REFRACTION, see LIGHT.

REFRIGERATION.—R. is the cooling of a substance by the transference of some of its heat to another and cooler substance. Refrigerating machines may be divided into two main classes, liquid machines, and compressed air machines. One machine of the former class depends upon the fact that the boiling-point of water varies according to the pressure. Water is placed in an air-tight vessel connected with a vacuum pump, and the pressure is lowered until the water boils. The heat required for evaporation is abstracted from the water, and as the pressure is reduced further and further, the temperature gradually falls to the freezing-point, and ice is formed. In other machines, liquids more volatile than water, such as ammonia, carbonic acid, or ether, are employed as the refrigerating agent. The principle of these machines is much the same as that of the water machine, except that the refrigerating agent is recovered by compressing the vapour.

Still another type of liquid machine makes use of the fact that certain vapours are capable of being absorbed in water, and separated again by heat. Compressed air machines consist essentially of three chambers, for compression, cooling, and expansion respectively. Air is drawn into the first chamber and compressed. It is then cooled by passing through the cooling chamber, and finally it enters the expansion chamber. Here it is allowed to expand to atmospheric pressure, and during this expansion it is made to perform mechanical work by pressing upon a piston. The air thus loses heat equivalent to the energy expended upon the piston.

Refrigerating machines are used for the production of ice for domestic purposes, and on a commercial scale in special ice factories, and for cooling the air in rooms for the cold storage of meat. They are used also in dairies and breweries, for cooling the magazines on warships, and to some extent for cooling the air-blast for blast-furnaces. On vessels for the transport of meat ammonia or carbonic acid machines are chiefly used, though some ships still use the compressed air machine. The water vacuum machine is employed principally in making ice for domestic use.

REFUSE DESTRUCTORS, furnaces for destroying by burning miscellaneous refuse of towns. During recent years great attention has been given to the problem of utilising this rubbish as a low-class fuel for the production of steam. The value of town refuse varies greatly, being highest in coal-mining districts. The amount of refuse also varies, the average in Britain being roughly from 5 cwt. to 10 cwt. per head per annum.

The first destructor was erected in Manchester by Mr. Fryer of Nottingham, about 1876, and it was quickly followed by others in Leeds, Birmingham, and Bradford. This destructor had many defects, and the types which immediately succeeded it were also

unsatisfactory, chiefly on account of the necessity of mixing with the refuse a considerable proportion of other fuel. It was soon realised that a furnace specially adapted to the purpose was necessary. Fryer's destructor forms the basis of many of the modern garbage-furnaces, while others are on quite different lines, but in all the main features are a furnace designed to consume the refuse with the least possible remainder, arrangements to prevent escape of noxious gases, and appliances for utilising heat generated for the production of power for pumping, electric lighting and traction, and other purposes, thus reducing the cost of the disposal of the refuse.

Besides furnaces and boilers, a modern destructor station contains elaborate plant for speedy handling and transport of refuse material. This includes railways or tramways for the removal, and appliances for the utilisation of the clinker, centrifugal dust-catchers, solder extraction furnaces, etc. Destructors are worked in conjunction with the other sanitary arrangements of the town, under municipal control.

REGALIA (neuter plural of Lat. *regalis*, royal), emblems of royalty, which in U.K. are crown, sceptre, sword, ring, bracelets, robe, orb, cross, spurs.

REGENCY, government by deputy. The Brit. sovereign has the prerogative of appointing a regent or lords justices to rule during his absence from the realm or his own or heir's infancy. The question as to the powers of Parliament arose when George III. (*q.v.*) went mad. The Regency Act, 1910, appoints Queen Mary regent in case one of her children accedes to the throne before attaining the age of 18.

REGENERATION OF LOST PARTS, reproduction of a part lost through disease or injury, frequently associated with the power of first casting off the part so damaged; exhibited in very different degrees by different animals, but generally more highly developed where the organism is less complex: a sea-cucumber can regrow fresh viscera, a worm a new head or tail, a crab a new limb, a lizard a new tail, but in man regeneration is exceedingly limited.

REGENSBURG, RATISBON (Gallic *Radaspona*, Rom. *Castra Regina*) (49° 1′ N., 12° 6′ E.), city, on Danube; capital of Upper Palatinate, Bavaria; contains Gothic cathedral founded 1275; other notable buildings are the abbey of St. Emmeran, church of St. Ulrich, Schottenkirche, Golden Cross Inn, and town hall (seat of Imperial diets, 1663-1806); has active transit trade; iron and steel manufactures; suffered in the Thirty Years and other wars; annexed by Bavaria in 1810. Pop. (1910) 52,624.

REGGIO DI CALABRIA (38° 8′ N., 15° 39′ E.) (ancient *Rhegium*), town, on Strait of Messina; capital of province of same name, Italy; manufactures perfumes. Pop. (1911) 42,876; (province) 444,215.

REGGIO NELL' EMILIA (44° 42′ N., 10° 38′ E.) (ancient *Regium Lepidi*), city, capital of province of same name, Italy; cathedral; manufactures silk goods. Pop. (1911) 70,499; (province) 308,167.

REGICIDE (Lat. *Rex*, *regis*, king; *cædere*, to kill).—(1) one who kills a king. (2) one of those who sat in the tribunal which sentenced Charles I.

REGILLUS (41° 50′ N., 12° 42′ E.), lake, Latium; scene of victory of Romans over Latins, 496 B.C.

REGINA (50° 25′ N., 104° 38′ W.), capital of Saskatchewan, Canada; agricultural centre; swept by cyclone, 1912. Pop. (1911) 30,213.

REGIOMONTANUS (1436–76), name adopted by JOHANN MÜLLER, Ger. astronomer; prof. of Astron., Vienna; compiled *Kalendarium Novum*.

REGISTER HOUSE, see RECORD.

REGLA, formerly seaport, province Havana, Cuba; now part of city of Havana. Pop. 16,000.

REGNARD, JEAN FRANÇOIS (1655–1709), Fr. dramatist; travelled in various countries; made a slave in Africa; his masterpiece, *Le Joueur*, appeared, 1696; one of most successful comic writers of classical school.

REGNAULT, HENRI VICTOR (1810–78), Fr. chemist and physicist; worked on organic chem., thermometry, expansion of gases, specific heats, hygrometry, steam-engines.

RÉGNIER, MATHURIN (1573–1613), Fr. satirist; typical poet of Renaissance; wrote 16 *satires* against bad poets, courtiers, hypocrites, and other permanent human types; many of his expressions have become proverbs.

REGNITZ (49° 40′ N., 11° E.), river, Bavaria; joins Main near Bamberg.

REGULIDÆ, Kinglets (*q.v.*).

REGULUS, ST., ST. RULE (IV. cent.), legendary monk who carried bones of St. Andrew from Patras to St. Andrews.

REICHENAU (47° 42′ N., 9° 5′ E.), island in the Untersee of Lake Constance, belonging to Baden.

REICHENBACH (51° 8′ N., 14° 45′ E.), town, province Silesia, Prussia, on Peile; scene of victory of Prussians over Austrians, 1762. Pop. (1910) 16,369.

REICHENBACH (50° 38′ N., 12° 17′ E.), town, kingdom of Saxony; textiles. Pop. (1910) 29,685.

REICHENBERG (50° 47′ N., 15° 3′ E.), town, Bohemia, Austria; cloth. Pop. (1910) 36,359.

REICHENHALL (47° 42′ N., 12° 51′ E.), town, watering-place, on Saalach, Bavaria; salt-springs. Pop. (1910) 6386.

REICHSTADT, DUKE OF, see NAPOLEON II.

REICHSTAG, see GERMAN EMPIRE.

REID, THOMAS (1710–96), Scot. philosopher; b. Strachan; prof. at Glasgow. Against Berkeley and Hume, R. affirmed doctrines of sense perception and of common sense; denied that objects are perceived through ideas. Mind is active, every sense perception an act of judgment. Common sense is the criterion of knowledge. Certain necessary truths belong to the constitution of the human mind. These principles include 'contingent' truths (*e.g.* self-identity, existence of fellow-creatures, uniformity of nature) and 'necessary' truths (mathematical axioms, moral and metaphysical truths).

REID, THOMAS MAYNE (1818–83), Irish writer of adventure stories, e.g. *The Rifle Rangers*, *The Scalp Hunters*, *The Headless Horseman*.

REID, WHITELAW (1837–1913), Amer. diplomatist; editor of *New York Tribune* (1872); U.S.A. Minister to France, 1889–92; to Britain, 1905–13.

REIGATE (51° 14′ N., 0° 12′ W.), market-town, Surrey, England. Pop. (1911) 28,505.

REIGN OF TERROR, see FRENCH REVOLUTION.

REIMARUS, HERMANN SAMUEL (1694–1768), Ger. philosopher; champion of natural religion; believer in purposiveness of Nature, and human blessedness in future life; denied reasonableness and morality of contents of Biblical lit.; argued that New Testament writers seek their own selfish ambitions.

REIMS, RHEIMS (49° 15′ N., 4° 2′ E.), town, Marne, France, on Vesle and Aine and Marne canal; famous Gothic cathedral (XIII.–XIV. cent's, magnificent façade, paintings, windows, etc.), where Fr. kings (since Clovis) were crowned; church of St. Rémi, Mars gate (c. IV. cent.), archiepiscopal palace (1498–1509), town hall (containing picture gallery and library); great champagne centre; merinoes, flannels, cashmeres, cloths of mixed silk and wool, ironmongery, glass-making. Pop. (1911) 115,178.

REINACH JOSEPH (1856–), Fr. publicist and politician; sec. of Gambetta, 1881; political editor of *République française*; personal attacks involved him in several duels; fought for revision of Dreyfus sentence, 1897–1900. His brothers, SALOMON (1858–) and THÉODORE (1860–), are distinguished archæologists.

REINDEER, see under DEER FAMILY.

REINDEER MOSS, see LICHENS.

REINEKE FUCHS, old Ger. version of *Reynard the Fox* (*q.v.*).

REINKENS, JOSEPH HUBERT (1821–96), bp. of Old Catholics of Germany (1873).

REISKE, JOHANN JACOB (1716–74), Ger.

Arabic scholar, born at Zörbig in Saxony. He early mastered Arabic, and in spite of extreme poverty he made his way to Warnerianum to study Arabic MSS. In 1746 he graduated M.D., hoping by medicine to secure a nucleus income, and so prosecute his materially unprofitable studies in Arabic. As a practitioner, however, he was unsuccessful, but was rescued from abject poverty by his appointment to the rectorate of St. Nicolai. The last decade of his life was mainly devoted to Greek.

REITBOK, Reedbuck (*Cervicapra arundinaceum*), rare antelope found in the N. portion of Cape Colony; colour, reddish ash-grey; tail, short and bushy; horns, 1 ft. long and ringed; height, 3 ft.

RELAPSING FEVER, an infectious fever, characterised by sudden onset and very high temperature, declining and returning to normal in from five to seven days, and followed in another week by a recurrent attack. The disease is due to a specific spirillum, the *Spirochæte Obermeieri*, probably conveyed to man by fleas, and usually occurs in times of famine—overcrowding, lack of nutrition, dirty, unhealthy surroundings being predisposing causes. The incubation period varies considerably, the onset is abrupt, with headache and shiverings, and the temperature may go as high as 109°; the skin is dry, there is thirst, pain in the limbs, enlargement of the spleen and liver, and often constipation or diarrhœa. A slight eruption may be present, but it is unusual. The fall of temperature is accompanied by profuse perspiration, and the patient feels quite well in a day or two, a relapse, with renewed rise of temperature, taking place in a week, after which recovery is prolonged, with or without other relapses. The treatment is rest, careful dieting, the administration of quinine in the early stages, while the high fever is relieved by cold packs or sponging. A serum has been prepared which is said to prevent relapse when injected during the period following the first attack.

RELATIVITY OF KNOWLEDGE.—(*a*) Objects of knowledge are known not absolutely, but only in relation to other objects; with Green, all experience becomes a system of relations, and sensation has no part in its constitution. (*b*) We know things not as they are, but as they affect the percipient mind.

RELICS, objects held sacred because of their connection with the saints, such as parts of their bodies or instruments used at their martyrdom. Great veneration has been paid to r's in Catholic Christianity. It had its origin partly in the respect paid to the dead, partly in the idea of association by which sanctity was held to be communicated by a person. Among the most famous r's was the true cross which Helena, mother of Constantine the Great, believed she had discovered. Catholic theologians defend reverence paid to r's, but the practice has sometimes exceeded the theory.

RELIEF, in sculpture or architecture, is the projection of a figure beyond the plane on which it is formed. Technically it is of three kinds, high, low, and middle, according to the degree of projection.

RELIGION.—The word's original signification is probably something akin to 'awe,' or that feeling we experience in the presence of powerful but unknown forces; but the exact etymology is uncertain. As used by us, r. has come to have a real and definite meaning, but one exceedingly difficult to define; thus,' the worship of a God or gods' is inadmissible, as one of the most important of the world r's, Buddhism, is atheistic, hence prayer, the commonest outward expression of most r's, has no place. A man, too, might still have a r. and never belong to any ecclesiastical organisation, though both Prayer and Church are so bound up into r. that it is impossible to separate the treatment of them.

Perhaps it is best to say that r. is a sort of sixth sense, or rather complex of senses, the exact nature of which it is very difficult to understand, as it is concerned with the deepest and most mysterious part of man's nature. All attempts to explain away r., if not futile, are at any rate begging the question, for they generally assume the non-existence of the spiritual forces the man of r. feels himself to possess. The explanation that all manifestations of religious feeling are due to illusion, while difficult to refute in theory, is one that satisfies few of those who have studied it most deeply. But in its earliest stages r. is very crude, and many of its primitive forms seem little more than degraded superstitions hardly worthy the name r. at all. Thus in Animism every object is thought of as alive and possessed of a soul. A more advanced stage is Polytheism, then Monotheism, but among the Jews monotheism was preceded by Monolatry—*i.e.* only one God was to be worshipped, but the existence of others was not denied.

It is impossible even to summarise here the different r's of the world, as regards either their history or their tenets—reference must be made to the articles on the r's themselves. Most of them have an extensive religious lit., and as their growth falls within historic times, they can be studied, so to speak, in the full light of day, but with more primitive forms this is not so; literary remains are more scanty, or can only be traced in survivals, or by way of analogy in the rites of savage races at the present time. But such inquiries, though extremely valuable, can at times be futile or misleading; resemblance does not prove derivation, and it is not always easy to argue back from a rite to the idea which underlies it. The results of the still young science of Comparative Religion are used by controversialists for exactly opposite purposes, so the exact significance of much that is known (itself but a small portion of what we may hope to know) is often an open question.

Considerable care, too, must be taken in the study of religions not to group them in an arbitrary way. Though divisions such as 'polytheistic,' 'monotheistic,' etc., may be useful, it is often best to keep to hist. or geographical arrangement, for certain times and countries seem to give their peculiar character to the faiths which have grown up in them, however different these faiths may be in origin. As civilisation has gradually progressed we can notice tendencies, both in the internal development of religious feeling and in the place occupied by religion in political and social life. The first may be considered under the heading *Prayer*, though it includes other sides of r. besides, such as ritual and sacrifice (*qq.v.*), the latter under the conception of the *Church*.

Prayer is the intercourse between the soul and God, but in cruder forms of religious thought it can only take the form of petition for the receiving of good things and the averting of evil. Sometimes the relation between a savage and his god takes the form (at any rate from the point of view of the savage) of a business transaction. The devotee promises certain gifts to his god if he can have benefits in return. Here there is nothing really spiritual; that only comes later, and increases with the growth of the moral as distinct from the ritual side of relation. Prayer is then the means of intercourse between God and man, for by it man brings himself into harmony and union with God, so that he is capable of receiving spiritual benefits, and, if the spiritual be the only real, other benefits besides. Given the existence of the Unseen, it is in prayer that communion with the Unseen is realised.

But r., like every other aspect of life, must have its corporate as well as its individual expression, and this we have in the **Church.** In primitive r., and in some forms of r. not primitive, there is no clear conception of the Church as distinct from human society, for r. was corporate and was shared in by all. No one could be outside the Church any more than he could be outside the tribe to which he belonged. But with Christianity, while the conception of the Chosen People was taken over from Judaism, there was now no distinction of race, and till the Church could be realised and the Kingdom of God come, the Church was bound to be set over against the world. Only in the Church could man be brought to God—***Extra Ecclesiam nulla salus*** **(outside the Church no salvation).**

According to the Catholic view the Church consists of all the baptized, and all can claim her privileges and sacraments, however they may have sinned, if they will but submit to her discipline. But this view did not win acceptance without challenge, for some, holding a most rigid theory, excluded from all participation in Church membership here and hope of salvation hereafter those guilty of serious post-baptismal sin. A somewhat similar position was taken up in the XVII. cent. by the Puritans, who would limit Church membership to a chosen few rather than the sinful many. Hence Protestantism tends rather to view the Church as the company of the converted.

The tendency of some forms of Liberal thought at the present time is to open the Church to all who are desirous in any way of participating in its activities. Stated differently, the Catholic view makes the Church an organism, the Protestant a collection of individuals, the Liberal an engine of progress. Besides these, many like the idea of the Church as a spiritual and heavenly company, of which the Church on earth is but a feeble reflection.

For primitive religion: Frazer, *Golden Bough*; Robertson Smith, *Religion of the Semites*. On religious psychology: W. James, *Varieties of Religious Experience*; Sanday, *Christologies Ancient and Modern*; Inge, *Christian Mysticism*. Generally: Martineau, *Study of Religion*; Gwatkin, *Knowledge of God*; Pfleiderer, *Philosophy of Religion*. Various modern interpretations in Inge, *The Church and the Age*; Figgis, *The Gospel and Human Needs*. For non-Christian religions: Menzies, *History of Religion*, and *World Religions*.

REMAGEN (50° 35′ N., 7° E.) (ancient *Rigomagus*), town, Rhineland, Prussia; Rom. antiquities. Pop. 3700.

REMAINDER, that portion or residue of interest which is made over to some other person, on the creation of a particular estate. It is always the work of certain parties; whereas **Reversion**—that portion of an estate left over, after a grant of less than the whole has been made by the owner to another person—arises by operation of law.

REMBRANDT, R. HARMENSZ VAN RHYN (1606-69), greatest painter of Dutch school, was born in Leiden. His first master was Jacob von Swanenburch. In 1624 he entered the studio of the famous Pieter Lastman at Amsterdam, but after six months' study Rembrandt left, finding his master's artificial style abhorrent to his own realistic taste, and resolved to develop his art according to the dictates of his own genius. Among his earliest pictures are *St. Paul in Prison*, the *Money Changer*, and the famous *Lesson in Anatomy*. In 1634 he married Saskia van Uylenborch, who died eight years later.

From this time the artist's life was darkened with domestic trouble, and the gloom within is reflected in his art. It was character in the human face which appealed to R. above all else, and in which his intuitive realism found its noblest expression. This fact accounts for his preference for portrait-painting and the predominance of old age among his subjects. In his Biblical subjects his art is simple, frank, and bold: characteristic are the *Entombment* and *The Woman taken in Adultery*. His finest portrait groups are the *Night Watch* and the *Lesson in Anatomy*.

His landscapes are also dark and sombre. The *Mill* is a magnificent specimen. As an etcher Rembrandt also reaches the highest perfection. There is a fine collection of his etchings in the Brit. Museum.

Rembrandt, Masterpieces in Colour Series.

REMEDIOS, SAN JUAN DE LOS REMEDIOS (22° 30′ N., 79° 30′ W.), town, Santa Clara province, Cuba. Pop. 6800.

REMIGIUS, ST. (437–533), bp. of Reims, France.

REMINISCENCE.—(1) in general, a term for memory. (2) particularly, a translation of Plato's *Anamnesis*, or recollection in this life of knowledge gained in a previous state of existence.

REMIREMONT (48° N., 6° 36′ E.), town, on Moselle, department Vosges, France; has interesting remains of mediæval abbey; cotton spinning and weaving. Pop. 10,600.

REMONSTRANTS, Dutch followers of Arminius (*q.v.*) who, in 1610, drew up Remonstrance against orthodox Calvinist views on predestination.

REMSCHEID (51° 12′ N., 7° 12′ E.), town, Rhineland, Prussia; hardware manufactures. Pop. (1910) 72,159.

RÉMUSAT, CHARLES FRANÇOIS MARIE, COMTE DE (1797–1875), Fr. statesman and writer; took an active part in politics from 1830; philosophic and hist. works of value for impartial attitude and width of view.

RENAISSANCE, THE, RENASCENCE, the intellectual development by which modern Europe was evolved from the Middle Ages. The R. (Fr. *renaissance*, rebirth) meant the full restoration of civilisation.

For hist. convenience modern history has been divided into the three chief periods of Dark Ages, Middle Ages, Modern Times. The Dark Ages commenced with the final overthrow of classical civilisation by the barbarians who overran the Rom. Empire; a convenient date is 476, when the Ger. king Flavius Odoacer deposed the last Rom. emperor of the West, Augustulus. The Middle Ages ended when the Teutonic barbarians, who had been evolving a civilisation of their own, rediscovered the civilisation of antiquity. Concurrent discoveries made the movement no mere **Revival of Learning**, as it is sometimes called, but a development of the human spirit almost amounting to rebirth.

There were many signs that, in an infinitely longer time, the Middle Ages would by themselves have achieved the new civilisation: the mediæval conception of the Holy Rom. Empire of the Ger. nation, mediæval Rom. Catholicism, the very theology and law which constituted the mediæval 'scholastic system' (anathema at the R.), were wonderful intellectual structures, undertaken in the spirit of the men of the R. Gothic architecture, which started with the imitation of Rom. buildings, mediæval art, the *troubadours* and *minnesingers*, great poets like Dante, Chaucer, and Petrarch, show that there is some exaggeration in christening the subsequent development *Renaissance*.

A great difference, however, between mediæval and R. culture was the conscious *humanism* of the latter. HUMANISM, antagonistic to Rom. Catholicism, struck at the roots of mediæval thought; instead of setting before man an ideal for the realisation of which his individuality was to be sacrificed, it insisted on the further development of his actual character. The men of the R. chose to be called Humanists from their salient characteristic. Their attitude towards the Middle Ages may be judged by the adjective with which they described its arch.: not for 300 years did 'Gothic' cease to be a term of contempt.

'The first modern man was an Italian'; the Italians, with Latin blood in their veins and living among the ruins of classical culture, readily revived the pagan spirit. PETRARCH (1304–74), although belonging to the Middle Ages, was one of first to feel the spell of antiquity; he treasured MSS. of Latin classics and wrote to the pope begging him to restore Rome to its place as the head of civilisation. The Humanistic movement began when the study of Gk. classics was added to that of Latin. Scholars like the famous Poggio visited Byzantium, learned Greek, and spread the knowledge in Italy, but the study was attended with difficulty till the FALL OF CONSTANTINOPLE, 1453, when Gk. scholars fled from Turk. rule to Italy. The R. is generally said to date from 1453.

Closely connected with this Revival of Learning is the movement which produced the REFORMATION. Study of the Gk. Scriptures and Gk. Fathers, known then as the NEW LEARNING, resulted in the break-up of the mediæval universal Church. The other movements concurrent with the Revival of Learning were chiefly—the invention of printing, about 1450; the

development of nationalities, which destroyed the mediæval conception of a world-empire; the use of gunpowder, which revolutionised the art of war and dealt a great blow at feudal organisation of society, and astronomical and geographical discoveries. With the Revival of Learning came the knowledge, handed down by the Egyptians, that the earth is spherical in form, and COPERNICUS (1473–1543) proved that the earth was a satellite of the sun. Portug. and Genoese travellers, who discovered America, rounded the Cape of Good Hope, and circumnavigated the globe, drew their inspiration from geographical works of ancients and received the congratulations of the Humanists. Their discoveries played almost as important a part in the imaginative outburst as did the classical revival.

The Italian R. produced great scholars and archæologists like Giovanni di Conversino, Coluccio de' Salutati, Gasparino da Barzizza, Lorenzo Valla, Bembo, Paulus Jovius, Poggio, Biondo, Pico della Mirandola, and the Aldi, patronised by Humanists like the Medici; but the immortal works of Ital. R. are seen in Architecture (*q.v.*), Sculpture (*q.v.*), and Painting (*q.v.*); famous names—Brunelleschi, Alberti, Michelangelo, Raphael, Donatello, etc. France and Germany were both influenced by the movement before England; cf. famous Fr. R. buildings, art, printing, etc., and great literary outburst of *Pléiade*. England had its small Oxford school of Humanists, of whom ERASMUS was Dutch and of the others MORE alone enjoyed European fame. Architecture, etc., was little influenced till XVII. cent. Surrey, Wyatt, and others experimented with new verse-forms, but true R. outburst in England only came with age of Shakespeare.

J. A. Symonds, *Renaissance in Italy*; *Cambridge Modern History*; Sidney Lee, *French Renaissance in England*; Hudson, *Story of the Renaissance* (1912).

RENAISSANCE OF WONDER, RENASCENCE OF WONDER, name given by Theodore Watts-Dunton (*q.v.*) to the Romantic Revival. To fact, the Romanticists sought to impart "the light that never was on sea or land." Coleridge's *Ancient Mariner* is perhaps the Eng. masterpiece of the Romantic movement, considered in this aspect. In Germany Tieck and Hoffman showed similar mastery of the supernatural.

RENAIX (50° 45′ N., 3° 45′ E.), town, province E. Flanders, Belgium; dye-works; bleachfields. Pop. 22,000.

RENAN, ERNEST (1823–92), Fr. philosopher. A Breton fisherman's grandson, he was (owing to his brilliant gifts) trained for priesthood at Saint Sulpice Seminary. Leaving through religious doubts, R. began to seek truth in Science. His first work, *The Future of Science* (1849), was published last. He studied philosophy, theology, history of religions, and ancient languages, but never became a great scholar; although he did much service to Biblical criticism, his style is his great merit; his opinions have roused much disputation; *Life of Jesus* (1863) and *Origins of Christianity* caused great sensation by rejection of divine elements from history of Christianity; best work, partly autobiographical *Souvenirs d'Enfance et de Jeunesse* (1876–82), written in exquisitely simple style; last work, *People of Israel* (1887–92).

Barry, *Renan* (1905, Literary Lives Series).

RENARD, ALPHONSE FRANÇOIS (1842–1903), Belg. geologist; prof. of Geol., Univ. of Ghent, 1888; awarded Bigsby medal (Geological Soc., London), 1885.

RENAUD DE MONTAUBAN, hero of Fr. and Ital. romance. Aymon, a favourite of Charlemagne, has four sons—Renaud, Alard, Guichard, and Richard. A feud arises between Charlemagne and the youths. Renaud in his exile becomes a hero of Christian chivalry.

RENAUDOT, THÉOPHRASTE (1586–1653), Fr. physician and philanthropist; b. at Loudun; summoned to Paris by Richelieu; opened a charitable information bureau, and a free dispensary; in 1631 established the first Fr. newspaper, the weekly *Gazette*; app. Historiographer Royal by Mazarin.

RENDSBURG (54° 18′ N., 9° 40′ E.), town (former fortress), Schleswig-Holstein, Prussia, on Eider and Kaiser Wilhelm Canal; cotton goods. Pop. (1910) 17,315.

RENÉ, GOOD KING RENÉ (1409–80), Duke of Anjou, of Lorraine, and Bar, count of Provence, etc., king of Naples and of Jerusalem; m. Isabel, heiress of Charles II. of Lorraine, on whose death he sought to enter duchy of Lorraine, but was defeated and imprisoned, 1431; released, 1432, but revived claim, 1435, and returned to prison; succ. bro., Louis III., in Naples, Provence, and Anjou, 1435; liberated, 1437, but could not wrest Naples from Alphonse of Aragon, and established himself in Provence, where he made a great name in the history of lit.

RENFREW (55° 53′ N., 4° 24′ W.), town, on Clyde, Renfrewshire, Scotland; shipbuilding yards, engineering-works. Pop. (1911) 12,565.

RENFREWSHIRE (55° 50′ N., 4° 30′ W.), county, W. Scotland, lying along Clyde; area, 239 sq. miles; surface reaches an extreme height of 1711 ft. in Hill of Stake; chief towns, Renfrew (county town), Paisley, Greenock, Gourock, Port-Glasgow; agriculture, dairy-farming, and stock-raising are important industries; produces coal, iron-stone, and shale; manufactures thread, cottons, chemicals; has shipbuilding, engineering, sugar-refining, and print and bleach works. Pop. (1911) 314,574.

RENI, GUIDO, see GUIDO RENI.

RENNES (Gallic *Condate*) (48° 6′ N., 1° 40′ W.), town, at junction Ille and Vilaine; capital, department Ille-et-Vilaine, France; ancient capital of Brittany; abp.'s see; principal buildings are the cathedral, church of Notre Dame, Mordelaise gate, palace of justice, and town hall; has univ. coll., picture-gallery, and library; tanneries, sawmills; besieged by the English in 1356. Pop. (1911) 79,372.

RENNIE, JOHN (1761–1821), Scot. engineer; began life as millwright; constructed or designed Waterloo Bridge, London Bridge, London Docks, Plymouth Breakwater, and other great engineering undertakings.

RENO (39° 40′ N., 119° 55′ W.), city, on Truckee, Nevada, U.S.A.; reduction-works; flour-mills. Pop. (1910) 10,867.

RENOUVIER, CHARLES BERNARD (1815–1903), Fr. philosopher; disciple of Kant; held that metaphysics cannot reach knowledge of God, yet claims of religion are vindicated on practical grounds.

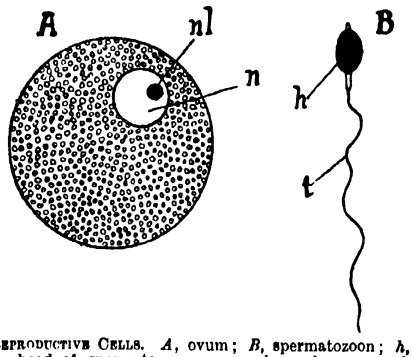
RENSSELAER (42° 40′ N., 73° 45′ W.), city, on Hudson, New York State, U.S.A.; railway-shops; felt manufactures. Pop. (1910) 10,711.

RENT, the charge made by the landlord for the use of land or premises thereon. It is legally due on the morning of the last day of the tenancy, according to the length of time of the tenancy. Different kinds of rent exist—*Rack rent*, an excessive charge equal to the full annual value of the property; *peppercorn rent*, a nominal charge, often inserted in building leases, to be paid while premises are in course of erection; *ground rent*, paid to the owner of the freehold; *net rent*, the amount payable to the landlord clear of all deduction; *quit rent*, the ancient rent of a freeholder to the manor whereby he went quit and free of all services. Defined by Ricardo as 'that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil'; by Marshall as 'the income derived from the ownership of land and other free gifts of nature.'

RENTON (55° 58′ N., 4° 35′ W.), town, on Leven, Dumbartonshire, Scotland; dye-works. Pop. (1911) 4977.

REPINGTON, PHILIP (d. 1419), bp. of Lincoln, 1404–17; cardinal, 1408.

REPNIN, PRINCE ANIKITA IVANOVICH (1668–1726), Russ. general under Peter the Great; made field-marshal by Catherine I. Grandson, PRINCE



NIKOLAI VASILEVICH (1734–1801), field-marshal, 1796; won great victories against Turks.

REPORTING.—Reporting staffs of important newspapers number from six to fifteen or more men, their work being supplemented by reports of News Agencies, *Press Associations*, etc. A recent innovation is the inclusion of women, to whom special duties are assigned, such as attendance at social functions. Except in the case of political leaders, verbatim reports are rarely given. Speeches in Parliament were at first reported surreptitiously, but now ample accommodation is provided for the Press. The successors of Luke Hansard (b. 1752) provide a substitute for an official report by supplementing newspaper reports by notes taken by their own staff.

REPRESENTATION, see ELECTION, PARLIAMENT.

REPRODUCTION, the power possessed by plants and animals, and by them alone, of giving origin to new forms of life after their own kind. R. in general follows two main types, *vegetative* or *asexual* and *sexual*.

The former, in spite of its name, is by no means confined to plants, for it is chiefly shown in the formation of buds which assume adult characters before or after being set free from the parent to become independent individuals. This asexual reproduction is equally exhibited by the runners of Strawberry plants and the stolons of Hydroid Zoophytes, by the tubers of Potatoes and the buds which spring from the bodies of Sponges and of many Cœlenterates. Especially in the last, generation after generation of buds frequently remain attached to the parent and result in the formation of colonies such as those of coral polyps or of many Hydrozoa. Asexual r. is manifested in its simplest form in the division of a single cell into two daughter

REPRODUCTIVE CELLS. *A*, ovum; *B*, spermatozoon; *h*, head of spermatozoon; *n*, nucleus of ovum; *nl*, nucleolus of ovum; *t*, tail of spermatozoon.

cells which become independent, as in many Protozoa and Protophyta and, in more complex form, in those successive divisions which take place usually in drought-withstanding cysts and results in the formation of many minute spores which develop into adults, as in Mycetozoa, Sporozoa, other Protozoa. A highly specialised asexual development is illustrated in the alternation of generations (*q.v.*) which takes place in many Cœlenterates, pelagic Tunicates, some Worms and Sponges.

SEXUAL REPRODUCTION, however, is more common than asexual, and consists essentially in the union of two cells set aside for the purpose, and kept apart during their existence from the construction of the body which contains them. In flowering plants sexual cells of a kind are obscured in the vegetative pollen grain and ovule, but in animals their relationships are comparatively simple and definite, although there are different grades of sexual specialisation in the two cells concerned. Thus in Protozoa two or many similar cells may flow together, their nuclei may fuse, and finally the conjunct cell may break afresh into two or more individuals, each endowed with a new lease of life. Or, again in Protozoa, the cells which unite may show slight differences in structure and habit, a small active member uniting with a larger more passive individual, and this foreshadows the final development, found in most animals higher than Protozoa, where a minute active *spermatozoon* or male cell fuses with larger immobile *ovum*, egg, or female cell, and so starts the growth of a new individual.

In a few cases, often under special conditions, eggs may develop into new individuals without the help or presence of spermatozoa; this occurs, for example, in many Aphides or Green-Flies, small Crustacea, Wheel Animalcules or Rotifers, and in the case of drone-bees, and is known as *parthenogenesis*.

But the more normal course of sexual r.—fertilisation—may be glanced at. A minute, active, often tadpole-like spermatozoon, wriggles to the ovum (*q.v.*), which has undergone a strange process of preparation or *maturation*, for it has rejected two polar bodies split off the nucleus or germinal vesicle, in such a way that the definite number of chromatin rods (chromosomes) of the nucleus is reduced by half. A similar reducing or meiotic division has taken place during the formation of the spermatozoon, so that when the head of the latter, bearing the nucleus, enters the ovum, the intimate fusion of the nuclei of both results in a new single nucleus with the full specific number of chromosomes. And in this mixing of two parental strains, or *amphimixis*, lies the possibility of variations so characteristic in the results of sexual union.

Following on this intimate union of spermatozoon and ovum the latter begins to segment or divide into daughter cells, the typical course being the formation of two, four, eight, sixteen cells, and so on until a solid ball of cells or morula results. Further division leaves a central hollow, and the hollow ball is known as a *blastula* or *blastosphere*.

At one pole the wall of the bastosphere topples in, and dinted thimble-shaped ball is known as a *gastrula*, the outer wall of which becomes *ectoderm*, while the dinted-in wall, now lying close against the other, forms an inner layer, the *endoderm*. There are many modifications of this process due to the presence of varying quantities of yolk upon which the embryo is to be nourished, but all divisions result in the formation of these two layers—ectoderm and endoderm, separated eventually by a layer of secondary origin, the *mesoderm*. It is valuable to remember that throughout the animal kingdom these primitive layers always give rise to similar types of organs: from the ectoderm develop the outer skin and its products, such as nails, hair, and horny armour, the nervous system, and portions of the sense organs and food tract; from the mesoderm develop the lower skin layer (*dermis*), muscles, bone, the vascular system, and such like; while the endoderm gives rise to the notochord, and to the mid portion of the food tract with its products, liver, kidneys, lungs, etc.

So various are the details of development in different groups and even species of animals that it is impossible to follow them further, but it is well to remember that in most ova there is a comparatively large supply of nutritive yolk upon which the embryo is sustained until it is able to fend for itself.

The young of higher vertebrates—Reptiles, Birds, and Mammals—are protected by a membrane, the *amnion*, which forms a fluid bag around the developing embryo, and with this is associated another outgrowth, the allantois, with respiratory and yolk-absorbing powers. This latter structure in great part forms the placenta which in most Mammals unites the young with the mother, a means whereby the embryo is nourished directly by the blood of the parent which shields it.

The reproductive faculty varies in different animals almost without limit. On the one hand a single liver-fluke may engender half a million embryos, or a cod-fish may produce in a year over four million eggs; on the other hand the limit is reached by most Mammals and by some Birds, such as the Fork-tailed Petrel,

which have only one young at a time. Again, many Insects and lower animals have a multitude of broods in a year, while some Mammals, such as the Elephant, have only offspring at intervals of several years. As a general rule, where the offspring is better cared for by the parent and where it runs fewer risks of destruction before maturity is reached, there the numbers of young broods and of young in a brood become reduced. See also EMBRYOLOGY and SEX.

REPRODUCTIVE SYSTEM in man has certain parts in common with the urinary system (*q.v.*), and includes, in the *male*, the testicles or testes, epididymis, vasa deferentia, seminal vesicles, prostate gland, urethra, and penis, and in the *female*, the ovaries, Fallopian tubes, uterus or womb, vagina, and vulva.

The *testicles* or *testes* are two in number and are situated side by side in the *scrotum*; each is oval in shape, about 1½ inches long and 1 inch broad, covered with a strong fibrous coat, from which fibrous partitions go into the substance of the gland, dividing it up into compartments in which are, intricately coiled, the seminiferous tubules, where the spermatozoa, or male sexual elements, are formed. The *epididymis* lies behind the testis, and is a body formed of a greatly convoluted tube, the duct from the testis.

The *vas deferens* is the continuation of the tube which forms the epididymis, at first also convoluted, but soon becoming straight, and running up from the scrotum, through the external and internal abdominal rings, down the side of the pelvis to the base of the bladder, where it becomes dilated and then joins its fellow of the opposite side to form the common ejaculatory duct.

The *seminal vesicles* are two sacs, which are really tubes coiled upon themselves and held in a sac-like form by dense tissue; they lie close behind the bladder and alongside the vasa deferentia, into the ends of which they open. It is now considered that the vesicles are not merely receptacles for the semen, or secretion of the testes, but that they themselves secrete a mucous fluid which mixes with the semen.

The *prostate gland* is a cone-shaped structure partly of glandular and partly of muscular tissue, and covered with a strong fibrous capsule; it lies with its base in contact with the bladder, and its substance is traversed by the urethra and by the ejaculatory ducts from the seminal vesicles and vasa deferentia.

The *urethra* is the tube which conveys the urine from the bladder and also the semen, or secretion of the testes, from the vasa deferentia and seminal vesicles. It may be considered as in three parts, the prostatic urethra, in which the ejaculatory ducts, which convey the semen, and the numerous small ducts of the prostate open; the membranous urethra, which is very narrow, and is between the two layers of the triangular ligament; the spongy urethra is that part which is within the penis, and into it mucous glands and the two small glands known as *Cowper's glands* open.

The *penis* is composed of three cylindrical masses of erectile tissue, covered with subcutaneous tissue and skin; two of the cylindrical masses, the *corpora cavernosa*, are situated above, side by side, and one, the *corpus spongiosum*, in which the urethra runs, below, in the middle. At the root of the penis the two corpora cavernosa become thicker and more fibrous, and are joined at each side to the arch of the pubis, while the corpus spongiosum enlarges to form the bulb, which is attached to the triangular ligament. At the front of the penis the corpus spongiosum enlarges to form the *glans*, which constitutes the whole of the front part of the organ, and is covered by the foreskin.

In the female the *ovaries* are two in number, almond-shaped, situated in the pelvis, one on each side, joined by short folds of peritoneum with the broad ligaments which attach the uterus to the sides of the pelvis. Embedded in the fibrous tissue of the substance of the ovary are little masses of epithelial cells, from which the *Graafian follicles*, and eventually the ova, or female sexual elements, develop.

The *Fallopian tubes* lie one on each side in the upper borders of the broad ligaments and serve to convey the ova from the ovaries to the uterus into the upper angles of which they open; the distal end of each tube has in it a small opening into the peritoneal cavity of the abdomen, and has fringes, or *fimbriæ*, hanging from it, the largest of which is attached to the ovary. The ova, which are discharged upon the surface of the ovary, thus pass actually into the abdominal cavity before being swept by the fimbriæ into the Fallopian tube and so to the uterus.

The *uterus* or *womb* is a pear-shaped, muscular, hollow organ, about 3 inches long, 2 inches broad at its widest part, and nearly 1 inch thick, in its non-pregnant condition; it is usually considered in three parts: the *fundus*, or upper rounded part, above the entrance on each side of the Fallopian tubes; the *body*, which gradually diminishes in breadth, and is marked off by a slight constriction from the *cervix*, which is narrower and more cylindrical than the body, with a knob-like, rounded, lower extremity, in which is a minute opening, termed the *os externum* of the uterus. The normal position of the uterus is that of anteflexion, *i.e.* it is bent forward upon itself so that the body and cervix meet at an acute angle. From each side of the organ the *broad ligaments*, formed of a double layer of peritoneum, go out to the wall of the pelvis; to them are attached the ovaries, and they contain several important structures, including the Fallopian tubes and the muscular *round ligaments*, which have an important share in holding the uterus in position.

The *vagina* is the passage, lined with mucous membrane, which leads from the uterus to the exterior.

The *vulva* includes all the female external genital organs, comprising the *mons veneris*, the fatty pad covered with hair in front of the pubis; the *labia majora*, the two folds of skin extending from the mons veneris almost to the anus; the *labia minora*, two smaller folds of skin lying internal to the labia majora, enclosing the clitoris in front; the *clitoris*, which is the representative of the male penis in the female, composed like it of erectile tissue; the *urethral orifice*, a puckered opening about an inch below the clitoris; the *hymen*, a fold of mucous membrane incompletely closing the entrance to the vagina.

The development of the reproductive organs is practically the same in the two sexes up to the fifth or sixth week of intra-uterine life, and only then does the differentiation of the sexes begin to become evident. The main points are that the embryonic *Wolffian duct* becomes, in the male, the epididymis, vas deferens, seminal vesicle, and ejaculatory duct, while in the female it disappears, except for a few traces; on the other hand the embryonic *Müllerian duct* is represented in the male only by a minute diverticulum in the upper part of the urethra, while in the female it develops into the Fallopian tubes, uterus, and vagina.

Cunningham, *Textbook of Anatomy*; Gray, *Anatomy*.

REPTILES, Class REPTILIA (Lat. *repo* or *repto*, I crawl).—In this great class are grouped the very diverse animals known as crocodiles, tortoises, turtles, snakes, lizards, and a host of gigantic extinct forms as various in shape and habit as are their modern relatives. Together they form a class of great interest, placed far on in vertebrate lineage at that vital point in evolution when, after a period of oscillation between water and land, the latter was selected as the site for that development which was to lead to man. R. show relationships both backwards with Amphibia and forwards with Birds and Mammals, but they are more closely connected with the latter groups, which they resemble in the protection given to the embryo by a fœtal membrane, the *amnion*. Hence R., Birds and Mammals are known collectively as *Amniota*. But the likenesses between R. and Birds are particularly striking—so that Huxley even termed the latter greatly modified Reptiles, and placed both in a new division, Sauropsida (*q.v.*).

The distinctive features of R. as a class may be

summarised thus. They are cold-blooded Vertebrates with bodies protected externally by an armour of scales or horny plates. They breathe by lungs, and at no stage have functional gills. They lay large eggs, and the embryos are protected by two membranes, an amnion and an allantois.

To glance at reptilian features in greater detail, the body is generally elongated, with a well-developed, strong tail, and is the chief organ of locomotion, for the four legs, which are present except in Snakes and a few limbless Lizards, usually act as simple paddles which push the main bulk of the body along the ground. Particularly characteristic from an external point of view is the armour of scales, composed of horny material or keratin and formed by the epidermis, which protects the animal from injury as it creeps along or from the attacks of enemies. This scaly coat is cast regularly, either in fragments or, in Snakes and many Lizards, as a whole—the process being known as *sloughing* or *ecdysis*. In some Lizards the protecting scale-like structures are true dermal ossifications.

In the skeleton, generally strongly built, there are several points of interest. The skull has many cartilage bones and articulates with the backbone by a single condyle. The jaws, except in adult Chelonia which possess horny sheaths, have small sharp teeth, often curved backwards, suitable for grasping prey but useless for crushing. In some Snakes (*q.v.*) specialised teeth in the upper jaw are associated with a poison gland, and a somewhat similar structure occurs in the Lizard, *Holoderma*. The bodies of the vertebræ, which are often exceedingly numerous, are usually concave in front, convex behind—procœlous, but in *Sphenodon*, Gecko Lizards, and many fossil forms they are amphicœlous, concave at both ends. Ribs are well developed, sometimes immobile as in Tortoises and Turtles, where they are guard to the carapace, but usually free and movable as in Snakes, where they take a great part in locomotion, or in Flying Lizards, where they form the framework on which a parachute is stretched.

Muscular and nervous systems are well developed, and the senses of R. are in many cases acute. Peculiarities are to be noted in the lidless eyes of Snakes and some Lizards, in the sensitiveness to vibrations of the tongue of Snakes, and in the valved nostrils of some aquatic forms.

The majority of R. feed on flesh, and their digestive system is regulated accordingly. Thus there are well-developed salivary or sublingual glands; the gullet is long, generally with plaited walls so that it may undergo the inordinate amount of stretching necessary where large prey is swallowed without previous mastication; and the intestine is short. Exceptions occur in the case of the vegetarian Chelonians where the gullet often bears horny processes used in tearing the food, such as seaweed upon which many marine species live, and the intestine, as in most vegetarian animals, is long and coiled. In all, the food canal ends in a common vent or cloaca, into which the urinary passage and genital ducts open, the latter being accompanied in the case of males by a protrusible sexual organ which lies on the anterior or posterior of the common vestibule.

R. differ from Amphibia in that at no stage of their existence do they breathe by gills. Lungs are well developed and air enters them by the action of the ribs or by simple swallowing. The heart shows a gradual advance in efficiency, for while in most it is three-chambered, the undivided ventricles allowing pure and impure blood to mingle, in the Crocodiles it is four-chambered, the ventricles being separated by an internal partition which divides arterial from venous blood. At least two aortic arches rise from the ventricles. As in Birds, the red blood corpuscles bear a nucleus and are oval in shape, but R. are cold-blooded creatures, their temperature standing only a little above that of their surroundings, with which it fluctuates.

Reproduction and development are of great interest. Like Birds, R. lay large eggs, protected by a limy or sometimes membranous shell, but in a few forms development takes place within the body of the parent and living young are produced. Unlike most Birds, however, they give little care to the development of the egg, which is generally allowed to hatch by the heat of the sun. As in Birds and Mammals, part of the egg forms a sort of water-jacket—the amnion—which surrounds the embryo, keeping it afloat in a liquid medium and protecting it. With it is associated a respiratory and yolk absorbing outgrowth, the allantois; but both these, allantois and amnion, are cast off at birth.

R. are predominantly terrestrial creatures, but they exhibit much diversity of habit. The majority crawl on the surface, but some Snakes and Lizards burrow underground, many Chelonia and a few Snakes have adopted an aquatic life, Snakes and Lizards frequently adopt an arboreal habit, Flying Lizards parachute from tree to tree, and the extinct Pterodactyls conquered the air. All are dwellers in tropical or temperate regions, but the former is their true home and their numbers dwindle as one recedes from the Equator. Like many creatures subjected to extremes of heat, a large proportion of their number pass over the dangerous drought seasons in a state of torpor, known as *æstivation*, a phenomenon very similar to the physiological winter sleep or *hibernation* in which others of their class (Tortoises are well-known examples) spend the cold periods of the year.

At the present day R., though they number almost 5000 species, are decadent members of the animal kingdom, for in earlier ages no creatures could compare with them in size, strength, or number. Their earliest fossilised remains have been found in rocks of Permian Age, but in Jurassic and Cretaceous times they reached their greatest development, constituting the predominant inhabitants of air, land, and water. A few of the strange forms then in existence are mentioned below in the note on classification.

R., though of little use to man, still have much significance for him, for in India alone an annual toll of some 20,000 lives is paid to the bite of poisonous Snakes, and Crocodiles add to the death-roll. African Crocodiles harbour in their bodies a Trypanosome which subsequently develops in the Tse-tse Fly, and has been considered to be the cause of the fatal disease sleeping sickness. But this allegation seems to be due to a confusion between some stages of the Crocodile parasite, *T. grayi*, and the distinct *T. gambiense*—the true cause of sleeping sickness. Reptiles serve useful purpose from the human point of view in destroying the multitudes of insects upon which most Lizards and many Snakes feed, and the latter especially do much to keep down the numbers of ground vermin. Apart from such indirect services, Crocodiles furnish a stout ornamental leather, manufactured from portions of their skin, and the horny carapace of Tortoises is made into articles of tortoise-shell.

The Class REPTILIA is divided into eleven orders, sometimes grouped in various sub-classes:—

Order I. RHYNCHOCEPHALIA, e.g. *Sphenodon* (q.v.), sometimes made the solitary occupant of the sub-class PROSAURIA.

Order II. LACERTILIA or LIZARDS (*q.v.*).

Order III. OPHIDIA or SNAKES (*q.v.*). (Owing to their many resemblances, Lizards and Snakes are sometimes grouped together in the sub-class SAURIA.)

Order IV. CHELONIA, TORTOISES AND TURTLES (*q.v.*).

Order V. CROCODILIA, CROCODILES (*q.v.*).

Extinct forms:—

Order VI. PYTHONOMORPHA, e.g. *Liodon* and *Dolichosaurus*, elongated Cretaceous relatives of *Sphenodon* and the Lizards, found in American and European deposits; body snake-like,

sometimes 80 ft. long, with two pairs of swimming paddles; marine and carnivorous.

Order VII. ICHTHYOSAURIA or ICHTHYOPTERYGIA, e.g. *Ichthyosaurus*; extinct r. which lived in the Old World from Triassic to Cretaceous times; body whale-like, 30 to 40 ft. long, with two pairs of swimming paddles; marine and carnivorous.

Order VIII. PLESIOSAURIA or SAUROPTERYGIA; inhabitants of Europe, New Zealand and America in the Chalk period; heavy-bodied, long-necked r. related to Tortoises and Turtles, but without external armour. Some lived on land, but the majority were marine and had paddle-like limbs and tail, e.g. *Plesiosaurus*, 40 ft. long, found fossil in England, and the American *Elasmosaurus*.

Order IX. THEROMORPHA, e.g. *Dicynodon* and *Elginia*; Permian and Triassic, r. whose remains are found mainly in S. Africa, though *Elginia* and others are Scot. fossils, and several are Amer. Lizard-like land creatures, interesting because they exhibit both reptilian and mammalian characteristics, indicating perhaps the point of origin of the mammals.

Order X. DINOSAURIA, DINOSAURS, mammal-like r. with large body bearing four limbs, on all of which or on the hinder pair only, the creatures moved. Their remains, which show bird and mammal relationships, are widely distributed in deposits ranging from Triassic to Cretaceous Age, especially in America and Belgium. All were terrestrial, but some, such as the gigantic *Diplodocus*, *Brontosaurus* (50 ft.), and *Iguanodon* (28 ft.), were herbivorous and probably amphibian, while *Læaps* and *Megalosaurus* were fiercely carnivorous; examples of the former stood 18 ft. high.

Order XI. PTEROSAURIA, ORNITHOSAURIA or PTERODACTYLS, e.g. *Pterosaurus* and *Rhamphorhynchus*, highly specialised flying reptiles, the remains of which are found in rocks from Lower Jurassic to Upper Chalk; wing-like flaps of skin extended from an exceedingly long finger to hind limbs and tail. Though distinctly reptilian, in many structures they closely resemble birds, varying 'from the size of a sparrow to that of a condor,' but no traces of such external covering as feathers have been found.

REPTON (52° 50′ N., 1° 32′ W.), village, on Trent, Derbyshire, England; noted grammar school.

REPUBLIC (Lat. *res*, business; *publicus*, public), state in which government is aristocratic or democratic, not monarchical. The city-states of antiquity usually passed through a monarchical to a republican phase, and attained their highest culture in the latter, but the r's of Greece and Rome were oligarchic—a few ruling a large slave class. The ancient cities of Italy retained the Rom. ideal. Rome itself made attempts at republican revolution in XII. and XIV. cent's, while Venice quickly won freedom from imperial control. Florence became the centre of republican feeling under Renaissance influence; the political institutions of Greece and Rome were studied, but the Florentine republic came to an end, 1530, and the greater part of Italy, like the rest of the world, came under absolute government. Calvinism was the parent of modern democracy,—the Swiss federation, the Dutch republic, the Eng. Commonwealth, and Amer. colonies (of which republicanism was natural development); and Fr. Revolution, it is agreed, was largely due to admiration of the *philosophes* for Eng. and Amer. ideas. The Fr. Revolution, however, was the child of both Reformation and Renaissance, owing as much to Plutarch as to democratic ideals of Reformed countries. U.S.A. and Switzerland are *federal* r's, *i.e.* composed of federated states; France and Portugal are unitary r's. For methods of government in r's, see CHINA, UNITED STATES, FRANCE, SWITZERLAND, MEXICO, PORTUGAL, and various S. Amer. states.

REPUBLICAN PARTY, first arose in America in disputes of North and South as to slavery. The Kansas-Nebraska Bill raised the whole question, and both Whigs and Democrats of North joined in formation of new Abolitionist party, which they named Republican, 1854, under leadership of Henry Ward Beecher, Abraham Lincoln, Sumner, Seward, Greeley, etc. The strength of the party determined the South to secede, and Republicans thereupon became identified with the Union party. They secured Lincoln's election as Pres., 1860, but on immediate secession of Southern States slavery agitation was for a while laid aside. Their statesmanship in crushing Southern revolt secured their future importance, and they remained supreme in U.S.A., 1865–77; followed up victory by liberation of slaves, 1863; enormous question of treatment of liberated slaves tried their powers of administration to utmost. Disputes between Congress and Pres. as to latter's powers, restiveness of South under misgovernment, and, finally, corruption of R. party culminating in scandals at Washington, 1874–76, destroyed enthusiasm for it.

The election of 1874 gave Democrats a majority in House of Representatives, though Republicans carried their candidate, Hayes, at disputed presidential election, 1876. For 16 years between 1874–94 the Democrats controlled the House of Representatives and then (1896) the Republicans' support of gold standard of currency and increased Protection led to their return, with M'Kinley as Pres.; split between R. 'Insurgents' (of whom Roosevelt assumed leadership) and 'Old Guard' (led by Pres. Taft) was followed (1910) by Democratic triumph in House of Representatives elections, although Republicans retained majority in Senate. Roosevelt (*q.v.*) and new Progressive party broke away from R. party, and Democrat candidate won at presidential election, 1912.

REQUEÑA (39° 31′ N., 1° 10′ W.), town, Valencia, Spain; manufactures wine. Pop. 17,000.

REQUEST, LETTERS OF, are sent by an inferior judge to the Dean of Arches, for the trial of cases, when the right of jurisdiction has been waived in the lower court.

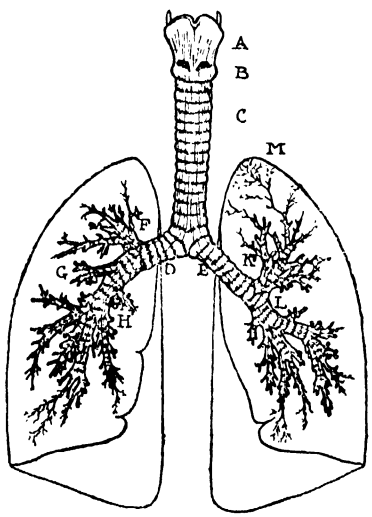
RESCHEN SCHEIDECK (46° 50′ N., 10° 31′ E.), Alpine pass (4890 ft.) between Inn and Adige valleys.

RESERVE, see ARMY.

RESHT (37° 15′ N., 49° 25′ E.), town, Gilan, Persia; trade in silk and cocoons. Pop. *c.* 42,000.

RESINS, vegetable compounds of oxygen, carbon and hydrogen; soluble in alcohol, ether, essential oils, alkalis. Hard r's are solid; they include lac, copal, guaiacum, mastic, jalap (*qq.v.*). Soft r's contain essential oils (see BALSAM). See GUM, ROSIN.

RESORCIN, RESORCINOL ($C_6H_4(OH)_2$), metadihydroxybenzene, colourless crystals, soluble in water, alcohol, ether; M.P. 118° C.; obtained by heating galbanum resin with potash; used to make fluorescein, eosin, azo-dyes.



RESPIRATORY SYSTEM includes the nasal passages, pharynx, larynx, trachea, bronchi, and lungs; the first three are treated under OLFACTORY SYSTEM, PHARYNX, LARYNX, so that the trachea, bronchi, and lungs only fall to be considered here.

The TRACHEA is the tube which conveys the air from the larynx to the bronchi, being rather over 4 inches in length, the upper inch being situated in the neck, and the remaining part in the thorax. It is composed of a fibro-elastic membrane, in which are horseshoe-shaped plates of cartilage which serve to keep the passage permanently open; the posterior aspect, where the cartilages are deficient, being closed by non-striped muscle, which, by contracting, can alter the diameter of the tube. The interior is lined with mucous membrane.

The BRONCHI, into which the trachea divides, are two in number, the right being rather wider, shorter, and at a less acute angle than the left. The structure of

the bronchi resembles that of the trachea, rings of cartilage, deficient behind, similarly keeping the tubes permanently open. The bronchi branch freely on all sides in the substance of the lungs, the smaller branches sending off still smaller branches, and as the air passages become smaller the cartilages disappear, and the muscle fibres form a layer all round the passages.

The LUNGS are two in number, and are conical, spongy, vascular organs, situated one on each side of the thorax. Each is invested with a serous membrane, the *pleura*, which is continuous at the root of the lungs with a similar membrane which lines the cavity of the chest, the practically non-existent space between the two membranes, which are only separated by a slight film of serous fluid, being termed the pleural cavity. Each lung has a deep fissure running obliquely downwards and forwards in its substance, and the right lung has also a secondary fissure running horizontally from the middle of the greater fissure to the inner border of the lung. The left lung is thus divided into two, and the right into three lobes. Each lung is attached on its inner aspect to the mediastinal

RESPIRATORY SYSTEM. *A*, thyroid cartilage; *B*, cricoid cartilage; *C*, trachea or windpipe; *D*, right bronchus, leading to right lung; *E*, left bronchus, leading to left lung; *F*, main branch to upper lobe of right lung; *G*, main branch to middle lobe of right lung; *H*, main branch to lower lobe of right lung; *K*, main branch to upper lobe of left lung; *L*, main branch to lower lobe of left lung; *M*, terminal branches of bronchi ending in the air-cells.

wall of the pleural cavity, at the root, where the blood vessels, bronchi, lymphatics, and nerves enter and leave its substance. The terminal branches of the bronchi end in irregular passages, from the sides of which go off the air-sacs or *alveoli*, which have delicate membranous walls containing a fine network of capillaries. The blood in these capillaries is thus only separated from the air in the alveoli by the slight framework of the walls of the capillaries and the alveoli being spread by the capillary network over a comparatively large surface, and it is here that the interchange of gases between the air and the blood takes place.

The process of **breathing** consists in enlarging the chest by raising the ribs to a more horizontal plane and depressing the diaphragm, so as to inspire air into the lungs, the former being the more important factor in women and the latter in men. The movements of the ribs in *inspiration* are produced by muscles attached from the ribs to the skull, vertebral column, and scapulæ, including the levatores costarum, scalein, sternomastoid, serratus posticus superior, cervicalis ascendens, pectoralis minor, and, in certain cases, the serratus magnus and pectoralis major, while the external intercostal muscles are also concerned. The diaphragm is depressed by the longitudinal curves being straightened through the contraction of the muscular fibres, the central tendon moving but slightly in respiration. In *expiration* the ribs and diaphragm regain their position of rest, and, except the internal intercostal muscles, no special expiratory muscles are called into play in ordinary expiration. In forced expiratory effort, however, the muscles of the abdominal walls force up the diaphragm and pull down the ribs and sternum, assisted by the triangularis sterni, which is attached to the costal cartilages and sternum, the serratus posticus inferior, attached to the lumbar fascia and the lower ribs, and the quadratus lumborum, attached from the pelvis to the last rib.

The *chest* acts practically like a bag, which, when it is enlarged, draws in air, and when it is collapsed, drives it out again. The movements of the chest change the air only in the trachea and the larger bronchi, the air-sacs or alveoli not being affected to any extent by the movements, and the air which they contain is renewed by diffusion of gases; since the air in them is not changed, as in the larger passages, it is always poorer in oxygen and contains a greater quantity of carbon dioxide than the outside air.

The amount of air which is taken in and passes out at an ordinary respiration is about 20 to 30 cubic inches, this being termed the *tidal air*; the *complemental air*, or the amount that can be inspired beyond this by a forced inspiration, is about 100 to 120 cubic inches; the *supplemental air*, or the amount that can be forcibly expelled from the chest after an ordinary expiration, is about 100 cubic inches; while the *residual air*, or the amount that remains in the lungs after the most complete effort of expiration, is about 100 to 120 cubic inches.

The oxygen is held in the blood in chemical combination with the hæmoglobin of the red corpuscles, and is carried in this way from the lungs to the heart and thence by the arteries and capillaries to the various tissues of the body, where it breaks away from the hæmoglobin and is absorbed. Carbon dioxide, on the other hand, is given off by the tissues and is dissolved in the blood plasma and combined with the sodium carbonate in it, forming sodium bicarbonate; this is conveyed by the veins to the lungs, where it is given off and passes out in the expired air.

The composition of pure atmospheric air is 20·9 % oxygen, 79 % nitrogen, 0·04 % carbon dioxide, and a slight quantity of moisture; the composition of dried expired air is about 16 % oxygen, 79 % nitrogen, and 4·5 % carbon dioxide, while it contains, in addition, up to 6 % of moisture.

The respiration is governed by a nerve centre in the medulla oblongata, the lowest part of the brain immediately above the spinal cord, and the nerve by which it is chiefly regulated is the vagus; if the centre in the medulla is injured, respiration stops, if the end of the vagus nearer to the brain is stimulated, respiration is quickened, and if the vagus is cut, respiration is slowed. Stimuli through various other nerves, however, may excite the respiratory centre, and, reflected to the muscles of the chest and the diaphragm, have an effect upon the respiration; for instance, cold water suddenly dashed on the back of the head causes a person to take a deep inspiration and hold it, while in *artificial respiration* pressure is made upon the chest walls, or the chest is enlarged and compressed alternately by moving the arms or body of the affected person, according to various methods, in order to stimulate the mechanism of respiration in cases of persons apparently drowned. The respiration is regulated by the carbon dioxide in the blood, which, when it is in sufficient quantity, stimulates the nervous centre in the medulla, which causes contraction of the inspiratory muscles, and thus the lungs receive a fresh supply of oxygen.

Pathology.—The various diseases of the respiratory

system will be found described under their different headings, *e.g.* ASTHMA, BRONCHITIS, EMPHYSEMA, PLEURISY, PNEUMONIA, TUBERCULOSIS. The main general symptoms of diseases of the r. s. are *pain*, which may be burning, as in bronchitis, or stabbing, as in pleurisy or in pneumonia, the pain in the latter being due to the associated pleurisy; *interference with respiration*, either the respiration being accelerated or difficulty in breathing experienced; *rise of temperature*, to a greater or less extent, a feature common to practically all diseases of the respiratory system; *cough*, generally accompanied by sputum, which may be frothy, as in bronchitis, gelatinous and plum-coloured, later of a rusty tinge, as in pneumonia, in disc-like purulent masses, 'nummular,' as in phthisis.

Certain occupations predispose towards diseases of the r. s., stone-masons, coal-miners, knife-grinders, mill-workers, and others working in dusty atmospheres being affected. The particles of stone, coal, or other dust which are inhaled may cause chronic bronchitis, which is followed by emphysema, or they may cause an overgrowth of fibrous tissue in the lung itself, this tissue sometimes becoming softened in parts and breaking down to form cavities, a condition known as stone-masons' or coal-miners'or knife-grinders' phthisis. Glass-blowers are also liable to bronchitis.

Tracheotomy, or the making of an opening into the trachea or wind-pipe by cutting into it from the front of the neck, may be necessary through a foreign body in the air-passages, acute laryngitis causing great swelling of the walls of the air-passages, diphtheritic inflammation, or some similar cause, preventing the passage of air into the trachea by the natural passages. A bent silver double tube is introduced as a means of communication between the trachea and the exterior, the inner tube being loosely in the outer so that it can easily be removed by coughing when sputum is coughed into it.

RESTIF, NICOLAS EDME, RÉTIF DE LA BRETONNE (1734–1806), Fr. novelist and printer; pub. more than 200 vol's of licentious nature but skilful description.

'RESURRECTION MEN,' see BURIAL.

RETFORD, EAST (53° 20′ N., 0° 57′ W.), town, on Idle, Nottinghamshire, England; iron foundries. Pop. (1911) 13,386.

RETHEL (49° 32′ N., 4° 21′ E.), town, on Aisne, Ardennes, France; fine woollen cloths. Pop. 5800.

RETICULUM, see under PECORA.

RETINA, see EYE.

RETRIEVER DOGS, see DOG FAMILY.

RETZ, GILLES DE, RAIS (1404–40), leader of Fr. resistance to English and protector of Joan of Arc; marshal of France, 1426; kept magnificent mediæval household; a man of horrible depravity; murder and torture of numbers of children disclosed, 1440; hanged; of literary interest for connection with mystery plays and Bluebeard legend.

RETZ, JEAN-FRANÇOIS-PAUL DE GONDI, CARDINAL DE (1613–79), Fr. *Frondeur*; member of family which had produced three abp's; coadjutor of his uncle, Abp. of Paris, 1643; raised regiment and fought against court party, 1649 and 1651; made terms with king, receiving cardinalate, 1652; arrested, 1652, and fled; returned after Mazarin's death; abandoned claim to archbishopric; made abbot of St. Denis; accumulated enormous debts; wrote remarkable *Mémoires*.

REUCHLIN, JOHANN (1455–1522), Renaissance scholar; studied Greek at Paris and Basel, and then studied law. In 1492 he began to study Hebrew, and to his work the revival of the language was largely due. Though devout, R. was the bitter opponent of ignorance and bigotry, and he became embroiled in a controversy with Johann Pfefferkorn, a converted Jew, who got an imperial mandate for burning all Jewish books. He was tried for heresy, but at length proceedings against him were annulled. His most famous work was *De Rudimentis Hebraicis*. R. and Erasmus were the greatest scholars of their time.

RÉUNION, ÎLE BOURBON (21° 5′ S., 55° 35′ E.), island belonging to France, one of group lying to E. of Madagascar; area, 965 sq. miles; surface generally mountainous; has one very active volcano, Piton de Fournaise; drained by many short streams; chief towns, St. Denis (capital), St. Pierre, St. Paul, and St. Louis. R. was first visited by Portug. explorers early in XVI. cent. and was settled by French c. 1649; occupied by British, 1810–15, when reverted to France. R. is administered by gov.; represented in Fr. Parliament by one Senator and two Deputies; produces sugar, coffee, vanilla, tapioca, spices, rum; horses, cattle, mules, sheep, and goats raised. Inhabitants include Europeans, Creoles, British Indians, negroes. Pop. (1911) 173,822.

REUS (41° 10′ N., 1° E.), city, province Tarragona, Spain; wines; cotton and silk goods. Pop. (1910) 25,763.

REUSCH, FRANZ HEINRICH (1823–1900), Ger. Old Catholic divine; prof. at Bonn, 1858; opposed papal infallibility and was excommunicated; wrote theological works—some with Döllinger.

REUSS, two Ger. principalities.—**Reuss-Greiz** is held by elder branch of R. family; area, 122 sq. miles; capital, Greiz; woollens are manufactured and live stock reared. Pop. (1910) 72,769. **Reuss-Schleiz-Gera** belongs to younger branch of R. family; area, 319 sq. miles; capital, Gera; principal industries—agriculture, manufacture of woollens. Pop. (1910) 152,752. All princes of R. family have been called Heinrich since XI. cent.

REUSS, ÉDOUARD GUILLAUME EUGÈNE (1804–91), theologian; prof. at Strassburg, 1836; pub. works in German, French, and Latin; a pioneer in Old Testament criticism.

REUTER, FRITZ (1810–74), 'Low German' novelist and humorist; b. Stavenhagen (Mecklenburg-Schwerin); sentenced to death for high treason, afterwards commuted to imprisonment; released after seven years; best works, *Ut mine Stromtid*; *Ut mine Festungstid*; *Ut de Franzosentid*, etc. (prose works).

REUTER, PAUL JULIUS, BARON DE (1821–99), originator of Reuter's News Agency; b. Cassel, Germany; became a naturalised Brit. subject (1851), and founded his offices in London, with correspondents in all parts of the world.

REUTLINGEN (48° 30′ N., 9° 13′ E.), town, on Echatz, Württemberg, Germany; leather manufactures. Pop. (1910) 29,763.

REVAL, REVEL (59° 27′ N., 24° 49′ E.), fortified seaport, watering-place, on Gulf of Finland; capital of Esthonia, Russia; among chief buildings are the castle, cathedral, and churches of St. Olai and St. Nicolai; exports grain and flax. Pop. (1910) 73,340.

REVELATION, BOOK OF, sometimes called the **Apocalypse,** bearing the name of John certainly since 200. It is the last and in many ways the most remarkable of the New Testament, in which it is the only Apocalypse. There are several possible references to it in sub-Apostolic writings, but none certain before Justin Martyr, who ascribes it to the Apostle St. John. Its authenticity was denied by Marcion, Dionysius of Alexandria, and Eusebius, and for some time it was rejected in the East.

The history of the interpretation of the Apocalypse is a very long one, for the book presents numerous difficulties to the scholar, the exegete, and the theologian, and of much of it the meaning is still obscure. For long the book was viewed as containing a picture of the Millennium, the reign of Christ and His saints that was to be. At the Reformation Protestants identified the pope with Antichrist. Another view made the Revelation a prophecy of all future history, and many theologians have sought in it reference to political events of their own time. This view has generally gone out, and is only followed now by cranks and fanatics.

Far saner are those who would see in it reference to the history of the writer's own day. Indeed, it is only since this has been recognised as the starting-point that any scientific study or real progress in interpretation has been possible.

All these views, however, presuppose the book to be a literary unity. But there has recently been an increasing number of scholars who think they can find trace either of a number of sources, or of several redactions, or of the incorporation of older fragments, *i.e.* of myths derived from outside Christianity. This leads to another interpretation called by a recent critic 'traditional historical.' The great point here is chapter 12, which can hardly be derived from a pure Christian source, and it has been thought to come from Babylonian, Egyptian, or Gk. mythology. This theory was started by Gunkel, and he has expanded it in an extreme form. It is now accepted by many scholars as accounting for something otherwise inexplicable. We view, therefore, *Revelation* as a literary work of one author, though of different dates, into which have been incorporated ancient myths, the whole to be interpreted in the light of the history of the writer's time.

There is another point to be considered, that is the psychology of its author. It is undoubtedly the work of an intense mystic whose visions are not mere literary vehicle, but owe something to his own experience. Over its date scholars have long quarrelled. A generation ago the reign of Nero was preferred, and, though this is true of parts, there are passages which seem to necessitate the time of Domitian, *i.e.* c. 93–95 A.D. It is then difficult to ascribe it to the same author as the Fourth Gospel, which was written about, or soon after, this time, for there would not be sufficient time to account for the difference in language and standpoint between the two works. Though the question is not settled, yet it is probably not by John the Apostle, and if not by John the Elder, it is the outcome, like the other Johannine writings, of his disciple and his school.

Scott, *Revelation* (Century Bible); Swete, *The Apocalypse of St. John*; Ramsay, *Letter to the Seven Churches of Asia*; Green, *The Ephesian Canonical Writings*; Gunkel, *Schöpfung und Chaos in Urzeit und Endzeit*.

REVELSTOKE (50° 30′ N., 118° W.), town, Brit. Columbia; mining industries; railroad-shops. Pop. 3700.

REVENTLOW, CHRISTIAN DITLEV FREDERICK, COUNT (1748–1827), Dan. statesman; pres. of *Rentekammeret*, 1784; carried out agrarian reforms; obtained appointment of royal commission, 1786, to inquire into condition of peasantry; result—abolition of feudal services; introduced free trade measures; fell, 1813.

REVENUE, see FINANCE.

REVERBERATING FURNACE, see FURNACE.

REVERE (42° 25′ N., 71° W.), watering-place, Massachusetts, U.S.A., on Massachusetts Bay. Pop. (1910) 18,219.

REVERSION, see REMAINDER, HEREDITY.

REVIEWS, see PERIODICALS.

REVILLAGIGEDO (19° 25′ N., 110° 30′ W.), group of islands, N. Pacific, belonging to Mexico; mostly uninhabited.

RÉVILLE, ALBERT (1826–1906), and his son **Jean** (1854–1908), Fr. liberal Protestants; prof's at Paris.

REVIVAL OF LEARNING, see RENAISSANCE.

REVOLVER, see PISTOLS.

REWA (24° 31′ N., 81° 20′ E.), native state, Baghelkhand, Central India. Pop. 1,330,000, Capital, **Rewa**. Pop. 26,000.

REWA KANTHA (22° 30′ N., 73° 30′ E.), collection of native states, Bombay, India. Pop. c. 480,000.

REWARI (28° 12′ N., 70° 40′ E.), town, Gurgaon district, **Punjab**, Brit. India; trade in grain. Pop. 30,000.

REYKJAVIK (64° 8′ N., 21° 55′ W.), capital of Iceland (*q.v.*).

REYNARD THE FOX, an epic of animal life common to French, Dutch, and German Romance. Of this story there were various versions, but all are based upon the cunning of Reynard the Fox directed against his enemy, Isengrim the Wolf, who was chief informer against him at the court of the Lion, king of beasts.

REYNOLDS, JOHN FULTON (1820–63), Amer. soldier; commander of Federal left wing at Gettysburg, where he fell.

REYNOLDS, SIR JOSHUA (1723–92), painter; born near Plymouth, studied in England and in Italy, established himself in London, and became so successful that in 1755 he had 120 sitters. Though he worked in other departments, it was as a portrait-painter that he excelled. His pictures of children have a peculiar tenderness and beauty, and his greatest portrait, that of Mrs. Siddons as 'The Tragic Muse,' remains unsurpassed for many distinctive qualities. At the foundation of the Royal Academy in 1768, he was elected President, and in 1784 was made painter to the King. He founded the famous literary club of which Johnson, Goldsmith, and Burke were members, and his name figures prominently in Boswell's *Johnson*.

REYNOLDS, WALTER (d. 1327), treasurer of England, 1307; bp. of Worcester, 1308; chancellor, 1310; abp. of Canterbury, 1313.

REZÁNOV, NICOLAI PETROVICH DE (1764–1807), Russ. diplomatist and financier; obtained charter for Russian-American Fur Company; obtained great wealth as promoter, and sought to extend Russ. territory in hunting districts of western North America; untimely death prevented realisation of plans.

RHABDOCŒLIDA, a group of Turbellarian Worms (*q.v.*).

RHABDOMANCY, science of using Divining-rod (*q.v.*).

RHACOPHORUS, Flying Frog, see FROGS.

RHADAMANTHUS (classical myth.), s. of Zeus and Europa; because of his justice he was made a judge of the dead in Hades.

RHÆTIA, RÆTIA, former country of Central Alps; inhabitants thought immigrant Etruscans; Rom. province, 5 B.C.

RHÆTIC BEDS, uppermost strata of Triassic, or lowest of Liassic, systems; found in England, Germany, but most extensively developed in Rhætian Alps; highly fossiliferous, especially in marine remains, the characteristic being *avicula contorta*, while Celemontes make their first appearance. Corals, plants, bones, teeth, insects, and first appearance of mammals in northern hemisphere are other interesting features.

RHAMNACEÆ, natural order of trees and shrubs; two genera: *Rhamnus* (Buckthorn), used in dyeing as an astringent; and *Zizyphus*, the lotus of antiquity.

RHAMNUSIO, see RAMUSIO.

RHAMPHASTIDÆ, Toucans (*q.v.*).

RHAMPHORHYNCHUS, an extinct REPTILE (*q.v.*).

RHAPSODISTS, in ancient Greece, itinerant reciters of epic poetry; competed at games and festivals; wore rich robes; possibly the earliest r's composed epics, but later ones merely declaimed Homer, *e.g.* Plato's *Ion*.

RHATANY (*Krameria*), plant of order Polygaleæ; roots of Peruvian R. and Savanilla R. are used as strong astringent.

RHAYADER (52° 18′ N., 3° 28′ W.), town, on Wye, Radnorshire, England. Pop. (1911) (rural district) 5198.

RHÉ, ÎLE DE, see RÉ.

RHEA, see RAMIE.

RHEA, see under RUNNING BIRDS.

RHEGIUM, REGIUM (modern REGGIO DI CALABRIA) (38° 5′ N., 15° 40′ E.), ancient city, on coast of Brut-

tium, S. Italy; founded by Chalcidians and Messinians, VIII. cent. B.C.; became a Rom. colony, III. cent. B.C.

RHEIMS, see REIMS.

RHEIN, see RHINE.

RHEINBAYERN, see PALATINATE.

RHEINE (52° 16′ N., 7° 25′ E.), town, on Ems, Westphalia province, Prussia; manufactures cotton. Pop. (1910) 14,417.

RHEINPFALZ, see PALATINATE.

RHENISH PRUSSIA, see RHINELAND.

RHETORIC is the art of public speaking. The popular assemblies of the Gk. states made it essential for all men to be able to express their thoughts lucidly and correctly, and hence among the ancients the art was widely cultivated and highly esteemed. R. was first taught in Sicily by Corax and Tisias, about the year 460 B.C., in order to assist those involved in the many lawsuits which the redistribution of land at that period had occasioned. Gorgias brought the art to a pitch of high perfection, but he was essentially a stylist and cared little about the content. R. was one of the chief subjects taught by the sophists, but it was Aristotle who first raised the study to the dignity of a science. His *Rhetoric* survives, and consists of three books containing copious illustrations from Gk. rhetoricians and writers. The first two books are mainly devoted to *proofs*, but the third which treats style is the most interesting. Of the Attic orators, Antiphon, Lysias, and Isocrates are famous, but Demosthenes is on a plane by himself. Among the Romans the art was cultivated assiduously, being in harmony with Rom. ideals and temperaments.

Cicero extends the sphere of r. to include the formation of a man's character and the entire field of his studies. His best works on the subject are the *De Oratore* and the *Brutus*. The *Rhetoric* of Quintilian is an exhaustive manual dealing with r. on the broad basis defined by Cicero. In modern times r. has not received the close attention it received in classical times. Perhaps the most brilliant and systematic Eng. rhetorician has been John Bright.

Saintsbury, *History of Criticism*.

RHEUMATISM, term popularly applied to a number of conditions characterised by pain, more accurately differentiated as acute r., chronic r., and muscular r.

ACUTE RHEUMATISM or RHEUMATIC FEVER is an acute fever due to a toxic condition of the blood caused by a micro-organism, the chief symptom in *adults* being the affection of the joints, which become swollen, reddened, hot, and tender, first one of the larger joints (knee, ankle, shoulder) being affected, then some of the others, often in symmetrical order. At the same time the temperature rises, accompanied by other symptoms, and the heart may become affected, but the latter is not so usual as in children. In *children* the affection of the joints is slight, the other symptoms are not so marked, and the patient does not seem very ill. There is, however, a particular liability to affection of the heart and pericardium, and the heart must be frequently examined by a physician. The presence of fibrous nodules under the skin is also often a characteristic of the disease in children. The *treatment* of acute r. is to put the patient to bed between blankets, give him a dose of calomel, and keep the affected joints at rest, wrapped in cotton wool. Salicylate of soda (grs. xx. every two hours till pain is relieved, then every four hours till temperature is normal) has a remarkable effect in relieving pain, reducing the temperature, and shortening the course of an attack. Alkaline drinks in liberal quantities are also of benefit. Aspirin is a valuable substitute for salicylates.

CHRONIC RHEUMATISM may follow one or more acute attacks, or it may be chronic from the beginning, sometimes several joints being affected, sometimes only one. The capsule, tendon sheaths, and ligaments are thickened, and there is a tendency towards adhesions and fibrous thickenings in the joint, which may be somewhat distorted. There is no tendency to heart or kidney affections. The treatment is to give potassium iodide, quinine, cod-liver oil internally; and massage, iodine, and other liniments are of value. Alcohol of any kind and sugar should be avoided in the diet, while Turkish baths, hot-air or hot-sand baths are of benefit.

MUSCULAR RHEUMATISM usually comes on suddenly with pain in certain groups of muscles, with little or no swelling, often accompanied by digestive disturbances, the chief varieties being *lumbago* (affecting lower part of the back), *intercostal rheumatism* (affecting the muscles between the ribs), and *torticollis* (affecting one side of the neck), gouty or rheumatic persons being generally affected. The treatment is to administer calomel and saline purges, while sodium salicylate, quinine, and potassium iodide are of benefit. Counter-irritants (*e.g.* iodine or mustard leaves) should be applied locally, and rest is necessary. Massage, electricity, and mineral baths have been found valuable, and the diet should be kept simple, alcohol and sugars being avoided.

RHEUMATOID ARTHRITIS, OSTEO-ARTHRITIS, ARTHRITIS DEFORMANS, is a disease characterised usually by a chronic course and destructive changes in the joints, the cause of which is believed to be either a micro-organism or toxæmia due to absorption of toxins from the alimentary canal. It may assume one of several types: in the most *common form* the tissues around the joint and the synovial membrane of the joint are involved, the joints are swollen, painful, and tender, and there is often fever. Later, there may be a certain amount of muscular atrophy, the skin is glossy and pigmented, and the joint may become deformed. In the *atrophic* type, which is rarer and more serious, there is atrophy of bone and of cartilage in the joint, which becomes disorganised and usually ankylosed. In the *hypertrophic* type new bone is formed, projecting around the joint and sometimes leading to ankylosis, while there are also changes in the cartilage. In a type of r. a. which usually affects children (*Still's disease*) there is usually fever in the acute stages, and, in addition to the swelling of joints, swelling of the lymph glands and the spleen, accompanied by anæmia, muscular wasting, and limitation of movement.

The *treatment* of r. a. is, in the acute stages, rest and an abundant nourishing diet. Passive hyperæmia has been induced with benefit by applying an elastic bandage above the joint for a few hours each day. Douches, massage, hot-air and mineral baths afford relief, and the treatment as carried out at such spas as Bath, Buxton, and Aix-les-Bains is valuable. It is necessary to improve the general health, and iron, arsenic, or cod-liver oil are given for that purpose, while potassium iodide and guiacum have proved beneficial in the general treatment of the condition.

RHEYDT (51° 11′ N., 6° 28′ E.), town, Rhineland, Prussia, on Niers; textiles. Pop. (1910) 43,999.

RHINA, see ANGEL-FISH.

RHINE, RHEIN (50° 12′ N., 7° 34′ E.), largest river in Germany and chief commercial river of European continent; rises in Switzerland; formed by union of Hinter and Vorder R. at Reichenau; enters Lake Constance; famous falls near Schaffhausen (*q.v.*); flows N. through Germany to Mainz, then N. and N.W., entering Holland below Emmerich, divides into several arms and enters North Sea. R. forms boundary between Switzerland and Germany; chief tributaries —Aar, Ill, Neckar, Main, Lahn, Moselle, Ruhr, Lippe; chief towns—Strassburg, Speyer, Ludwigshaven, Mannheim, Wörms, Mainz, Bingen, Coblenz, Bonn, Cologne, Düsseldorf; total length, 760 miles, of which over 500 are navigable, beginning at Basel. R. is connected by canals with Danube, Rhône, and Marne. Large quantities of timber are floated down from Black Forest, etc.; important lamprey, salmon, and sturgeon fisheries; famous wine district. R. has

always played an important part in history, romance, lit., and commerce; a great natural frontier from Rom. Empire onwards; left bank annexed by French, 1801; retaken by Germans, 1871; scenery between Bingen and Coblenz especially romantic — with mediæval castles (Rheinfels, Rheinstein, Ehrenbreitstein), Lorelei, Mousetower, etc.

Mackinder, *The Rhine: Its Valley and History* (1908).

RHINELAND, RHINE PROVINCE, RHENISH PRUSSIA (50° 50′ N., 7° E.), most westerly province of Prussia, between Luxemburg, Belgium, and Holland on W., and Westphalia and Hesse-Nassau on E.; area, 10,423 sq. miles; chief rivers, Rhine, Moselle, Sieg, Ruhr, Lippe; capital, Coblenz; other towns—Cologne, Düsseldorf, Duisburg, Elberfeld-Barmen, Crefeld, Essen, etc. Province was constituted in 1815 out of duchies of Berg, Cleves, Guelders, Jülich; Trier, Cologne, Aix-la-Chapelle, and other territories. R. is great manufacturing centre of iron, brass, and steel goods; cutlery, chemicals, textiles; fertile soil; famous wines; mineral springs at Aachen, Kreuznach, etc. Pop. (1910) 7,121,140.

RHINOCEROSES (*Rhinocerotidæ*), a genus and family of large Odd-toed or Perissodactyle Ungulate Mammals, with five species found only in Africa, N.E. India, Burma, Malay, Sumatra, Borneo, and Java. They are shy nocturnal creatures, with thick skins and one or two upright horns on or behind the snout. They live on foliage and the young shoots of trees, and are often found wallowing in muddy pools or in rivers.

RHIZOPODA (Gk. *rhiza*, a root; and *podos*, a foot), a sub-class of the simplest class (*Sarcodina*) of the Protozoa. Its members are distinguished by the possession of pseudopodia, which are mobile, branched, and root-like (hence the name), in contradistinction to the unbranched, ray-like pseudopodia of the *Actinopoda*. The structure is of the simplest nature, consisting essentially of a single cell without definite bounding walls, and containing a nucleus, and vacuoles utilised in digestion and respiration.

Movement amongst the R. is a simple creeping, in the majority of forms a mere flowing forwards of the cell-substance in indefinite processes. They possess a diffuse capacity of response to chemical and physical stimuli. Their food consists of minute plants, such as Diatoms and Desmids, and organic débris. It is engulfed by the protoplasm at any part of the body, within which it is digested in a food vacuole, the residue being ejected from the cell by a contractile vacuole. Reproduction normally occurs by simple division.

R. are found all the world over. The majority are aquatic, living in fresh water or in the sea. Some live in damp earth, while many are parasitic in the bodies of animals and of man, and to such are due amœbic dysentery and abscesses in the liver and other organs.

The R. are divided, according to Minchin, 1912, into four orders, distinguished as follows: (1) *Amœbœa*, simple indefinite individuals, with naked protoplasm or a simple shell; (2) *Foraminifera*, marine, with complex shells of carbonate of lime or cemented sand particles and fine net-like pseudopodia; (3) *Xenophyophora*, marine, with skeleton of hollow tubes, containing the protoplasmic body; (4) *Mycetozoa*, terrestrial forms, without skeleton, and with complex spore reproduction.

RHODANUS, see RHONE.

RHODE ISLAND (41° 19′ to 42° 3′ N., 71° 7′ to 71° 50′ W.), smallest state of U.S.A.; bounded N. and E. by Massachusetts, S. by Atlantic, W. by Connecticut; area, 1250 sq. miles. Surface generally undulating, but nowhere reaching any great height. Narragansett Bay, which extends inland over 30 miles, increases the coast-line so that it has a total length of nearly 400 miles; drained by Pawtuxet, Pawcatuck, and other streams. Largest towns are Providence (capital), Pawtucket, Woonsocket, and Newport.

R. I. is said to have been reached by Norsemen in X. cent. It was first permanently colonised by Roger Williams, the apostle of religious liberty, and other settlers from Massachusetts, in 1636; and was incorporated as a Brit. colony in 1663; had an active share in War of Amer. Independence, was temporarily occupied by British, 1776-79, and became one of the thirteen original states of the Union, 1790; remained loyal to Union in Civil War.

R. I. is administered by a gov. assisted by lieut.-gov. and other state officials; legislature consists of Senate of 40 members and House of Representatives of 72 members. Education is gratuitous and obligatory; Providence is seat of Univ. and of other educational institutions. Chief religious denominations, in order of numerical importance, are R.C., Baptist, Prot., Episcopal, Congregational, and Methodist.

R. I. produces graphite, talc, lime, and building stone; it is pre-eminently an industrial state; manufactures woollens, cottons, locomotives, screws, hardware, jewellery, rubber, leather; has dye-, bleach-, and print-works. Railway mileage is *c.* 600. Inhabitants include Americans, British, Canadians, Italians, Germans, negroes; most densely populated state of Union. Pop. (1910) 542,610.

Richman, *Rhode Island: Its Making and Meaning* (1902), *Rhode Island: A Study in Separation* (1905).

RHODES, RHODOS (36° 10′ N., 28° E.), island belonging to Turkey in Ægean Sea; area, 423 sq. miles; surface mountainous, reaching extreme height of 4560 ft. in Mt. Atairo; considerable area wooded; climate mild; capital, RHODES, long celebrated for its Colossus. The island was originally peopled by Greeks, and afterwards passed into hands of Persians, Saracens, and Knights of St. John; the last-named held it for over two cent's, but finally surrendered it in 1522 to the Turks; occupied by Italians, 1912; claimed by Greece, 1913 (see TURCO-BALKAN WAR). Trade is now unimportant, as the two harbours have been neglected and are sand-choked. Pop. 33,000; (town) 10,500.

Torr, *Rhodes in Ancient Times* and *Rhodes in Modern Times*.

RHODES, CECIL JOHN (1853–1902), Brit. colonial statesman; b. at Bishop Stortfort, Herts; s. of clergyman; sent to Natal for health, 1871; with bro. Herbert made fortune in Kimberley diamond fields; founded De Beers Mining Co., 1880; early formed plan of making S. Africa British and linking it with Brit. protectorate of Egypt; entered Cape politics, 1881; negotiated (1883) surrender of territories in Bechuanaland; obtained Brit. troops which secured establishment of Brit. protectorate of Bechuanaland, 1884; established, with Rudd, Gold Fields of South Africa Co., 1886, and British South Africa Co. with Rothschild; through Sir Hercules Robinson secured for Britain pre-emption of Matabeleland, 1888; obtained charter for South Africa Co. ('Chartered Co.'), 1889. The company occupied Mashonaland, 1890, extended influence to great lakes, and built up what is now known as RHODESIA (*q.v.*).

R. became prime minister at Cape, 1890; advocated policy of 'Equal rights for all civilised men south of the Zambezi,' regardless of colour; strove to conciliate the Dutch; Jameson (*q.v.*) Raid (1895) forced him to resign, 1896; quelled Matabele revolt, 1896; censured by parliamentary inquiry for not preventing Jameson Raid, 1897; chief promoter of Cape to Cairo railway and trans-African telegraph line; present in siege of Kimberley, 1899–1900, when his health broke down. Public-spirited, energetic, autocratic, R. was a great 'empire-maker.' With his immense fortune he endowed (175) RHODES SCHOLARSHIPS (for British Colonial, American, and German students) at Oxford.

Life, by Colvin (1912), 'Vindex' (1900), Michell (2 vols., 1910), Jourdan (1910), Fuller (1910).

RHODESIA (13° to 22° S., 22° to 33° E.), territory of Brit. South African Co. in South-Central Africa, named after founder, Cecil Rhodes (*q.v.*); bounded N. by

Belg. Congo, Lake Tanganyika, Ger. East Africa, E. by Nyasaland and Portug. East Africa, S. by Transvaal, S.W. by Bechuanaland, W. by Ger. South-West Africa and Angola; length, *c.* 980 miles; breadth, 600 miles; area, *c.* 445,000 sq. miles. R. is divided into (1) SOUTHERN RHODESIA, containing the provinces of Matabeleland and Mashonaland, with area, 148,500 sq. miles; and (2) NORTHERN RHODESIA, which was formerly divided into North-Eastern and North-Western R. or Barotseland (*q.v.*), amalgamated 1911; area nearly 300,000 sq. miles. The Zambezi separates N. and S. Rhodesia. Surface consists mainly of an elevated plateau from 3000 to 7000 ft. above sea-level; Inyana plateau in Southern Rhodesia with highest part *c.* 7000 ft.; Tanganyika and Matoka plateaux highest elevations of Northern Rhodesia. Chief rivers are Zambezi (*q.v.*), Luangwa, Kafue, Chembezi, Kabompo, Gwaai, Hanyani, Umniati. Large lakes are Bangweolo and part of Tanganyika and Mweru; many swamps; climate is sub-tropical; tableland healthy, river valleys and low-lying country unhealthy, malaria being very prevalent; sleeping sickness in some districts owing to tse-tse fly; rainy season between Oct. and April. Fauna is that of tropical Africa; affords splendid big-game shooting; includes eland, kudu, giraffe, zebra, baboons, elephant, hippopotamus, rhinoceros, lion; numerous reptiles, butterflies, and birds; white ants and locusts abound and are very destructive. Vegetation generally is sub-tropical; extensive forests; immense tracts of grass and large stretches of country suitable for pasturage and agriculture.

History.—Numerous ruins (see ZIMBABWE) prove that Rhodesian gold-mines were worked in the Middle Ages; a now abandoned theory traced them to Solomon's days; R. is probably old Empire of Monomotapa; Portuguese entered Mashonaland, XVI. cent.; Matabeles overwhelmed pastoral tribes, 1836 onwards; region explored by Livingstone; British South Africa Company (B.S.A. Co.) obtained Charter, 1889; Mashonaland administered under Rhodes (*q.v.*); Matabele rebellion, 1893; *Shangani River* disaster, 1893; King Lobengula died in 1894; name Rhodesia officially adopted, 1895; Jameson Raid, 1895; Matabeles again revolt, 1896; Protectorate proclaimed over N.W. Rhodesia, 1900.

R. is under the administration of B.S.A. Co.; Southern R. is governed by Administrator and Executive Council (not less than 4 members) app. with Sec. of State's approval, and Legislative Council of Administrator, Resident Commissioner, and 7 members app. by the Company with Sec. of State's approval and 12 members elected by registered voters of Matabeleland and Mashonaland; Northern R. is administered by Resident Commissoner app. by Northern Rhodesian Order in Council, and administrator app. by B.S.A. Co., with Sec. of State's approval; feeling in R. is as yet adverse to the suggested incorporation in the Union of South Africa. Principal towns are Salisbury (capital of S.R.), Bulawayo, Victoria, Umtali, Gwelo; Fort Jameson (capital of N.R.), Abercorn, and Fife.

Of utmost importance for development of R. are its railways. Cape-to-Cairo railway traverses R. Rhodesian and Mashona railways begin at Vryburg (Bechuanaland), pass Bulawayo, Victoria Falls (*q.v.*), Wankie coal-fields, and cross Congo border at Bwana Mkubwa to Katanga copper region. Another important line runs from Bulawayo *via* Salisbury, Umtali, and Gwelo to east coast at Beira (*q.v.*); small branches link main lines with mining districts; total railway mileage, *c.* 2400 miles; chief products are wheat, maize, cotton, coffee, rice, rubber, tobacco, timber, ivory; rich in minerals which are already extensively worked; gold, silver, copper, coal, lead, chrome iron, diamonds, asbestos; output of gold (1909) valued at £2,623,708; country is being rapidly developed, and is of great promise. Pop. (1911) 1,750,000.

Hone, *Southern Rhodesia* (1909); Honsman, *History of Rhodesia* (1900); MacIver, *Mediæval Rhodesia* (1906); Gouldsbury and Sheane, *Great Plateau of N. Rhodesia* (1911).

RHODIUM (Rh=102·9), rare metal of platinum group, named from red colour of salts; occurs with platinum and gold; white, S.G. 12·1, difficult to fuse, tarnishes fused, easily attacked by chlorine, employed for crucibles, etc.; colloidal solution obtainable. Compounds: RhO, Rh_2O_3, $RhCl_3$, Na_3RhCl_6, $Rh_2(SO_4)_3$, and alum, RhO_2.

RHODODENDRON (Gk. 'rose-tree'), an ericaceous evergreen shrub with tough glossy leaves; handsome flower, slightly zygomorphic; high decorative value.

RHONDDA (51° 40′ N., 3° 32′ W.), parliamentary division, Glamorganshire, Wales; includes 9 ecclesiastical parishes; watered by R. river, a tributary of Taff, and by R.-Fach river, which forms E. boundary; has coal mines. Pop. (1911) 120,790.

RHÔNE (45° 40′ N., 4° 35′ E.), department of S.E. France, embracing old provinces of Lyonnais and Beaujolais; area, 1077 sq. miles; traversed by river Rhône; capital, Lyons; silk industry, wines, copper, coal, manganese, iron-smelting. Pop. (1911) 915,581.

RHÔNE, RHONE (43° 20′ N., 4° 41′ E.), swiftest Fr. river (Rom. *Rhodanus*); rises in Swiss Alps between Furka and Grimsel mts.; flows into and through Lake of Geneva; from Genova westwards to Lyons, then S. to Mediterannean, entering Gulf of Lyons through delta known as La Camargue; chief tributaries, Ain, Saône, Ardèche, Gard, Arve, Isère, Drôme, Durance; chief towns, Geneva, Brieg, Seyssel, Lyons, Vienne, Valence, Avignon, Tarascon, Arles; total length, 504 miles; passes through fine scenery; fierce current prevents navigation above Lyons; canals connect R. with Loire, Seine, Rhine.

Wood, *Valley of the Rhone* (1900).

RHÖNGEBIRGE (50° 30′ N., 10° E.), mountain group, N.W. Bavaria and Hesse-Nassau, Germany; highest peak the Wasserkuppe (3115 ft.).

RHOPALOCERA, see under LEPIDOPTERA.

RHUBARB, any one of several plants of the genus *Rheum*, the *R. rhaponticum* and *R. undulatum* being grown extensively in Britain, U.S.A., and other temperate countries; their leaf-stalks, boiled with sugar, being a favourite article of food. The *R. officinale* and *R. palmatum* are grown chiefly in northern China, but also to a small extent in Europe, their roots being dried and employed as a drug, used, in small doses, from ½ to 2 grs., as an astringent tonic, and in larger doses, 15 to 30 grs., as a purgative. *Gregory's powder*, composed of rhubarb, magnesia, and ginger (dose, 20 to 60 grs.), is a popular and valuable means of administering the drug.

RHYL (53° 39′ N., 3° 29′ W.), watering-place, near mouth of Clwyd, Flintshire, Wales. Pop. (1911) 9005.

RHYME, the recurrence of similar sounds at intervals not too great to be perceived by the ear. Rhyme as a poetical device was not used by the ancients. Only when the quantitative system had grown corrupt in mediæval times did rhyme come into prominence. Rhyme usually denotes a correspondence in the final syllables of words at the ends of lines, and in English the vowel sounds and following consonantal sounds of a perfect rhyme must be the same, but the preceding consonantal sound must be different, *e.g.* love, dove; crew, true. For *false r.*, see ASSONANCE. See also POETRY.

RHYMNEY (51° 45′ N., 3° 16′ W.), town, Monmouthshire, England; ironworks; collieries. Pop. (1911) 11,451.

RHYNCHOFLAGELLATA, a sub-class of Flagellata (*q.v.*).

RHYNCHOPHOROUS BEETLES, RHYNCHOPHORA, a sub-order of Beetles with head prolonged into a snout or rostrum. Those most familiar are the Weevils (*Curculionidæ*), the 20,000 species of

which occur all over the world. Both larvæ and adults are vegetarian, but many are exceedingly destructive to plants. The Ambrosia, and Elm Beetles (*Scolytidæ*) are wood- and bark-borers, the former living gregariously in a burrow and feeding on fungi growing therein.

RHYNCHOPS, Skimmer, see under Gull Family.

RHYOLITE, Liparite or Quartz-Trachyte, group of volcanic rocks, widely distributed and resembling granite in chemical composition; highly acidic; occurs mostly in lava flows, especially in Lipari Islands (whence name *Liparite*); with exception of dacites (*q.v.*) the only lavas containing free primary quartz. They contain orthoclase, plagioclase, felspar, and biotite.

RHYTHM, a combination of movements or sounds halting and recurring at intervals on a more or less settled plan, producing that balance which is one of the main constituents of harmony. It applies to the world of motion and of sound that peculiar quality of harmonious order which in the visual world is called symmetry. Its three chief spheres are music, lit., and dancing. In all three it is notable that the modern tendency is to favour an irregular and apparently unsettled system of cadence rather than the staid and well-ordered r. of classical times. A striking instance of this may be found in the comparison of a fugue of Johann Sebastian Bach with a modern composition of Debussy.

Contrary to popular impression r. is fully as important an element in prose as it is in verse; it is more obvious in verse because it is aided by outward manifestations, but it is perhaps of even greater importance in prose, where, owing to the absence of formal restrictions, the danger of inharmonious lack of balance is all the greater. There is without doubt an unconscious use of r. as the vehicle of emotion, and it is noticeable that impassioned prose such as oratory often acquires a perfection of r. which brings it near to blank verse.

Thomson, *The Basis of Eng. Rhythm* (1904); Saintsbury, *History of Prose Rhythms* (1912).

RHYTINA, Steller's Sea Cow, see under Sirenia.

RIAZAN, see Ryazan.

RIBBON FISHES and **OAR FISHES** (*Trachypteridæ*), long, laterally compressed, fragile, bony fishes with thin light bones and silvery skin. The Oar Fish or 'King of the Herrings,' many specimens of which have been stranded on British coasts, may be over 20 ft. long. They live in the open sea, but are seldom captured alive.

RIBBON-WORMS, see Nemertine Worms.

RIBEAUVILLE, see Rappoltsweiler.

RIBEIRA (42° 35′ N., 9° 5′ W.), town, province Corunna, Spain. Pop. 12,500.

RIBEIRO, BERNARDIM (1482–1552), Portug. poet and sec. to the court. Disappointed in his love for his cousin, D. Joanna Zagalo, and banished from court, the poet composed his five exquisite eclogues. His chief work is *Menina e Moça*, a pastoral romance.

RIBERA, GIUSEPPE (1588–1656), a leading artist of the Span. school, settled in Naples, became Court painter, and member of the Academy of St. Luke at Rome. The subjects of his pictures are mostly horrible and gruesome.

RIBES, see Currants.

RIBOT, ALEXANDRE FÉLIX JOSEPH (1842–), Fr. statesman; moderate Republican, prominent 1877 onwards; Foreign Minister, 1890–93; Premier, 1892, 1895, and 1898; brought about alliance with Russia, 1895; as leader of opposition greatly dreaded; lofty, eloquent speaker; member of Fr. Academy.

RIBS, see Skeleton.

RIBWORT PLANTAIN, see Plantain.

RICARDO, DAVID (1772–1823), Eng. political economist; Jew converted to Christianity; obtained practical knowledge of economics from early life as stockbroker, when he amassed large fortune; pub. *High Price of Bullion a Proof of the Depreciation of Banknotes*, first scientific treatise on currency, 1810. This and various articles written at about this time, in clear, trenchant style, exercised great influence on economic theories. He published *Principles of Political Economy and Taxation*, 1817, universally praised, though now to a large extent antiquated; most important feature, doctrine of nature of rent; M.P., 1818–23.

RICCI, MATTEO (1552–1610), Ital. Catholic missionary; entered Society of Jesus, 1571, and went to East; in India, 1578–82; went to China and settled with his friends in Peking. R. devoted himself to teaching and the writing of works in Chinese, astonishing the people by his mathematical and scientific knowledge; was specially popular for constructing a map which made China prominent.

RICCIO, see Rizzio.

RICE (*Oryza sativa*), the staple Asiatic cereal; grown in hot, damp plains, well irrigated; unhusked r. is known as *paddy*, and the areas under cultivation as 'paddy fields'; flower differs from that of most grasses in possessing six stamens. Principal rice-producing countries are: India (78¾ million acres under r.), Japan, Siam, Madagascar, Ceylon, U.S.A.

RICE BUNTING, Bob o' Link, Boblink, Bob-Lincoln (*Dolichonyx oryzivora*), N. Amer. relative of the Buntings—a favourite singer, and an esteemed article of food.

RICE, JAMES (1843–82), Eng. novelist; collaborated with Sir Walter Besant (*q.v.*).

RICH, EDMUND, see Edmund, Saint.

RICH, PENELOPE, LADY (*c.* 1562–1607), dau. of Walter Devereux, Earl of Essex; famous as the Stella of Sidney's *Astrophel and Stella*.

RICH, RICHARD, 1ST BARON (*c.*1500–67), Eng. Lord Chancellor, 1547–51; Attorney-General of Wales, 1532; Speaker, 1536; long career of treachery; Henry VIII.'s tool in persecution of More and Fisher, and suppression of monasteries; reformer under Edward VI., but eager to persecute Protestants under Mary.

RICH HILL (38° 5′ N., 94° 20′ W.), city, Bates County, Missouri, U.S.A.; coal mines; brick- and tile-works.

RICHARD I., Cœur-de-lion (1157–99), king of England; third s. of Henry II.; Duke of Aquitaine, 1168; succ. to Eng. throne, 1189; raised money for Crusade; prominent in capture of Acre, 1191; defeated Saladin at *Arsuf*, 1191; on way home, captured and imprisoned by Leopold of Austria; handed over to Emperor Henry VI., who released him for ransom; on return to England, 1194, crushed bro. John's intrigues against him; subsequently returned to Fr. dominions; killed during siege of castle of Châlus.

Archer, *Crusade of Richard I.*

RICHARD II. (1367–1400), king of England; s. of Black Prince; succ., 1377; met rebels under Wat Tyler at Mile End and Smithfield, 1381, and ended their insurrection; deprived of absolute power by Lords Appellant under Gloucester, 1388; concluded peace with France, 1396; revenged himself on Lords Appellant, 1397–98, sentencing them to death or exile; captured and deposed by cousin, Henry of Bolingbroke (afterwards Henry IV.), 1399; subsequently imprisoned in Pontefract Castle.

RICHARD III. (1452–85), king of England; s. of Richard, Duke of York; distinguished at battles of *Barnet* and *Tewkesbury*; crowned, 1483; shortly afterwards his nephews, Edward V. and his bro., were murdered in Tower, by his orders; suppressed Buckingham's insurrection, which ensued; defeated and killed at *Bosworth* by Henry of Richmond (afterwards Henry VII.), 1485. See *Life and Reign of Richard III.*, by Gairdner; and *Life and Character*, by Markham.

RICHARD, EARL OF CORNWALL, see Cornwall, Earl of.

RICHARD, FRANÇOIS MARIE BENJAMIN (1819–1908), abp. of Paris, 1886; cardinal, 1889.

RICHARD OF CANTERBURY (d. 1184), abp. of Canterbury, 1173.

RICHARD OF CIRENCESTER (*c.* 1335–1401),

Eng. monk and historian; wrote *Speculum Historiale de Gestis Regum Angliæ, 447–1066* (Rolls Ser.), of little value; forgery, *De situ Britanniæ*, for long accepted.

RICHARD, ST. (1197–1253), bp. of Chichester, England, 1244.

RICHARDSON, HENRY HOBSON (1838–86), Amer. architect of great and original gifts.

RICHARDSON, SIR JOHN (1787–1865), Scot. zoologist, associated with Franklin and Parry in their arctic expeditions.

RICHARDSON, SAMUEL (1689–1761), Eng. novelist; b. Derbyshire; s. of joiner; after successful apprenticeship, entered into business, became printer of House of Commons Journals, and King's Printer; was made master of the Stationers' Company. R. began to write novels when advanced in years; he had gained some reputation as a writer of letters, and was approached with a view to publishing a 'model' letter-writer; this he did (1741), but his first novel, *Pamela*, suggested by the other idea, was published some months before (1740).

It was intended as a 'moral' novel, and therefore met with much ridicule, but was original and full of life. *Pamela* was followed by *Clarissa Harlowe*, a somewhat tedious seven-vol. novel, witten in 1744–48, and *History of Charles Grandison*, 1753.

R.'s chief legacy is his introduction of the analysis of human emotion into novel-writing, but his constant moralising is wearisome, and he occasionally degenerates into prurience. He had many continental admirers.

Fielding's *Joseph Andrews* was begun as a satire on *Pamela.—Life*, by Austin Dobson (1902).

RICHELIEU, CARDINAL DE, ARMAND JEAN DU PLESSIS (1585–1642), Fr. statesman; bp. of Luçon, 1607; representative of clergy in States-General, 1614; Sec. of War and Foreign Affairs, 1616; assisted Marie de' Medici in recovery of power, 1620; cardinal, 1622; Minister of State, 1624–42. R. laid foundations of France's pre-eminence; won permanent power over king on 'Day of Dupes,' 1630; over-rode opposition of Gaston d'Orléans, bro. of Louis XIII., and secured supersession and exile of Marie de' Medicis; made government strong by suppression of feudal nobility; captured Rochelle, 1628, and destroyed political power of Huguenots, but granted them certain amount of religious toleration; initiated policy of opposition to Austria in Thirty Years War, and so destroyed power of France's great rival; opposed Hapsburgs in Netherlands and Piedmont, and aided revolt of Catalonia against Spain; patron of letters (founded *Académie française*), magnificent, extravagant; his taxes and wars sapped real prosperity of country.

Lodge, *Life of Richelieu*; Hanotaux, *Histoire du Cardinal de Richelieu*; Perkins, *Richelieu*.

RICHELIEU, DUC DE, ARMAND-EMMANUEL-SOPHIE-SEPTEMANIE DU PLESSIS (1766–1822), Fr. statesman; grandson of the great R.; volunteer in Russ. army, 1790; Foreign Minister of France after Restoration, procured speedy evacuation by allies; failed to carry through electoral reform and new Concordat.

RICHEPIN, JEAN (1849–), Fr. dramatist, poet, novelist; good psychologist, especially in his plays.

RICHERUS (later X. cent.), Fr. chronicler; monk at Reims.

RICHFIELD SPRINGS (42° 50′ N., 75° W.), village, summer resort, on Schuyler Lake, Otsego Co., New York; sulphur springs. Pop. (1910) 1503.

RICHMOND (39° 49′ N., 84° 52′ W.), city, capital Wayne Co., Indiana, U.S.A.; railway and commercial centre; manufactures agricultural machinery. Pop. (1910) 22,324.

RICHMOND (37° 43′ N., 84° 16′ W.), city, capital, Madison Co., Kentucky, U.S.A.; manufactures tobacco, flour. Pop. (1910) 5340.

RICHMOND, city, Victoria, Australia; S.E. suburb of Melbourne. Pop. 40,000.

RICHMOND (37° 32′ N., 77° 26′ W.), town, capital of Virginia, U.S.A.; finely situated on James River (with falls); public buildings include City Hall, capitol, various libraries and museums; seat of Richmond Coll., a Women's Coll., and a Negro Univ., and of many educational institutions; has R.C. cathedral. R. was capital of the Southern Confederacy, 1861–65, but being evacuated, was occupied by the Federals, April, 1865; great coal-mining and industrial centre; important manufactures of tobacco and cigars; has also ironworks, manufactures of machinery, locomotives, paper, cottons, flour, artificial manure, etc. Pop. (1910) 127,628.

RICHMOND (54° 24′ N., 1° 45′ W.), town, on Swale, Yorkshire; fine old ruined castle; trade chiefly consists of agricultural produce. Pop. (1911) 3934.

RICHMOND (51° 28′ N., 0° 18′ W.), formerly SHEEN, town, Surrey, on Thames; noted for its scenery; has remains of the Royal palace of Sheen. Pop. (1911) 33,223.

RICHMOND, EARLDOM AND DUKEDOM OF.—The Counts of Brittany held in early times the title of Richmond in Yorkshire; first of line to rank as Eng. earl is COUNT ALAN, lord of R. (*c.* 1145). In 1399 the earldom was finally separated from Brittany; it was granted to EDMUND TUDOR, 1453; merged in Crown, 1485. Henry VIII. created his illegitimate son Duke of R., 1525; dukedom has been held by STEWART family of Lennox, 1623–72, and from 1675 by the LENNOX family, descendants of Charles II.'s illegitimate son.

RICHMOND AND LENNOX, DUCHESS OF, FRANCES TERESA STEWART (1648–1712), Eng. court beauty; maid of honour; m. 5th Duke of R., 1667; attack of small-pox, 1668, spoiled her appearance.

RICHMOND, LEGH (1772–1827), Anglican clergyman; wrote *The Dairyman's Daughter*, which had extraordinary circulation.

RICHMOND, SIR WILLIAM BLAKE (1843–), Eng. painter; succ. Ruskin as Slade prof. at Oxford, 1878; fashionable portrait-painter.

RICHTER, EUGEN (1839–1906), Ger. politician; liberal and free-trader of old-fashioned type; opposed to Socialism; one of first *Freisinnige*; founder, 1885, and editor of *Freisinnige Zeitung*.

RICHTER, HANS (1843–), Hungarian musician; conductor at Bayreuth festivals since 1876, of Birmingham festivals, 1885–1909, of Hallé concerts, Manchester, 1900 on.

RICHTER, JOHANN PAUL FRIEDRICH, JEAN PAUL (1763–1825), celebrated Ger. novelist and humorist; b. Wunsiedel, Bavaria; studied, Leipzig, 1781–84; best works, *Die unsichtbare Loge, Hesperus oder 45 Hundsposttage, Flegeljahre* (novels); *Leben Fibels, Doktor Katzenbergers Badereise* (humoristic works); *Levana oder Erziehungslehre* (educational treatise).

RICHTHOFEN, FERDINAND, BARON VON (1833–1905), Ger. geographer; pub. well-known geographical work, *China, Ergebnisse eigner Reisen und darauf gegründeter Studien*, 1877–85; prof. of Geography at Berlin, 1886–1905.

RICINA (43° 20′ N., 13° 30′ E.), ancient town, Picenum, Italy, on Potenza.

RICINUS, see CASTOR OIL.

RICKETS, RACHETIS, a constitutional disease of childhood, characterised chiefly by softening and consequent deformities of the bones. The disease is due to alteration of metabolism believed to be due to defective diet, the deficiency being in proteids and fats, but there is another opinion that it is due to a toxæmic condition of the alimentary tract. Unhealthy conditions of life and bad hygiene are contributory causes. The symptoms which are first evident are digestive disturbances, vomiting, and diarrhœa, with profuse sweating, especially of the head, and general restlessness. Changes in the bones become evident, enlargements appear at the ends of the ribs, the wrists, and ankles. The long bones become curved, this being best seen in the bones of

the leg, which curve usually outwards (bow-leg), and the chest is deformed, the breast-bone standing out prominently, and the ribs sinking in, at the junction of ribs and rib-cartilages, at the side. There is often also deformity of the pelvis, which, in females, leads to serious difficulties in childbirth. The treatment of r. is mainly in the direction of improving the general hygiene and nutrition. Starchy foods are reduced in quantity, and plenty of milk and, after the first year of life, light soups and meat juice given. Attention is paid to the warmth and general conditions of the child, and plenty of fresh air and sunshine is necessary. Cod-liver oil and lacto-phosphate of iron are drugs of great value in improving this condition.

RICKMANSWORTH (51° 38′ N., 0° 28′ W.), town, on Colne, Hertfordshire, England; paper-mills. Pop. (1911) 6288.

RICOCHET, the low firing of a gun, so that the shot bounds along the ground—a deliberate device in the XVII. and XVIII. cent's.

RICOLD OF MONTE CROCE (1242–1320), Ital. Dominican, who preached in Muslim lands.

RIDDLES, very ancient form of diversion, mentioned in Homer; most famous classical instance, the Riddle of the Sphinx, answered by Œdipus; references in the Bible, *e.g.* Samson's conundrum to the Philistines. Frequently embodied fragment of mythology. Popular in the Middle Ages, still in vogue in Russia and in the East.

RIDING, use of animals, especially horse, as means of locomotion known since earliest time; Greeks and Romans expert horsemen, rode without saddle; Numidian cavalry in great demand as mercenary troops, rode barebacked without bridle; horses never used extensively by Jews. Good horsemen ride with body above hips loose, to move with swing of horse; bridle held in left hand; both hands kept low; right hand used as means of preserving seat sure sign of bad horseman; seat preserved by balance combined with gripping with thigh and knee; foot should be level with horse's barrel except in such forms as fox-hunting (*q.v.*) and horse-racing (*q.v.*) when stirrup-leathers must be shortened. Military horsemanship differs from ordinary; Italian cavalry probably best horsemen.

RIDINGS (originally *thrithing*, the third part), name applied to the three districts of Yorkshire (N., E., and W.).

RIDLEY, NICHOLAS (1500–55), Eng. chaplain to Henry VIII., 1541; supported Lady Jane Grey; tried as a heretic under Mary, and burnt.

RIEGO NUÑEZ, RAFAEL DEL (1784–1823), Span. agitator; imbibed Liberal ideas while prisoner in France; made independent revolt backed by his regiment, 1820; captured and hanged.

RIEHM, EDUARD KARL AUGUST (1830–88), Ger. Old Testament scholar; prof. at Heidelberg, 1861, Halle, 1862.

RIEL, LOUIS (1844–85), Canadian rebel; led discontented Métis; headed insurrections in Manitoba region, 1869, 1885; betrayed and executed.

RIEMANN, GEORG FRIEDRICH BERNHARD (1826–66), Ger. mathematical physicist; studied at Göttingen (1846) and Berlin (1847–50) under Dirichlet and Jacobi; wrote thesis on theory of functions of a complex variable (1851). This theory he applied subsequently in a memoir on Abelian functions (1857). Much of his best work deals with the applications of pure math's to the solution of problems in physics.

RIENZI, COLA DI, Rienzo (*c.* 1313–54), Rom. tribune; friend of Petrarch, and one of precursors of Renaissance in that he strove to restore glories of ancient Rome; raised the people, who proclaimed him tribune, 1347, and established republic; several Ital. towns joined, but R. alienated supporters by extortions, and in few months was forced to fly; again obtained power, 1354, but was murdered.

RIESA (51° 20′ N., 13° 18′ E.), town on Elbe, kingdom of Saxony; sawmills; boat-building yards. Pop. (1910) 15,253.

RIESENER, JEAN HENRI (1734–1806), Fr. cabinet-maker; b. Gladbach; apprenticed in Paris to Oeben, whom he succeeded; married twice; divorced second wife; greatest of Louis Seize cabinet-makers; son became famous portrait painter.

RIESENGEBIRGE, Giant Mountains (50° 48′ N., 15° 35′ E.), mountain range, Germany, separating Bohemia from Pruss. Silesia and connected westward with the Erzgebirge, and eastward with the Sudetengebirge; length, 24 miles; highest point, Schneekoppe (5260 ft.).

RIETI (42° 25′ N., 12° 53′ E.), ancient *Reate*, cathedral city, province Perugia, Italy. Pop. 10,500.

RIEVAULX (54° 16′ N., 1° 6′ W.), town, Yorkshire, England; ruined mediæval abbey.

RIFLE-BIRDS (*Ptilorhis*), genus of Birds of Paradise, found in woods of N. Australia and New Guinea.

RIFLES.—Military rifles, that is, muskets with grooved barrels, date from the XVIII. cent., and examples may be seen in the museum of the Royal United Service Institution.

The Minié rifle used in the Crimean War (1854) was the final type of muzzle-loading weapon. The modern rifle is associated with a breech-loading action, and the first type was used at the battle of Sadowa in 1866; it was called the needle-gun, but four years later it was out-ranged by the French 'Chassepôt.'

In Britain in 1866 the old Enfield rifle of 1853 was provided with Snider's breech action, but in 1877 the Martini-Henry b.-l. rifle was adopted. The third stage of the rifle was reached when the breech action was connected with a chamber, placed either along the barrel or near the trigger-guard, to contain a reserve of cartridges. The Brit. army was re-armed with the Lee-Metford Magazine rifle, 1892–94. According to the official *Field Service Pocket Book* (1911), the sixteen principal states have in use: the Mannlicher (·315 and ·256); the Mauser (·311, ·301, ·276, ·256); the Krag-Jorgensen (·315 and ·256); the Lebel (·315); the Year 38 (·256); the 3 Line (·3); the Schmidt-Rubin (·295); the Springfield (·3).

These various rifles are sighted to 2000 to 2460 yds. Except the Belgian and Swedish rifles (Mauser), which have round-nosed bullets, all fire pointed bullets; and all are charger-loading except the Mannlicher rifles used by Bulgaria, Austria, Holland, and Italy, which are clip-loaders, and the French 'Lebel' rifle, which loads from a tube at the fore end.

In every army various other types of rifle exist, as on the score of expense a complete re-armament with a new weapon is rarely carried out. First line troops have the newest rifles and hand over their discarded weapons to reserve troops. It is estimated that £24,000,000 would be needed to re-arm the French infantry (3½ million) with a new rifle. An automatic rifle would double the expenditure of ammunition, and its delicate mechanism would doubtless unfit it for the rough usage of active service; there is also a special danger pointed out in our article on automatic pistols (*q.v.*). Existing rifles are often improved as to ballistics by changes in powder and bullet; for example, the German 'S' bullet has advantages up to half a mile, but at longer ranges the French 'D' bullet, which is heavier, should prevail.

Brit. infantry are armed with the short magazine Lee-Enfield rifle, calibre ·303 in., composed of 62 separate parts. It is constructed on the bolt system, the breech being closed by a bolt which is worked by a lever on the right side. The bolt contains the main-spring and striker. It is 'charger' loading, and the charger holds 5 cartridges. The rifling is on the Enfield system, with left-hand twist, one turn in 10 in. Muzzle velocity about 2440 f.s. This rifle has an adjustable blade foresight and radial backsight with vertical adjustment and wind-gauge. Length of rifle with normal butt about 3 ft. 8½ in., or with sword bayonet about 5 ft. 2 in. Weight with magazine empty about (Mark IV.) 8 lb. 14½ oz.

The foresight is of blade pattern, and is made in seven heights. The backsight is fitted with a leaf and has a curved ramp on each side of the bed on which the slide rests and by means of which elevation is obtained. The leaf is graduated on the right by lines for every hundred yards from 200 to 2000 yds. The slide can be adjusted for every 50 yds. The lines on the left of the leaf give graduations for 25 yds. The wind-gauge is adjusted by means of a screw with milled head on the right. On the left side of the rifle long-range sights are provided for ranges from 1600 yds. to 2800 yds.

A magazine of sheet steel to hold 10 cartridges is fixed in front of the trigger-guard. The cartridges rest on a platform which is actuated by a spring made from ribbon steel: to afford a smooth bearing for the platform an auxiliary spring is fixed by a lip and stud to the front of the magazine. With a distinct aiming mark within about 1000 yds. soldiers can deliver 12 to 15 rounds a minute with fair accuracy.

Morris Tube is a small-bored rifled tube inserted in a rifle barrel for purposes of firing-practice at short range.

RIGA (56° 57′ N., 24° 3′ E.), port, Livonia, Russia; near mouth of Dvina; formerly fortified; has an old castle; formerly a member of Hanseatic League; has very large import and export trade, although the harbour is closed by ice for four months every year; exports corn, flax, hemp, timber, skins, linseed, eggs; manufactures cottons, machinery, glass, paper, etc. Pop. (1910) 324,720.

RIGG, JAMES HARRISON (1821–1909), Eng. Wesleyan minister and educationist; member of first London School Board.

RIGGING, term applied to whole machinery of propulsion of a sailing ship, including mast, yards, sails, and the complexity of cordage; divided into 'standing' (fixed) and 'running' (haulable). 'Standing r.' comprises those ropes by which mast is secured and assisted against force of wind; backstays support against force from behind, breast-stays and shrouds resist lateral pressure, all combine against force from front. 'Running r.' includes movable timber (spars), sails, and the tackle necessary for their management.

There are two main types of rigging, one where sails are slung parallel with vessel (fore and aft), the other where sails are placed crosswise (square); shape of sails usually triangular in first case, rectangular in second. Most primitive form, still to be seen in small craft, consists of quadrangular sail with rope for hoisting; mast must be between wind and sail, hence, in tacking, sail frequently lowered and rehoisted. 'Lug-sail,' the next development, is 'lifting' sail, *i.e.* carries wind-pressure upwards. Both these styles are cumbersome. A further step is introduction of 'jaws,' bifurcation of boom (spar attached to lower border of sail) to meet mast enabling sail to swing either way; second sail, 'jib,' now makes its appearance, attached in front of mast to bowsprit (prolongation of bows). Schooner-rigged vessels are development of this class, generally two- or three-masted. In large vessels such as *Sovereign of the Seas*, 1637, square sails were used; modern large sailing-vessels usually combine these types.

It is impossible to give history of evolution of sail; process of adaptation differing in various countries; *e.g.* in Mediterranean and East, lateen rig. Variation of 'lug' still habitually used.

Cordage now made of hemp or esparto grass, formerly hide or leather; matting sails used on Chin. junks.

R. of all vessels is development of above types; no different types evolved; difference lies in development.

RIGIDITY, MODULUS OF, see ELASTICITY.

RIGORISM, term used of any ethical theory (such as those of the Stoics and of Kant) which is ascetic in type and finds the moral value of conduct rather in self-control and obedience to law than in conduciveness to happiness.

RIMBAUD, JEAN ARTHUR (1854–91), Fr. poet; after producing marvellous 'Symbolist' poems between ages of seventeen and nineteen, and enjoying friendship (which turned to enmity) of Verlaine and other chief contemporary poets, vanished from Europe; his poems appeared as *Les Illuminations*, 1886.

RIMINI (44° 3′ N., 12° 33′ E.), town, Forli, Italy; there are many remains of the ancient city of ARIMINUM, which, after belonging to the Umbrians and Etruscans, was taken by the Romans in 286 B.C., and at a later date was a bone of contention between Goths and Byzantines; after passing through the hands of Byzantines, Lombards, and Franks, it came in 1237 to the possession of Malatesta family, by whom it was sold to Venice in 1503; seized by pope in 1528, remaining a papal possession until 1860. Rom. remains include triumphal arch erected to Augustus, five-arch marble bridge, and parts of the old walls. There are many interesting mediæval and Renaissance buildings, including fine cathedral (built by Sigismondo Malatesta in middle of XV. cent. as a monument to his romantic attachment to his third wife, Isotta degli Atti), and the Palazzo Ruffo, which is associated with the murder of Francesca da Rimini in 1285; the churches of St. Girolamo and St. Giuliano contain pictures by Guercino and Veronese respectively. R. is an episcopal see. The principal industries are shipbuilding, fisheries, and the manufacture of matches, furniture, and silk. Pop. (commune) 48,000.

RIMPLER, see FORTIFICATION.

RIMSKY-KORSAKOV, NIKOLAS ANDREIEVITCH (1844–1908), Russ. composer; wrote operas, symphonies, and songs.

RINDERPEST, CATTLE-PLAGUE, infectious disease affecting cattle, sheep, goats, camels, deer, and similar animals; endemic in Central and Southern Asia; introduced into S. Africa towards end of XIX. cent.; only occurring in Western Europe from time to time by infection through imported cattle or hides. The last outbreak in Britain occurred in 1872, infection being due to cattle imported from Germany.

The disease is believed to be caused by a bacterium, but the infective agent has not yet been isolated, although it is known to exist in the excretions, and in the blood, flesh, organs, and their secretions, of the affected animal. The symptoms include fever, diarrhœa, inflammation of the mucous membranes, and great prostration; there may be discharges from the nose, mouth, and eyes, difficulty in breathing, a hard cough, and sometimes an eruption on the skin. In districts where the disease is endemic an attack is usually much slighter than in cases elsewhere, and the symptoms mild and difficult to recognise. Diagnosis is most certain when made after a post-mortem examination of an animal which has died or has been killed, the intensely congested appearance of the alimentary canal and respiratory passages being characteristic. The chief protection against the disease is by the prohibition of the importation of cattle from infected countries, while inoculation methods, either of bile or of blood serum from affected animals, have had some success in producing protection against attacks.

RING, ornament for fingers or ears; also used by savages for various other parts of body. R's have been worn from earliest times, most ancient being those found in Egyptian tombs. They may be made of gold, silver, or precious metal, and may carry precious stones.

It is supposed that r's owe their origin to the cylindrical seals of early times. These developed from small stones to signet rings, or rings with engraved seals, used by their owners for giving their authority to documents, etc. Among the later r's of the ancients are found those used for ornamental purposes only, and of these the pure gold belonged to the rich, but the poorer classes had rings of silver, bronze, iron, glass or porcelain. Episcopal r's are given to bishops on consecration; betrothal and wedding r's are given as pledges, and were used in this way by the Jews before the Christian era. Posy r's had rhymes engraved on the inside of the hoop, and were common in XVI.–XVII. cent's. See also EAR-RING.

RING OUSEL, see under THRUSH FAMILY.

RINGWOOD (50° 51′ N., 1° 47′ W.), market-town, on Avon, Southampton, England. Pop. (1911) (rural district), 7151.

RINGWORM, disease usually affecting the scalp, caused by a fungus which grows on the hairs, characterised by the development of a bald spot which is scaly and has broken hairs upon it. The treatment is to apply X-rays to the affected spot, which remove the hairs, or paint it with formalin, which kills the fungus.

RIO CUARTO (34° S., 64° 39′ W.), town, on Rio Cuarto, Cordoba, Argentina. Pop. 16,000.

RIO DE CONTAS (13° 17′ S., 42° 34′ W.), town, Bahia, Brazil. Pop. 18,000.

RIO DE JANEIRO (22° 57′ S., 43° 7′ W.), maritime state, Brazil, drained by Parahyba; interior is mountainous; chief product, coffee. Pop. 970,000. Capital, Nictheroy.

RIO DE JANEIRO (22° 57′ S., 43° 7′ W.), capital, Brazil, beautifully situated on east coast, on inlet of same name; archiepiscopal see, but no cathedral. Public buildings include the old city palace, formerly viceregal residence, and the museum, formerly imperial palace, national library, observatory, arsenal, exchange, palace of justice, and various ministerial offices. There are numerous philanthropic institutions, one or two educational establishments, fine parks, and botanical gardens. The climate is hot and unhealthy.

R. was discovered by Portug. explorers early in XVI. cent.; French settled here in 1555, but were subsequently expelled by Portuguese; taken by French for short time in 1711; became capital of Brazil, 1763; scene of rising in 1831, which led to abdication of Pedro I. In 1875 several large banks failed; and here occurred the revolution of 1889, when Brazil was proclaimed a republic, and rising of 1893, when town was damaged by bombardment.

The harbour is one of the finest in the world, and the commercial importance of the city is very great, half the imports and exports of Brazil passing through it; exports coffee, gold, manganese ore, hides, tobacco, diamonds, rubber, etc. Pop. 858,000.

RIO DE ORO (23° 30′ N., 16° W.), Span. possession, W. Africa, extending along Atlantic coast between Capes Bojador and Blanco, and forming part of W. Sahara; area, 71,000 sq. miles; administered under the control of the governor of the Canary Islands. Pop. 13,000.

RIO GRANDE DEL NORTE (35° N., 106° 40′ W.), river, N. America, rises in San Juan mountains, Colorado, and flowing S.E., forms boundary between Mexico and Texas; falls into Gulf of Mexico; length 2000 miles.

RIO GRANDE DO SUL (21° 47′ S., 40° 52′ W.), most southerly state, Brazil, lying between Atlantic and Uruguay R.; area, 91,333 sq. miles; plateau in N., grass-covered plains in S. Colonised by Jesuits in XVII. cent., R. G. came under Portug. control, 1750; rebellion occurred, 1835–45; became state of Brazilian Republic after revolution of 1889. Soil is fertile; pastures of S. and S.W. given up to rearing of cattle, horses, and sheep, the principal exports being hides, horse-hair, bones, tallow, and preserved meat. Cereals, vegetables, fruit, coffee, and sugar-cane are grown. Minerals include coal, gold, lead. Chief towns are Porte Alegre and Rio Grande do Sul. Pop. 1,400,000; (town) 20,000.

RIO GRANDE DO SUL (32° 7′ S., 52° 18′ W.), city, seaport, state **Rio Grande Do Sul**, Brazil; exports dried meats, hides. Pop. 22,000; (state) 1,410,000.

RIO MUNI, see MUNI RIVER SETTLEMENT.

RIO NEGRO (40° S., 64° W.), (1) territory, E. part of Argentina. Pop. 30,000. Capital, Viedma, on Rio Negro; (2) river, rises as Guainia, Colombia, S. America, tributary of Amazon; length *c.* 1400 miles.

RIO PARDO (29° 58′ S., 52° 30′ W.), town, Rio Grande do Sul, Brazil, at junction of Rio Pardo and Jacuhy. Pop. 4000.

RIO TINTO (37° 46′ N., 6° 38′ W.), town, Huelva, Spain; copper mines. Pop. 11,300.

RIOBAMBA (1° 38′ S., 78° 40′ W.), town, capital, province Chimborazo, Ecuador. Pop. 19,000.

RIOJA, LA (25° 25′ S., 67° W.), province, N.W. Argentina. Pop. 89,000. Capital, **Rioja**. Pop. 6500.

RIOM (45° 54′ N., 3° 8′ E.) (ancient *Ricomagus*), town, Puy-du-Dôme, France; formerly capital of Auvergne. Pop. 10,700.

RIOT, a tumultuous disturbance of the peace by three or more persons assembling on their own authority, with the intent to assist one another mutually against any who shall oppose them in some enterprise of a private nature; also the carrying out of this enterprise in a violent and turbulent manner to the terror of the people—whether the act intended were of itself lawful or unlawful; punishable by fine and imprisonment, with or without hard labour. Compensation is to be paid out of the police rate to persons sustaining damage in a riot; formerly it was recoverable from the Hundred. The RIOT ACT (1714) makes it felony for twelve or more persons, assembled unlawfully to the disturbance of the peace, to refuse to disperse after proclamation.

RIOUW, RHIO (0° 59′ N., 104° 26′ E.), archipelago, Dutch East Indies, S. of Malay Peninsula. Pop. 115,000.

RIPLEY (53° 3′ N., 1° 25′ W.), town, Derbyshire; collieries; silk-mills. Pop. (1911) 11,848.

RIPLEY, GEORGE (1802–80), Amer. man of letters; took active part in Transcendental movement, and inaugurated Brook Farm experiment.

RIPON (43° 50′ N., 88° 50′ W.), city, on Silver Creek, Fond du Lac County, Wisconsin, U.S.A.; flour-mills, canneries. Pop. (1910) 3739.

RIPON (54° 8′ N., 1° 31′ W.), town, on Ure, Yorkshire, England; episcopal see, has fine cathedral (dating from XII. cent. and containing many interesting monuments); R.'s manufactures (especially spurs) have greatly declined; in neighbourhood is Studley Royal, seat of Lord R., with Fountains Abbey in the grounds. Pop. (1911) 8218.

RIPON, BARONY, EARLDOM, AND MARQUESSATE OF, Eng. honours.—Duke of Queensberry (*q.v.*) was created Lord R., 1708. FREDERICK JOHN, younger son of Thomas Robinson, Lord Grantham, cr. Viscount Goderich, 1827; Prime Minister, 1827–28; was created Earl of R., 1833; known as 'Prosperity Robinson.'

RIPON, 1ST MARQUESS OF, GEORGE FREDERICK SAMUEL ROBINSON (1827–1909), Brit. Liberal statesman; succ. his f. as Earl of R., 1859; Sec. for War, 1863–66; Sec. for India, 1866; pres. of the Council, 1868–73; commissioner to decide Alabama claims, 1871; cr. Marquess, 1871; Viceroy of India, 1880–84; incurred disapproval at home for too Liberal measures; Colonial Sec., 1892–95; Lord Privy Seal, 1905–8.

RIPPERDA, DUKE OF, JOHN WILLIAM (1690–1737), Dutch minister of Philip V. of Spain; bitterly disliked by Castillian nobility; concluded treaty with Austria, 1725, falling into disgrace when Austria broke agreement, 1726; imprisoned for treasonable utterances; escaped; slain at *Ceuta*, fighting against Spain.

RISTITCH, JOVAN, RISTICH (1831–99), Servian Liberal statesman; responsible for wars with Turkey, 1876–78, which resulted in some gains to Servia, but loss of Bosnia and Herzegovina; fell, 1893.

RISTORI, ADELAIDE (1822–1906), famous Ital. tragic actress; in *Studies and Memoirs* left her interpretation of her characters.

RITSCHL, ALBRECHT (1822–89), Ger. theologian and philosopher; ed. at Halle; prof. at Bonn, 1852, Göttingen, 1864; at first influenced by Tübingen school, but rejected their standpoint. His view of Christianity is to divorce it from metaphysics; thus all controversies as to the nature of the Father and Son are fruitless; spiritual experience is everything. His theology has had considerable influence, though often only partially accepted.

RITSCHL, FRIEDRICH WILHELM (1806–76),

Ger. philologist; b. Grossvargula, in Thuringia; prof. of Philology, Breslau (1834), Leipzig (1865). Among his pupils were Curtius, Ihne, Ribbeck, Bücheler. As a scholar his fame will always be secure on account of his great collection of Latin inscriptions, *Priscæ Latinitatis Monumenta Epigraphica* (1862), on which was modelled the famous Berlin *Corpus Inscriptionum Latinarum*.

RITSON, JOSEPH (1752–1803), Eng. antiquary; collected Minot's *Poems*, *Ancient Eng. Metrical Romances*, etc.

RITTER, see KNIGHTHOOD.

RITTER, KARL (1779–1859), Ger. geographer whose name is borne by geographical institutions in Berlin and Leipzig; chief work, *Geography in its Relation to Nature and the History of Men*.

RITUAL, the outward acts of worship. In common use, a *Ritualist* is a High Churchman or one who copies in the Anglican Church the ceremonial of the Roman, but this is a narrowing of the term. R. plays a prominent part in all religions, indeed it would be difficult to imagine a religion with no outward forms: it is more necessary even than priesthood or sacrifice. R. is historically closely allied to sacramentalism, *i.e.* the performance of certain outward acts, and the use of symbols becomes a supernatural act and the symbol becomes identified with the thing symbolised. Gradually a rite once practised becomes more and more elaborate, and once begun is seldom dropped; the two chief tendencies of R. thus are to complexity and conservation. Some religious systems are almost entirely r.; in others, *e.g.* Catholic Christianity, the doctrinal and r. are both highly developed.

Frazer, *Golden Bough*; Robertson Smith, *Religion of the Semites*.

RIVA (45° 54′ N., 10° 50′ E.), town, on Lago di Garda, Tyrol, Austria; tourist resort. Pop. (1911) 9224.

RIVE-DE-GIER (45° 33′ N., 4° 41′ E.), town, on Gier, Loire, France; coal mines; glass- and iron-works. Pop. 15,600.

RIVER ENGINEERING, works for the improvement of a river; either for preventing floods or increasing the capacity of the river for navigation. R. e. is often a difficult matter owing to irregular flow of river and materials it carries. A river's power of moving objects depends on the velocity of the current, but this difficulty is modified where there is a lake in its course, for rocks, stones, and other débris are left lying in the lake, and the remaining flow is much freer than would otherwise be the case. Floods also cause difficulties. When the land through which a river flows is hard and impervious to rain, the water flows rapidly from the hills into the river, which cannot accommodate the extra supply, and therefore a flood takes place. The remedy is to widen or deepen the river channel; in some cases dams are built across one end of a valley, thus forming a reservoir, which can be emptied when the flood is past. Sometimes rivers may be helped against floods by removing obstructions which occur in their course. Obstructions may be either natural, such as accumulations of gravel, tree trunks, or artificial, as mining refuse, sluices for mills, wide piers for bridges.

Sometimes the embankments of the river are raised, but this course tends to lift the level of the river bed, and is not to be recommended, for if the river bed be of a higher level than the surrounding country, there is the danger that the banks may be broken and the land devastated. An instance of this is found in the Hoang Ho, China, where periodic floods take place. Artificial banks were erected some time back, and they have caused the river bed to rise. The consequence is that very often large numbers of lives are lost, and great damage is done to property, by the bursting of the banks when the river is in flood.

Bends in a river tend to become carried away by the current endeavouring to take a short cut. They often can be protected or eased by the erection of timber or concrete walls.

R. e. may also be said to include operations at the mouths of rivers, which have to be kept free from sand accumulations by dredging. Bars are soon formed by the deposits of sand and mud, carried some distance from the actual mouth of the river by the current. This is especially so in the case of river mouths where there are deltas.

Fresh-water rivers depend entirely on their own supply for their capacity, but those rivers which are tidal, as the Humber for instance, have their navigational capacity greatly increased by the tides. In these cases great improvements may be effected by dredging. Narrow rivers like the Clyde and the Tyne are more satisfactorily improved by deepening than are wide ones.

In the case of estuaries, r. e. may be said to extend to the reclamation of land by the erection of artificial river banks (see LAND).

RIVERINA (33° S., 145° E.), large pastoral tract between Murray and Darling, New South Wales.

RIVERS, EARLDOM OF.—Richard Woodville, 1st Earl (d. 1469), Eng. noble; m. Jaquetta of Luxemburg, widow of the Duke of Bedford; commanded in French wars; his daughter Elizabeth married Edward IV., 1464, after which he adhered to Yorkist side; seized by Lancastrians and beheaded. — **Anthony Woodville, 2nd Earl** (1442–83), held great positions as uncle of Prince Edward (Edward V.); executed by Gloucester's orders without trial; author of translation, *Dictes and Sayings*, first book printed in England.—**Richard Savage, 4th Earl** (c. 1660–1712), Eng. general; first nobleman to desert James II. on landing of William of Orange, 1688; dissolute but able character; commander-in-chief, 1712.

RIVERSIDE (33° 55′ N., 117° 20′ W.), city, on Santa Ana, capital, Riverside County, California, U.S.A.; orange orchards. Pop. (1910) 15,212.

RIVIERA (44° N., 8° E.), the narrow strip of coast on Gulf of Genoa, Italy, between Nice and Spezia; celebrated holiday resort.

RIVOLI (45° 34′ N., 10° 48′ E.), village, Verona, Italy; scene of Fr. victory over Austrians, 1797.

RIVOLI, DUKE OF, see MASSÉNA.

RIXDORF, suburb of Berlin, Germany; manufactures linoleum. Pop. (1910) 237,369.

RIZZIO, DAVID, RICCIO (c. 1532–66), Ital. musician; sec. to Mary Queen of Scots; murdered in her presence in supper-room, Holyrood Palace, by Darnley and others.

ROACH, see under CARPS.

ROADS are lines of communication constructed from place to place for vehicular and pedestrian traffic. 'Road' is applied generally to a broad way, 'street' is restricted to ways which pass through cities, towns, and villages.

The Romans were the first European people to construct roads scientifically and secure their permanency. The oldest and most famous of Rom. roads was the Appian Way, commenced in 312 B.C. and named after Appius Claudius. The construction of the Rom. road is characteristic of the people who invented it; it follows a geometrically straight line without deviation according to the contour of the land, and in solidity it is almost imperishable. Two trenches were first constructed indicating the breadth of the road. The interspace was then excavated until a solid foundation was reached. Slabs of stone were then laid on the foundation and consolidated by mortar; the second layer consisted of rubble, the third of fine concrete, and the fourth of a finely fitted mosaic of polygonal pavement stones. The total depth of the construction was frequently as much as 4 feet. The width was usually about 15 feet. Pavements of about 7 feet in width frequently bordered the Rom. way. The Latin expression for road-making, *munire viam* (lit. 'to fortify a way'), is graphic. Some of the ancient Rom. roads are in a state of perfect preservation to-day; others form the foundation for more modern ways.

The Rom. methods were adopted to some extent in

France in the XIX. cent., but the ancient type has now been superseded by less costly and less massive types. The two principal modern systems are the Telford and the Macadam methods. The Telford road rests on a built foundation; the Macadam road consists of several layers of broken stones. In London, owing to the noise of motor-traffic and the constant wear and tear, wood pavement is almost exclusively adopted. This road pavement consists of a layer of concrete, on which is laid a layer of wood, and which is finally covered with a thin layer of tar-Macadam.

In concrete roads the stone or clinker is broken into nodules of about 2 in. in diameter. The stones are then laid between layers of cement to a depth of about 7 in., and are then rammed down to a depth of 6 in. In metalled roads the 'soiling' or lower layer of metalled work consists of lighter and cheaper materials than the true metal or top surface. Trap rock and granite well watered and rolled make the best surface.

ROANNE (46° 2′ N., 4° 4′ E.), town, Loire, France; ancient *Rodumna*; cottons, woollens. Pop. 36,697.

ROANOKE.—(1) (36° 10′ N., 77° 15′ W.) river, Virginia and N. Carolina, U.S.A.; flows into Albemarle Sound. (2) (37° 15′ N., 80° W.) city, on Roanoke, Virginia; coal and iron mining; tobacco factories. Pop. (1910) 34,874.

ROASTING, see COOKERY.

ROB ROY, ROBERT M'GREGOR (1671–1734), the Scot. Robin Hood, subject of one of Scott's novels. His exploits are matters of familiar knowledge.

ROBBEN ISLAND (33° 47′ S., 18° 23′ E.), small flat island in Table Bay, S. Africa; leper and convict establishments.

ROBBERY, see THEFT.

ROBBIA, see DELLA ROBBIA.

ROBERT I., THE DEVIL (d. 1035), Duke of Normandy; aided Edward the Confessor and was f. of William the Conqueror. His grandson, ROBERT II. (d. 1134), succ. William the Conqueror as Duke of Normandy, 1087.

ROBERT I., ROBERT BRUCE, BRUS (1274–1329), Scot. king and national hero; of Norman descent; great-grandson of Robert le Brus, 4th lord of Annandale, by Isabel, 2nd dau. of David, Earl of Huntingdon, bro. of William the Lion of Scotland. His grandfather was one of three claimants to Scot. throne on death of 'Maid of Norway.' Bruce swore fealty to Edward I., 1296; joined Wallace (*q.v.*), 1297; one of four regents who continued struggle in Baliol's name, 1299, but submitted when Edward again marched north; murdered his rival, Comyn, in quarrel in a church, 1306; crowned king at Scone, March 27, 1306; fled on news of Edward's approach; Edward d. at Burgh-on-Sands. The Eng. army under Pembroke scoured Scotland for Bruce, who led wild life in hiding, collecting forces; Pembroke captured his castles and confiscated his estates and Bruce was excommunicated. The tide turned, 1307; Bruce won battle of *Loudon Hill*, and by 1309 was lord of most of Scotland; Edward II. was compelled to retreat, 1309; Stirling alone held out. A large Eng. army under Edward II., marching to relief, was decisively defeated at *Bannockburn*, June 24, 1314, by superior skill of Bruce. Invasions of England extorted recognition of independence of Scotland by Treaty of Northampton, 1328. Bruce died of leprosy; a wise king, a brave soldier, and a true patriot. Murison, *King Robert the Bruce*; Maxwell, *Robert the Bruce*.

ROBERT II. (1316–90), king of Scotland; s. of Walter the Steward and Robert Bruce's dau. Marjory; succ. uncle, David II., 1371; founded Stewart dynasty; his peaceable nature was unfitted to troublous times.

ROBERT II., THE PIOUS (c. 970–1031), king of France; succ. his f., Hugh Capet, 996; excommunicated for uncanonical marriage with cousin, Bertha, Countess of Blois; submitted after long struggle with papacy.

ROBERT GUISCARD, see GUISCARD.

ROBERT OF GLOUCESTER (fl. late XIII. cent.), Eng. chronicler; notable in early history of prosody as user of 'fourteener' verses.

ROBERT OF JUMIÈGES, bp. of London, 1044; abp. of Canterbury, 1051–52; d. 1070.

ROBERTS, DAVID (1796–1864), Scot. landscape and architectural painter; he travelled extensively, and most of his pictures were worked up from drawings made abroad.

ROBERTS OF KANDAHAR, EARL, FREDERICK SLEIGH ROBERTS (1832–), Brit. soldier; b. Cawnpore, India; distinguished in Mutiny, 1857–58, Afghan War, 1878; commanded at relief of Kandahar, capture of Kabul, defeat of Ayoob Khan, 1879–80; cr. baronet, 1881; app. commander-in-chief in India, 1885, and commanded in campaigns in Upper Burma, 1886–87; became general, 1890, field-marshal, 1895; cr. baron, 1892; frequently thanked by Parliament; commander-in-chief in South African War, 1899–1900; secured triumph of Brit. arms and annexed Transvaal and Orange Free State; commander-in-chief of Brit. Army, 1901–4; cr. Earl Roberts of Kandahar, Pretoria, and Waterford, 1901, and voted grant of £100,000 by Parliament; O.M., 1902; pres. of National Service League and advocate of compulsory military training in Britain. Author of *Rise of Wellington*; *Forty-One Years in India*; see *Life*, by Cobban (1901). His only son won V.C. and met death at *Colenso*, 1899.

ROBERTSON, FREDERICK WILLIAM (1816–53), Anglican divine; studied law, then worked for army, but went to Oxford and was ordained; an earnest and able preacher and spiritual leader, though not a great thinker; had considerable influence.

ROBERTSON, THOMAS WILLIAM (1829–71), Eng. dramatist and actor, produced several plays in the 'sixties, such as *David Garrick*, *Society*, and *Caste*.

ROBERTSON, WILLIAM (1721–93), Scot. historian and Presbyterian minister; member of General Assembly, 1746; nominated to Edinburgh living, 1756; pub. *History of Scotland*, 1759, which speedily ran through numerous editions; principal of Edinburgh Univ., 1762; royal historiographer, 1763; pub. *Charles V.*, 1769; excellent at generalisation; style good, but not brilliant.

ROBES, see COSTUME.

ROBES, MISTRESS OF THE, see BEDCHAMBER, OFFICIALS OF THE.

ROBESPIERRE, MAXIMILIEN FRANÇOIS MARIE ISIDORE DE (1758–94), Fr. revolutionist; b. at Arras, of a legal family of Irish descent. Having qualified for the Bar, R. was appointed criminal judge at Arras; resigned to avoid passing death sentence. His fame in the political world was made by his participation in discussion as to mode of electing the States-general; elected as one of the deputies of the *tiers état* of Artois in the States-general, 1789. R. was an ardent believer in Rousseau (*q.v.*). In the Assembly he was leader of the Extreme Left, or 'the Thirty Voices,' as Mirabeau called them; but it was in the Jacobin Club that the influence of R. was truly in the ascendant. The death of Mirabeau in 1791 gave his policy room in the Assembly, but his narrowness and lack of insight were apparent in his motion that no member of the present Assembly should be eligible for the next. This was a death-blow to Mirabeau's ideal of a competent ministry. Then followed the flight of the king, the dissolution of the Assembly, and the triumph of R. Meanwhile the Girondist party urged war with Austria, which Marat and R. successfully opposed. In April 1792 R. resigned his post as public prosecutor, and during the weeks of Terror which saw the overthrow of the Bourbon dynasty he lay inactive. To Danton and Billand-Varenne he left the responsibilities of the deeds of August 10, but the deeds being accomplished he took his seat in the Commune of Paris and petitioned a revolutionary tribunal and a convention. As deputy for Paris to the Convention he met with attacks, but in demanding the execution of Louis drew Danton and his party to him. The Girondists

were overcome, and R. was elected to this new Committee of Public Safety. R. was now the leader of the Revolution, and his power seemed supreme. All important offices he filled with his own tools, and abolished even a show of justice in the year of Terror, when he took from the tribunal the right of hearing witnesses. R. now began to oppose the Committee and to carry his own policy into practice. He instituted a great fête in honour of the Supreme Being and the soul's immortality—thus following Rousseau's ideas. Matters drew to a crisis. R. retired from the Convention for a month, and on his return his position was no longer secure. Open feud followed, and R. was guillotined on July 28 as an outlaw. Narrow, unpractical, the victim of a fixed idea, R. was unfitted for the life of a statesman, but he was whole-hearted and, according to his lights, an unflinching patriot.

ROBIN, see under THRUSH FAMILY.

ROBIN GOODFELLOW, see PUCK.

ROBIN HOOD, Eng. mediæval hero, frequently mentioned in literature from XIV. cent.; probably historical character; there is no reason to doubt existence of famous brigand when historical basis is conceded to earlier Arthurian legends; variant name, Robin o' the Wood; depicted as brave and chivalrous adventurer who had his headquarters in Sherwood Forest, where he levied toll upon travellers. Friar Tuck and Maid Marian are probably later additions to story. R. H. was popular hero as Arthur was pattern of nobility.

Hunter, *Great Hero of the Ancient Minstrelsy of England* (1852); Child, *English and Scotch Popular Ballads* (1888); Gummere, *Old English Ballads* (1894).

ROBIN HOOD'S BAY (54° 27′ N., 0° 31′ W.), inlet and seaside resort, Yorkshire, England.

ROBINIA, genus of trees, order Leguminosæ; flowers pink or white. Chief species, the Locust tree of America, yields hard wood of value.

ROBINSON, AGNES MARY F., see DUCLAUX.

ROBINSON, EDWARD (1794–1863), Amer. Biblical scholar and philologist; chief work, *Biblical Researches in Palestine and Adjacent Countries*, 3 vols.

ROBINSON, JOHN (1575–1625), Eng. clergyman; founded church in Leiden which produced Pilgrim Fathers (*q.v.* under Massachusetts).

ROBINSON, SIR HERCULES, see ROSMEAD.

ROBSART, AMY, see LEICESTER, ROBERT DUDLEY, EARL OF.

ROC, RUKH, bird in *Arabian Nights* which carried Sindbad from Valley of Diamonds.

ROCAMADOUR (44° 47′ N., 1° 42′ E.), village, Lot, France; place of pilgrimage.

ROCHAMBEAU, JEAN-BAPTISTE-DONATIEN DE VIMEUR, COMTE DE (1725–1807), Fr. soldier; marshal of France; sent as lieutenant-general to America, 1780, and obtained capitulation of Cornwallis at *Yorktown*. His s., DONATIEN-MARIE-JOSEPH (1750–1813), was distinguished general.

ROCHDALE (53° 37′ N., 2° 10′ W.), town, on Roch, Lancashire; woollens, cottons; seat of first co-operative society (1844). Pop. (1911) 91,437.

ROCHE, SIR BOYLE, Bart. (1743–1807), Irish politician and soldier; celebrated for Irish 'bulls.'

ROCHEFORT (50° 9′ N., 5° 13′ E.), town, Namur, Belgium; marble quarries. Pop. 3600.

ROCHEFORT (45° 56′ N., 0° 57′ W.), fortified seaport, on Charente, Charente-Inférieure, France; important naval station, with arsenal, hospital, and other establishments; naval and commercial harbour; shipbuilding yards; scene of victory of Brit. fleet over French, 1809. Pop. (1911) 35,019.

ROCHEFORT-LUÇAY, VICTOR HENRI, MARQUIS DE, HENRI ROCHEFORT (1831–1913), brilliant Fr. journalist; editor of *La Patrie*; founder of *La Lanterne* (1868), *La Marseillaise* (1869), *L'Intransigeant* (1880); a leader in Commune (1871); transported to New Caledonia, 1873; escaped, 1874; returned to Paris, 1880; attacked Thiers, supported Boulanger, stirred up feeling against Panama scandals (1892–95), and against Dreyfus (1897–99); author of frequently acted vaudevilles and novels.

ROCHEFOUCAULD, see LA ROCHEFOUCAULD.

ROCHESTER.—(1) (51° 24′ N., 0° 29′ E.) town, Kent, England; episcopal see, has interesting cathedral, originally founded by St. Augustine in 604; part of original building remains, but most of present structure is in the Norman and Early Eng. styles of XI., XII., and XIII. cent's. R. has a grammar school, founded, 1544; and ruins of an old Norman castle. Pop. (1911) 31,388. (2) (43° 8′ N., 77° 41′ W.) city, New York State, U.S.A.; on Genesee R., 7 miles above L. Ontario; seat of Univ. (founded, 1850); has R.C. cathedral; Erie Canal crosses river by aqueduct; falls of river supply power for lighting, haulage, and industrial purposes; principal manufactures are clothing, boots and shoes, rubber goods, agricultural tools, hardware, and photographic appliances; fruit-canning is carried on; seed-gardens and nurseries. Pop. (1910) 218,149. (3) (43° 16′ N., 71° 6′ W.) city, New Hampshire, U.S.A.; woollen manufactures. Pop. (1910) 8868. (4) (44° 1′ N., 92° 24′ W.) city, Minnesota, U.S.A.; flour-mills. Pop. (1910) 7844.

ROCHESTER, JOHN WILMOT, 2ND EARL OF (1647–80), Eng. wit, b. Ditchley, Oxfordshire. He was a reprobate at the court of Charles II., but in spite of his excesses his wit was keen to the end. He is the author of the famous epitaph on Charles II.:—

> 'Here lies our sovereign lord the king,
> Whose word no man relies on;
> He never said a foolish thing,
> Nor ever did a wise one.'

To which Charles is said to have replied, 'My words are my own, my acts are my ministers'.'

ROCHESTER, LAWRENCE HYDE, EARL OF (1641–1711), Brit. statesman; first lord of treasury (one of 'the Chits'), 1679–84, 1685–87; pres. of Council, 1684–85, 1710–11; led Tory reaction under Charles II.; able and conscientious; wife, HENRIETTA, a famous beauty.

ROCHET, white linen garment with sleeves, worn by bp's in Roman and Anglican churches; in R.C. Church it is short and edged with lace; in Anglican Church long and with full sleeves, and is worn under chimere.

ROCHFORD (51° 35′ N., 0° 42′ E.), town, Essex, England, on Roach estuary.

ROCK, DANIEL (1799–1871), R.C. theologian; wrote *Hierurgia, or the Holy Sacrifice of the Mass, The Sacrifice of the Mass.*

ROCK HILL (34° 55′ N., 81° 5′ N.), city, S. Carolina, U.S.A.; cotton manufactures. Pop. (1910) 7216.

ROCK ISLAND (41° 28′ N., 90° 32′ W.), city, on Mississippi; capital, Rock Island County, Illinois, U.S.A.; seat of arsenal and armoury; agricultural implements. Pop. (1910) 24,335.

ROCK ROSE, see CISTUS.

ROCK-CRYSTAL, pure silica $(SiO_2)_n$, crystallised, colourless, six-sided prisms; found in quartz veins of granite, especially in Switzerland; used for spectacle lenses.

ROCKEFELLER, JOHN DAVISON (1839–), Amer. millionaire; with bro. WILLIAM (1841–), Samuel Andrews, Henry M. Flagler, and Stephen V. Harkness, formed first great 'trust,' 'Standard Oil Co.,' 1870, himself pres.

ROCKET.—(1) name of two species of plants; (2) cylindrical case filled with explosives, used in pyrotechnics, signalling, and life-saving apparatus.

ROCKFORD (42° 14′ N., 89° W.), city, on Rock River, Illinois, U.S.A.; agricultural machinery; woollen goods. Pop. (1910) 45,401.

ROCKHAMPTON (23° 25′ S., 150° 25′ E.), seaport, Queensland, Australia, on Fitzroy; outlet for produce of Central Queensland; frozen meat, live stock; gold, silver, copper, coal; sapphires and opals. Pop. 16,500.

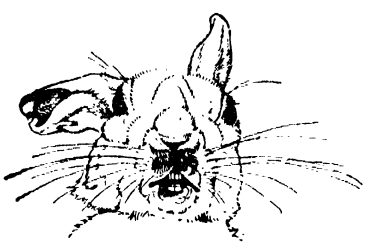
ROCKINGHAM, CHARLES WATSON-WENT-

WORTH, 2ND MARQUESS OF (1730–82), Brit. Whig statesman; first lord of treasury, 1765–66, with Burke as sec.; fell through passing unpopular repeal of Stamp Act; formed second ministry, 1782; poor orator and party manager.

ROCKLAND.—(1) (44° 6′ N., 69° 7′ W.) town, Maine, U.S.A., on Penobscot Bay; lime-kilns; shipbuilding yards. Pop. (1910) 8174. (2) (42° 15′ N., 70° 54′ W.) town, Massachusetts, U.S.A.; boots and shoes. Pop. (1910) 6928.

ROCKVILLE (41° 52′ N., 72° 28′ W.), city, Conn., U.S.A.; silk and woollen goods. Pop. (1910) 7977.

ROCKY MOUNTAIN GOAT (*Haplocerus montanus*), a goat-like relative of the Chamois (but no true goat) found on the Rocky Mountains from Alaska to the latitude of San Francisco.



ROCKY MOUNTAINS, system of ranges of W. N. America from Alaska to Mexico; greatest breadth (*c.* 40° N.) 1000 miles; highest peaks, Mt. M'Kinley (20,464 ft.) in Alaska, and Blanca Peak (14,464 ft.).

ROCROI (49° 55′ N., 4° 31′ E.), fortified town, France; scene of Fr. victory over Spaniards, 1643.

ROD, ÉDOUARD (1857–1910), Swiss novelist; prof. of Comparative Literature, Geneva, 1887–93; obtained wide appreciation as writer of psychological novels; among chief books are *La Course à la mort*, *Le Sens de la vie*, *L'Affaire J. J. Rousseau.*

RODBERTUS, KARL JOHANN (1805–75), Ger. politician and writer; minister of public worship and education for fourteen days in Hansemann ministry, 1848; leader of left centre in lower house, 1849; retired from politics on introduction of new electoral law; called 'founder of scientific socialism.'

RODENTS, RODENTIA, GLIRES, or GNAWERS (Lat. *rodo*, I gnaw), an order of mammals important on account of its wide distribution, for Rodents occur everywhere, and on account of the extraordinary number (almost 2700) of its species. From all other mammals they can readily be distinguished by their front or incisor teeth, which are long, parallel-sided, and chisel-edged, this last unique feature being due to the absence or insignificance of a layer of hard enamel on the back of the tooth, so that the back wears more rapidly and leaves the front edge projecting. The incisors never cease growing, but are worn away in front by gnawing as they are pushed forward from behind. There are no canine teeth, a great gap or diastema between front and back teeth allowing a pad of cheek skin to fall within the mouth. Rodents walk on the joints of their toes, which are tipped with blunt, sometimes hoof-like, nails.

HEAD OF RABBIT, TO SHOW RODENT TYPE OF TEETH.

A great family likeness runs through the Rodent family—they have long heads with sharp snouts projecting far beyond a small mouth. Their gnawing and the sideways motion of their jaws in chewing is very characteristic. They are typically vegetarian, but some, such as SQUIRRELS, occasionally feed on birds' eggs, or even young birds, while RATS devour fish, game, birds, frogs, and at times their own kind.

Many different modes of life are exhibited by Rodents. Most are protected by their nocturnal habits; but the POCKET-GOPHERS spend the whole of their lives underground, the RABBITS, MARMOTS, and many others trust to the safety of burrows, the HARES to their speed of foot, the PORCUPINES to their spiny covering, the BEAVERS to a house entered from under water, while the SQUIRRELS live in the tree-tops, and the 'FLYING' SQUIRRELS have made an effort to conquer the air. Several species hibernate in winter.

Of peculiar structures, perhaps the most interesting is the skin-fold which enables the Flying Squirrels to parachute from tree to tree. The fur is generally short and soft, but it may be coarse, as in Rats, or even spiny, as in Spiny Mice and Porcupines. Very common are special glands which give a characteristic odour, as in the case of the MUSK RAT.

To man the group is of considerable importance. Owing to their vegetarian habit many Rodents are exceedingly destructive: Squirrels destroy young trees by gnawing the bark, while Rats, Lemmings, and Voles often ruin the crops throughout wide districts, being slaughtered by thousands in 'plague' years. On the other hand, Beavers, Marmots, Chinchillas, Hares, the American Coypu, and others possess soft fur highly valued for garments and wraps, while garbage-feeders, such as Rats, play a useful part as scavengers.

At the present day Rodents are found all the world over, although their chief home is in South America. Fossil remains indicate that they were plentiful even from early Tertiary times.

The order RODENTIA falls into two great divisions—SIMPLICIDENTATA with a single pair of incisors in the upper jaw, and DUPLICIDENTATA with two pairs. The former includes three sub-orders: (1) SCIUROMORPHA—Squirrels, Beavers, Marmots, etc.; (2) MYOMORPHA—Rats, Mice, Dormice, Gerbils, Jerboas, Lemmings, Voles, Gophers, etc.; (3) HYSTRICOMORPHA—Porcupines, Chinchillas, Cavies, Agouties, Capybara, etc. DUPLICIDENTATA includes only the sub-order LAGOMORPHA—Rabbits, Hares, and Picas.

RODERIC (d. 711), 'The last of the Goths,' was Visigothic king of Spain, supplanting Witiza, whose sons, aided by Tarik, a Moor, defeated and slew R. at Guadalete. R.'s story was treated by Scott and Southey.

RODEZ (44° 21′ N., 2° 35′ E.), chief town, Aveyron, France, on Aveyron; ancient *Segodunum*; cathedral; textiles. Pop. 15,600.

RODIN, AUGUSTE (1840–), Fr. sculptor; chiefly distinguished for portrait busts and statues. A bust and monument of Victor Hugo are his masterpieces; has executed Biblical and symbolical groups.

RODNEY, GEORGE BRYDGES RODNEY, BARON (1718–92), Brit. admiral; admiral of the White, 1778; vice-admiral of Great Britain, 1781; destroyed Havre harbour, 1759; took Martinique, 1761; cr. baronet, 1764; won victories of *Cape Finisterre* and *Cape St. Vincent*, and relieved Gibraltar, 1780; captured St. Eustachia, 1781; defeated Fr. fleet off Leeward Islands, 1782, his crowning victory; cr. baron, 1782; characterised by Lecky as vain, boasting, daring, skilful.—*Life*, by Hannay.

RODOSTO (41° N., 27° 31′ E.), seaport, European Turkey, on Sea of Marmora; ancient *Bisanthe* or *Rhædestus*. Pop. 40,000.

RODRIGUEZ (19° 40′ S., 63° 25′ E.), island, dependency of Mauritius, in Ind. Ocean; area, 42 sq. miles; of volcanic formation; surface mountainous; chief town and port, Mathurin; R. was first visited by Portuguese, 1645, and has belonged to Britain since 1810; produces rice, cotton, sugar-cane, tobacco, fruits, vegetables, timber. Pop. (1911) 4826.

ROE, EDWARD PAYSON (1838–88), Amer. Presbyterian clergyman and novelist; wrote *From Jest to Earnest*, etc.

ROE DEER, see under DEER FAMILY.

ROEMER, FRIEDRICH ADOLPH (1809–69), Ger. geologist; prof. of Geol., Clausthal, 1845; director of School of Mines, 1862.

ROEMER, OLE (1644–1710), Dan. astronomer; prof. at Copenhagen Univ.; discovered velocity of light and invented accurate astronomical apparatus.

ROERMOND (51° 12′ N., 5° 59′ E.), town, Limburg, Netherlands, at junction of Roer and Meuse; cathedral; cloth manufactures. Pop. (1910) 13,858.

ROESKILDE, see ROSKILDE.

ROGATION DAYS, the Monday, Tuesday, and Wednesday before Ascension Day; these days are appointed for prayer and fasting.

ROGER I. (1031–1101), Count of Sicily; youngest of twelve sons of Tancred de Hauteville; divided Calabria with bro., Robert Guiscard, 1062; conquered Sicily, 1060–1101.

ROGER II. (1093–1154), king of Sicily; succ. his f., Roger I., as Count of Sicily, 1101; Duke of Apulia and Calabria, 1127; conquered Capua, Amalfi, and Naples, thus establishing later realm of the Two Sicilies, which he made civilised Norman state; crowned, 1130; established over-lordship over Arabs of Africa.

ROGER (d. 1139), Norman priest; entered service of Henry I., who created him bp. of Salisbury; became very powerful; a worldly man.

ROGERS, JAMES EDWIN THOROLD (1823–90), Eng. economist; Drummond prof. of Political Economy, Oxford; author of *History of Agriculture and Prices*.

ROGERS, JOHN (1500–55), Eng. Prot. divine; helped to publish Tyndale's Bible; prebendary of St. Paul's, 1551; accused of heresy and martyred under Mary; first Protestant to suffer in her reign.

ROGERS, RANDOLPH (1825–92), Amer. sculptor; made bronze doors of Capitol at Washington.

ROGERS, ROBERT (1727–1800), Anglo-American colonel and author; *Rogers's Rangers* were distinguished in Canada against French, 1755–60; mistrusted by nationalists and fought for Britain in War of Independence.

ROGERS, SAMUEL (1763–1855), Eng. poet; b. Stoke-Newington; entered his father's bank, 1784; became head of the firm, 1793; famous as poet in his own day, and was ranked by Byron above Wordsworth and Coleridge, but his works are unread to-day, and even *The Pleasures of Memory* is but a name. His home at 22 St. James's Place, London, was noted for its elegance, and the witty company that visited it.

ROGIER, CHARLES LATOUR (1800–85), Belg. statesman and author; aided revolution, 1830; member of provisional government; Minister of Interior, 1832–34; laid down railroads; Minister of Public Works, 1840–41; Minister of Interior, 1847–52, 1857–61; avoided revolution, 1848, by concessions; Minister of Foreign Affairs, 1861–68; freed navigation of Scheldt.

ROHAN, LOUIS RENÉ ÉDOUARD, CARDINAL DE (1734–1803), Fr. courtier; notorious for the **Diamond Necklace Affair**. The necklace, originally made for Madame du Barry, was priced at £80,000; R., duped by De Lamotte, an adventuress, believed that the queen wanted it and became security; De Lamotte and her husband sold the separate stones; the theft discovered, De Lamotte was branded, her husband fled to England, R. was tried and acquitted by the Parlement of Paris; becoming a popular hero R. was elected to the States-general, 1789.

ROHAN, HENRI, DUC DE (1579–1638), Fr. Huguenot commander; obtained for Huguenots Treaty of Montpellier, 1623, and became marshal; Huguenots crushed by Richelieu, despite warfare waged by R. and younger bro., SOUBISE, 1625–29; wrote *Mémoires*, famous book *Parfait capitaine*, etc.

ROHILKHAND (28° 50′ N., 78° 40′ E.), division, United Provinces, India. Pop. 5,500,000. Chief town, Bareilly.

ROHLFS, FRIEDRICH GERHARD (1831–96), Ger. explorer and author of books of travel; first European to visit oasis of Touat in Sahara, 1864; explored Kamar, 1866; Siwa, 1869; Libyan Desert, 1873–74; oases of Sokna and Koufra, 1878; consul at Zanzibar, 1885.

ROHTAK (28° 54′ N., 76° 38′ W.), district, Punjab, India. Pop. 635,000. Capital, ROHTAK. Pop. 21,000.

ROKITANSKY, CARL, FREIHERR VON (1804–78), Ger. pathological anatomist; b. Königgrätz, Bohemia; studied med. at Prague and Vienna; became assistant and later prof. of Pathological Anat. in Vienna, medico-legal anatomist to the city, and medical adviser to the Minister of Education; pres., Imperial Academy of Sciences, 1869; founder of the great Vienna school of pathological anat., and author of various works on that subject.

ROLAND, the hero of the famous Charlemagne legend. There is a nucleus of historical truth in this *Chanson de geste*, for in Eginhard's *Vita Karoli*, one Hruodlandus, prefect of Brittany, was slain by the Gascons in a Pyrenees valley, but romance has magnified the hero and the campaign beyond recognition.

ROLAND DE LA PLATIÈRE, JEAN MARIE (1734–93), Fr. statesman; delegate of Lyons to obtain from Constituent Assembly nationalisation of debt, 1791; he and his wife became ardent Jacobins; Minister of Interior, 1792; one of '*Sans culottes*'; joined party opposed to Robespierre, and sought to save king; resigned, 1793; committed suicide on hearing of sentence against his wife, **Madame Roland**, JEANNE-MARIE PHLIPON (1754–93), heroine of Fr. Revolution; nourished on classic lit. and full of Rom. republican ideas; presided over celebrated *Salon*; perished by guillotine, 'fresh, calm, smiling.'

ROLANDSECK (50° 40′ N., 7° 12′ E.), village, Rhineland, Prussia, on Rhine; noted ruined castle.

ROLLE DE HAMPOLE, RICHARD (d. 1349), Eng. author; b. Pickering, Yorkshire. His habits were rigidly ascetic; adopted garb of hermit. He records visions and revelations; and is reputed to have performed miracles. His most famous work is *The Pricke of Conscience*, a long religious poem in rhyming couplets.

ROLLERS (*Coraciidæ*), so called from their habit of turning somersaults in flying; a family of over 30 species of Picarian Birds distributed throughout the Old World. The **Common Roller** (*Coracias garrulus*) is an occasional visitor to Britain.

ROLLING MILLS, apparatus for reducing masses of metal to plates, bars, etc.; metal is first heated, then roughly flattened by steam-hammer or coarse cogging-mill, then reduced between two iron rollers, flat or grooved, according to shape required; vertical rolls sometimes used to smooth sides of plate; process repeated with smaller-geared rollers till desired thinness is reached; there are generally three rollers, plate goes through lower pair, repasses through top rollers; specially shaped rollers for shaping tyres and tubes.

ROLLS, see RECORD.

ROLLS, MASTER OF THE, see MASTER OF THE ROLLS.

ROMA (26° 33′ S., 148° 42′ E.), town, Queensland, Australia; wheat, fruit; vineyards in vicinity. Pop. 3000.

ROMAN (46° 57′ N., 26° 55′ E.), town, Rumania; seat of Gk. bp. Pop. 14,400.

ROMAN ARMY.—The genius of the Romans was seen in its highest expression in the organisation of the army. In the early days of the Republic the army was strictly a militia, where class distinctions were sharply drawn, but Gaius Marius (B.C. 157–86) reconstructed the forces and created the professional soldier. Marius admitted all freeborn citizens to the infantry, made the cohort, instead of the maniple, the unit, filled the ranks of the cavalry with Thracians, Africans, and Gauls, and the ranks of the light-armed troops with slingers from Liguria and the Balearic Isles. The Roman legion consisted of 4000 infantry and 300 cavalry. It was not so heavy as the Gk. phalanx, and consequently better suited for offensive warfare. The infantry was distributed into four divisions—*hastati* (light armed) and *principes* (heavy armed) forming the first and second lines, and the *triarii* (veterans) and *velites* (skirmishers) occupying the rear. The legion was subsequently extended to embrace more than 6000 men, and was divided into ten cohorts. In the days of the Empire this magnificent organisation degenerated into a purely mercenary army.

ROMAN ART, like Rom. literature, developed at a comparatively late date in the history of the State.

Only when Rome had made herself mistress of Italy and had secured her position in the Mediterranean Sea did she turn her thoughts seriously to the cultivation of her artistic talents; and just as in her literature her first efforts were imitative rather than creative, so in her art she commenced by reproducing Gk. originals. But there was latent in the ancient Italian temperament an autochthonous artistic talent, which, though checked by the Philhellenic enthusiasts of the late Republic and early Empire, was never quite extinguished, and reasserted itself in all its strength in the II. cent. A.D.

Realism and detail were the distinguishing features of the decorative masterpieces of the ancient Etruscan sarcophagi, and it was this realism and detail which combated Hellenistic conventions in the Imperial age and conditioned the genuinely Rom. artistic expression in the commemorative reliefs and portrait sculpture of the Flavian period. The most ancient works of art preserved at Rome were of Etruscan origin. The arch and vault, which persisted in Rom. architecture even during the period when Hellenism exerted its most potent influence, were derived from Etruria. The waves of Hellenistic influence in art reached Rome in 212 B.C., when Marcellus transported from Syracuse the finest specimens of Gk. statuary, and from that period the triumphs of Rom. generals were embellished with magnificent works of Gk. art.

In the age of Cicero it was the custom of the cultivated to adorn their palaces and villas with masterpieces of Gk. art, and the ardour of the connoisseurs is illustrated by the correspondence of Cicero. But Philhellenism rapidly degenerated into dilettantism. Art for art's sake was an ideal utterly alien to the Rom. mind; but the gift of moulding in marbles the busts of Rome's valorous sons and representing in relief the story of her greatness was an art worthy of Rom. cultivation, in that it was art for power's sake.

Augustus, realising the possibilities of art in establishing the new order, extended his patronage to sculptors, painters, and architects. The new temples were adorned with reliefs illustrating the great events of Rome's history. In these works the technical excellence reflects Gk. influences, but the motive ideal is purely Roman. A fine specimen of Rom. art in the Augustan age is the *Ara Pacis Augustæ*. Under the Julio-Claudian dynasty the Hellenistic conventions cramped and trammelled the native genius. But there followed a genuinely Rom. artistic revival which culminated in the magnificent stone column and forum of Trajan.

In the reign of Hadrian there was a revival of the Hellenistic tradition, which found expression in the ideal representations of Antinous. But in the Antonine period the purity of the Gk. spirit and verisimilitude of the Rom. spirit alike failed before the blatant and bizarre influences of the East. The simple appeal of marble is abandoned for the gaudy effectiveness of basalt, porphyry and alabaster, and mosaic work.

ROMAN DE LA ROSE, Fr. allegory of XIV. cent.; first part, written by Guillaume de Lorris, is full of the conventional allegorical incidents—the dream, the singing of birds, etc.; second part, by Jean de Meung (*q.v.*), is satirical, realistic, 'modern.' The Middle Scots school (*e.g.* Dunbar and Lyndesay) shows influence of both authors. The 'Rose' tradition coloured Eng. poetry for many years.

ROMAN CATHOLICISM is the oldest and largest form of Christianity. Its name sufficiently well sets forth its claim to be a Church for all time, all nations, all intelligences. From the name, too, the idea is further deduced of a union with the See of Rome as of essential consequence. Indeed, in the description of this portion of the Christian faith as the R.C. Church is contained the briefest and tersest account of all her claims and proofs. For, to begin with, the very notion of a Church, as continuing the work of Christ, implies the office of teaching all peoples. A Church is nothing else than an organised form of belief. If, then, it is admitted that Christ established through the Apostles a form of doctrine and a means of propagating that doctrine, the logical conclusion, according to the Catholic theologians, would be to acknowledge at once the most astounding claim of Catholicism, *i.e.* her infallibility.

This claim, therefore, she considers to be necessarily bound up with the idea of a Church, and to be based on those texts of Scripture in which Christ describes His claim to reveal the truths of His Father, and in those others in which He definitely commissions His Apostles to teach to others what He has taught to them. To achieve this, a visible divine Society is needed—visible, that is, in the sense first of being public; and second, of being recognisable among all other forms of belief. The first, or *material visibility*, is ensured by communion with the Roman See, as representing the apostolic line. It is the outward symbol of visible unity and, as such, acts as a material centre of unity, expressed in material relations to a definite authority. The *formal visibility* of the Church is looked upon as a finer and more delicate manifestation. It regards the divine Society of the Son of God as being clearly marked off from the Christian sects by certain attributes which evidently substantiate its claims to be of Christ. Necessarily it presumes certain moral predispositions on the part of the seeker; it postulates in the end a definite gift of God (never therefore originating from, or producible by, the would-be believer), known as the supernatural habit of faith. But granting a right disposition and the co-operation of God's grace, the clearness of her divinity, if she is at all to fulfil her mission of 'teaching all nations,' should be apparent to the most unlettered as well as to the most intelligent.

Lastly, from her name may be deduced her claim to the exclusive use of the title *Catholic*. This boast of her universality has been the great modern argument by which she has drawn to her some of the noblest of her converts. It is essentially the argument of Lacordaire, Newman, Brunetière, etc.; in an exaggerated form it is the pith of the modernistic defence. Briefly, it may be summarised thus: The facts brought forward by the study of comparative religions have proved a universal groping towards the full Christian faith as taught by Catholicism. A savage tribe here, a philosophical speculator there, a mystic rite, a heathen custom, have each some separate idea which is eventually found to exist also in the Catholic faith. These primitive notions are discovered by the force of the life of the human soul which has felt towards them and has found their truth by first finding their need. The void came first, then a religious idea was found to satisfy that void; the idea was held in consequence to be true. If then, as opponents assert, almost every Catholic doctrine has been held by one people or another in the stages of the world's development, the logical conclusion should not be, say her defenders, 'Therefore Catholic doctrine is purely natural,' but 'Therefore Catholic doctrine plainly suits the needs of the human heart.' In this sense, the Roman faith is Catholic, for it touches human nature at its base; it is the bringing into one and gathering together of all the strongest facts of religion, of all elements of the religious idea which could prove their fitness by survival, or their vitality by their growth, or by their richness their capacity for a deeper interpretation. It is here, say the modern apologists of the Church, 'in the bosom of humanity,' 'in the full pell-mell of human life,' and not in the efforts of any individual that the fulness of religion can be recognised.

Certainly the success and longevity of Catholicism are due to the unfaltering assertion of her claims. Hampered at first by her connection with the Byzantine emperors, she was unable to develop herself upon her own lines. But when once she had emancipated herself from New Rome and had baptized Clovis as earlier she had baptized Constantine, her influence over all Europe was without question. Then, at first tentatively, eventually with full consciousness, the

Greeks sprang off from her communion and caused that split between Eastern and Western Catholicism which has brought untold evil on the Asiatic portion of the faith. From time to time, at Lyons (1274) and Florence (1439), to go back no farther, union has been made between Latin and Greek, but its effects have been short-lived and its purpose very slightly religious.

European history she has to a great extent moulded, and the discoveries of America, etc., were due in no slight measure to her missionary zeal; and she endeavoured, through Las Casas and others, to mitigate the severe lot of the subject peoples. She is now in the whole of that continent numerically the strongest religious body.

The Reformation showed her power, for with the Reformation, ecclesiastical influence in the domestic life of the people has steadily declined; and only those religious organisations which are frankly political or frankly adopt her methods have any hold on the national life. By the penal laws, Catholicism was long excluded from any position of trust or any opportunity for fairly stating her claims; with their repeal, 1829, and the growth of the Oxford Movement her importance has been of marked increase. Her future in the British Isles will depend upon whether she will be able to grasp the opportunity which democracy affords her.

Newman, *Development of Christian Doctrine*, 1845; Coxon, *Roman Catholicism*, 1912; Williams, *Newman, Pascal, Loisy and the Catholic Church*, 1906; Procter, *Catholic Belief*, 1907; Batifoll, *Primitive Catholicism*, 1911.

ROMAN EMPIRE.—For the later Rom. Empire, the seat of which Constantine established at Byzantium (henceforth Constantinople), the description 'Byzantine' is most convenient. The title 'East Roman' is not always correct: from Augustulus to Charlemagne East and West were nominally united. The 'Later Rom. Empire,' again, leads to confusion with the 'Holy Rom. Empire of the German People.' This latter should always be spoken of as the 'Holy Rom. Empire,' not as the 'Rom. Empire'; its tenant as the 'Holy Rom. Emperor,' not the 'Rom. Emperor.' In the Middle Ages it was always, though not necessarily, held by the king of the Ger. people, and hence often called the Ger. Empire; in the middle of the XVI. cent. it became attached to Austria, and is thence often called Austrian; but these appellations lead to confusion with the bodies so named in the XIX. cent.

ROMAN EMPIRE, THE LOWER, see BYZANTINE EMPIRE.

ROMANCE LANGUAGES, the general name for a group of modern languages and dialects owing their common direct origin to Latin. They are thus all Indo-European (or Aryan) languages (see PHILOLOGY). The following languages are comprised in the group: French, Italian, Spanish, Portuguese, Rumanian; to these must be added Romaunsch, the speech common in S.E. Switzerland, Provençal, the popular language of S.E. France, Walloon, the dialect of southern Belgium, and a number of Ital. and Span. local dialects. Although all derived directly from Latin, these languages present great points of mutual difference, some being very much more altered than others. This is due partly to the fact that Rom. civilisation, and the language of the Romans, was more firmly established in some parts of the Empire than in others, and partly to subsequent alien invasions. Thus Spanish contains a considerable admixture of Arab. words, while Walloon and Romaunsch have absorbed a number of Teutonic words; French has been obviously influenced by the original Celtic and Germanic of natives and invaders, and Rumanian by the Slav speech of the surrounding populations. Some of the R. languages have in course of time been so profoundly modified by these influences as to become extinct, *e.g.* Dalmatian. Others, such as Sardinian, have been merged into one of the more vigorous R. languages or have sunk to a mere local dialect. A group of R. dialects may also be mentioned of extra-European growth, such as the French of the West Indies, the French of large parts of Canada, the popular Spanish of South and Central America, the Portuguese of Brazil; these generally show an older form of the parent language with an admixture of native and foreign words. In the Channel Islands dialect the oldest extant form of French is found.

ROMANES, GEORGE JOHN (1848–94), Brit. biologist, animal physiologist, and psychologist.

ROMANOV, FEODOR, see PHILARET.

ROMANS (45° 4′ N., 5° 4′ E.), town, on Isère, Drôme, France; leather manufactures. Pop. 17,700.

ROMANS, EPISTLE TO THE, the greatest of St. Paul's writings, was written from Corinth about 57 or 58 A.D. It is his most systematic theological treatise, and expands his view of Christianity and the Law, touching on many other matters besides. Its argument is sometimes hard to follow, and, while showing his intense spirituality and dealing with practical problems, manifests also the involutions of his unique mind. External testimony in support of it is good; it may have left traces elsewhere in the New Testament. Its authenticity is doubted only by the wildest critics. Its influence on Christian theology has been enormous, and all who have formed, or tried to form, their theology on Paul's have largely based it on this Epistle. Spiritually and intellectually it is one of the most wonderful productions of the Early Church.

Garvie, *Romans* (Century Bible); Sanday and Headlam, in *International Critical Commentary*.

ROMANSHORN (47° 34′ N., 9° 22′ E.), town, and port, on Lake of Constance, canton Thurgau, Switzerland; commercial centre. Pop. (1910) 5973.

ROMANTIC REVIVAL, see RENAISSANCE OF WONDER.

ROMANUS, name of four Byzantine emperors; first (919–48) was deposed by his sons; second (959–63) acquired Crete; third (1028–34) suffered Muhammadan attacks; fourth (1068–71) lost Bari.

ROMANY, see GYPSIES.

ROME (34° 15′ N., 85° 12′ W.), city, on Coosa, Georgia, U.S.A.; cotton and lumber industries. Pop. (1910) 12,099.

ROME, ROMA (41° 54′ N., 13° E.), capital of Italy and seat of the papal court, is situated on the E. bank of the Tiber, 15 miles above its mouth, on the Tyrrhenian Sea. Its site was marked out by nature for an important town. Its Seven Hills offered plentiful, though not perfect, refuge from the malaria of the valley, and the ford here was from early times the route from Etruria into Samnium. The Janiculan Hill on the right or W. bank of the Tiber was not included in the city until some time after its foundation, and of the hills on the left bank the *Aventine*, *Cœlian*, *Palatine*, *Esquiline*, *Viminal*, *Quirinal*, and *Capitoline* composed the Seven, commemorated in the festival of the *Septimontium*.

The Seven Hills.—The earliest settlement, *Roma quadrata*, said to have been fortified by ROMULUS (*q.v.*), was on the Palatine Hill, the central eminence, close to the stream, with the Germalan and Velian spurs running N.W. and N.E. respectively. The four steep slopes of the Palatine were crowned by a square wall, of which remains have been discovered, showing large stones with no trace of mortar. The Aventine lies S. by the Tiber; in the valley between it and the Palatine was the *Circus Maximus*, said to have been formed by Tarquinius Priscus. E. is *Mons Cœlius* separated by a deep valley from the Esquiline to the N., with *Mons Oppia* and *Mons Cispia*. The Viminal, Quirinal, and *Mons Pincius* follow to the N., enclosing on its E. the *Campus Martius*, between which and the Palatine Hill is the Capitoline. The Capitoline Hill has two peaks, the *Arx* and the Capitol; its steep S. slope was known as the TARPEIAN ROCK, from the top of which traitors were flung. The valley E. of the Capitoline Hill was known as the *Subura*, in the lowest portion of which, at the foot of the Palatine Hill, was the *Forum Romanum*.

Walls.—The city wall ascribed to SERVIUS TULLIUS, of extraordinary height, surrounding all the fortified hills of the regal period, is still in places to be seen, with its great trench and ditch. It just enclosed the Capitoline on the N.W., ending opposite the Tiber Island in the middle of the city, and excluding the plain of the *Campus Martius* between the hills and the river. The emperors AURELIAN (270–75) and PROBUS (276–82) built a wall, starting by the Tiber S. of that of Servius and making a wider circle; it touches the Tiber near the N.W. gate, goes S.E. along the left bank of the stream to within a short distance of the *Pons Aurelius* (the present Sistine Bridge), then includes part of the Janiculan Hill, returns to the Tiber and goes S. along the left bank to its starting-place, in all a distance of 12 miles. The Janiculan and its spur, *Mons Vaticanus*, became the papal quarters of the city and were enclosed by the Leonine Wall, built by Leo IV. (847–55).

Gates and Streets.—The various gates (R. possessed thirty-seven) in the Aurelian Wall correspond to the streets of ancient R., which all converged on the ford over the Tiber. From the valley round the Palatine Hill went the *Via Aurelia* W., crossing the Tiber by the *Pons Æmilius* (Ponte Rotto) and having issue at the *Porta Aurelia* (S. Pancrazio); the *Via Ostiensis*, S.W. to the Rom. port, Ostia, passing through the *Porta Ostiensis* (S. Paolo); the *Via Appia* (Via di Porta and Via S. Sebastiano), made by Appius Claudius, censor, 304 B.C., as far as Capua in the S.E. and extended later, the first great military road of R.; the *Via Tiburtina*, E., passing the Servian Wall by the *Porta Esquilina*, the Aurelian Wall by the *Porta Tiburtina* (S. Lorenzo); the *Via Nomentana*, passing the Servian Wall by the *Porta Collina*, the Aurelian by the *Porta Nomentana* (Porta Pia); and the great north road named from C. Flaminius, who repaired and extended it (220 B.C.), the *Via Flaminia* (del Corso), which issued by the *Porta Flaminia* (del Popolo). The *Via Latina*, still so named, branched off from the Appian Way and went S.E. through the *Porta Latina*. The *Via Prænestina* and *Via Labicana* branched off from the Tiburtine Way. The *Via Cassia*, built *c.* 187 B.C., went from R. to Arretium, the *Via Salaria* (di Pia Salaria) from the *Via Nomentana* to Reate; the *Via Cornelia* and *Via Triumphalis* built at a later date led N.W. from the *Campus Martius* over the Tiber; and on the right bank the *Via Portuensis* led S. from the *Via Aurelia* to the coast; the *Viæ Asinaria* and *Tusculana* ran S.E. from the *Porta Asinaria*, and there was another exit to the N. in the *Porta Pinciana*.

In the city itself the most important street was the *Sacra Via*, which started at the Esquiline Hill, curved round the foot of the Palatine Hill, and passed through the *Forum Romanum*, to the temple of Saturn below the *Clivus Capitolinus*. The *Vicus Tuscus*, an old Etrurian road, bounded the N.W. side of the Palatine square, running from the Sacred Way to the *Circus Maximus*. The *Vicus Iugarius*, containing the temple of *Iuno Iuga*, goddess of marriage, passed from the Forum to the *Porta Carmentalis* along the S. slope of the *Capitolium*. **Bridges** were the *Pons Sublicius* (the first), superseded by the *Pons Æmilius*, like itself in the centre of the city, the *Pons Probi* and *Pons Theodosii* farther south, and the *pontes Gratiani, Cestius* (the keystone of which is the Tiber Island), *Fabricius, Aurelius, Agrippæ, Neronianus*, and *Ælius*, ascending the stream. Three remain, and there are ten new ones.

Etruscan Remains.—The great Etruscan *Cloaca Maxima* and other **sewers** drained into the Tiber the marsh round the Palatine Hill, and the former is of architectural interest for its vaulting, the contribution of Etruria to the Rom. art of building. Another Etruscan building of interest is the *Tullianum*, known in mediæval times as the MAMERTINE PRISON of the Capitoline Hill. This vault, probably the city well in the regal period, was used for political prisoners during the republic, and is now consecrated as the Church of *S. Pietro in Carcere*, from the supposed imprisonment here of St. Peter.

Palatine Hill.—Primitive remains in the S.W. angle of the Palatine Hill were connected in historical times with various incidents of the Romulus story (see below); both here and in the *Area Palatina* of the centre various earthworks are found. To the Area Palatina (near which stood the temple of *Apollo Palatinus* and other splendid buildings) the *Clivus Palatinus* ascended from the Sacred Way, spanned at this point by the Arch of Titus, which commemorates his capture of Jerusalem (70 A.D.). Near the foot of the N. slope, parallel in the E. with the Sacred Way, was the *Via Nova* to the Forum; it was the S. boundary of the S. buildings of the Sacred Way. Between the two streets, one on each side of the *Summa Sacra Via*, were the temple of the *Lares and Penates*, and the temple thought to be that of *Iupiter Stator*. The stately palace of Augustus (*Domus Augustana*) stretched S. of the Palatine Area; adjoining are the remains of a remarkable temple of the republican period. The house of the notorious Livia follows, and near the primitive remains of the W. corner was the temple of the *Magna Mater*, built by Augustus. From this point the *Clivus Victoriæ*, a narrow winding path circling the N.W angle, led down towards the *Vicus Tuscus* on the W. The various dwellings of rich Romans and the great palaces of Tiberius and Caligula are to be traced in this angle, where the Farnese Gardens now stand; the palaces of Hadrian and Severus were in the S.E. Mention by classical writers of the marshy *Velabrum* show that it was between this hill and the Vicus Tuscus.

The CAPITOLIUM, the S. summit of the **Capitoline Hill**, was the site of the temple of *Iupiter Capitolinus* (Jupiter of the Capitol), three times burnt and always rebuilt in the most costly fashion. The N. peak, the *Arx*, held the temple of *Iuno Moneta* (the Mint, whence the term money), now the Church of S. Maria in Ara Cœli. On the **Aventine** there were temples of *Luna, Minerva, Honos et Virtus*, and the *Bona Dea*, the *Thermæ* (Baths) of Decianus and Antoninus, and the tombs of the Scipios; on the **Cœlian Hill** stood the temple of Claudius; on the Oppian and Cispian hills, peaks of the **Esquiline**, were the *Thermæ* of Trajan and Titus, Nero's Golden House, the temple of *Iuno Lucina*, and various gardens and graves, including the tomb of Horace. On the **Quirinal** were the Thermæ of Constantine; at the foot of the Viminal and Quirinal, surrounded by the Servian Wall, were the Thermæ of Diocletian; on the **Pincian** were the Gardens of Sallust.

From the beginning of the republic R. had an excellent **water-supply**; in addition to numerous springs, conduits were made, the chief being the *Aqua Appia* of the maker of the Appian Way, the *Anio Vetus, Aqua Marcia, Alsietina, Traiana, Iulia, Claudia*. These supplied the numerous *Thermæ*. In the old *Forum Boarium*, which occupied the E. side of the open space round the *Pons Æmilius*, the first gladiatorial show was held in 264 B.C.

The imperial *fora, Julium, Augustum, Nervæ, Traiani, Pacis Vespasiani*, adjoin the *Forum Romanum* The **Forum Romanum**, the meeting-place of the *comitia curiata* and various public assemblies, is believed to have been the grave of Romulus and was the scene of many important Rom. events. Its central space was surrounded by numerous statues and buildings. On the W. of the Forum stood the *Rostra*, where speakers held forth, so named from the beaks of ships which from the maritime success against the Carthaginians (338) adorned the public platform. On the N. was the *Curia*, where the Senate met; it was restored by Diocletian and afterwards consecrated as the Church of S. Adriano, still standing. In front of the *Curia* was the *Comitium*, in low-lying, formerly marshy, district. The marsh waters formerly collected in the *Lacus Curtius* and other pools in the centre of the Forum. The TEMPLE

of JANUS, ascribed to the regal period, was at the N.E. Its doors were always closed in time of peace; the closing was a solemn occasion, as when performed by Augustus in 29 B.C.

The temple of Saturn, of which remains are found, stood on the W. below the Capitoline slope; it was connected with one of the oldest religions of the State, and contained the public treasury. In the S.E. on the Sacred Way are remains of the imperial temple of Castor and Pollux (*Castorum*), built on the site of earlier temples, still to be traced, to these guardians of the Rom. State. The two republican *basilicæ*, or law-courts, in the N.E. were superseded by the great *Basilica Julia*, commenced by Julius Cæsar and frequently rebuilt in imperial times, on the S. side of the Sacred Way. Various arches erected by the emperors in this forum are, with the exception of the Arch of Severus in the N.W. (203 A.D.), now only to be traced by the archæologist.

The **Sacred Way** is of equal antiquarian interest. The site of the oldest building of all, the *Ædes Vestæ*, and even the ashes of the fire brought from Alba Longa by Romulus, have been discovered in the S.E., with remains of imperial temples to Vesta on the same spot. The Sacred Way also contained the house of the Vestal Virgins, the palace of the *Pontifex Maximus* (*Regia*), and the *Templum Divi Iulii* on the S.W. On its N.E. side were the *Templum Divi Antonini et Divæ Faustinæ* (erected by Antoninus Pius to his wife), which was rededicated to S. Lorenzo in Miranda in the Middle Ages, the *Templum Divi Romuli*, and the Basilica of Constantine. The *Curia* to the N. of the *Forum Romanum* faces the *Forum Iulium* on the other side of the modern Via Bonella. The legend elaborated in the *Æneid* of the connection of Venus with R. had been woven by Cæsar's time, and in the centre of his forum was the great temple of *Venus Genetrix*.

By crossing the Via del Priorato on the N.E. side the *Forum Augustum* is reached; it contained the temple of *Mars Ultor*, dedicated in commemoration of vengeance on the murderers of Cæsar. E. is the much-restored *Forum Traiani*, entered by the Arch of Trajan, facing which at the N.W. end is the Column of Trajan. The *Basilica* and *Bibliotheca Ulpia* stood at this point, now known as the Piazzo di Foro Trajano; farther N.W. is the temple of Trajan. On the S.E. side of the Via Bonella were the *Forum* of Nerva, the *Forum Transitorium* or *Palladium*, with the temple of Minerva, and the Forum of Vespasian or of Peace, with the *Templum Pacis*.

The **Campus Martius** contained in republican times the *Circus Flaminius*, the *Navalia* (on the bank of the Tiber), the *Theatrum Pompeii*, etc. But its chief buildings were due to the emperors; the *Sæpta Iulia*, the *Porticus Argonautarum*, Column of Aurelius, and Mausoleum of Augustus lined the Flaminian Way; in the centre were the *thermæ* of Agrippa and Nero, the *Stadium* and *Pantheon*; the theatres of Balbus and Marcellus lay S. of that of Pompey, and there were numerous *portici*. In the open space between the Cælian, Esquiline, and Palatine hills was the *Amphitheatrum Flavium* or COLISEUM. Augustus divided R. within the Aurelian Wall into the fourteen **Regiones** of *Porta Capena, Cælimontium, Isis et Serapis, Templum Pacis, Esquiliæ, Alta Semita, Via Lata, Forum Romanum, Circus Flaminius, Palatium, Circus Maximus, Piscina Publica, Aventinus, Trans-Tiberim*.

The **Christian Monuments** of R. almost equal in number the Pagan. By the Appian Way, outside the walls, are the CATACOMBS (*q.v.*). The Ital. law courts were often turned into churches, or their materials were employed in their construction, or else formed a model for the Early Christian churches, hence called *basilican* (see ARCHITECTURE). The eight BASILICAN CHURCHES of R. are those of S. Giovanni in Laterano, S. Pietro in Vaticano, S. Maria Maggiore, S. Lorenzo fuori le Mura, S. Paolo, S. Croce, S. Clemente, and S. Agnese, dating from the IV. cent. The church of St. John Lateran is by the Porta S. Giovanni on the Appian Way. It was given to the pope for his residence by Constantine the Great, who was possibly baptized there. The LATERAN PALACE is at its E. end; the Scala Santa in this building ascended to the pope's private chapel, the *Cappella Sancta Sanctorum*. Among the numerous other churches dating back to the early basilican period are SS. Giovanni and Paolo (IV. cent.), S. Stefano Rotondo and S. Vitale (V. cent.), S. Maria in Ara Cœli and S. Giorgio in Velabro (VI.–VII. cent's), S. Maria in Cosmedin, S. Pietro in Vincoli, and S. Giovanni ad Portam Latinam (VIII. cent.), S. Cecilia in Trastevere (IX. cent.), and S. Maria in Trastevere (XII. cent.).

The transition from Romanesque to GOTHIC ARCHITECTURE was, perhaps naturally, later in this classical region than elsewhere in Europe; in the XIII. cent., however, the essentially Gothic *campanili* were raised on many of the basilicas, and there are a few churches in this style (*e.g.* S. Maria sopra Minerva). The RENAISSANCE, again naturally, was earlier in R. than anywhere else. One of the most important facts in the mediæval topography of R. was that the popes took up their residence on the right bank of the Tiber on *Mons Vaticanus*. Here the **Basilica of St. Peter** stood, and here the abode of his successors, the **Vatican** palace, was raised in the early VI. cent. This palace, rebuilt in the Gothic period, was entirely reconstructed in the XV. and XVI. cent's by the best artists of the Renaissance, Fra Angelico, Michael Angelo, Bramante, Sangallo, and Raphael, Raphael decorating it with wall-ornament imitated from the classical work of Pompeii. The Renaissance Church which rose out of the basilica of **St. Peter** had a long history; it is the largest church in the world, and its dome is of the greatest architectural interest. Bramante erected in R. some of the most important Renaissance buildings in the world, the churches of S. Lorenzo in Damaso (of the Palazzo della Cancelleria also erected by him) and S. Pietro in Montorio, the Palazzo Giraud, and portions of various other buildings. The Rococo left by Bernini and other architects of the XVII. cent. was followed by the BAROCCO of the XVIII. cent.; the Gothic revival of the XIX. cent. has found little understanding in R.

There are many **New Quarters**, and the old town has been much altered under a scheme accepted by the State in 1882. The Via del Corso ends at the Piazza di Venezia; from it the Via Nazionale goes E., the Via Plebiscito W. to the Corso Vittorio Emanuele, which ends at the Tiber where the Ponte Vittorio Emanuele stands; other new streets are the Via di Ripetta, Via del Babuino, Via Sistina, Via delle Quattro Fontane, Via della Quirinale, Via del Venti Settembre, Via Veneto, Via Boncompagni, Via Ludovisi, Via del Tritone, Via Cavour, Via in Merulana, Via Arenula. There are numerous squares with fountains, columns, etc., and there are 400 churches. The palace of the king of Italy is on the **Quirinal Hill**. The modern city has no important manufactures, but derives its prosperity from the expenditure of the royal and papal households, and from tourists, who flock from all parts of the world to see the antiquities. It is the seat of a university. Pop. (1911) 538,634.

History.—From the legends of the REGAL PERIOD of Rom. history (753–510 B.C.) the Romans themselves and modern historians have extracted a good deal of probable fact. The story of ÆNEAS '*fato profugus*' setting forth from Troy and founding a city at Lavinium in Latium is obviously due to Gk. influence. Ascanius, s. of Æneas, founded Alba Longa, head city of the Lat. League; finally his descendant, the Vestal virgin Rhea Silvia, had by the god Mars the twin sons ROMULUS and REMUS, suckled by a wolf under the fig tree by the Palatine Hill, where Romulus founded

R. The traditional date for the foundation of R. is 753 B.C.

The chief facts narrated of the regal period are these: Romulus (753–715) made the sacred trench, the *Pomœrium*, round the Palatine Hill, built the wall within it, established an 'asylum' for outlaws on the Capitoline Hill, where he allowed the SABINES to settle and amalgamate with the Romans. The Sabines were said to have been also called Quirites, probably as an explanation of the full title of the Rom. people, '*Senatus Populusque Romanus Quiritium.*' Romulus is said to have divided the citizens into three tribes (*i.e.* into three; this is the origin of the modern use of tribe), each divided into 10 *curiæ* or wards, and to have organised the Senate. His successor, the Sabine, NUMA POMPILIUS (715–673), is the traditional founder of all the religious observances of R., except the cult of Vesta, which goes back to the remotest Lat. antiquity; the sacred fire for the temple of Vesta had been brought from Alba Longa by Romulus. Numa organised the worship of Quirinus, Mars, and Jupiter. TULLUS HOSTILIUS (673–642), after destroying Alba Longa, allowed its inhabitants to settle on the Cælian Hill and become the first members of the plebeian order so important in Rom. history. ANCUS MARTIUS (642–616), a Sabine like Numa, established the inhabitants of defeated Lat. cities on the Aventine Hill, made a fort on the Janiculan Hill, the first bridge over the Tiber (the *Pons Sublicius*), and the port of Rome, Ostia.

The Etruscan, LUCIUS TARQUINIUS PRISCUS (616–579), probably represents a foreign dynasty thrust on the Romans after subjugation by their Etruscan neighbours; to his reign is due the first great engineering work of Rome, the *Cloaca Maxima* (still to be seen, with its great Etruscan vault, R.'s first lesson in architecture), which drained the marsh where the Forum lay. To him are also attributed the Great Circus and *Ludi* and the addition of the *patres minorum gentium to the Senate.* His slave, SERVIUS TULLIUS (578–535), succeeded, surrounded the Seven Hills with a wall, accompanied in certain parts by entrenchments, divided the people into six *classes* (subdivided into *centuriæ*) according to their wealth, the city into four *regiones*, added country tribes to the city tribes, and organised taxation, military service, and voting. The beginnings of plebeian uprising are to be traced to this reign. LUCIUS TARQUINIUS SUPERBUS (534–510), the last king, built the temple of Jupiter on the Capitoline Hill, so called, legend said, because a newly decapitated man's head was there found, a symbol that R. was to be head of the world. He extended the power of R. in Latium, but was a cruel tyrant. After the rape of Lucrece by his s. Sextus, the house of Tarquin was expelled.

The story of HORATIUS keeping the bridge against the Etruscans belongs to the still mythical days of the early republic, as does that of the final defeat of the Tarquinii at *Lake Regillus.* Indeed, it was 300 years before the legendary element was entirely eliminated from Rom. history. Theories as to these legends have become scientific since Niebuhr's time. Many of the heroes are thought to be eponymous; the desire of later Romans to explain existing institutions may be traced in many cases, but this is very often of service to history as throwing a new light on those institutions; many of the legends, too, may still have an undisclosed meaning. The abolition of the kingship probably coincided with the throwing off of the Etruscan yoke; this may explain why the name king was held in such detestation in republican R.

REPUBLICAN PERIOD (509–27 B.C.).—The Rom. people at the commencement of this period were arranged in *gentes* or clans, composed of families (*familiæ*) all supposed to be related and bearing the same name. The *paterfamilias*, with his formidable *patria potestas*, was the unit of Rom. life; the heads of the families of the original *gentes* formed the original patricians, their descendants the great PATRICIAN ORDER; *gentes* formed later consisted of the PLEBS (originally 'the many'), who possessed no political rights until they won them under the early republic. The *gentes* were gathered in wards (*curiæ*, with a meeting-house, *curia*, and a priestly official, the *curio* or *flamen curialis*), the wards into 21 (afterwards 35) tribes. There were originally the three tribes of Ramnes, Tities, and Luceres, probably representing three original peoples, who together constituted the Rom. people.

A popular assembly, the *comitia curiata*, assembled in the *comitium*, the Lower House; by it, and by the Servian institution, the *comitia centuriata* of the *Campus Martius*, the *populus* expressed its will. The Upper House, the SENATUS (originally composed of *senes*, old men, the heads of the *familiæ*), was said to have received its final complement of 300 *senatores* —all patricians—from Tarquinius Priscus. It was also known as the CONSCRIPT FATHERS, originally *Patres et Conscripti*, i.e. senators by right of rank and persons summoned by the king (the parallel of our mediæval barons by writ). The senate solemnly conferred the sole executive power of the State on the king and afterwards on the CONSULS. The kingship, elective, conferred the powers of punishment and death, symbolised by the *fasces* or rods and axes borne before the Rom. ruler by 12 *lictores.* The king (or the INTER-REX, *q.v.*) appointed his successor. The revolution of 509 was in many ways conservative; the two consuls exercised the regal power in secular matters, the *inter-rex* was still appointed, and the chief religious official, who performed the regal priestly functions, was called *rex sacrorum.* The power of the consuls was limited by their veto on each other's actions when in R. (*domi*), by the moral weight of the senate which made the government virtually aristocratic, and the fact of only holding office for one year. In times of crisis the consular power was suspended and a DICTATOR appointed for six months; unlike the consuls the dictator had axes in his *fasces* in R. itself.

PATRICIANS AND PLEBEIANS.—From the *regifugium* for over two cent's the history of R. is chiefly the struggle of the patrician and plebeian orders. The year of the expulsion of the kings was that of the *Lex Valeria de Provocatione* (509), forcing the magistrates to consult the *comitia centuriata* (*provocatio ad populum*) before putting a citizen to death. Poverty and the custom by which the debtor became the slave (*nexus* or *addictus*) of his creditor led in 494 to the secession of the plebeians to the *Mons Sacer* where they threatened to establish an independent city. They are said to have been persuaded to return by AGRIPPA's parable of the quarrel between the belly and the limbs. By the *Lex Sacrata*, however, they obtained some alleviation of their misery and the right to appoint annually *tribuni plebis*, originally 2, finally 10, in number, with power to protect members of their order against any one but a dictator, and the presidency of the plebeian assemblies who passed *plebiscita* at first only binding on themselves. Their persons were sacrosanct, and any one opposing them *dis inferis deditus.* By the *Lex Publilia* of 471 the method of electing the tribunes and the two ædiles who took charge of the *plebiscita* was settled.

The *comitia tributa*, the plebeian assembly (possibly responsible for the word tribune), received by the *Leges Valeriæ-Horatiæ* of 449 equal legislative rights with the *comitia centuriata*, the decisions of which were the regular *leges.* The *decemviri legibus scribundis* drew up, in 451–450, the Twelve Tables of the Roman law, thus abolishing a great plebeian grievance—law, like religion, having been previously a mystery only to be known by patricians. The *Lex Canuleia* (445) legalised, for the first time, marriage between patricians and plebeians; it was wrung from the patricians by a plebeian secession to the Janiculan Hill. When in 445 the *plebs* secured the appointment of *tribuni militares consulari potestate*, the patricians commenced to make the chief offices less important, some of the

most important consular functions being transferred to *censores*. The quæstorship was opened to plebeians in 421, which meant that they could be senators, and in 367, after a period of bitter social discontent, the military tribunes were abolished and, by the LICINIAN ROGATIONS, one consul must be a plebeian; the consul's judicial functions were given to a patrician *prætor*, but this office was shortly afterwards opened to plebeians; and two new 'curule' ædiles were appointed. In 339 a plebeian dictator passed the *Leges Publiliæ*, by which one censor must be a plebeian, and *plebiscita* were made binding on all. After the 4th secession the *Lex Hortensia* (287) gave *plebiscita* the full authority of *leges*. The *Lex Ogulnia* (300) removed the last disability, admitting plebeians to the colleges of *pontifices* and *augures*.

EXPANSION OF ROME.—By this time Rom. power had extended considerably beyond the Seven Hills; indeed, foreign warfare was one of the causes of the rise of the *plebs*. The ETRUSCANS, whose rule had been presumably thrown off in 509, seized all Rom. territory on the right bank of the Tiber, and there were wars with the LATINS until 493, when R. again entered the Lat. League. The joint attacks of Latins and Greeks on the Etruscans brought about their final decline in this century, Etruria being planted with Rom. colonies. The great GALLIC INVASION and sack of R. (390) followed, and marvellous legends were handed down of the successful defence of the Capitol. The three SAMNITE WARS (343–341, 326–304, 295–290), in which occurred the disaster of the *Caudine Forks* (321), left R. supreme in Campania, Etruria, Apulia, and Lucania. *Magna Græcia*, led by Pyrrhus, was subjugated (some of its cities voluntarily entered the Rom. alliance) by 272 and planted by Rom. colonies. With the destruction of Volsinii in 265 the whole peninsula was united under Rom. rule, and R. began almost immediately to acquire an empire over seas.

The three PUNIC WARS (*q.v.*), 264–241, 218–201, 149–146), in which a foreign foe was again at the walls of R., resulted in the formation of the Rom. provinces of SICILY (261), CORSICA (227), HITHER AND FURTHER SPAIN (197), and AFRICA (146). The three MACEDONIAN WARS ended in Macedonia being formed into a province (147) and the dissolution of the Achæan League, every Gk. city being made directly dependent on R. The province of ASIA was formed in 133. The Gauls between the Alps and Apennines and the Ligurians between that district and Spain were subjugated, and the provinces of *Gallia Cisalpina* (181) and *Gallia Narbonensis* (121) established (see GAUL, SPAIN).

During these wars, despite the theoretical supremacy of the *populus*, the SENATE, the only permanent body of experienced administrators, had become supreme in the state, and a new close order, the *nobilitas*, had taken the place lost by the patricians; this 'senatorial order' was a prominent factor in Rom. society until the passing of the Republic. The *equites* who exercised the business of tax-farmers (*publicani*), though forbidden the senatorial order, constituted an extremely wealthy middle class, and as provincial administrators members of the senatorial order amassed fortunes from the spoils of war and extortion. Italy, however, which had been devastated by Hannibal, lost its yeomanry in foreign conquest and was reduced to a great state of wretchedness by the slump in the market through the immense quantities of foreign corn brought to the Tiber; ploughing was no longer profitable, and wealthy cultivators began the course elsewhere attended with such suffering to the peasantry, the turning of arable land into large sheep-farms. The result was the effort of the GRACCHI (*q.v.*) to obtain agrarian reform, their defiance of the Senate, and murder (131 and 121 respectively). The conduct of the Senate in this affair, its misrule of the provinces and weakness and corruption in the JUGURTHINE WAR (111–106), destroyed the prestige it had hitherto possessed.

The plebeian MARIUS, who had at last captured Jugurtha, prepared the people's minds for the supersession of the Senate by an autocratic ruler. After the revolt of R.'s Ital. allies (*socii*) and the SOCIAL WAR (90–88), which resulted in all Italy S. of the Po receiving the Rom. franchise, internal politics became of chief importance. Marius' and SULLA'S rivalry for the command against Mithradates VI., who overran and sought to acquire the Rom. province of Asia, led to Sulla's march with his army on R. in 87. He then went eastwards and won brilliant victories against Mithradates, while Marius returned, massacred his opponents, and became consul (86), but soon died. Sulla returned, fought his way to R., 'proscribed' the Marians, and as dictator (81–79) passed many anti-democratic measures.

After his death in 78, POMPEIUS came to the front. Pompeius made a great name in the East, helped to subdue Spartacus (*q.v.*), and put down the pirates of the Mediterranean; in his absence the CATILINIAN CONSPIRACY had been disclosed, and the warring parties all welcomed the successful general, who celebrated a unique triumph (60). CÆSAR returned from Spain, covered with honour, in 60, and the FIRST TRIUMVIRATE was formed between Pompeius, Cæsar, and Crassus. Pompeius never showed much gift for politics, and his star at once paled before that of Cæsar, who became consul (59) and inaugurated agrarian and other reforms. From 58–51 Cæsar carried out his Gallic campaigns, and invaded England (*q.v.*), leaving Pompeius a free hand in R., where in 52 he was sole consul for six months to restore order; but as Pompeius grew ever more jealous, Cæsar had cause to fear that he would be impeached on his return home; as he could not be impeached before laying down his *imperium* (military command), he transgressed the laws of R. by crossing the Rubicon (Jan., 49) without doing so. Pompeius and the consuls fled to Greece, and Cæsar triumphantly entered R.

After five more years of warfare (Pompeius being finally defeated near *Pharsalus* in 48), Cæsar was assassinated (44). As dictator for nearly the whole period of his rule, Cæsar restored order at home, subdued Pontus, Egypt, 'Africa,' and Spain, and received the title '*imperator*,' or autocrat, a rank lesser in kind in R. than that of king. The suggestion of coronation led to his murder by the republicans in 44. The Triumvirate of Cæsar's heir, OCTAVIANUS, MARCUS ANTONIUS, and LEPIDUS, was victorious over the republicans at *Philippi* (42), and the subsequent quarrel of Octavianus and Antonius ended in the former's victory at *Actium* (31). The Triumvirate had, however, done its work in the proscription of all prominent republicans, including Cicero.

PRINCIPATE AND EMPIRE (27 B.C.–476 A.D.).—Cæsar Octavianus had already accustomed the Rom. populace to his rule, receiving from 36 onwards the sacrosanctity of the tribunate, and he carefully restored republican forms, reversing the acts of the Triumvirate. He was granted *proconsulare imperium* throughout his rule, and as an honorary distinction the titles AUGUSTUS and *princeps senatus*. He reformed the provincial, army, and home administrations, and sought to crush Asiatic cults and orgies prevalent in R. Unfortunately his corn doles and other devices for contenting the city *plebs* ended in the demoralisation complained of by Juvenal (*q.v.*), the sole demand for 'bread and public displays' (*panem et circenses*). He added provinces to the empire, created a new imperial feeling, and the cult of R.

His successors made his purely republican titles symbols of more than royal power, and the rulers of his house, TIBERIUS (14–37 A.D.), CALIGULA (37–41), CLAUDIUS (41–54), and NERO (54–68), left names which have become almost synonymous with luxury and vice, no doubt exaggerated by the Christians, whom they persecuted, and by the republicans, who continued to cherish anti-monarchical feeling. They fully maintained R.'s power abroad, but tyranny at home led to Nero's assassination in 68. Claudius was the first Rom. ruler to be proclaimed by the prætorians (*q.v.*).

After the deposition of the Julian line the soldiery took the chief part in the election of emperors. Among the more famous emperors who succeeded may be mentioned TRAJAN (98–117), who extended the frontier to the Tigris, HADRIAN (117–38), who withdrew to the Euphrates, but held his restricted territory with a firm hand, ANTONINUS PIUS (139–61), who, like Hadrian, made a wall in Britain, and the Stoic MARCUS AURELIUS (161–80), who allowed Ger. tribes to settle in the empire. The 'decline' then started, Alemanni, Franks, and Goths taking up their abode within the frontiers in the middle of the III. cent. They were driven back for a while by the Illyrian emperors, CLAUDIUS II. (268–70), AURELIAN (270–75), and DIOCLETIAN (284–305), whose reign is known as the *Era of the Martyrs*. Diocletian reorganised the empire in 285, dividing the command between himself, another Augustus, and two *Cæsares*, with respective headquarters at Nicomedia, Milan, Treves, and Sirmium, not R.

CONSTANTINE THE GREAT, who made Christianity the State religion, made Byzantium the capital of the whole empire (330). The system of division into **Western** and **Eastern Empire** (see BYZANTINE EMPIRE) originated in 334, and was fixed in 364. JULIAN THE APOSTATE (360–63) restored paganism, but Christianity was replaced after his death. VALENTINIAN (364–75) and VALENS (364–78) had to face barbarian inroads on every frontier and were distracted by the quarrels of Athanasians and Arians. THEODOSIUS (378–95), who temporarily united the empire, suppressed the latter. R. was sacked (410) by ALARIC the Visigoth during the rule of HONORIUS (395–423), when Britain was lost to the empire (407), and Goths and Franks settled in Gaul, Vandals in Spain. Under VALENTINIAN III. (423–55) the Vandals conquered Africa; in 451 the Huns under ATTILA were defeated at Châlons, one of the decisive battles of the world, but in 455, after Valentinian's murder, R. was sacked by the Vandal Genseric. The Visigoths then took possession of what remained of the W. empire, and after for a while appointing the emperors, deposed Romulus 'Augustulus' in 476, and established ODOACER as king of Italy, nominally vassal of the Byzantine emperor. For the later history of R., see ITALY.

Mommsen, *History of Rome* (Eng. trans., new edit., 1894); Gibbon, *Decline and Fall of the Rom. Empire* (Bury's edit., 1897–1900); Bury, *Later Rom. Empire* (1889); Middleton, *Remains of Ancient R.* (1892); Platner, *Topography and Monuments of Ancient R.* (1904). A good text-book is Myers' *History of Rome*.

Law.—In their system of Civil Law the Romans have supplied the civilised world with a model for its codes (the term Civil Law in England means Roman Law), a legal terminology, and an inexhaustible mine of principles which are the direct source of much of the law of modern Europe. The history of Rom. Law fascinates, because one can watch its gradual development for 1000 years from the times of patriarchal Rome to the Emperor JUSTINIAN, who reduced and arranged the unwieldy mass of legislation, decisions, and commentaries.

In the earliest stage notions of law and religion were mixed, and the guiding principle of the lawgiver was to consider what would be pleasing or displeasing to the gods. The kings, as chief pontiffs, were the supreme judges, and all legal proceedings were elaborate and solemn ceremonies which lost their effect by a wrong word or a misplaced gesture. The way for the development of the law was cleared when, on the expulsion of the kings, the connection between law and religion disappeared and the magistrates were secular officials.

The Twelve Tables.—The first landmark in the history of Rom. Law is the Twelve Tables, which were drawn up by Decemvirate in 450 B.C. under pressure of plebeian agitation. The Twelve Tables state the customary law of the community, and at the same time indicate that some of the institutions of patriarchal Rome were beginning to change. They established the *patria potestas*, the supreme power of the head of the family even over the lives of his children, but provided that a son sold thrice should be emancipated from the power of the paterfamilias. A wife who stayed away from her husband's home for three nights in succession prevented his acquiring over her by prescription rights similar to a father's rights over a daughter. Both these provisions came to be used as regular modes of escaping the patriarchal powers of the father and husband. The solemn forms of transferring property and the principle of ownership being acquired by prescription were set forth, and a provision ostensibly for the protection of the debtor postponed the day on which he might be killed by his creditor or hewn in pieces by his creditors.

The principal part in developing the law and ridding it of its rigidity was played by the PRÆTOR, the chief magistrate, elected for a year. Rome's conquests made her acquainted with other systems of law, and her growing trade brought within her gates many strangers who were debarred the legal rights and remedies of a Roman citizen. These two facts forced a comparison between Rom. Law and the law of other states; a notion of a *jus gentium*, a law of nations, entered the minds of the Roman jurists. At the same time the idea of a law of the universe was imported from the philosophy of the Grecian Stoics. The combined force of these two ideas was powerful enough to warrant the Prætor in supplementing the law where the law would not do justice, and a body of equitable rules was in this way built up. The Prætor could not give full ownership in Rome to an alien, but he gave him possession and prevented any one disturbing his possession. The principal work of the Prætor was to make the tie of blood supersede the artificial tie of the *patria potestas* in the law of succession.

In adding to the law the Prætor was greatly aided by the labours of the jurisconsults. The JURISCONSULTI, or JURISPRUDENTES, were men of distinction who devoted themselves to the study of the law, founded schools, and advised clients. The Prætor was not a permanent legal officer, but a politician, and the skilled interpretations of the jurisconsults were naturally welcome to him. The jurisconsults were responsible for supplying Rom. Law with its chief glory, wealth of principle. In addition to their *responsa* in particular cases, the jurisconsults wrote authoritative commentaries on the Prætor's jurisdiction, and so created a vast mass of legislation which is naturally greater than Eng. case-law, made by judges who are limited to particular sets of facts. The interpretations of five of the greatest of the jurisconsults were made by THEODOSIUS (in 426 A.D.) binding on the the magistrates and judges. These authorities were Gaius, Papinian, Ulpian, Paul, and Modestinus, and it was decreed that the opinion of 'the illustrious PAPINIAN' should prevail if those who dealt with any particular point were equally divided. Papinian, the greatest of all the Roman jurists, and famous for his eloquence as well as his learning, accompanied the Emperor Severus to Britain, and was with him when he died at York. GAIUS is noted for his commentary on the Twelve Tables and his Institutes, on which the Institutes of Justinian were modelled. ULPIAN, PAUL, and MODESTINUS were pupils of Papinian.

The Prætor did not, as a rule, decide cases himself. He heard the parties and then sent a formula to a number of judges who tried the case. The formula was the means by which the Prætor modified the law. The formulary system was gradually replaced by the direct administration of the magistrate, a jurisdiction that had earlier been styled *extraordinaria*. By the time of Diocletian, at the end of the III. cent., the magistrates had become judicial officers, and imperial enactments were the only mode of changing the law.

Code of Justinian.—Before the time of Justinian attempts had been made to codify the law—by the jurists GREGORIANUS (in A.D. 306) and HERMOGENIANUS (in A.D. 365) and the Emperor THEODOSIUS II. (in

A.D. 438). The Code of Theodosius, which was a compilation of the imperial decrees since the time of Constantine, was taken as a model by Justinian.

The Emperor JUSTINIAN, who was born in Bulgaria, ascended the throne in 527 A.D., and in the first year of his reign started on the work of reducing and harmonising the enormous volume of the civil law. His lieutenant was TRIBONIAN, Quæstor of the palace, a remarkable man whose all-embracing knowledge and supposed venality led Gibbon to compare him with Bacon. He is said to have written in prose and verse on a variety of subjects, from the nature of happiness to the different kinds of metre. Justinian's first work was a revised code of the imperial laws, founded on that of Theodosius. A commission of ten, with Tribonian at the head of it, completed the work in fourteen months. A far greater task was to extract the essence from the writings of the jurists. About two thousand treatises were examined by Tribonian and sixteen associates, and summarised into fifty books in the space of three years. This work, known as the DIGEST, or PANDECTS, became law in 533 A.D. The INSTITUTES, an elementary work giving an outline of the law, was published at the same time. His enthusiasm unabated, Justinian next prepared a book of Fifty Decisions on debated points, and combined this with a new edition of the Code, the first being carefully suppressed. Many of the most important changes that Justinian made are contained in the 165 *Novellæ Constitutiones* which he promulgated after 534, the date of the new Code.

Justinian adopts the following classification of the law: Persons, things, succession, obligations, actions. The LAW OF PERSONS was, naturally, dominated by the idea of the *patria potestas*, the supreme power of the head of the family over the lives and property of his sons—and their wives and children—and his unmarried daughters. A daughter who married fell under the *potestas* of her father-in-law. Only the head of the family could bring an action, and a child, having no property, could not make a will. Though he had full civic rights, a son *in potestate* was in private law much in the position of a slave. Children were gradually allowed some small rights of property—for example, over things acquired on military service and over the profits of certain high offices. The power of putting a child to death disappeared soon after the publication of the Twelve Tables, and Constantine made the father who killed a child as guilty as a child who killed a father. Justinian freed from the *patria potestas* sons who reached the rank of bishop, consul, or quæstor of the palace, and reduced the father's rights over the property of a son *in potestate* to a life-interest.

In early Rome a legal marriage had the effect of placing the wife in the *manus* of the husband. She was like a daughter: she could own no property and make no will. But, as has been stated, the practice became general of a wife staying from her husband's home for three nights in succession and thus escaping the disabilities of the *manus*. A result was that the wife, in theory, was still in her father's *potestas* and he was bound to support her. The anomaly gave rise to the institution of the *dos*, or dowry, the father, in a lump sum given to the husband, compounding for the liability for his daughter's maintenance. A wife who was not under the *manus* of her husband was still legally married. All that was required to make the tie binding was consent and some indication that the woman passed into the possession of the man—her reception into his house, for instance. Marriage, being looked on only as a contract based on mutual consent, could be dissolved at the wish of either party up to the time of Constantine, who only allowed divorce where there had been misconduct.

In its classification of THINGS Rom. Law regarded the seashore as a *res communis*, free to all, and recognised no private ownership of rivers. The riparian owner in those days had to submit to his land being used by any one who wished to do so for the purposes of navigation.

The law of SUCCESSION saw the completest change in the thousand years between the Twelve Tables and Justinian. In the earliest times the making of a will was a public ceremony performed before a special assembly of the *comitia curiata*. This was superseded by a fictitious sale to the heir, the ceremony requiring the presence of a man to hold a pair of scales and five Roman citizens as witnesses. The essential thing was the appointment of an heir—a survival of the ancient notion that at all costs there must be some one to discharge the funeral rites and give peace to the dead man's spirit. The distribution of the property was a secondary matter. Under the Prætorian system the fictitious sale was dispensed with, but the parties to that ceremony figured as witnesses and had to affix their seals to the written testament. Theodosius II. made the witnesses subscribe as well as seal the will. The heir, who succeeded to the testator's personality, had to discharge all his debts. The prospect, in certain cases, might well cause an heir to hesitate, and to prevent an intestacy, of which the Romans always had a horror, the *Lex Falcidia* in 39 B.C. secured him in a fourth of the estate after the payment of debts and funeral expenses. Justinian made a great change, converting the heir into a mere executor.

Rom. Law always considered a testator's rights over his property limited by his duty to his immediate relatives. If a father wished to disinherit a son he had to do so expressly and to have a just cause. A child who was disinherited or omitted from the will without just cause, or who received less than a fourth of what would have been his share had his father died intestate, could have the will set aside. The fiction was that the testator was insane, but there was no need to prove insanity. Justinian allowed brothers and sisters to attack a will. He also specified the legal grounds on which a testator might disinherit relatives, and declared that the reason of disinheritance should be expressly stated in the will.

The gradual breaking-down of the *patria potestas* had an important effect on the laws of intestate succession. Emancipated sons, who were not in their father's 'power,' could not succeed until the Prætor gave them 'possession' of what ought to have been their share. Justinian regularised intestate succession. All the kindred of the same degree shared equally, the shares of those who were dead going to their children. There was never any hint in Rom. Law of the feudal system of primogeniture.

In the law of CONTRACT the Rom. jurists never got as far as the doctrine of valuable consideration, which is the basis of the Eng. law of contract, but the principle of part performance was adopted by the Prætor. Where one party to an agreement performed his part he could bring an action to compel the other party to fulfil his engagement. The jurists classified contracts under the heads according to the subject-matter or the form of the agreement. Agreements which fell outside this classification and which were not enforceable by reason of one party having done his part were called *pacts*. The Prætor allowed a pact to be a good defence to an action, though it could not be enforced by an action. Afterwards certain pacts, such as an agreement to give and an agreement to pay what was owing, were made enforceable by action. A promise extorted by force or intimidation was invalid, as were contracts for an illegal purpose and contracts against public morality or public policy. Fraud did not vitiate a contract unless an action for damages could not give an adequate remedy. A contract of sale became binding directly the price and subject were fixed. *Caveat vendor*, not *caveat emptor*, was the rule in Rom. Law. The vendor was liable for an undisclosed fault in the thing sold, and even for a fault of which he was ignorant. In either case the buyer could rescind the contract or claim damages. The rule was derived

from the custom of the slave-market. A slave's defects could be so easily hidden that a warranty was implied in all sales and the principle was extended to every other kind of property.

CRIMINAL TRIALS always took the form of civil actions. Many acts now treated as crimes, such as theft and robbery with violence, were regarded as civil wrongs, the injured party bringing an action for damages. The punishment of death—which was prescribed in the Twelve Tables for the false witness, the incendiary, and the nocturnal devastator of crops—could only be inflicted by the king, and later by the *comitia centuriata*. A regular system of criminal procedure came into being towards the end of the Republic. Different sets of judges were appointed to deal with different kinds of offences. The penalties were set forth in the decrees creating the judges. Many minor offences were left to the summary jurisdiction of the magistrates, and this jurisdiction was by degrees extended until it embraced all crimes.

The principal CIVIL ACTION in ancient Rome was the *actio sacramenti* heard in public in the Forum. Gaius describes the action where both parties claim a slave. Each party repeats a solemn form of words and seizes the slave. This is symbolic of the struggle which the appeal to the law averts. At the magistrate's command the parties then let go their hold of the slave, and in further formal words make the *sacramentum*, or wager, challenging each other to deposit a certain sum. The magistrate sends the case to the judges, and the loser pays the wager to the public treasury to be used for sacrifices. If the matter in dispute could not be brought into court it was represented by a part, for example, a brick instead of the house, or one sheep instead of the flock. Only Rom. citizens could take part in these formal actions, and the Prætor devised simpler proceedings for cases to which foreigners were parties. The Prætor's procedure eventually became general. The distinction between the magistrate and the judge disappeared, the magistrates trying all cases themselves. By the time of Justinian there was a president and vice-president of each province who tried the more important cases, and a staff of inferior judges who heard minor cases. The emperor was supreme judge until Hadrian made the Senate the final Court of Appeal.

Maine, *Roman Law*.

Religion.—Rom. religion is difficult to study and to understand, for what was essentially Rom. was only formal survival or had been buried beneath foreign accretions when Rome had won her conquests and the so-called 'classical' period was reached. Nevertheless, archæology and anthropology and survival give some due to its earlier stages. The earliest form of religion, 'fetishism,' is shown to have once existed by the reverence paid in later times to some sacred objects, but it was soon displaced by 'animism,' in which everything worshipped enshrines a 'spirit.' A definite anthropomorphism was hardly reached—what there was, was borrowed in the later days from Gk. mythology. Roman religion was above all things an affair of the State, and ritual forms had to be punctiliously observed. After the Punic Wars there was much borrowing of Oriental rites, and under the Empire this reached a climax of weird cults and wild emotionalism. A revival of religion was attempted by Augustus, but the real innovator was the cult of the Cæsars which became the dominant and unifying cult of the Empire, and was only displaced by Christianity.

Warde Fowler, *Roman Festivals*.

Roman Architecture, see ARCHITECTURE.

Roman Literature and Language, see LATIN LITERATURE and LATIN LANGUAGE.

ROME (43° 12′ N., 75° 32′ W.), formerly Fort Stanwix, city, on Mohawk, Oneida County, New York, U.S.A.; iron and brass manufactures. Pop. (1910) 20,497.

ROMFORD (51° 35′ N., 0° 10′ E.), town, Essex, England; breweries. Pop. (1911) 16,972; parliamentary constituency (312,864) is largest in U.K.

ROMILLY, SIR SAMUEL (1757–1818), Eng. legal reformer; persistently advocated reform of the criminal law by closer restriction of capital punishment, and reduction of penalties for lesser crimes; M.P. and Solicitor-General.

ROMILLY-SUR-SEINE (48° 32′ N., 3° 45′ E.), town, Aube, France; hosiery. Pop. 10,000.

ROMNEY, NEW ROMNEY (50° 59′ N., 0° 52′ E.), decayed town, on English Channel, Kent, England; one of the old *Cinque Ports*.

ROMNEY, GEORGE (1734–1802), Eng. portrait painter; worked first at his father's trade of carpenter, also taking lessons in painting; went to London, 1762, where he became so successful with his portraits that Lord Thurlow remarked: 'Reynolds and Romney divide the town.' The most famous of his sitters was Lady Hamilton, whom he painted in more than 30 characters.

ROMNEY, HENRY SIDNEY, 1ST EARL OF (1641–1704), general of Brit. forces in Dutch service, 1681; one of the seven who sent invitation to William of Orange.

ROMORANTIN (47° 21′ N., 1° 44′ E.), town, on Sauldre, Loir-et-Cher, France; here edict was passed refusing admission to France of Inquisition, 1560; asparagus. Pop. 8500.

ROMSDAL (62° 40′ N., 7° 30′ E.), valley of river Rauma, Norway; celebrated scenery; on W. coast is R. Fjord. Pop. (1910) 144,736.

ROMSEY (50° 59′ N., 1° 30′ W.), town, Hampshire, England; fine Roman church. Pop. (1911) 4671.

ROMULUS AND REMUS were, according to tradition, twin sons by Mars of the vestal virgin Rhea Silvia, dau. of Numitor, king of Alba Longa. Exposed at their birth, they were suckled by a she-wolf and adopted by a shepherd Faustulus and his wife Acca Laurentia. Romulus founded Rome, 753 B.C., slew Remus (who showed his scorn of the city by leaping over its wall), secured wives for its citizens by the Rape of the Sabine Women, reigned nearly forty years, was translated in a thunderstorm, and afterwards worshipped as QUIRINUS.

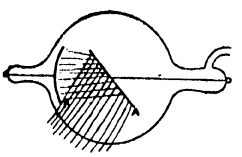
RONCESVALLES, RONCEVAUX (42° 59′ N., 1° 20′ W.), village, in Pyrenees, Navarre, Spain; Charlemagne's army defeated and Roland killed here by Saracens, 778.

RONDA (36° 49′ N., 5° 18′ W.), town, summer resort, Malaga, Spain; famous bull-fights. Pop. (1910) 22,525.

RONDEAU, a form in poetry, consisting of 13 lines made up of 3 unequal strophes. The form is old, but was revived, notably, by Swinburne.

RONDO, a musical form; name derived from Fr. poem in which first verse, after being followed by a second, is repeated; embraces many varieties, but in every case the essential feature is the frequent repetition of the principal theme.

RONSARD, PIERRE DE (1524–85), Fr. poet; chief of the *Pléiade* (R., Dubellay, Remi, Belleau, Jodelle, Dorat, Baïf, and Pontus de Thiard), which aimed at introducing the Renaissance into France. R. was of noble family (near Vendôme); page to François I., afterwards to James V. of Scotland; spent some years in England, Flanders, Germany, Piedmont. Becoming deaf at twenty he devoted himself to lit.; speedily won fame in France and abroad. Among friends and admirers were Henri II. and his sister Marguerite de France, Charles IX., Mary Stewart, and Elizabeth. His productions include *Odes* (1550), *Les Amours de Cassandre* (1552), *Le Bocage Royal* (1554), *Hymnes* (1556), *Les Discours des Misères de ce Temps* (1560), and an unsuccessful and unfinished epic, *La Françiade* (1572). Some of his sonnets are exquisite. His poetry shows rich fancy, a charming blend of mediæval and classical spirit, and beauty and variety of rhythm; he sought to make Fr. idioms more classical. The 'Prince of Poets' died surrounded with honours. A reaction set in under Malherbe, and



R. was forgotten until the Romantic Revival, two centuries later.

Wyndham, *Ronsard and La Pléiade* (1906).

RONSDORF (51° 15′ N., 7° 12′ E.), town, Rhineland, Prussia; iron- and steel-works. Pop. (1910) 15,376.

RÖNTGEN, DAVID (1743–1807), Ger. cabinet-maker; b. Herrenhag; inherited his father's business at Neuweid; opened shop in Paris; patronised by Marie Antoinette; delighted in mechanical contrivances to change shape or function of furniture, which he carried to excess; master of marquetry; goods confiscated by Revolutionary Government, 1793.

RÖNTGEN RAYS.—If a glass bulb similar to that shown in the figure be fitted with two platinum discs, A and K, the latter being spherical and concave towards A, and if the discs be connected to the terminals of a powerful induction coil, an interesting series of phenomena is displayed as the air in the bulb is gradually removed by an air pump. At first, a series of sparks, following zig-zag paths resembling lightning, pass between the discs. As the exhaustion proceeds, these sparks spread out into a luminous brush-like discharge which fills the intermediate space. Later on, this brush discharge shows striations perpendicular to its length: then a dark space appears at K and extends until it reaches to A and to the walls of the bulb, which then become phosphorescent. The dark space contains lines of faintly luminous matter, and these, since they proceed from the disc K (known as the *kathode*), are termed kathode rays. When these rays fall upon the *anode* A, they produce there disturbances which travel outwards in all directions from the face of the anode, and these disturbances are termed *Röntgen rays*. They were discovered by Röntgen in 1895 and were first known as X-RAYS.

They are believed to be due to pulsations in the luminiferous ether and to travel through that medium with a speed approaching that of light. The kathode rays consist of streams of negatively charged particles, or electrons, and when an electron strikes the anode its course is suddenly arrested, and this gives rise to the pulsational disturbance known as the R. r. The chief property of these rays is that they can pass through matter which is opaque to light, and as a rule the less dense such matter is, the greater is the ease with which they are transmitted. The rays are also capable of affecting a photographic plate, and of producing phosphorescence on a screen coated with barium platinocyanide. This, together with the absorption of the rays by denser substances, makes it possible to show on a photograph or screen the structure of different parts of the human body, the bones being distinguished by their darker shade. Another important property of the rays is that they are capable of ionising a gas (see CONDUCTION, ELECTRIC). R. r's differ from light in several important respects. They cannot be refracted or polarised; their reflection from any surface is a diffuse reflection which does not follow the laws of reflection in light; and phenomena of interference and diffraction have not, so far, been observed in them.

R. r's are employed by surgeons not only for diagnostic purposes, as in the diagnosis of fractures, dislocations, calculi, foreign bodies, but in the treatment of various conditions. Cancers and sarcomas treated by application of R. r's diminish in growth, and rodent ulcer, which is a form of cancer, may be completely cured if it has not progressed too deeply. In many skin diseases, especially ringworm and chronic skin conditions, it generally effects a cure, and it has a valuable influence on lupus, although a relapse is common in that disease. The swollen condition of the spleen in *leukæmia* is reduced by application of the R. r's, and the enlargement of lymph glands in tuberculosis (scrofula) and *lymphadenoma* can also be reduced by this method. The rays have a destructive effect upon the normal healthy tissues, and they must be protected both by careful regulation of the quantity of rays emitted and by enclosing the R. r's tube in an impermeable box with a suitable opening in it for the passage of the rays.

ROOFS, the chief purpose of r's is to exclude moisture. In very dry countries flat r's are used, but for rainy climates r's sloping sharply are necessary. So-called flat r's have a slight slope, enough for water to run off. They are made of wooden joists laid across from one wall to the other, and covered with asphalt, zinc, lead, or copper. Pent or lean-to r's are built similarly to flat r's, but the joists are laid at an angle, and covered with slates, corrugated iron, or tiles. The double-slope r. is mostly used. In the simple

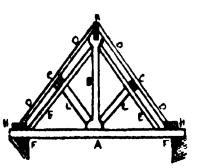


FIG. 1.

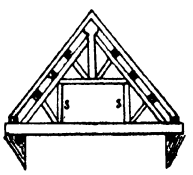

FIG. 2.

form for small spans, two sets of rafters slope upwards from the walls and meet against a ridge-piece. For larger spans the king-post r. is largely used (**Fig. 1**). A is a tie-beam to prevent a tendency to push the walls outward; B, the king-post to prevent sagging; CC, purlins to support common rafters; DD, common rafters; EE, principal rafters. FF, wall-plates to distribute pressure of trusses; HH, pole-plates against which feet of common rafters rest; K, ridge-piece; LL, struts, extra supports for rafters. **Fig. 2** shows a queen-post r. for still larger spans, SS. being queen-posts. Roofing felt is useful for temporary buildings, and to go below other coverings as a non-conductor of heat. Copper is lighter and more durable than zinc or sheet-lead, but more costly. Corrugated iron is used for temporary structures and out-buildings. Slate is the commonest covering, but tiles give more artistic effects. Slates are fixed by nailing, and tiles are hung upon battens or nailed. Asbestos tiles are used for lightness and fire-resisting power. Very large r's, for stations, etc., are metal framework structures.

ROOK, see under CROW FAMILY.

ROON, ALBRECHT THEODOR EMIL, COUNT VON (1803–79), Pruss. soldier and military author; instructor in Military Cadet School, Berlin, 1827; prof. in Military Academy, Berlin, 1835; on commission for reorganisation of army, 1859; Minister of War, 1859–73, of Navy, 1861–71, and carried out reforms; general of infantry, 1866; field-marshal and pres. of council, 1873.

ROORKEE, RURKI (29° 52′ N., 77° 55′ E.), town, Sharanpur district, United Provinces, India. Pop. 17,500.

ROOSEVELT, THEODORE (1858–), Amer. statesman, writer, soldier, and sportsman; ex-Pres. (26th) of U.S.A.; b. New York, of Dutch-Scottish descent; ed. Harvard; member of New York State Legislature, 1882–84; Civil Service Commissioner, 1889–95; head of Police Department, New York, 1895–97; assistant sec. of Navy, 1897; organised and led 'Rough Riders' in Cuba during Spanish-American War; elected gov. of New York State, 1898; Vice-Pres. of U.S.A. (Republican), 1901; on M'Kinley's assassination succ. as Pres., 1901; elected Pres. for second term, 1904, by great majority; on retirement, 1909, secured election of friend and lieutenant Taft (*q.v.*). Estranged from Taft, R. organised new Progressive party and came forward as independent candidate for presidency, 1912, but without success.

Colonel R. is the most prominent American of his day; everywhere admired—or detested—as a strong

and fearless reformer. His tenure of office was distinguished by the carrying of many notable statutes and schemes and prosecution of vigorous Anti-Trust Campaign. America owes to him, *inter alia*, Pure Food and Drugs Act, Meat Inspection Act, Employers' Liability Act, Act to regulate railway rates, etc., and adoption of Panama Canal project. R. acted as peacemaker in Russo-Japanese War, 1905. An exponent of the 'strenuous life,' R. has not confined his energies to politics, war, and diplomacy. In his books he appears as a keen sportsman, rancher, student of men and of natural history. Big-game shooting (in Rockies and E. Africa) is a favourite recreation. On relinquishing presidential office he became Associate-Editor of New York *Outlook*. Exercising, when necessary, remarkable tact, 'Teddy' is also an expert wielder of the 'Big Stick,' and his oratory is sometimes more forcible than polished. R. officially adopted 'Reformed Spelling.' His addresses to Congress were remarkable for length as well as strength, and persistently laid down such planks as conservation of national natural resources (forests, etc.) and 'trust-busting.' R. is unquestionably a great leader of men.

J. Morgan, *Theodore Roosevelt: the Boy and the Man.*

ROOT, that part of a vascular plant which normally grows downward into the soil, acting as an anchor and also as the agent of food absorption from that medium. In ferns and most monocotyledons the r. system is secondary or adventitious, but in dicotyledons consists of a main or tap r. from which lateral r's arise endogenously in acropetal succession. R's are distinguished from stems by absence of buds and leaves, by possession of an apical, protective r.-cap, and production of absorptive r.-hairs immediately behind the apex.

ROOT AND BRANCH MEN, Puritan party (including Vane and Hampden) which demanded that Episcopacy should be destroyed.

ROPE AND ROPE-MAKING, rope is name for all varieties of cordage over 1 inch in circumference. Ropes are made of strong vegetable fibres, such as hemp, flax, cotton, and coir. Sometimes ropes are made from iron, steel, or other metal wires. Hempen rope is the most common, being both strong and durable; cotton ropes are more flexible than hempen, and are generally used for transmitting the power of textile machinery, hemp being too stiff. Manilla hemp, which belongs to quite a different order of plants to the common hemp, gives a fibre very much in demand for the manufacture of strong ropes and hawsers, while coir fibre, which is obtained from the cocoa-nut and is lighter than hemp or manilla, has long been used by natives of India for making ropes; it is, however, generally necessary to tar coir rope in order to preserve it—a proceeding unnecessary with hemp. In rope-making, the hemp, etc., arrives in bales and is cleaned and twisted by machinery. It is then spun into yarn, wound on bobbins, and is ready for twisting into cordage. The ends of the threads to be twisted are attached to a hook which revolves and draws the yarns from the bobbins. The finished ropes are then wound on large reels. Hawser-laid rope is composed of three strands twisted left-hand; cable-laid rope has three strands of hawser-laid rope twisted right-hand; while shroud-rope has a central strand slightly twisted with three other strands twisted around it. Flat rope is a series of hawser-laid ropes placed side by side and fastened by sewing.

RORKE'S DRIFT, on Tugela River, Zululand; scene of heroic defence of Brit. hospital and stores by remnant of 24th Regiment against 4000 Zulus, Jan. 22–23, 1879.

RORQUAL, see under WHALES.

RORSCHACH (47° 28′ N., 9° 29′ E.), watering-place, on Lake of Constance, canton St. Gall, Switzerland; trade in grain; manufactures lace. Pop. (1910) 12,677.

ROSA, CARL AUGUST NICHOLAS (1843–89), Ger. impresario; founded Carl Rosa Opera Company.

ROSA, MONTE (45° 56′ N., 7° 52′ E.), mountain, on borders of Swiss canton Valais and N. Italy; highest peak, Durfourspitze, 15,217 ft.

ROSA, SALVATOR (1615–73), Ital. painter; b. Naples; practically self-taught; attracted the notice of Lanfranco by some landscapes of S. Italy, and was encouraged to go to Rome, where he attained fame by a picture, *Tityus tortured by the Vulture*. He excelled in his landscapes, which deal chiefly with wild and savage scenes, but he also treated historical subjects, and executed numerous etchings. His versatility was astonishing, for he was a good musician, an improvisatore, and an actor; and as a poet he proved himself by his *Satires*, published in 1719.

ROSACEÆ, large natural order of dicotyledons, the majority of which are perennials, and comprising trees, shrubs, and herbs. Vegetative propagation by runners (strawberry) or stem suckers (raspberry) is frequent. The leaves are characteristically stipulate, and may be simple or compound. The flowers are extremely variable, being hypogynous in the strawberry, showing varying degrees of epigyny in cherry, rose, etc., and true epigyny in the apple. Calyx and corolla are pentamerous, the former showing also an epicalyx. There are numerous stamens. The fruits may be achenes (Potentilla), an aggregate of drupes (raspberry), a single drupe (cherry, plum), or a pome (apple, pear).

ROSAMOND, FAIR (d. *c.* 1176), dau. of Walter of Clifford; mistress of Henry II.

ROSARIO (32° 59′ S., 60° 39′ W.), city, on Paraná, port of entry, Santa Fé, Argentina; railway terminus; commercial centre; exports grain, hides. Pop. (1911) 208,990.

ROSARY, a string of beads used by Catholics for assisting the memory in the counting of prayers. R's from very ancient times were used for such purposes by Eastern peoples, and were probably introduced thence into the Catholic Church.

ROSAS, JUAN MANUEL ORTEZ DE (1793–1877), dictator of Buenos Aires; took advantage of anarchy to proclaim himself gov., 1828; dismissed Assembly, crushed liberty; accepted dictatorship, 1835; driven out, 1852.

ROSCOE, WILLIAM (1753–1831), Eng. historian; b. Liverpool; s. of a market gardener; wrote Liberal pamphlets and verses which procured him notice; author of *Life of Lorenzo de' Medici*, 1796, praised for 'Grecian simplicity' by Horace Walpole and trans. into many languages; *Leo the Tenth*, 1805, was variously received; works no longer regarded as classic.

ROSCOFF (48° 45′ N., 3° 58′ W.), town, watering-place, on Eng. Channel, Finistère, France. Pop. (commune) 5200.

ROSCOMMON (53° 38′ N., 8° 11′ W.), inland county, Connaught, Ireland; level or undulating; drained by the Shannon; generally fertile with fine pastures; some coal worked; pursuits chiefly agricultural; contains some interesting remains of antiquity. Pop. (1911) 93,904.

ROSCOMMON (53° 38′ N., 8° 11′ W.), county town, Roscommon, Ireland; fine mediæval castle.

ROSCREA (52° 57′ N., 7° 48′ W.), town, County Tipperary, Ireland; agricultural centre.

ROSE (*Rosa*), a very variable genus, including several indigenous Brit. species (e.g. *Rosa canina*). The stem is thorny, the thorns representing hooked outgrowths of the epidermis, which, in the case of 'rambler' r's at least, enable the shoots to attain a more favourable position than they otherwise would do. The fruit or *hip* consists of a hollow fleshy receptacle containing a number of hairy nutlets. To get good results r's should be grown in a rich, loamy soil with plenty of light and shelter. Rampant and weak growths should be carefully pruned, and, like others of their family, the plants should be plentifully supplied with liquid manure.

H. R. Darlington, *Roses*.

ROSE CHAFERS, see CHAFERS.

ROSE FINCH, see under FINCH FAMILY.

ROSEBERY, VISCOUNTY, EARLDOM, AND BARONY OF, Scot. honours. Archibald Primrose, son of Sir Archibald Primrose, Bart., of Dalmeny (Scotland), was created viscount of R., Lord Primrose and Dalmeny, 1700, Earl of R., etc., 1703; one of commissioners for Union; ancestor of present earl.

ROSEBERY, 5TH EARL OF, ARCHIBALD PHILIP PRIMROSE (1847–), Brit. statesman; Liberal Imperialist, taking independent line on many party questions; Under-Sec., Home Office, 1881–83; First Commissioner of Works, 1884; Foreign Sec., 1886, 1892–94; Prime Minister, 1894–95 (succeeding Gladstone); resigned owing to party dissensions; resigned leadership of Liberal party, 1896; Pres. of Liberal League, 1902; makes sporadic returns to political arena, as independent critic of both parties. R. early advocated Reform of House of Lords; definitely opposed Home Rule (1905); supported Unionist Foreign policy (*e.g.* Egypt, Transvaal); preached imperialistic ideals; attacked both Tariff Reform and Socialistic legislation.

A devotee of Local Government, R. was first Chairman of London County Council (1889); Lord-Lieutenant of Linlithgow (since 1873), of Midlothian (since 1884). Keenly interested in Univ. work, he was elected Rector of Aberdeen Univ. (1878), Edinburgh Univ. (1880), Glasgow Univ. (1899), St. Andrews Univ. (1911); Chancellor of London Univ. An ardent sportsman, he won the Derby, 1894, 1895, 1905. He succeeded his grandfather as Earl of R., 1868; cr. Earl of Midlothian (U.K.), 1911. A brilliant speaker, he has been called 'Orator of the Empire.' Among other literary works he has written *Napoleon, the Last Phase* (1900), and monographs on Pitt, Peel, Cromwell, Randolph Churchill, Chatham.

Coates, *Lord Rosebery: his Life and Speeches* (1900); Jeyes, *Life* (1905).

ROSECRANS, WILLIAM STARKE (1819-98), Amer. general; fought for Union in Civil War; at first won successes; saved by Grant when invested by Bragg, 1863, and superseded.

ROSEMARY (*Rosmarinus*), genus of plants, order Labiatæ; leaves yield *Oil of R.*, a hair-wash; flowers are bluish.

ROSENHEIM (47° 51′ N., 12° 7′ E.), watering-place, on Inn, Upper Bavaria; salt-works. Pop. 15,696.

ROSES, WARS OF THE, Eng. civil wars of XV. cent. between houses of York and Lancaster; name taken from badges of combatants (white and red rose respectively). Yorkists won *St. Albans*, 1455; *Storeheath*, 1459; *Northampton*, 1460; *Mortimer's Cross*, 1461; *Towton*, 1461; *Hedgeley Moor* and *Hexham*, 1464; *Barnet*, 1471; *Tewkesbury*, 1471. Lancastrians won *Wakefield*, 1460; *St. Albans*, 1461; *Bosworth*, 1485. Dispute settled by marriage of Henry VII., victor at Bosworth, with Elizabeth of York. See YORK, DUKEDOM OF; LANCASTER, HOUSE OF; ENGLAND (HISTORY).

ROSETTA (31° N., 30° 30′ E.), town, Egypt, on Rosetta arm of Nile, in delta. The *Rosetta Stone* (discovered 1799) with its triplicate inscription opened the way to the interpretation of Egyptian hieroglyphics.

ROSEWOOD (*Dalbergia*), found in Brazil; varieties come from Jamaica, New South Wales, Honduras, Burma; best r. (Brazilian and Indian) takes a high polish and is much used in furniture-making.

ROSICRUCIANISM, name given to a school of Ger. thinkers who about 1610 began publishing works devoted to progressive ideas, with a suggestion of secrecy and supernaturalism; had a short vogue in England during reign of Anne.

ROSIN, RESIN, COLOPHONY, residue after distilling turpentine; brittle; M.P. 100–140° C.; contains much abietic anhydride, $C_{44}H_{62}O_4$; used for soap-making, varnishes, etc., and to give 'grip' to violin bow-strings.

ROSKILDE, ROESKILDE (55° 38′ N., 12° 4′ E.), town, on R. Fjord, island of Zealand, Denmark; cathedral; formerly capital of the kingdom. Pop. (1911) 9696.

ROSMEAD, HERCULES GEORGE ROBERT ROBINSON, 1ST BARON (1824–97), Brit. colonial governor; pres. of Montserrat, 1854; lieut.-gov. of St. Kitts, 1855–59; gov. of Hong-Kong, 1859–65, Ceylon, 1865–72, New South Wales, 1872–79, New Zealand, 1879–80; gov. of Cape Colony, and high commissioner for S. Africa, 1881–89, 1895–97.

ROSMINI-SERBATI, ANTONIO (1797–1855), Ital. philosopher; b. Ital. Tyrol; took part in struggle for Ital. freedom from Austria; founder of modern idealism in Italy. From objective and true notion of being presupposed in our acquired cognitions, follows perception of external world.

ROSS (51° 55′ N., 2° 35′ W.), market town, on Wye, Hertfordshire, England; chief building is the church (1316), with tomb of John Kyrle, Pope's 'Man of Ross.' Pop. (1911) 4682.

ROSS AND CROMARTY (57° 40′ N., 5° W.), northern county, Scotland; bounded by Sutherland, North Sea, Inverness, Atlantic; area, 3089 sq. miles; includes Lewis proper (Outer Hebrides); Ross and Cromarty were united, 1889. Coasts are much indented, having Dornoch, Cromarty, and Moray Firths on E., Loch Broom, Loch Torridon, and other sea lochs on W.; most easterly point is Tarbat Ness; great part of surface mountainous; highest peaks are Mam Soul, Ben Dearg, Ben More, and Ben Wyvis, all above 3400 ft.; county town, Dingwall; chief lake, Loch Maree. Sheep are extensively reared, and various crops are grown on the lower ground; there are important fisheries; and whisky is manufactured. Pop. (1911) 77,353.

ROSS, ROBERT (1766–1814), Brit. soldier; in Corunna retreat, 1808; defeated Americans at *Bladensburg* and captured Washington, 1814; mortally wounded at *Baltimore*.

ROSS, SIR HEW DALRYMPLE (1779–1868), Brit. field-marshal; fought in Peninsula, 1809–14, Waterloo campaign, 1814–15; organised artillery for Crimea.

ROSSANO (39° 34′ N., 16° 40′ E.), city, Cosenza, Italy; ancient *Roscianum*; abp.'s see; marble and alabaster quarries. Pop. 13,600.

ROSSBACH, village, Prus. Saxony; noted for Frederick the Great's defeat of Austrian and Fr. allies on Nov. 5, 1757.

ROSSE, VISCOUNTY AND EARLDOM OF, Irish honours.—Sir RICHARD PARSONS, Bart., was created viscount, 1681; his son Richard, earl, 1718; extinct 1764. Lawrence Harman HARMAN (formerly Parsons), was created earl, 1806; title descended to his nephew, Lawrence PARSONS, whose descendant now holds it.

ROSSE, WILLIAM PARSONS, 3RD EARL OF (1800–67), Irish astronomer and telescope constructor; b. York; ed. Dublin and Oxford; made reflecting telescope with which certain nebulæ resolved into groups of stars, and numerous binary and trinary stars discovered.

ROSSETTI, CHRISTINA GEORGINA (1830–94), Eng. poetess; dau. of Gabriele Rossetti and sister of D. G. Rossetti (*q.v.*); published *Goblin Market* (1862) and *Sing-Song* (1872). She ranks high among lyric poets.

ROSSETTI, DANTE GABRIEL (1828–82), Eng. painter and poet; b. London; s. of Gabriele Rossetti, Ital. patriot, who had settled in England and become prof. of Ital. at King's College, London; ed. privately, King's College School, Cary's Art Academy, and finally at Royal Academy Antique School. His artistic and poetic careers were, to a great extent, contemporaneous. Both gifts were displayed early, and under the teaching of Ford Madox Brown he soon became familiar with the technicalities of painting; his first exhibited picture was *The Girlhood of Mary, Virgin* (1849). This was followed by *The Laboratory*, a lurid visualisation of Robert Browning's poem, magnificent in colour

and striking in design, and *Ecce Ancilla Domini*, a beautiful conception of the Annunciation, in which white is the predominating shade. This last picture was harshly criticised and was, for the time, quite unsaleable. The critics could not understand the Pre-Raphaelite Brotherhood, an artistic fraternity founded by R. and including Holman Hunt and Millais. It stood for lofty ideals, expressed in appropriate design and coloration. A series of Arthurian scenes was published in 1857. *Rosa Triplex*, *Dante's Dream*, *Veronica Veronese*, are other well-known pictures by R., while his designs for stained-glass windows (from 1861 onwards) did much to revive interest in that branch of art. R.'s work is reminiscent of the early Italian masters and has little in common with modernity.

As a writer, R. was essentially romantic and mystic. His earliest published poems appeared in the *Germ* (1850) and the *Oxford and Cambridge Magazine*; the *Poems* were printed in 1870, *Ballads and Sonnets* in 1881. His scope ranges from the ethereal dreaminess of the *Blessed Damozel* to the despairing cry of *The Woodspurge*. Like his painting, his poems are mediæval, and, for the most part, dissociated from the present.—A. C. Benson, *Rossetti*.

ROSSETTI, WILLIAM MICHAEL (1829–), Eng. author, bro. of above; wrote *Life of Keats* (1887), etc.

ROSSINI, GIOACCHINO ANTONIO (1792–1868), Ital. composer; excelled in opera. He wrote five operas before he was twenty, and at twenty-one *Tancredi* brought him success at Venice. In 1816 he had his crowning triumph with *The Barber of Seville*; and *William Tell* was produced in 1829. Though he wrote a vast number of operas, only these two survive. A *Stabat Mater* is occasionally performed.

ROSSLAND (49° N., 118° W.), city, Brit. Columbia, Canada; gold region. Pop. 6000.

ROSSLAU (51° 50′ N., 12° 13′ E.), town, on Elbe, duchy Anhalt, Germany; paper, sealing-wax. Pop. (1910) 11,304.

ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF (1733–1805), Brit. Lord Chancellor; of acknowledged ability, but character praised by no one; satirised early in life in the *Rosciad*, 'Guilt in his heart and famine in his face'; deserted Tories for Whigs; Chancellor, 1793–1801; presided at trial of Warren Hastings, 1793–95; one of suggested authors of *Letters of Junius*.

ROSSTREVOR (54° 6′ N., 6° 12′ W.), seaport, watering-place, County Down, Ireland.

ROSSWEIN (51° 5′ N., 13° 10′ E.), town, on Freiburg Mulde, Saxony; textiles. Pop. (1910) 9210.

ROSTAND, EDMOND (1864–), Fr. dramatist; author of *Cyrano de Bergerac* (1898); best known for his *Chantecler* (1910).

ROSTOCK (54° 5′ N., 12° 9′ E.), seaport, on Warnow, Mecklenburg-Schwerin, Germany; seat of university (1419); other features of interest are the Church of St. Peter and grand-ducal palace; one of the chief Baltic ports; important commercial centre; fisheries; manufactures machinery; exports grain; was a member of the Hanseatic League; birthplace of Blücher. Pop. (1910) 65,383.

ROSTOV (57° N., 39° E.), town, Yaroslavl, Russia, on Lake R.; manufactures textiles. Pop. 15,200.

ROSTOV-ON-THE-DON (47° 12′ N., 39° 42′ E.), seaport, Don Cossacks, Russia, on Don; commercial centre; flour-mills; trade in agricultural machinery. Pop. (1910) 121,300.

ROSTRA, in Rom. antiquities, a scaffold or raised platform where orations, etc., were delivered. 'Rostrum' is modern term, but Romans used plural form.

ROTATORIA, see ROTIFERA.

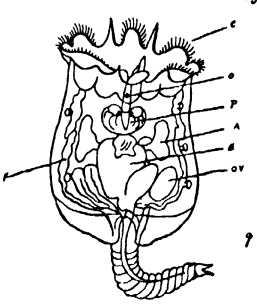
ROTCHE, or LITTLE AUK, see under GUILLEMOT AND AUK FAMILY.

ROTHE, RICHARD (1799–1867), Ger. Lutheran divine; prof. at Wittenberg, 1832, Heidelberg, 1854; influenced by Pietistic school, then specially studied relation of ethics and religion; pub. *Die Anfänge der Christlichen Kirche und ihrer Verfassung* and *Theologische Ethik*; an able thinker who has left his mark on Ger. theology.

ROTHENBURG-OB-DER-TAUBER (49° 23′ N., 10° 11′ E.), old town, Bavaria, with well-preserved mediæval houses, walls, towers, and gateways. Pop. 8600.

ROTHERHAM (53° 26′ N., 1° 21′ W.), town, on Don, Yorkshire, England; iron- and steel-works. Pop. (1911) 62,507.

ROTHERHAM, THOMAS (1423–1500), bp. of Worcester, 1468, Lincoln, 1472; chancellor, 1475; abp. of York, 1480.



ROTHES, EARLDOM AND DUKEDOM OF.—GEORGE LESLIE of Rothes, Moray, Scotland, was created earl in or before 1458.—ANDREW LESLIE, 5th earl (d. 1611), became P.C. of Mary, Queen of Scots, and joined association for her support, 1568; supported Arran, 1585.—JOHN LESLIE, 6th earl (1600–41), Covenanter leader and commander in invasion of England, 1640.—JOHN LESLIE, 7th earl (1630–81), Royalist; captured at *Worcester*, 1651; imprisoned till 1658; Lord Chancellor for life, 1667; cr. Duke of R., 1680; d. childless.—JOHN LESLIE, 10th earl (*c.* 1698–1767), major-general at *Dettingen*; led cavalry at *Rocoux*, 1746; general, 1765.

ROTHESAY (55° 50′ N., 5° 3′ W.), county town, Bute, Scotland, on Isle of Bute; favourite watering-place; ruined castle; fisheries. Pop. (1911) 9299. **Dukedom of Rothesay** (first dukedom in Scot. peerage) was created 1398, and conferred on David, Earl of Carrick, Robert III.'s eldest son (killed by uncle, Duke of Albany, 1402); since held by Scot. sovereign's eldest son; now by Brit. sovereign's eldest son, as collateral title to Prince of Wales for England.

ROTHSCHILD, Jewish family of bankers; founded by MAYER ANSELM ROTHSCHILD (1743–1812), s. of Anselm Moses Bauer; took surname from red shield, sign of his bank at Frankfort-on-the-Main; eldest of five sons succeeded to Frankfort bank, the others founded houses at Vienna, Paris, London, Naples; all made Austrian barons, 1822. NATHAN, founder of London house, financed England in crisis, 1813; represented now by grandson Nathan, raised to Eng. peerage, 1885.

ROTHWELL (53° 45′ N., 1° 29′ W.), town, Yorkshire, England; ropes, matches. Pop. (1911) (dist.) 14,279.

ROTIFERA, ROTATORIA, 'WHEEL-ANIMALCULES,' a class of microscopically minute animals, related on one side to Arthropods, and on the other to Annelid Worms, although their resemblance to neither is apparent. They are favourite objects for microscopic examination owing to the readiness with which they can be obtained in any stagnant, greenish, fresh-water pool. Rotifers have usually a top-shaped transparent body, within which the internal organs can easily be distinguished. The head of the top is furnished with a crown of cilia, which lash in unison, giving rise to the appearance of a revolving wheel, and enabling the animal to swim. The opposite end of the body, known as the 'foot,' is also used for locomotion or more often for attachment, bearing two or more pincer processes, or an adhesive patch with cement glands.

ROTIFERA, *Brachionus Urceolaris*. *C*, cilia; *O*, eye; *P*, pharynx; *A*, appendages to stomach; *E*, stomach; *OV*, ovarium; *F*, branchial canal; *q*, tail.

Rotifers are common in almost any pool of stagnant water, fixed on water weeds or swimming near the surface; some occur in the sea, and at least one floating form is phosphorescent; while many species

lurk amongst the roots and leaves of moist Sphagnum and mosses. The majority are free living, but a considerable number build beautiful tubes, of semi-transparent horny material, or of a mosaic of selected sand grains. Others are parasitic in water weeds or in aquatic animals such as worms and crustacea.

Rotifers occur all the world over, even in the coldest regions, for they are able to withstand intense heat (water at 158° F.) or intense cold (−4° F., *i.e.* 36° of frost). This resistance is due to their power of sealing their bodies by gelatinous secretions to prevent desiccation. The sexes are separate and the females lay three kinds of eggs, small eggs which produce males, and thin-shelled summer or thick-shelled, resting winter eggs which produce females only, the resting eggs carrying the species through times of stress. Many Rotifers lay parthenogenic eggs.

ROTORUA (38° 10′ S., 176° 10′ E.), town, N. Island, New Zealand, on R. Lake; hot springs.

ROTROU, JEAN DE (1609–50), Fr. poet; one of Richelieu's five poets. Corneille called him his father, but became his pattern. When only nineteen he had a play acted at the *Hôtel de Rambouillet*; chief works, *Saint-Genest* (1646), *Don Bernard de Cabrères* (1647), *Venceslas* (1647), *Cosroës* (1649), among thirty-six comedies and tragedies; greatest member of Corneille's school.

ROTTENBURG (48° 28′ N., 8° 57′ E.), town, on Neckar, Württemberg, Germany; machinery. Pop. (1910) 7603.

ROTTERDAM (51° 55′ N., 4° 29′ E.), chief commercial city of Netherlands, at junction of Rotte and Meuse; intersected by dyke; canals along leading streets; extensive quay called the Boompjes; quaint gabled houses built on piles; Grootekerk completed, *c.* 1475 (fine organ); Boyman museum, town hall, palace of justice, etc.; shipbuilding, furniture, clocks, chocolate, distilling, chemical products, etc.; trades with Dutch East Indies, America, and European ports; birthplace of Erasmus and Cornelius van Tromp. Pop. (1910) 436,018.

ROTTWEIL (48° 10′ N., 8° 37′ E.), town, Württemberg, Germany; manufactures gunpowder. Pop. (1910) 9643.

ROTUMAH (12° S., 177° E.), small island, S. Pacific; dependency of Fiji Islands.

ROUBAIX (50° 38′ N., 3° 12′ E.), town, Nord, France; cloths, velvets. Pop. (1911) 122,723.

ROUBILIAC, LOUIS FRANÇOIS (1695–1762), Fr. sculptor; settled in London, and became famous by his statues of Handel, Shakespeare, and Sir Isaac Newton, and by monuments in Westminster Abbey.

ROUEN (49° 26′ N., 1° 6′ E.), chief town, Seine-Inférieure, France, on Seine; important industries, shipping, and commerce. Old R., with mediæval appearance, contains Gothic and Renaissance buildings, famous churches including cathedral (begun XIII. cent.), St. Ouen (founded, 1318), St. Maclou (begun, 1437), St. Vincent (XVI. cent.); palace of justice; Musée-Bibliothèque and other museums; monument to Jeanne d'Arc. R. became capital of Normandy, X. cent.; taken by Henry V. of England, 1419; by Charles VII. of France, 1449; Jeanne d'Arc burnt, 1431; surrendered to Germans, 1870; birthplace of Corneille, Boieldieu, Fontenelle; chief industries are spinning and weaving of cottons, velvets, woollens, linens, mixed silk, machinery, shipbuilding, refining of petroleum, chemicals, etc. Pop. (1911) 124,987.

Cook, *Rouen* (Mediæval Town Series).

ROUERGUE (44° 15′ N., 2° 30′ E.), ancient province, France; now included in department of Aveyron; capital, Rodez.

ROUGE ET NOIR, see TRENTE ET QUARANTE.

ROUHER, EUGÈNE (1814–84), Fr. statesman; won over from republicanism by Napoleon III., whose mainstay he became; called 'vice-emperor'; defended empire after its fall.

ROULERS, ROUSSELAERE (50° 56′ N., 3° 7′ E.), town, W. Flanders, Belgium; manufactures linen. Pop. (1910) 25,026.

ROULETTE, game of chance; played on table with depression containing movable bottom; ball flung into cavity and spun round, eventually landing in one of the 38 holes marked round bottom; various modes of staking; biggest odds, 38 to 1; played extensively at Monte Carlo.

ROUMANIA, see RUMANIA.

ROUMELIA, see RUMELIA.

ROUND TABLE, THE, in Arthurian cycle of romances. First mention is found in *Roman de Brut*, where Wace recounts that Arthur made R.T. so that his knights should have no disputes as to precedence, but already many fables had arisen; founding of order of Christian knights of R.T. became ascribed to Merlin. See ARTHUR, KING.

ROUND TOWERS, see TOWER, ROUND.

ROUNDELS, see FORTIFICATION.

ROUNDERS, ball game; object of striker to run round whole or part of course after stroke; Amer. base-ball derived from R.

ROUND-WORMS, see NEMATHELMINTHES and NEMATODA.

ROUSSEAU, JEAN BAPTISTE (1670–1741), Fr. poet; s. of a shoemaker, but rose in society; has long since lost readers, but was regarded in his time as the foremost lyric poet.

ROUSSEAU, JEAN JACQUES (1712–78), Fr. philosopher and writer, pioneer of Romantic Movement, precursor of Fr. Revolution, and preacher of 'Return to Nature' creed. A Geneva watchmaker's son, young R. was in turn engraver's apprentice, vagabond, candidate for Holy Orders, lackey, copyist of music, and what not. In Madame de Warens he found a patroness and lover for some years at *Les Charmettes*. Making his way to Paris, 1741, R. associated with the Encyclopædists; won Academy of Dijon's prize for *Discours sur les Arts et les Sciences*, 1749; awakened interest of Louis XV., who ordered representation of *Le Devin du Village*, opera of R.'s composition, 1752; compiled *Dictionnaire de Musique*, 1767; formed liaison with servant-girl, Thérèse Levasseur, whom he eventually married. R. published *Discours sur l'Inégalité*, 1755, *Julie, ou La Nouvelle Héloïse* (a novel), 1760, *Émile, ou de l'Education*, and *Le Contrat Social* (political), 1762. His deism forced him to leave France; from Switzerland he wrote *Lettres de la Montagne*; visited England under Hume's patronage; returned to France and spent miserable years obsessed with idea of persecution; died at Ermenonville; buried in Panthéon. His autobiographical *Confessions* shed much light on his irregular life and morbid character. R. proclaimed the rights of individuality, denounced the evils of artificial civilisation, revolted against rules and schools and sought to reinstate Nature in education, literature, and life generally; government, he held, depends on consent of the people. He taught Fr. mothers to nurse their own children—and sent his own offspring to a foundling hospital.

Lord Morley, *Life* (1886); Hudson, *Rousseau and Naturalism in Life and Thought* (1903); Texte, *Rousseau and the Cosmopolitan Spirit in Literature*; Mrs. Macdonald, *Jean Jacques Rousseau* (1906).

ROUSSEAU, PIERRE ÉTIENNE THÉODORE (1812–67), Fr. painter; studied in Paris, and exhibited in the Salon there from 1831 onwards. He reproduced landscapes in various parts of France; but, having settled in the village of Barbizon, in 1848, the Forest of Fontainebleau became his favourite painting-ground. His works had a prominent place in the Expositions of 1855 and 1867, and now command high prices.

ROUSSELAERE, see ROULERS.

ROUSSILLON (42° 32′ N., 2° 30′ E.), ancient province, France, bordering Pyrenees; capital, Perpignan; corresponds nearly to Pyrénées Orientales.

ROUVIER, MAURICE (1842–1911). Fr. states-

man; pres. of Council, 1887 and 1905–6; removed Boulanger from War Office; successful Minister of Finance; implicated in Panama scandals, 1892.

ROVER, see THEFT.

ROVERETO, ROVEREDO (45° 53′ N., 11° 3′ E.), town, Tyrol, Austria, on Leno, near Adige; silk manufactures. Pop. (1911) 11,655.

ROVIGNO (45° 4′ N., 13° 39′ E.), seaport, Istria, Austria; cathedral; active trade. Pop. (1911) 12,326.

ROVIGO (45° 3′ N., 11° 47′ E.), capital, Rovigo province, Italy; XVII.-cent. cathedral; beer, silk, leather. Pop. c. 10,750.

ROVIGO (45° 3′ N., 11° 47′ E.), town (and province), Italy; picture gallery; library. Pop. 11,200; (prov.) (1911) 258,096.

ROVUMA (11° S., 40° E.), river, bounding Portug. and Ger. E. Africa; flows into Indian Ocean.

ROWAN TREE, MOUNTAIN ASH, QUICKEN TREE (*Pyrus aucuparia*), tree, order Rosaceæ; its bitter red berries are used in preserves; wood valuable for furniture.

ROWE, NICHOLAS (1674–1718), Eng. dramatist; best-known plays are *Tamerlane*, *The Fair Penitent*, and *The Tragedy of Jane Shore*. His reputation as a dramatist was eclipsed by his edition of *Shakespeare*.

ROWING, sport popular in every English-speaking country, but though its introduction into other countries has been effected, it does not seem to thrive there.

Amateur.—'Bumping races' were held at Oxford shortly after beginning of XIX. cent. They were intercollegiate in character and have now developed into an annual contest. 'Bumping,' in which the object of the rear boat (separated at the start from the first by a certain distance) is not to pass but to touch, is used on narrow rivers. The Oxford *v.* Cambridge race has been held annually since 1865 although held intermittently since 1829. Oxford were winners, 1913. Henley regatta, one of the events of the rowing year, is a three-days' meeting held in July; prizes include 'Diamond' for sculling, 'Silver Goblet' for pair, 'Stewards' Cup' for 1st class four, 'Grand Challenge' for 1st class eight. There are other races for school and second class teams.

Harvard first rowed against Yale (1852) on Lake Winnipiseogee and beat them; from 1855 to 1875 races were intermittent on different courses, and in 1876 eight-oared race over a four-mile course began; now at New London, Ct. A Columbia University four won the Visitors Challenge Cup at Henley (1878), but otherwise Amer. have had little success against Brit. crews. An intercollegiate regatta is held, but Yale and Harvard do not compete; there are many important regattas.

Professional races developed from watermen's matches; fostered by growth of professionalism. Sculling is principal form: World's Champion, 1912, Ernest Barry.

Racing boats differ from ordinary in that they are narrower and lighter; 'out-riggers' are used to obtain leverage and decrease beam; the shell is made of thin cedar. Sliding seats are almost universal. In an 'eight' the stroke sets the time and 'cox' steers; fours are now rowed without a cox.

Lehmann, *The Complete Oarsman* (1910).

ROWLAND, HENRY AUGUSTUS (1848–1901), Amer. physicist; prof. at Baltimore; made diffraction grating; redetermined mechanical equivalent of heat.

ROWLANDSON, THOMAS (1756–1827), Eng. caricaturist; pictures of broadly humorous character, depicting lower orders, *e.g.* famous Vauxhall drawing.

ROWLEY REGIS (52° 28′ N., 2° 4′ W.), town, Staffordshire, England; iron. Pop. (1911) 37,000.

ROWLEY, THOMAS, see CHATTERTON, THOMAS.

ROWLEY, WILLIAM (*c.* 1585–*c.* 1642), Eng. actor and playwright; collaborated with Webster, Massinger, Ford and others, and left four plays of his own.

ROWTON, BARON, MONTAGUE WILLIAM LOWRY-CORRY (1838–1903), private sec. to Beaconsfield, 1866–80; first of his model lodging-houses opened in London, 1892; **Rowton Houses** Co. Ltd. formed, 1894.

ROXBURGHE, BARONY, EARLDOM, AND DUKEDOM OF.—Sir Robert KER of Cessford, Roxburghshire, Scotland, was cr. baron, 1599, earl, 1616; settled remainder of earldom (barony becoming extinct) on grandson, William Drummond (afterwards Ker), whose grandson, John, 5th earl, was cr. duke, 1707; descent in female line to Henry John INNES-KER, present duke.

ROXBURGHE, JOHN KER, 1ST DUKE OF (*c.* 1680–1741), promoted Union; one of lords regents of realm on Queen Anne's death; one of lords justices who ruled realm during George I.'s absences.

ROXBURGHE, JOHN KER, 3RD DUKE OF (1740–1804), collector of rare books (sold 1812); **Roxburghe Club** founded in commemoration, 1812; collection of ballads purchased by Brit. Museum, 1845, and edited for Ballad Soc.

ROXBURGHE, ROBERT KER, 1ST EARL OF (*c.* 1570–1650), belonged to most turbulent family of Scot. border in reigns of Henry VIII. and Elizabeth; rose through personal liking of James I.

ROXBURGHSHIRE (55° 25′ N., 2° 35′ W.), Border county, Scotland; area, 666 sq. miles; surface hilly in S., more level in N.; highest points are Ruberslaw and the Eildons; drained by Tweed, with Teviot and other tributaries, and Liddel; county town, Jedburgh; monastic remains at Jedburgh, Melrose, and Kelso; scene of Border strife; has associations with Sir Walter Scott. Sheep are raised, and woollens manufactured; other industries are tanning, ironfounding, fisheries. Pop. (1911) 47,192.

ROXBURY, formerly city, Massachusetts, U.S.A.; now incorporated in Boston.

ROYAL ACADEMY, see under ACADEMY.

ROYAL MARINES, military force trained for both land and sea service. An Order in Council, 1664, directed training of regiments for service at sea; further marine regiments were created in later times, though not yet permanently maintained; were organised after plan of army, not navy, but were often transferred to navy, with idea of improving *morale* of navy, but chief function was to aid by land in naval sieges; often considered useless at sea, eulogised by Nelson; control transferred from War Office to Admiralty, 1747; army organisation abandoned, 1755; famous corps of *Royal Marine Artillery* formed 1804; two corps in service now.

U.S.A. adopted system, 1775; France has no corps, but divides coast defence between land-service and sea-service, and drafts soldiers for naval wars.

ROYAL SOCIETY, see SOCIETIES, LEARNED.

ROYAN (45° 39′ N., 1° 1′ W.), seaport, watering-place, Charente-Inférieure, France, at mouth of Gironde; sardine fisheries. Pop. 9000.

ROYAT (45° 45′ N., 3° 4′ E.), watering-place, Puy-de-Dôme, France; hot springs.

ROYER-COLLARD, PIERRE-PAUL (1763–1845), leader of Fr. *doctrinaries*; exercised great influence on Revolution; no sympathy with mob violence, but wished to abolish every institution not in accordance with Liberal 'reason.'

ROYSTON (52° 3′ N., 0° 3′ W.), town, Hertfordshire, England. Pop. (1911) 3985.

ROYTON (53° 33′ N., 2° 8′ W.), town, Lancashire, England; cotton manufactures. Pop. (1911) 17,069.

RUABON (52° 59′ N., 3° 3′ W.), town, Denbighshire, Wales; ironworks; collieries. Pop. 3500.

RUBBER is the *latex* from several tropical trees (*e.g. Hevea braziliensis*, *Manihot Glaziovii*, *Ficus elasticus*) growing in Brazil (Para rubber), Central America, E. and W. Africa, Ceylon, etc. Incisions made in the bark, beneath which the laticiferous vessels occur, and latex, an emulsion, runs out. Coagulation yields r.

Production.—In 1909, 70,000 tons of r. were produced; more than half came from America, about one-third from Africa, the rest from Asia, including 3000 tons of plantation r. from Ceylon and Malaya. Owing to exhaustion of natural resources, wild r. is likely to be gradually replaced by plantation r. The world's estimated annual consumption of r. is (1913) 100,000 tons, whereas in 1875 only 5000 tons were required.

This increase is largely due to the demand for motor and cycle tyres. Increased demand caused great r. 'boom,' 1910.

Nature.—The essential constituent of r. is *caoutchouc*, which is present to the extent of 70–90 %, mixed with resin, proteid matter, ash, and moisture. Caoutchouc is a soft, elastic solid, insoluble in water and alcohol, little acted on by acids and alkalis, but soluble in carbon disulphide, benzene, carbon tetrachloride, chloroform, etc., forming r. solutions; it softens above 100° C. and melts at 150–200° C.; it consists of unsaturated hydrocarbons of the composition $(C_5H_8)_n$, which on destructive distillation yield isoprene. Caoutchouc absorbs oxygen, forming a brittle substance; it also combines with ozone, halogens, and sulphur (vulcanisation).

Manufacture.—Crude r. is washed with hot water, and passed between rollers together with sulphur, pigment, and mineral matter, such as whitening or barium sulphate. Vulcanisation, which involves combination with the sulphur, is effected by heating the mixture for half an hour to 135–150° C. in closed iron vessels. Chloride of sulphur is sometimes employed for vulcanising. Vulcanised r. is harder than caoutchouc, and is unaltered at 160° C. Commercial r. contains 12–60 % caoutchouc, 1–2 % combined sulphur, and 25–70 % mineral matter. Excessive vulcanisation produces *vulcanite* or *ebonite*, which can be polished.

Synthetic Rubber.—As early as 1882 Bouchardat and Tilden had shown that isoprene is converted into r. by contact with certain catalytic agents; and this fact has recently assumed practical importance on account of the cheap production of isoprene and the simpler hydrocarbon butadiene, together with the discovery by F. E. Matthews (July 1910) that metallic sodium is a rapid catalyst.

The Process.—Fernbach has discovered a method of fermenting grain or potato starch so as to produce isoamyl or butyl instead of ethyl alcohol; and W. H. Perkin and his co-workers have converted these alcohols into corresponding unsaturated hydrocarbons. Isoamyl alcohol is converted into its chloride by dry hydrogen chloride, and this, by careful chlorination, yields as the chief product a dichloride, thus—

$$\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>\!CH.CH_2.CH_2.OH \longrightarrow \underset{\text{Isoamyl alcohol.}}{\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>\!CH.CH_2.CH_2Cl} \longrightarrow$$

$$\longrightarrow \underset{\text{1·3 Dichlorethyl dimethyl methane.}}{\begin{matrix}CH_3\\CH_3\end{matrix}\!\!>\!CCl.CH_2.CH_2Cl}$$

Isoamyl chloride.

When the vapour of this dichloride is passed over hot soda lime it is converted almost quantitatively into isoprene. Butyl alcohol similarly yields butadiene.

The hydrocarbons are sealed up in tubes with about 3 % of thin sodium wire, and heated at 60° C. for several days. The brown product is treated with acetone to precipitate the rubber, which after washing is found to possess properties qualifying it to become a serious rival of natural r.

RUBENS, PETER PAUL (1577–1640), most celebrated of Flemish painters, b. in Westphalia; in 1587 moved with his widowed mother to Antwerp, with which his art-life became chiefly associated; began study at 13, having several masters until, at 19, he went to Othon van Keen, court-painter to the Archduke Albert. In 1600 he proceeded to Venice to study the works of Titian and Veronese; and presently became gentleman of the chamber and court-painter to the Duke of Mantua. In 1605 he went on a semi-diplomatic mission to the Court of Spain, and at Madrid painted several portraits and historical pictures. Returning to Italy, he remained there till 1608, when he settled in Antwerp. Next year he was made court-painter to the Archduke Albert; and in 1611 began his master work, 'The Descent from the Cross,' now in Antwerp Cathedral. This occupied him for three years. In 1620 he went to Paris, where he painted for Marie de' Medici twenty-one large pictures, now in the Louvre. Diplomatic missions followed, first to Philip IV. of Spain, of whom he executed five portraits, and second to Charles I. of England. All the while his brush was busily employed; and by the time of his death his works numbered several thousands. Many of the best of these remain at Antwerp, but the first collection is in the Pinakothek at Munich. Rubens was great as subject-painter, animal painter, portraitist and landscapist. His pictures are notable for their marvellous spontaneity, creative vigour, superb animation, and magnificent colouring.

RUBIACEÆ, trees, shrubs, or herbs with leaves possessing prominent stipules, in some cases as large as leaves (e.g. *Galium*). *Coffæa* (coffee) and *Cinchona* (quinine) are most important economically.

RUBICON (44° 10′ N., 12° 28′ E.), small river, ancient Italy, falling into Adriatic; identified with modern Fiumicino; crossed by Cæsar, 49 B.C. See Rome (History).

RUBIDIUM (Rb=85·45), rare alkali metal, discovered by spectrum analysis (Bunsen, 1860); compounds occur in mineral waters, sea water, siliceous minerals, beet, tobacco, and other plants. Metal rapidly decomposes water, strongly electropositive, salts very soluble.

RUBINSTEIN, ANTON (1829–94), Russ. pianist and composer of Jewish extraction; became music-teacher in St. Petersburg, 1848, and there he founded the Russ. Musical Soc., 1861, and Conservatoire, 1862, of which he became director; toured much, giving recitals; his operas are less known than his symphonies *Ocean* and *Dramatic*; he opposed Wagnerianism and had much in common with Schubert and Mendelssohn; his technique as a pianist was great, and he played with marvellous emotion.

Autobiography (Eng. trans., 1891).

RUBRIC (Lat. *rubrica*, red earth used by carpenters to mark wood), titles (in red ink) to chapters in classical law books; later, directions in prayer-books, hence its meaning of 'rules for Divine Service and administration of the Sacraments'; modern r. is often printed in italics instead of red ink.

RUBRUQUIS, WILLIAM OF, Rubruck, mediæval explorer. The authorities for his life are his own works and those of Roger Bacon. R. became a Franciscan friar and travelled in the East by command of Louis IX. of France on an embassy to the Grand Khan. Expedition started from the Crimea in May 1253 and, crossing the Don and Volga, reached the Grand Khan's camp in Dec., having gone about 5000 miles; returned through Armenia and Cilicia to Cyprus, thence to Tripoli. R.'s account is a most valuable description of the topography and ethnology of Asia in his time, and is brightly written, though in bad Latin.

Beazley, *Dawn of Modern Geography*.

RUBY, precious stone of deep red colour. The *Oriental* r. is composed almost entirely of alumina, is very hard, and most valuable of precious stones; obtained from Burma, Siam, etc. *Spinel* is not so hard; composed of magnesium aluminate; obtained from Burma, Ceylon, China, and Afghanistan. True r. occurs in crystalline limestone or alluvial deposits. Spinel occurs in alluvial deposits and in river beds.

RUBY MINES (c. 22° 46′ N., 96° 20′ E.), district, Burma, on Irrawadi; chief town, Mogok; centre of ruby-mining industry. Pop. 92,000.

RÜCKERT, JOHANN MICHAEL FRIEDRICH (1788–1866), Ger. poet; b. Schweinfurth; wrote excellent lyrics; *Die Weisheit des Brahmanen* (didactic poem), besides Chin., Arab., and Persian translations.

RÚDAGÍ, see Persia (Language and Lit.).

RUDD, see under Carps.

RUDDER, part of ship, hanging on sternpost, by which the course is steered. It is moved by chains operated by a spoked wheel or helm. In Levant and Indian Ocean, steering-oar frequently replaces r., or

rather survives from ancient times, for r. is developed from steering-oar.

RUDDIMAN, THOMAS (1674–1757), Scot. Latin grammarian; printer to Edinburgh Univ.; author of well-known *Rudiments of the Latin Tongue.*

RÜDESHEIM (49° 59′ N., 7° 54′ E.), town, on Rhine, Hesse-Nassau, Prussia; noted wine. Pop. (1910) 4556.

RUDINI, ANTONIO STARABBA, MARQUIS DI (1839–1908), Ital. statesman; Pres. of Council and Foreign Minister, 1891; renewed Triple Alliance; again premier, 1896–98; failed in dealing with demands for reforms.

RUDOK (33° 30′ N., 79° 43′ E.), village, Western Tibet.

RUDOLF, Basso Norôk (4° N., 35° 40′ E.), lake, British E. Africa, near S. Abyssinian highlands; no outlet; altitude, 1200 ft.; area, 3250 sq. miles; receives the Omo from N.

RUDOLPH I., Rudolf (1218–91), First Hapsburg king of the Romans; ancestor of the Austrian royal house; 'pauper count' of Hapsburg; elected king, 1273, chief ground being his weakness; abandoned all claim to Italy, and consolidated power in S. Germany; occupied Austria, Styria, Carinthia, and Carinola, 1276, and, despite general alarm, obtained their definite cession, 1278; wielded little authority in central Germany.

RUDOLPH II. (1552–1612), Austrian emperor; succ. f., Maximilian II., 1576; scholarly and artistic but incapable ruler; persecuted Protestants; occupied Cleves duchies in Catholic interest, 1609, brought about Thirty Years War; supplanted by bro. Matthias.

RUDOLSTADT (50° 43′ N., 11° 20′ E.), capital of principality, Schwarzburg-Rudolstadt, Germany, on Saale; porcelain. Pop. (1910) 12,949.

RUE (*Ruta*), genus of plants, order Rutaceæ; Common R. (*R. graveolens*), a quondam charm against witches, is a Brit. garden-flower, yellowish and strongly smelling; used medicinally as a stimulant; r. is Shakespeare's *Herb of Grace.*

RUEIL (48° 50′ N., 2° 10′ E.), town, Seine-et-Oise, France; photographic material works. Pop. 12,600.

RUFF, see under Plover Family.

RUFFO, FABRIZIO (1744–1827), Neapolitan statesman; cr. cardinal, 1791; supported Royalists, then friendly with Napoleon, but at restoration in royal favour again.

RUFIJI (8° 15′ S., 39° E.), river, Ger. E. Africa; flows into Ind. Ocean.

RUFINUS, TYRANNIUS (*c.* 340–410), theologian; became a monk; settled in Jerusalem to study, and became friend of St. Jerome; trans. Pamphilus and Origen, and became suspected of heterodoxy; among other works wrote an Ecclesiastical History.

RUGBY, see Football.

RUGBY (52° 23′ N., 1° 16′ W.), town, on Avon, Warwickshire, England; railway junction; seat of famous public school founded by Laurence Sheriff in 1567. Pop. (1911) 21,762.

RUGELEY (52° 46′ N., 1° 56′ W.), town, Staffordshire, England; iron foundries; tanneries. Pop. (1911) 4504.

RUGEN (54° 30′ N., 13° 30′ E.), island, in Baltic, Pomerania, Prussia, separated from mainland by Strelasund; well-wooded; fertile; beautiful scenery; fishing industry. Pop. 50,000. Capital, Bergen; favourite sea-bathing resort.

RUHLA (50° 52′ N., 10° 20′ E.), town, summer resort, duchy of Saxe-Coburg and Saxe-Weimar, Germany; manufactures pipes. Pop. (1911) 7828.

RUHNKEN, DAVID (1723–98), classical scholar of the Netherlands; edited Plato, and Timæus's *Lexicon vocum Platonicarum*; published *Epistolæ Criticæ* (1749–51), an edition of Rutilius Lupus (1768) and of Muretus (1789). He was one of the finest scholars of the XVIII. cent.

RUHR (51° 24′ N., 8° 7′ E.), river, Prussia; joins Rhine at Ruhrort.

RUHRORT (51° 28′ N., 6° 44′ E.), town, at junction of Ruhr and Rhine, Rhineland, Prussia; large harbour; exports coal; was united to Duisburg, 1905.

RUISDAEL, see Ruysdael.

RUIZ, JUAN (*c.* 1283–*c.* 1350), the most famous poet of mediæval Spain; most representative work is the famous *Libro de Buen Amor.*

RUKWA, Rikwa (8° S., 32° E.), lake, Ger. E. Africa.

RULE, ST, see Regulus, St.

RULLION GREEN, see Covenanters.

RULLUS, PUBLIUS SERVILIUS, Rom. tribune of the plebs, 63 B.C.; proposed agrarian law, which Cicero opposed in three orations.

RUM, see Spirits.

RUMANIA, Roumania (43° 37′ to 48° 13′ N., 22° 30′ to 29° 42′ E.), kingdom, S.E. Europe; bounded N.E. and E. by Russia, from which it is separated by the Pruth and Danube; E. by Black Sea; S. by Bulgaria, from which it is separated by the Danube to a little N. of Turtukai, from where the line runs S.E. to the Black Sea S. of Ekrene; W. by Servia; N.W. by Austria-Hungary; area, *c.* 52,000 sq. miles; surface slopes upward from plain of Danube to Carpathians and their continuation, the Transylvanian Alps, in the N.W. Northern part is called Moldavia, and southern Wallachia; and in the E. between the lower Danube and the Black Sea is the district of the Dobruja, which has an average height of 500 ft. and an extreme height of over 1760 ft. The drainage is by the Pruth and Danube and their tributaries, numbers of which dry up in summer.

The Carpathians are an intensely folded range of comparatively recent upheaval, and the basin of the Danube is an alluvial plain covered with Tertiary and later deposits. Climate is strongly continental, with a great daily and seasonal range—from 10° F. in winter to 95° in summer; the winter mean is 27°, and the summer, 72°; there is a rainfall of over 25 inches, and a snowfall of 28 inches. Flora includes oak, beech, elm, lime, sycamore, and other trees, as well as the plants common to temperate and subtropical regions; and among the Fauna are wolves, foxes, and many kinds of birds and molluscs.

History.—R. was inhabited in early times by the Getæ, and later by the Dacians, who were subdued by Rome in 101–6 A.D., when the country became the Rom. province of Dacia. It was abandoned by Aurelian in 274 A.D., and henceforth was for many cent's overrun by successive hordes of barbarians—Goths, Huns, Gepidi, Avars, Slavs, Bulgars, Magyars, Tatars.

The independent principalities of Moldavia and Wallachia were established in the XIV. cent. Among the most notable rulers or voivodes of Moldavia were Alexander I., who reigned in the early part of the XIV. cent., and acknowledged Polish overlordship; Stephen the Great, who between 1460 and 1475 inflicted defeat on Poles, Hungarians, and Turks in turn, and subsequently captured Pokutia from the Poles; and Bogdan III., who in 1513 acknowledged the sovereignty of Turkey, agreeing to make a yearly payment to the sultan in return for protection. Early in the XVII. cent. Moldavia was temporarily united with Wallachia under Michael the Brave, but it soon afterwards again came under Turk. control. Under Basil Lupul, voivode in 1634–54, a number of legislative reforms were carried out. The last remains of even nominal independence disappeared in 1711, when the voivode, Demetrius Cantemir, was compelled to fly to Russia by an invading Turk. army; and henceforth the office of ruler was sold by the Turk. government to the highest bidder, generally a Greek from the Phanar district of Constantinople, whence the name *Phanariot*, applied to the period between 1712 and 1821.

Meantime in Wallachia, which had been originally a dependency of Hungary, history had followed a course resembling at many points that of the northern principality. The most important voivodes were Mircea I.,

who was defeated by the Turks in 1396 and was subsequently compelled to acknowledge the overlordship of the Porte (1411), and MICHAEL THE BRAVE, who reigned in 1593–1601, and combined Moldavia, Wallachia, and Transylvania under his sway. The last elected voivode was CONSTANTINE BRANCOVAN, whose wealth and prosperity roused the jealousy of his Turk. overlord; he was accordingly deposed and executed in 1712, and henceforth, here as in Moldavia, the voivodes were nominated by the Turk. government.

The PHANARIOT PERIOD in both states was marked by the oppression of the native population, and by extortionate taxation, the voivodes naturally aiming at reimbursing themselves for the sums with which they had bought their position. During this epoch also both Austria and Russia made encroachments upon Rumanian territory; thus Bukowina was transferred to Austria in 1775, and in 1812 a large part of Bessarabia was annexed by Russia. In 1821 the provinces took part in Gk. rising, and were harshly handled by the Turks; and in 1829 they were placed under Russ. protection by the Treaty of Adrianople.

The influence of Russia was for some time of great importance; in 1848 she aided Turkey in suppressing an insurrection, and her troops occupied the country in 1853; but after the Crimean War she had to restore Bessarabia to the principalities, which were declared neutral territories by the Congress of Paris in 1856. Three years later the election of ALEXANDER CUZA to the thrones of both Moldavia and Wallachia united the whole of R. under one ruler; the union was publicly proclaimed and the present name adopted in 1861. Alexander carried out a great number of legislative reforms, but he was not popular in the country and was eventually deposed in 1866, when Prince CAROL of Hohenzollern-Sigmaringen was chosen to succeed him. Carol married Elizabeth of Neuwied (CARMEN SYLVA), whose influence on Rumanian art and letters deserves mention. When war broke out in 1877 between Russia and Turkey, R. supported the former; and by the Treaty of Berlin in 1878 it was recognised as an independent state, but had to cede Bessarabia to Russia, receiving the Dobruja in exchange. It was declared a hereditary kingdom in 1881, when Carol was crowned as the first king. Various modifications were made in the constitution in 1884. In recent years R. has several times broken off relations with Greece; she took, however, no part in the war of 1912 between Turkey and the other Balkan states, but on war breaking out between the latter she invaded Bulgaria and claimed a strip of territory as compensation for her neutrality. This was confirmed to her by the Treaty of Bukharest (Aug. 1913).—See TURKO-BALKAN WAR.

Language and Literature.—The language is one of the Romance group, but has a large proportion of Slavonic words. Early forms of lit. were religious writings and translations from the Bible, the first of which were produced in the XVI. cent.; and a number of hist. chronicles appeared in the XVII. cent. This early period was marked by Slavonic influence. During the Phanariot epoch Gk. influence was all-important; to this time belong the poets Aaron and Vacarescu and the historians Klain and Neculcea. A great revival of national feeling occurred in first half of XIX. cent., one of the greatest names of this renaissance period being that of Eliade Radulescu. Poets of the XIX. cent. include Bolintineanu and Alexandri; and historians, Hasden and Xenopol. There are some fine collections of folk-songs and legends.

Government.—The government is a limited monarchy, a constitution dating from 1866; executive is in hands of a Cabinet, consisting of Premier and 8 ministers of state; legislative power is vested in a Senate of 120 members elected for eight years, and a Chamber of Deputies of 183 members, elected for four years. The country is divided for local administrative purposes into 32 districts (13 in Moldavia, 17 in Wallachia, 2 in the Dobruja). The administration of justice is carried out by 266 justices, 34 tribunals, 4 appeal courts, and 1 court of cassation. The revenue of the state was estimated at £19,135,809 in 1911–12; the principal sources of revenue are the public services, indirect taxes, and state monopolies; and the chief expenses are those connected with the departments of finance, public works, and war. The field army has a total strength of *c.* 170,000 men, and military service is compulsory. The navy consists of 1 protected cruiser, 7 gunboats, 6 coastguard vessels; 6 first-class and 2 second-class torpedo boats; a training-ship and a dispatch vessel; and there are 12 police boats.

Resources.—The most important towns are BUCHAREST, the capital, Jassy, Galatz, Braila, Plœsti, Craiova, and Botosani. There were 2328 miles of railway in 1911, all state-controlled, but there are no canals. The chief industry is agriculture; maize, wheat, barley, oats, rye, hemp, linseed are grown, and plums, peaches, and other fruits as well as tobacco and sugar-beet are cultivated; large numbers of sheep, cattle, pigs, and horses are raised. A large area is forested with oak, beech, and other timber. Minerals include coal, petroleum, and salt; petroleum springs are worked at Bacau, Dambovitza, and elsewhere, and salt-mining is a government monopoly. There are many medicinal springs. Apart from agriculture the chief industries are the manufacture of beet-sugar, woollens, leather, boots and shoes, and cement, and there are important fisheries; the manufacture of tobacco is a government monopoly. Chief imports are textiles, metals and metal goods, machinery, chemicals, pottery, glass, silks; and the chief exports, cereals, petroleum, timber, fruit, animal products; imports were valued at £16,276,320, exports at £24,414,480 in 1910.

Education is gratuitous and obligatory; Bucharest and Jassy are Univ. towns. The state religion is Gk. Orthodox, and the national church is recognised as an independent institution; there are two abp's and six bp's. There is complete religious toleration, and the inhabitants include many Jews, Muhammadans, R.C's, Prot's, and Armenians. Pop. estimated (1911) 7,086,000.

Miller, *The Balkans* (1896); Samuelson, *Rumania, Past and Present* (1882); Stratilesco, *From Carpathian to Pindus* (1906); Benger, *R. in 1900* (1900).

RUMELIA, ROUMELIA (41° 20′ N., 23° E.), former name for that part of European Turkey comprising ancient Thrace and Macedonia; Eastern Rumelia was united to Bulgaria, 1885.

RUMFORD, BENJAMIN THOMPSON, COUNT (1753–1814), soldier and physicist; b. Woburn (Massachusetts); during War of Independence sent with dispatches to England where he received Government appointment; entered Bavarian service, 1784; cr. count and held various high offices; finally settled Paris; made important discoveries in heat; helped poorer classes by spreading culinary, agricultural, and other useful knowledge.

RŪMĪ (1207–73), Persian poet; b. Balkh, Khorasan; a keen student of mystic theosophy. His poems are all richly tinged with mysticism; the best is *The Spiritual Mathnawi.*

RUMINANTIA, SELENODONTIA, a group of Even-toed (*Artiodactyle*), Hoofed Mammals, including Chevrotains, Camels, Deer, Giraffes, the Prong-Buck, and Cattle. The first name indicates their habit of ruminating or regurgitating swallowed food from the stomach to the mouth and chewing it again, a process accompanied by a complex stomach; the second name refers to the crescentic folds on the chewing surface of the teeth, which are known as selenodont.

RUMINATION, see above, and under PECORA.

RUNCORN (53° 21′ N., 2° 45′ W.), town, river port, on Mersey, Cheshire, England; shipbuilding-yards; iron foundries. Pop. (1911) 17,354.

RUNEBERG, JOHAN LUDWIG (1804–77), Swedish poet; b. Jakobstad, Finland. His best works

are *Elgskyttarne* ('The Elk-Hunters'), *Hanna, Kung Fjalar*, and his tragedy *Kungarne po Salamis* ('The Kings at Salamis').

RUNES, from the Gothic *runa*, 'mystery,' used to denote the ancient Norse alphabet. Runic inscriptions are found scattered over Scandinavia and more sparsely over other regions of N. Europe. The earliest extant Runic inscriptions are on metal (*e.g.* the Thorsbjerg Shield-buckle), belonging to the IV. and V. cent's; the earliest stone records are of the VI. cent. These runes are of immense philological value.

RUNN OF CUTCH, see CUTCH.

RUNNING, one of the oldest forms of athletic contest, formed an important part of ancient Games. In modern times there has been a great revival of long-distance r., and since 1909 'Marathon Races' have frequently been held. The most popular form of r. is cross-country r.—'Hare and Hounds,' 'Harriers,' etc. The first event of this kind was held at Wimbledon, 1867, and international contests are now held annually. The following are some of the *Olympic Games* records (1912): 100 metres, R. C. Craig (U.S.A.), 10⅘ sec.; 400 metres, C. D. Reidpath (U.S.A.), 48⅕ sec.; 800 metres, J. E. Meredith (U.S.A.), 1 min. 51⅕ sec.; 1500 metres, A. S. N. Jackson (U.K.), 3 min. 56⅘ sec.; Marathon Race (nearly 25 miles), K. K. M'Arthur (S. Africa), 2 hrs. 36 min. 54⅘ sec. At the *Amateur Athletic Association Championships* (1912), the 100 yds. was won by G. H. Patching in 9⅘ sec.; ¼ mile, C. N. Seedhouse, 49⅘ sec.; ½ mile, H. Braun, 1 min. 58⅕ sec.; 1 mile, E. Owen, 4 min. 21⅘ sec.; 10 miles, W. Scott, 52 min. 35 sec.

RUNNING BIRDS, RATITÆ, a division of large birds possessing wings altogether too small for flight, but used as sails to flap them along in running. The lack of strong flight muscles is correlated with the presence of a smooth, shield-like, unkeeled breast-bone, and the want of flying power is compensated by their agility in running. There are four distinct genera: The strong, swift AFRICAN OSTRICH (*Struthio*) is the largest of all living birds, the wings and tail of which supply the ostrich plumes of commerce. The male takes the larger share in hatching the eggs, for the reception of which it digs shallow hollows in the sand. The SOUTH AMERICAN OSTRICH (*Rhea*) is much smaller and is furnished with three instead of two toes as in the African Ostrich. The feathers are also less abundant and less valuable. The Australian deserts and plains are the natural home of the EMU (*Dromæus*), now becoming scarce. Two species are known—the Emu of the E. plains (*D. novæ hollandiæ*), almost equalling the African Ostrich in size, with long, brownish-grey plumage, and BARTLETT'S or the SPOTTED EMU (*D. irroratus*) of W. Australia, distinguished by its speckled plumage.

The KIWI (so called on account of its cry) or APTERYX of New Zealand, forms a very distinct genus of Running Bird. Not much larger than farmyard fowls, they are characterised by their dark brown, hair-like plumage, valued as an adjunct of dress, long, slender beak, and four-clawed toes. Nocturnal in habit, the Kiwis feed mainly on earthworms. They live in pairs, constructing a rough nest in holes, wherein the female lays her solitary egg, almost as large as that of a goose.

Among the extinct Running Birds are the giant New Zealand MOAS (*Dinornis*), which stood 10 feet high and possessed very large hind legs, the thigh bones being thicker than those of a horse.

RUNNYMEDE, RUNNIMEDE (51° 27′ N., 0° 32′ W.), meadow, on Thames, Surrey, England; where King John signed Magna Carta, 1215.

RUPAR (30° 57′ N., 76° 33′ E.), town, on Sutlej, Punjab, India; cotton cloth, hardware. Pop. 9000.

RUPEE, see MONEY.

RUPERT, PRINCE (1619–82), Count Palatine of the Rhine, Duke of Bavaria, Duke of Cumberland (cr. 1644); nephew of Charles I. of England, being son of Elector Frederick V. by Elizabeth, dau. of James I.; commanded royal forces in Civil War; skilful, though often rash, cavalry officer; distinguished as admiral against Dutch under Charles II.; pioneer in mezzotint engraving.

RUPERT'S LAND, former district, Canada, secured by Hudson's Bay Co., thanks to Prince Rupert; now included in N.W. territories and province of Manitoba.

RUPPIN, NEURUPPIN (52° 56′ N., 12° 44′ E.), town, Brandenburg, Prussia, on Lake R.; manufactures cloth. Pop. (1910) 18,714.

RUPTURE, see HERNIA.

RUSELLÆ (c. 42° 50′ N., 11° 10′ E.), ancient city, Etruria, Italy; taken by Romans, 294 B.C.

RUSH (*Juncus*), genus of plants, order Juncese; Common R. (*J. conglomeratus*) and the Soft R. (*J. effusus*) are used for making carpets, mats, chair-bottoms; the *pith* in centre of rush stems was much used for candle-wicks.

RUSH, BENJAMIN (1745–1813), Amer. physician; b. Philadelphia, ed. there and at Edinburgh Univ. A friend of Franklin's, he was a signatory to the Declaration of Independence, and a prominent anti-slavery advocate; prof. of Med. in medical coll., later prof. of Physiology and Clin. Med. and afterwards of Theory of Med. in Univ. of Pennsylvania; author of medical and other works.

RUSHDEN (52° 17′ N., 0° 35′ E.), town, Northamptonshire, England; boots and shoes. Pop. (1911) 13,354.

RUSHWORTH, JOHN (d. 1690), Eng. historian; his *Historical Collections* are valuable as record of the Civil War.

RUSKIN, JOHN (1819–1900), Brit. art critic, teacher and writer, and social reformer; b. London (Feb. 8); s. of prosperous wine merchant from Scotland; ed. by mother and private tutors, then at Christ's Church, Oxford; graduated, 1842; from childhood devoted to art, poetry, and science; gained Newdigate prize. R. early became self-constituted champion of J. M. Turner (*q.v.*). Repeated continental tours matured his creed as art expounder—Italy, Switzerland, and France being his chief inspirations. Appointed Slade prof. of Fine Art, Oxford, 1869, he removed from Denmark Hill, London, to Coniston, 1872, where he spent his closing years, latterly with clouded mind. His views on art, education, social and moral questions, are embodied in many books and lectures, among others, *Modern Painters* (1843–60), *Seven Lamps of Architecture* (1849), *Stones of Venice* (1851–53), *Notes on the Constitution of Sheepfolds* (1851), *Lectures on Architecture and Painting* (2 vols., 1854), *Political Economy of Art* (1857), *Munera Pulveris* (1862–63), *Unto this Last* (1862), *Sesame and Lilies* (his most popular work, 1865), *Crown of Wild Olive* (1866), *Queen of the Air* (1869), *Fors Clavigera* (1871–84), *Aratra Pentelici* (1872), *Laws of Fesolé* (1877–79); at *Præterita*, his autobiography, he worked till 1888. R.'s style is remarkable—long, rhythmical sentences; he paints pictures with words; he ranks among greatest modern prose-writers. As art-appreciator he was far ahead of his times, although now his message often seems obsolete or marred by narrowness; he insisted dogmatically on literal truth, extolled the pre-Raphaelites, attacked Whistler, had no liking for Impressionism. But he gave Art its due place in Eng. lit. for the first time. In political economy he still exerts a powerful influence; he advocated what has been called an aristocratic type of Socialism.

Life, by Collingwood (1893), Frederic Harrison (1902), Mrs. Meynell, E. T. Cook (2 vols., 1911); Symon, *John Ruskin: His Homes and Haunts*; Hobson, *Ruskin, Social Reformer*.

RUSSELL, family name of Duke of Bedford and Earl R. Earliest known ancestor is Henry R., burgess of Weymouth, which he represented in Parliament, 1425; he or his ancestors came from Gascony; his son John represented Weymouth in Parliament, 1450,

when he was Speaker, and left son James, whose son John was cr. Earl of Bedford (*q.v.*), 1550.

RUSSELL, 1ST EARL, LORD JOHN RUSSELL (1792–1878), Brit. Whig statesman; 3rd son of 6th Duke of Bedford; M.P. for family borough of Tavistock, 1813; started agitation for electoral reform, 1819; supported Catholic emancipation; chief promotor of Reform Bill, 1832; Home Sec., 1835–39; Colonial Sec., 1839–41; converted to Free Trade, 1845; Premier, 1846–52; Foreign Sec., 1853; pres. of Council, 1854; Colonial Sec., 1855; Foreign Sec., 1860; cr. Earl R., 1861; Premier, 1865–66; author of memoirs, etc.; solid, able, but lacked brilliance. *Life*, by Reid (1895).

RUSSELL, LORD WILLIAM (1639–83), Eng. politician; s. of 5th earl of Bedford; M.P. for county of Bedford, 1678–79, and attacked policy of Cabal as member of Country party; P.C., 1679; backed Shaftesbury's opposition to Duke of York; presented York as recusant and carried Exclusion Bill up to Lords; helped to form association to compel king to summon Parliament, 1682; denied charge of complicity in Rye House Plot, but executed after mock trial; pious, patriotic character; revered as Prot. martyr. *Life* by Lord John Russell. His devoted wife, Lady Rachel Wriothesley (1636–1723), wrote beautiful *Letters*.

RUSSELL OF KILLOWEN, CHARLES, 1ST BARON (1832–1900), Lord Chief Justice of England; b. Ireland; M.P. for Dundalk, 1880–85, South Hackney, 1885–94; knighted, 1886; Attorney-General, 1886, 1892–94; did great service to Britain as counsel in Bering Sea Arbitration, 1893; cr. baron, 1894, and made lord of appeal; Lord Chief Justice, 1894; presided at trial of leaders of Jameson Raid, 1896, Venezuela Arbitration Commission, 1899; obtained wonderful successes in private actions (*e.g.* Parnell trial, 1888–90); possessed of Irish good looks and charm, conscientious industry, and effective eloquence; although R.C., opposed Home Rule. *Life*, by O'Brien.

RUSSELL, SIR WILLIAM HOWARD (1821–1907), noted Eng. war correspondent; his letters from Crimea to *Times* exposed bad commissariat, etc.; wrote accounts of Mutiny, Amer. Civil War, Königgrätz, Franco-Prussian War, Zulu campaign, 1879, Egyptian campaign, 1882, etc.; knighted, 1895.

RUSSELL, WILLIAM CLARK (1844–1911), Eng. novelist; wrote sea stories, *e.g. Wreck of the Grosvenor*.

RUSSIA (36 to 77° 30′ N., 18° E. to 169° 44′ W.), occupying the whole E. half of Europe and the whole N. half of Asia; bounded N. by Arctic Ocean, E. by Bering Strait, Bering Sea, and Sea of Okhotsk; S. by Chinese Empire, Afghanistan, Persia, Turkey in Asia, and Black Sea; S.W. by Rumania and Austria-Hungary; W. by Germany, Baltic, Gulf of Bothnia, and Sweden; area, *c.* 9,176,900 sq. miles, of which 2,095,616 are in European Russia (including Finland and Poland), 180,843 in Caucasia, 1,548,825 in Central Asia, and about 5,350,000 in Siberia.

European R. has on N.W. and S.W. the boundaries already given, on E. Asiatic Siberia along the Ural Mts. and Ural R., and on S. the Caspian, Turkey in Asia, and Black Sea. It has a length and width of about 1600 miles. The surface is an undulating plain; average height, 500–900 ft.; extreme elevation of 1100 ft. in the Valdai Hills, midway between St. Petersburg and Moscow, with a plateau of 1000 ft. for some distance S. of them. The ground also rises on the E. border in the Urals and on the S. in the Caucasus. Although the Valdai Hills are neither far-spreading nor high they are very important, owing to the number of large rivers that rise in or near them and approach each other sufficiently to give facilities for intercommunication. All the S.E. is drained by the Ural and Volga and their tributaries into the Caspian; the S. by the Don, Dnieper, and Dniester and their tributaries into the Black Sea; the W. by the Bug, Vistula, Niemen, Düna, Neva, etc. into the Baltic and Gulf of Finland; and the N. by the Onega, Northern Dwina, and Mezen into the White Sea, and the Petchora into the Arctic Ocean.

The name **Siberia** is given to all the territories of Russia in Asia (except the Trans-Caucasus, Caspian and Turkestan [*q.v.*] regions)—that is, the whole expanse between Urals and Pacific, and between Arctic Ocean and Chinese Empire; area, *c.* 5,350,000 sq. miles, about 1½ times the size of Europe. The S.E. forms a great tableland, 2000 to over 3000 ft. high, with mountains rising above it to heights of over 7000 ft.; from it the region slopes N. and W. The drainage is carried off mainly by the great N. rivers already mentioned and by the Amoor.

The great plain of R. is composed of horizontal strata resting on the volcanic and metamorphic rocks which appear in Finland, and in the banks of streams. In Poland and in a long narrow strip of land from the White Sea to Tula, Carboniferous strata are superimposed on the gneiss. A narrow strip of Cambrian Rocks appears on the S. shore of the Gulf of Finland. Silurian Rocks appear S. of this and again in the Caucasus. S. of the Cambrian and Silurian Rocks is a large Devonian tract; Quaternary and Tertiary Rocks follow, going S. There are Quaternary Rocks round the N. of the Caspian Seas and the S. of the Arctic Ocean. Trias and Permian Rocks are found in the N.E.

The CLIMATE of the greater part of European R. is typically continental—a hot summer, a cold severe winter with sharp changes and dry winds, these conditions becoming more marked in the centre and towards the E. Considering the range of latitude the differences between N. and S. are less than might be expected, the temperature often falling in winter to 20° Fahr. in the S. and rising in summer to over 85° in the far N. In the N. the rivers are frozen for over 6 months, in the centre for 3½ to 4½, and in the S. for 2½ to 4. The rainfall varies from 25 in. along the Baltic to 14 in the S. and S.E. and 6 at N. end of Caspian.

In the *tundras* bordering the Arctic Ocean no VEGETATION grows, except dwarf trees, shrubs, and mosses, but the district S. of this belt and extending round the Baltic Sea is a great forest region; wheat is grown round the Baltic. The Black Sea is surrounded by pasture, arable land, and vineyards; the district round the Caspian is chiefly pastoral. The beech does not flourish in the N. farther W. than Poland, but the oak and ash are found. To the usual N. European FAUNA may be added wolves, bears, bisons, and wild boars, and many varieties of sea-birds not met with elsewhere.

HISTORY.—Remains of palæolithic man have been found in R., and there are numerous relics of neolithic and Bronze Age man, especially of the Lake-Dwellers. Turkish and Finnish stocks from the Far E. had been established in R. for centuries when, possibly in the VIII. cent., Slavonic tribes from the Danube and Elbe migrated into S. and N. R. respectively. The Finns were ultimately driven into Finland, the Turks S. and E.-ward, and it is uncertain how far those races mixed with the Slavs. The Russ. tribes—*Great*, *Little*, and *White Russians*—apparently came first in the Slavonic invasion, and filled the E. of this territory; Bulgarians, Czechs, Huns, Poles, etc., followed, or were sent by Russ. pressure, W. and S. They were an agricultural, pastoral people at this time, congregated in *gentes* which, it is believed, were originally matriarchal.

The Line of Rurik.—There was no kingdom of R. until the XVI. cent., but wide districts were joined under one ruler long before that date. According to Nestor's Chronicle, supposed to have been drawn up in the XII. cent. from earlier sources, the N. Slavs, who were gathered in Novgorod and its neighbourhood, in 862 invited Varangians from Scandinavia to be their leaders. This was the supposed origin of the line of Rurik, which ruled R. until 1598; its former principality was **Rus** (whence 'Russia'), the precise locality of which is uncertain.

The first rulers were the brothers RURIK, **Sineus**

and Travor and Oleg, who made Kieff the capital, and also acquired Smolensk. Oleg's widow, Olga, Regent for her son SVYATOSLAV, a famous warrior, was baptized at Constantinople in mid-X. cent. Svyatoslav's more famous son, VLADIMIR I. (980–1015), *the Saint*, was baptized at Kieff in 988 and largely followed by his subjects. He commenced the evil practice of dividing the principality between the sons of the

GEORGE PHILIP & SON LTD THE LONDON GEOGRAPHICAL INSTITUTE

ruler. This led to sanguinary civil wars. YAROSLAV THE WISE (1019–54) made himself supreme over all R., had relations with foreign kings, and compiled the first Russ. legal code. A period of political disturbance endured from his death until the rule of VLADIMIR II., *Monomachus* (1113–25), under whom R. appears as a prosperous mediæval community of thriving cities; but another century of civil war followed and led to the imposition of the Mongol yoke. Genghis Khan and his hordes seized the Crimea (1222) and won a great victory near the Sea of Azof (1224); Batu Khan in 1238–40 overran R. as far as Novgorod, but retreated and allowed the Russ. princes to continue in power as tributary vassals of the Golden Horde. They were unable, however, to maintain their authority, and there were set up various principalities, among which Moscow ultimately came to the front.

IVAN I., *Kalita* (1328–40), made Moscow (where the metropolitan see was established in 1325) his residence (building the *Kreml*), and won recognition as chief prince. His grandson, DMITRI DONSKOI (1359–89), made the first effort at throwing off the Mongol yoke, and won the battle of *Kulikovo* on the Don in 1380; the Khan, however, burned Moscow, and the prince submitted. Dmitri introduced primogeniture as the law of succession. VASSILI I. (1389–1425) and VASSILI II., *the Blind* (1425–62), contented themselves with strengthening their hold over R., but IVAN III., *the Great* (1462–1505), finally shook off the Khan's authority. He conquered and sacked Novgorod and its colonies, and an invasion of the Golden Horde, to extract tribute withheld, ended in its final retreat.

Ivan called himself Lord (*Hospodar*) of all R., and his s., VASSILI III. (1505–33), assumed the title of Tsar. He annexed the independent provinces of Smolensk, Ryazan, Novgorod-Syeversk, and Pskov, thus uniting R. His mother, niece of the last Gk. emperor, Constantine Palæologus, introduced into R. the autocratic ideals which have ever since been associated with the Russ. monarchy. The *boyars* ruled during his young son's minority, but when IVAN THE TERRIBLE (1533–84) came of age he established the strongest despotism in Europe, making turbulent cities and provinces the scenes of wholesale massacres, and conquered Kazan (1552) and Astrakhan (1556). His general, Yermak, conquered Siberia (1582). With his son FEODOR (1584–98) ended Rurik's line.

Feodor's brother-in-law, BORIS GODUNOFF (1598–1605), succeeded. He climbed through blood to the throne and was deeply detested. He had already in 1597 passed a law of which the effect was to tie Russ. peasants to the soil, and thus introduced serfdom. The FALSE DMITRI, who pretended to be Feodor's murdered brother, succeeded, but was deposed by Prince VASSILI SHOUISKY (1606–10).

House of Romanoff.—The strife of numerous

pretenders was ended by the first ruler of the house of Romanoff, MIKHAEL (1613–45), a Russ. candidate elected in the face of Polish candidates, at that time very powerful. War with Sweden was satisfactorily ended by the Treaty of Stolbova (1617), but the Poles were only satisfied by the surrender of Smolensk (1634). His son ALEXEII (1645–76) roused great discontent by confirming serfdom (1648), but a rising of the Cossacks was suppressed, and a legal code was issued. FEODOR ALEXEIOVITCH (1676–82) concluded the war with Turkey by which Little Russia was acquired (1681). His sister SOPHIA established her regency for her idiot brother Ivan and their stepbrother Peter, but after a disastrous war with the Turks Peter secured the throne and immured Sophia in a cloister.

PETER THE GREAT (1689–1725) raised R. to the important position she has ever since held in Europe. He gave R. a seaport (1696) by conquering Azov, which, however, he was forced to resign in 1711. By the Treaty of Nystadt (1721) he received from Sweden Esthonia, Ingria, and Livonia, and acquired Persian territory by the war of 1722-23. He replaced the independent patriarchs by the Holy Synod, made his new city of Petersburg his capital, and gave the Tsar the right of appointing his successor. He bequeathed the throne to his second wife, CATHERINE I. (1725–27), who elected Peter's grandson, PETER II. (1727–30). On his death Dolgorouki, his powerful minister, appointed ANNA, Duchess of Courland (1730–40), who was led by Ger. favourites and kept down the nobles. She named her great-nephew IVAN V. (1740–41), displaced for ELIZABETH (1741–62), dau. of Peter I. Elizabeth peacefully obtained possession of Finland (1743), and her armies played a respectable part in the SEVEN YEARS WAR (*q.v.*).

House of Romanoff-Holstein.—Her nephew, PETER III. of Holstein-Gottorp, ruled for a short space in 1762, but was deposed and murdered in favour of his wife, CATHERINE II. (1762–96). By the three PARTITIONS OF POLAND (1772, 1793, 1795) Catherine considerably extended Russ. territory, and in the two TURKISH WARS conquered the Crimea, won the passage of the Dardanelles, extended her territory to the Dniester, and established a protectorate over Moldavia and Wallachia; the war with Sweden (1788–90) left the *status quo ante*. PAUL I. (1796–1801), her son, was successful against France in Italy; he was murdered and his s., ALEXANDER I. (1801–25), made peace with France (1801), joined the Third Coalition against Napoleon (*q.v.*), suffered several defeats, and again made peace with the emperor at Tilsit (1808), receiving Pruss. territory. War with Sweden (1808–9) resulted in Russ. acquisition of Finland (1809); by the THIRD TURKISH WAR (1806–12) R.'s territory was extended to the Pruth, while she acquired Baku from Persia. Alexander having again joined the anti-Napoleonic alliance, R. was invaded by NAPOLEON, who was obliged to retreat after the burning of Moscow. Alexander took a prominent part in the War of Liberation and Treaties of Paris. The Vienna Congress gave Poland to Alexander, who in 1818 granted it a constitution. He was the ruling spirit of the conservative Holy Alliance (*q.v.*).

His younger son, NICHOLAS I. (1825–55), was despotic and apparently fanatical. He acquired the provinces of Nahitchevan and Erivan after the PERSIAN WAR (1826–28), the protectorate of the Danube States and the freedom of Greece after the TURKISH WAR (1828–29). A Polish insurrection was punished by loss of independence (1832). Turkey closed the Dardanelles to all but Russ. ships in 1833. After controlling E. Europe for thirty years Nicholas died during the humiliation of the CRIMEAN WAR (*q.v.*).

His son, ALEXANDER III. (1855–81), gave up by the Treaty of Paris (1856) the mouth of the Danube and conceded the neutrality of the Black Sea. He completed the subjugation of the Caucasus (1859), obtained Amur from China (1860), and established the provinces of Turkestan and Ferghana. His abolition of serfdom in 1863 made the condition of the serfs on the whole worse, and NIHILISM (*q.v.*) became at this time a political danger. Panslavism was revolted by A.'s treatment of Poland after rising of 1863, and by Alexander's policy of Asiatic expansion, and there was strong feeling against the alliance of 1872 with Germany and Austria (the *Dreikaiserbund*). R. was successful in the TURKISH WAR of 1877–78, but the Treaty of San Stefano was set aside by the Berlin Congress and R. gained little. One of many attempts at assassinating the Tsar succeeded.

ALEXANDER III. (1881–94), his son, renewed the *Dreikaiserbund* (1887), but gradually drew away towards France, with whom he made an alliance (1891). R. at this time lost her influence over the Balkan peninsula. His s., NICHOLAS II. (1894–), continued an ultra-Conservative policy. Mild agitators and political assassins were alike ruthlessly punished, but unrest only increased and culminated during the reverses of the JAPANESE WAR (see JAPAN). In Dec. 1904 the Tsar published a manifesto promising reform. The Peace of Portsmouth brought much loss of territory and was a serious blow to Russ. prestige. In Oct. 1905 the Tsar was forced to grant a CONSTITUTION; it led to great disputes, however, and massacres and counter-massacres took place in 1906 in R., Poland, Finland, etc., while in various parts famine reigned. In March 1913 the Romanoff Tercentenary celebrations were held.

After the Turco-Balkan War the Servian territorial claims were supported by R. In June 1913, when strained relations between Servia and Bulgaria first showed themselves, the Tsar sent a personal letter to the king of each, offering to arbitrate on the questions at issue.

The Government is now theoretically a constitutional monarchy, but actually an absolutism. The elective Council known as the DUMA was created in 1905 with control of legislation; half its members represent the seven largest cities and the provinces. There is also a Council of the Empire; half its members are elected, half appointed by the Tsar; it also has control of legislation and the executive. Laws are promulgated by the chief governmental department, the Senate. The empire is divided into 78 GOVERNMENTS for administration; among these governments Finland has had since 1905 almost complete autonomy; in the rest the governor has almost regal powers. The governments are subdivided into provinces which have representative assemblies, *zemstvos*, as have the towns; the provincial zemstvos, however, are controlled by the nobles. Trial by jury was adopted in 1864 when elective justices of the peace were instituted, but this reform has since been largely abolished.

Army and Navy.—Conscription was introduced in 1874. There are three armies, that of European R., that of the Caucasus, and that of Asiatic R. The Cossacks hold the S.W. frontier of European R. by military tenure. Fortresses exist round the immense frontier. R. has four fleets, the chief being the Baltic and the Black Sea Fleets. Almost entirely destroyed at Port Arthur, the navy is being rebuilt.

Towns.—St. Petersburg (pop. (1910) 1,907,708) is the capital; other towns are Moscow (1,481,240), Odessa (478,900), Kiev (446,800), and Lodz (395,670).

Communications.—The rivers are frozen in winter and low in summer, but excellent highways in spring and autumn; of 51,800 miles of available waterway in European R. and 52,200 in Asiatic R., only about 1400 are artificial. The basin of the Volga is connected with that of the Neva by the three systems of Vishni-Volotchok, Tichvin, and Maria, and with that of the N. Dwina by the system of Duke Alexander of Württemberg; the Dnieper is connected by the Berezin system with the Düna, with the Niemen by that of the Ogin, and with the Vistula by that of the Dnieper-Bug; the Niemen and Vistula are connected by the Augustov system. In Jan. 1911 there were

34,581 miles of railway open in European R., 10,497 in Asiatic R.; the state owns over 33,000 of this.

Industries.—European R. is an agricultural country, although mining and manufactures are rapidly becoming valuable. Along the Volga, in centre and in S. of R. there is a great manufacture of flour, the centres being Nizhniy-Novgorod, Kazan, Kostroma, Rybinsk, Odessa, Rostov, Krementz, Elisabethgrad, and Ekaterinoslav. Flax is cultivated for fibre round the lakes, along the Baltic provinces, and about Iver and Jaroslav, and with hemp for seed through Bessarabia, Kherson, Tauris, Ekaterinoslav, and the Don province. Rape is also grown, poppies for oil in the S.W. and S. centre, sunflowers in Voronezh, Saratov, Tambov, Samara, Kursk, the Don, and Kharkov. Fruit is grown in considerable quantities and made into preserves; the vine is cultivated and wine made in Bessarabia, Kherson, Ekaterinoslav, Taurida, S. Podolsk, and Astrakhan, the Don province, S. Saratov, and the Caucasus in Europe, and the Trans-Caspian and Syr Daria regions in Asia. The best beet regions are Kiev, Podolsk, Kharkov, Kursk, and along the Vistula. Tobacco is grown all over the S. The sheep number over 70,000,000, the cattle over 43,000,000, the horses some 26,000,000, and the pigs some 14,000,000. Butter, milk, poultry, eggs, feathers, down, hides, wool, bristles, hair, and horns are exported, besides fish-products (including *c.* 2000 tons of caviare).

R. is exceedingly rich in minerals. The total value of pig-iron produced is over £10,000,000; of the naphtha, coal, and gold from £4,000,000 to £6,000,000 each; of the salt, copper, platinum, manganese, and zinc from £700,000 to £1,000,000 each; 70 % of the coal comes from the Donetz basin, 29 % from Poland. The wood exported is valued at over £5,000,000, the chief timber ports being Riga, St. Petersburg, Cronstadt, Archangel, Odessa, Novorossisk, Batoum, and Poti. There are sawmills, manufactures of furniture, cottons, and yarns, dye and print works (Moscow, Vladimir, and St. Petersburg), making of carpets and other woollens (Moscow, Kiev district, Warsaw), linens, ropes, silks, and silk embroidery (Moscow), iron and steel (Tula, Moscow, Warsaw, Kazan), cutlery (Nizhniy-Novgorod, Tula, and Zlatoust), niello wares (Tula), samovars (Moscow, St. Petersburg, Tula), paper, leather, etc. The imports are valued at some £125,000,000, the exports at some £168,000,000.

Education is not flourishing. There are about 92,550 elementary schools, of which nearly half are under the Holy Synod; the majority are under the ministry of public instruction. There are ten univ's (see UNIVERSITIES).

The established religion is that of the Orthodox Greek Church. The Russ. branch is under the control of the Russ. Holy Synod. There are 66 bishoprics in the empire. Muhammadans number *c.* 14,000,000, R.C.'s over 11,000,000. The total population of the empire (one-seventh of the world's land-surface) was estimated in 1910 at 166,107,700, that of European R. by itself at 118,690,600. See also FINLAND, POLAND, SIBERIA, CAUCASUS.

Wallace, *Russia* (new edit., 1912); Rambaud, *Hist. of Russia* (2nd Eng. edit., 1887); Morfill, *History of Russia* (1902); Nisbet Bain, *The First Romanoffs* (1905); Kluchersky, *A History of Russia* (3 vol's, 1911).

Language and Literature.—The language is Slavonic, many dialects being spoken. R. has various cycles of rhythmical romances. There are a few chronicles, beginning with that of Nestor mentioned above. Literature was scanty until the XVIII. cent. TREDIAKOVSKI (1683–1769) and KANTEMIR (1708–44) the poets, SUMAROKOV (1718–77) the playwright, TATISTCHEV (1686–1750) the historian, and LOMONOSOV (1711–65) the scientist and poet, started a new movement. Kheraskov, Kniazhnin, Bogdanovich, Visin, and the great DERZHAVIN and KARAMZIN followed. The Romantic movement, introduced by Zhukovski, was illustrated by the famous PUSHKIN (1799–1837). The later realistic school—TOLSTOI, GORKI, TURGENIEFF, Anton Tckekhoff, etc.—has produced novels read all over Europe; their chief notes are pessimism, seriousness, and subtlety. Pogodin and Solovieff are notable historians. Even more widely famed than the Russ. novelists are the composers Rubinstein and Tschaikovsky, and Russ. artists are coming to the front.

RUSSO-JAPANESE WAR, see under JAPAN.

RUSSO-TURKISH WARS, 1768–74.—The Russians conquered the Crimea in 1771, won the battle of Tschesme in the island of Chios. By the treaty of Kutshuk Kainardji (1774) Russia extended her territory to the Bug, and obtained the protectorate of Moldavia and Walachia and the passage of the Dardanelles. The Crimea was ceded, 1784.

1787–92, in which the Turks lost over 200,000 men. Suvarov was victorious at Focsani and Rimnik in 1789, and in 1791 Oczacow was conquered. In 1792 Turkey agreed to Treaty of Jassy, ceding Oczacow and the territory between the Bug and Dniester.

1806–12.—Russia was defeated at Silistria (1809), but the tide turned, and by Treaty of Bucharest Russ. territory was extended to the Pruth.

1828–29.—Britain, in supporting Greeks in War of Independence, weakened Turkey; Russ. support to Greece had been with this view, and Russia could not be held back from further attack; to surprise of Europe, Turkey offered valiant resistance; wearisome campaign with little result, 1828; but in 1829 Russ. general Diebitsch captured Silistria, defeated the grand vizier, crossed the Balkans, captured Adrianople, and forced Turkey to make peace.

1853–56.—See CRIMEAN WAR.

1877–78.—Similar occasion to last, *i.e.* national risings against Turkey; cruel suppression of Bulgarian revolt roused indignation of Europe and gave Russia pretext for interference on behalf of Christian subjects of Turkey; fierce outcry in Britain under Gladstone; international conference at Constantinople presented Porte with ultimatum, rejected Jan. 1877; conference of London in March failed, and Russia invaded European and Asiatic Turkey in April; Roumania declared her independence, and the Tsar's army under Gurko captured capital of Bulgaria, crossed Balkans, and took Shipka Pass, but could get no farther; siege of Plevna lasted July 20 to Dec. 10, when starvation forced heroic defender, Osman Pasha, to surrender; meanwhile Turks were expelled from Montenegro and lost Nikshich and Kars, and Servia again declared war. Gurko captured Sofia and won battles of *Philippopolis*, Jan. 1878; SULEIMAN, now commander-in-chief of Turks, was cut off from Adrianople and forced to retreat and return to Constantinople by sea; he was not a skilful general, and had scattered his forces needlessly; Russians entered Adrianople and brutally drove Turks in flight. The Servians won victories of *Pirot* and *Vranya*, and Montenegrins captured Spizza (an old ambition), Antivari, and Dulcigno; hostilities ceased on news of armistice of Adrianople, Jan. 31. Britain had undergone reaction on hearing of Russ. successes, and Conservative government, which returned to power under Disraeli, restored policy of protecting Turkey; movement of Brit. fleet to scene of war for protection of Brit. interests aided in ending conflict; terms of Treaty of San Stefano, March 3, were modified by Treaty of Berlin, July 3.

RUST, see IRON, and also FUNGI.

RUSTCHUK (43° 51′ N., 25° 56′ E.), town (and department), at junction of Danube and Loni, Bulgaria; tobacco manufactures. Pop. (1910) 36,255; (dep.) 406,309.

RUSTENBURG (25° 39′ S., 27° 48′ E.), town (and district), Transvaal, S. Africa; tobacco. Pop. (dist.) (1911) 64,689.

RUSTIC, see PALÆOGRAPHY.

RÜSTOW, FRIEDRICH WILHELM (1821–78),

military writer; Prussian by birth; escaped to Switzerland, on condemnation by court martial; companion of Garibaldi; committed suicide on refusal of military professorship at Zürich.

RUTEBEUF, RUSTEBEUF (fl. XIII. cent.), Fr. poet; history unknown except from his own allusions to bitter poverty; none of his contemporaries mention even his name; writings probably pub., 1255–80, in purest dialect of Ile-de-France; wrote *chansons, fabliaux, satires*, and *mystères*.

RUTH, BOOK OF, in Old Testament, gives story of Ruth the Moabitess, who becomes wife of Boaz and ancestress of King David. Its date is uncertain, but probably pre-exilic as the Hebrew is good, but may be exilic or post-exilic; in Hebrew part of *Megilloth* (Rolls).

RUTHENIANS, see SLAVS.

RUTHENIUM (Ru=101·7), rare metal of platinum group, found in Urals; hard, brittle; S.G. 12·06; fusible in oxy-hydrogen flame, oxidisable when fused, slowly attacked by *aqua regia*; allied to osmium in types of compounds: $RuCl_3$, Ru_2O_3, $RuCl_3$, $RuCl_4$, K_2RuO_4, $KRuO_4$, RuO_4.

RUTHERFURD, SAMUEL (1600–61), Scot. Calvinist divine; prof. at Edinburgh and Aberdeen; wrote *Free Disputation against Pretended Liberty of Conscience*, defending persecution.

RUTHERGLEN (55° 50′ N., 4° 13′ W.), town, Lanarkshire, Scotland, near Clyde; collieries, chemical works. Pop. (1911) 24,411.

RUTHIN (53° 7′ N., 3° 19′ W.), market town, Denbighshire, Wales; agricultural produce.

RUTHVEN, BARONY OF.—Sir William Ruthven of Ruthven (Scotland) was cr. lord of parliament, 1488; barony held till attainder of 6th lord (Earl of Gowrie, *q.v.*), 1600. Barony conferred on descendants of 2nd lord, 1651, supposed to have become extinct, 1701. Ruthvens have ever since assumed title; claim ruthlessly crushed by Mr. Round.

RUTHVEN, RAID OF, see GOWRIE, WILLIAM, 4TH LORD RUTHVEN, EARL OF.

RUTICILLA, a genus of THRUSH (*q.v.*).

RUTILIUS CLAUDIUS NAMATIANUS, Rom. poet; native of Gaul; lived at the beginning of the V. cent. A.D.; *præfectus urbis* c. 414. By some authorities he is reputed to be the author of a poem on Mount Ætna. He is the author of an itinerary called *De Reditu* (descriptive of his return to Gaul), which was published by Burman in the *Pœtæ Latini minores*.

RUTLAM, see RATLAM.

RUTLAND.—(1) (52° 40′ N., 0° 40′ W.) smallest county of England; borders on Leicestershire, Lincolnshire, and Northamptonshire; area, 150 sq. miles; surface generally hilly; drained by Welland and its tributary, Wash; chief towns, OAKHAM (cap.) and Uppingham; live stock raised; wheat and other crops cultivated; cheese manufactured. Within county was fought battle of *Stamford* (q.v.), 1470. Pop. (1911) 21,168. (2) (43° 35′ N., 72° 59′ W.) city, Vermont, U.S.A., on Otter Creek; marble quarries. Pop. (1910) 13,546.

RUTLAND, EARLDOM AND DUKEDOM OF.—Edward PLANTAGENET, s. of Edmund, Duke of York, 5th s. of Edward III., first earl, 1390; became Duke of York, 1402; his great-nephew Richard, slain with his father at *Wakefield*, 1460, was styled earl. Thomas MANNERS, Lord Ros, descendant of Richard, Duke of York, was cr. earl, 1525; descent, with dukedom (cr. 1703), in direct male line to John Manners, present duke; one of oldest Eng. houses.

RUTLAND, EARL OF, HENRY MANNERS (c. 1516–63), commanded against French, 1556–57; lord pres. of North, 1561; bro. Sir John, who is said to have eloped with Dorothy Vernon, thereby acquiring Haddon Hall, was grandfather of 8th earl.

RUTLAND, 1ST DUKE OF, JOHN MANNERS (1638–1703), raised forces for Prince of Orange, 1688; Princess Anne fled to Belvoir Castle; hence in 1703 cr. Marquess of Granby and Duke of Rutland.

RUTLAND, 3RD DUKE OF, JOHN MANNERS (1696–1779), one of lords justices who governed realm, 1755; eldest s. JOHN, Marquess of Granby, fought at *Minden*, 1759, became commander-in-chief of forces in Germany, and commander-in-chief of land forces, 1766–70.

RUTLAND, 7TH DUKE OF, LORD JOHN MANNERS (1818–1906), leader of Tory 'Young England' party; chairman of committee of works with seat in cabinet, 1858–59, 1868; postmaster-general, 1874–80, 1885–86; chancellor of duchy of Lancaster, 1886–92; author of verses much mocked by political adversaries; appears as 'Lord Henry Sydney' in Disraeli's *Coningsby*.

RUVO (41° 6′ N., 16° 28′ E.), town, prov. Bari, Italy; ancient *Rubi*. Pop. 24,500.

RUWENZORI (0° 30′ N., 30° 3′ E.), range of mountains, equatorial Africa, situated near river Semliki between Albert Nyanza and Albert Edward Nyanza; reaches height of c. 17,000 ft. Was first discovered in 1888 by Stanley, after whom one of principal peaks is named; summits are covered with perpetual snow.

RUYSBROEK, JOHANNES, RUYSBROECK (1293–1381), Flemish mystic, 'Ecstatic Teacher'; inspired by his life, Groot founded the order *Brothers of the Common Life*, which helped on the Reformation.

Maeterlinck, *R. and the Mystics* (Eng. trans., 1897).

RUYSDAEL, JAKOB VAN, RUÏSDAEL (c. 1628–82), the most celebrated of Dutch landscape painters. He died in the almshouse of his native Haarlem.

RUYTER, see DE RUYTER.

RYAZAN, RIAZAN (54° 30′ N., 40° E.), government, Central Russia; generally level; fertile; traversed by the Oka; much covered with marshes and forests in the N.; minerals include coal, iron, limestone; chief occupation, agriculture. Pop. (1910) 2,408,400. Capital, Ryazan.

RYAZAN (54° 42′ N., 39° 50′ E.), chief town, R. government, Russia, on Trubezh; abp.'s see; active trade. Pop. (1910) 48,500; (government) 2,408,400.

RYAZHSK (54° N., 40° E.), town, Russia; trade in corn. Pop. 15,500.

RYBINSK, RUIBINSK (58° 2′ N., 39° 1′ E.), town, Yaroslavl, Russia, on Volga, opposite mouth of Shekena; centre of transit trade. Pop. 30,000.

RYDE (50° 44′ N., 1° 10′ W.), town, watering-place, Isle of Wight, England. Pop. (1910) 10,608.

RYE (*Secale cereale*), a grass extensively cultivated in Russia, Germany, and Scandinavia; r. flour produces 'black' bread.

RYE (50° 37′ N., 0° 44′ E.), town, on Rother, Sussex, England; one of the Cinque Ports; has a fine Norman and Early English church; fishing and shipbuilding. Pop. (1911) 4229.

RYE HOUSE PLOT (1683), conspiracy to murder Charles II. and James, Duke of York, on their way from Newmarket Races; deed was to be done at Rye House farm, near Hertford; plan failed owing to Charles's leaving Newmarket earlier than expected. Lord William Russell and Algernon Sidney were executed; Monmouth fled the country.

RYE-GRASS (*Lolium*), see under GRASS.

RYEZHITSA (c. 56° 10′ N., 26° 10′ E.), town, Vitebsk, Russia. Pop. 11,500.

RYLE, EDWARD (1856–), s. of John Charles R.; bp. of Exeter, 1901, Winchester, 1903; dean of Westminster, 1911.

RYLE, JOHN CHARLES (1816–1900), bp. of Liverpool, 1880; of Evangelical sympathies.

RYLSK (51° 30′ N., 34° 40′ E.), town, Kursk, Russia; oil-works. Pop. 12,000.

RYMER, THOMAS (1641–1713), Eng. antiquary; s. of Yorkshire country gentleman; good classical scholar; wrote *Edgar, or the English Monarch: an*

Heroic Tragedy, 1677, a classical drama of no merit; succ. Shadwell as Historiographer Royal, 1692; engaged in important compilation of *Fœdera* (pub. 1704–13); these vol's of treaties between England and foreign powers came down to 1586 at R.'s death and were continued from R.'s transcripts by Robert Sanderson to 1625.

RYSWICK, TREATY OF, 1697, treaty by which Louis XIV. of France, abandoning James II., recognised William III. as king of England and restored all continental towns (save Strasburg) captured since 1678.

RZHEV (56° 30′ N., 34° 30′ E.), town, on Volga, Tver, Russia; hemp manufactures. Pop. 22,500.

S, the 19th letter of the Eng. alphabet, and corresponding to the Gk. *sigma* and the Semitic *shin*. S is a hard, open sibilant, produced by bringing the blade of the tongue near the front of the palate.

'S HERTOGENBOSCH, Bois-le-Duc (51° 42′ N., 5° 18′ E.), town, capital of province, S. Holland, Netherlands; bp.'s see; manufactures woollens, cutlery. Pop. (1911) 35,157.

SÁ DE MIRANDA, FRANCISCO DE (1495–1558), Portug. poet, descendant of noble family; ed. for the law at Lisbon Univ., where he graduated Doctor, 1516, and for a time acted as professor, at the same time having the entrée to Court. After spending four years in Italy (1521–25), he brought back Ital. modes—Petrarch's sonnets, Dante's tercets, etc.—and in 1527 produced the first Portug. prose play, the *Estrangeiros*, thus replacing the popular *autos*; this was followed by several books of poems and his second comedy, the *Vilhalpandos* (1538). He had retired from the Court four years before, and spent the rest of his life in retirement in company with his wife. His claim to greatness rests rather on his example to his successors than on intrinsic merit, for his verse, being an essay of new forms, was not lacking in imperfections. Other poems include *Fabula de Mondego* (in Spanish), *Alexio*, *The Cartas*, and *Basto*.

SAADIA, see Seadiah.

SAALE (52° N., 11° 42′ E.), river, Germany; joins Elbe above Barby.

SAALFELD (50° 39′ N., 11° 21′ E.), town, on Saale, duchy Saxe-Meiningen, Germany; manufactures machinery. Pop. (1910) 14,368.

SAAR (49° 19′ N., 6° 45′ E.), river, Alsace-Lorraine and Rhineland, Germany; joins Moselle above Trèves.

SAARBRÜCKEN (49° 13′ N., 6° 59′ E.), town, on Saar, Rhineland, Prussia; incorporated with it are Sankt-Johann and Malstatt-Burbach (1909); coal-mining centre. Pop. (1910) 105,101.

SAARBURG.—(1) (48° 45′ N., 7° 3′ E.) town, on Saar, Lorraine, Germany; manufactures watch-springs. Pop. (1910) 15,376. (2) (49° 30′ N., 6° 40′ E.) town, on Saar, Rhineland, Prussia; ruined castle.

SAARDAM, see Zaandam.

SAARGEMÜND, Sarreguemines (49° 8′ N., 7° 5′ E.), town, at junction of Blies and Saar, Lorraine, Germany; pottery. Pop. (1910) 15,376.

SAARLOUIS (49° 17′ N., 6° 45′ E.), town (former fortress), on Saar, Rhineland, Prussia; manufactures porcelain. Pop. (1910) 15,262.

SAAZ, Bohem. Zatec (50° 20′ N., 13° 32′ E.), town, on Eger, Bohemia; trade in hops. Pop. (1911) 17,117.

SABA (17° 40′ N., 63° 20′ W.), small Dutch W. Indian island; part of Curaçao colony.

SABA, ST. (439–531), monk; founder of monastery of Mar Sâba, near Dead Sea.

SABADELL (41° 32′ N., 2° 3′ E.), town, Barcelona, Spain; textiles. Pop. (1910) 28,125.

SABÆANS, ancient inhabitants of S. Arabia; mentioned in the Old Testament, *Genesis* 10, in the reference to the pedigree of Sheba; *1 Kings* 10, the visit of the Queen of Sheba. Passages in *Isaiah*, *Jeremiah*, *Ezekiel*, and *Job* refer to the trading capacity of the S'a. Pliny and other classical writers extol the people of Yemen for their wealth and nobility and their great qualities as merchants. Dated inscriptions, coins, and cuneiform inscriptions afford the best information concerning the S'a. Five cent's B.C. they were a highly developed race of traders—the route from Egypt to the Far East passing through Yemen. Gold, precious stones, perfumes, spices, incense, horses and camels, the chief articles of commerce. Several independent 'kings' divided the country between them, and women held a high position in the state. The language was Semitic, akin to Arabic and Ethiopic. It is held by some authorities that the Phœnicians learnt the use of the alphabet from the S'a.

SABAH, district of Brit. North Borneo. See Borneo.

SABAKI (3° S., 39° 47′ E.), river, Brit. E. Africa; enters Indian Ocean.

SABBATAI SEBI (1626–76), Jewish mystic and pseudo-messiah. His eloquence and religious fervour attached to him vast crowds of followers. His disquieting influence was apprehended by the Sultan, and Sabbatai was imprisoned and put to death.

SABBATH, a Hebrew word, meaning rather a day of cessation than of pleasure or repose. It has always been observed by Jews, and at the time of Christ was hedged about with a large number of regulations. All work was strictly forbidden, even the plucking of ears of corn; only the saving of life was allowed. Though its observation sometimes developed into mere formalism it was dearly loved by many pious Jews. Still, Christ had to declare, 'The S. was made for man, and not man for the S.' In the Christian Church the idea of a sacred day was taken over from Judaism, but the day was not Saturday (the Jewish S.) but Sunday, when Christ rose from the dead. Hence the strict application of Jewish precedent about the S. to the Christian Sunday which some Christians have insisted on is based on a mistaken identity. For the relation of S. to Sunday, see Sunday. The origin of the S. is lost, but as a similar observance of one day in seven is found elsewhere it is probably connected with the four quarters of the moon.

SABELLARIA, a Bristle-Worm; see under Chætopoda.

SABELLIUS (early III. cent.), early Christian divine, and leader of 'Modalistic' party in Church, *i.e.* those who held that the Son was a manifestation of the Father. S. taught that the three persons of the Trinity were only different modes of apprehension or revelation of God. *Sabellianism* had more influence in East than West.

SABIANS, Oriental sect with Christian elements, something like Mandæans; term also used of people of Harran, who inherited Hellenic culture with other elements.

SABINES, people of ancient Italy, of Umbro-Sabellian stock; territories to the N.E. of Rome extended from sources of Nar to the Anio—some 85 miles; brave, austere, and religious; conquered by M. Curius Dentatus, 290 B.C., and enrolled in the Rom. *tribus Quirina*, 240 B.C.; fully enfranchised by Rome, 268 B.C. Nothing remains of Sabine lit. or language. The dialect disappeared very quickly under pressure of the Latin tongue. The legendary *Rape of the Sabine Women* occurred when Romulus, having founded Rome and seeking wives for its citizens, invited his Sabine neighbours to games, during which the Romans seized the unsuspecting maidens.

SABLÉ (47° 52′ N., 0° 20′ W.), town, Sarthe, France, on Sarthe; marble quarries. Pop. (commune) 5600.

SABLE, see Weasel Family.

SABLE ANTELOPE (*Hippotragus niger*), with maned neck, tufted tail, and stout horns; S. and E. African.

SABLE ISLAND (44° N., 60° W.), sandy island, in Atlantic, off Nova Scotia, Canada.

SABRE FENCING, see under FENCING.

SABRE-TOOTHED TIGER, see under CAT FAMILY.

SACCHARIN, $C_6H_4\begin{matrix}SO_2\\CO\end{matrix}>NH$, O-sulphobenzoic imide. White, crystalline powder, soluble in weak alkali; 500 times as sweet as sugar, for which it is a substitute.

SACHEVERELL, HENRY (c. 1673–1724), Eng. politician and clergyman; in 1709 denounced Revolution Settlement and Act of Toleration; impeached by Whigs, he was found guilty, but popular opinion in his favour forced Whigs to resign.

SACHEVERELL, WILLIAM (1638–91), Eng. politician and anti-Catholic agitator; originator of Exclusion Bill, etc.; famous orator; prominent at revolution, 1688.

SACHS, HANS (1494–1576), Ger. cobbler-poet, dramatist, and meistersinger; b. Nürnberg; wrote innumerable Meisterlieder, Spruchgedichte, and about 200 plays.

SACHS, JULIUS VON (1832–97), one of the greatest of recent German botanists; b. at Breslau; passed a large part of his life as professor at Würzberg; carried out investigation on physiology, and wrote the standard history of botany.

SACHS, MICHAEL (1808–64), Ger. Rabbi; wrote *Religiöse Poesie der Juden in Spanien*, 1845, *Stimmen von Jordan und Euphrat*, 1853, and *Mahzor*, trans. of Hebrew songs and prayers, 1855.

SACKETT'S HARBOR (43° 55′ N., 76° 15′ W.), village, on Lake Ontario, summer resort, Jefferson County, New York, U.S.A.; formerly important naval station.

SACKING, heavy fabric woven from hemp or jute; hemp better quality; three- or four-leaf twill; chief seat of manufacture in Britain is Dundee.

SACKVILLE, see DORSET, EARLDOM OF.

SACKVILLE, GEORGE, 1ST VISCOUNT (1716–85), commander-in-chief of Brit. forces in Germany under Prince of Brunswick, 1758–59; dismissed for disobedience at *Minden*; pres. of Board of Trade, 1775–79; Colonial Sec., 1779–82.

SACKVILLE, THOMAS, EARL OF DORSET, see DORSET, DUKEDOM AND EARLDOM OF.

SACO (43° 30′ N., 70° 34′ W.), city, Maine, U.S.A., on Saco; cotton manufactures. Pop. (1910) 6583.

SACRAMENT, the Latin word originally denoted the *oath* taken by a Rom. soldier on entering the army. It was adopted by the early Christians as the name for the most sacred rites of the Church. The R.C. Church and the Eastern Churches have seven s's—Baptism, Confirmation, the Eucharist, Penance, Holy Orders, Matrimony, and Extreme Unction. The Prot. Churches generally only recognise Baptism and the Supper of the Lord as 's's of the gospel' and as 'generally necessary to salvation,' although the Church of England recognises in addition the five 'minor s's.' In the R.C. Church s's are defined by the Council of Trent as 'outward signs of inward grace instituted by Christ for our sanctification,' and the Church of England definition is very similar: 'An outward visible sign of an inward spiritual grace given unto us, ordained by Christ Himself, as a means whereby we receive the same, and a pledge to assure us thereof.' The Eucharist is first in dignity of the s's in the Catholic Church.

SACRAMENTARIANS. — (1) reformers who separated from Luther on question of Eucharist; leaders—*e.g.* Carlstadt—held with Zwingli that the bread and wine were symbols only. (2) in Church of England those holding 'high' doctrine of sacraments.

SACRAMENTARY, see MISSAL.

SACRAMENTO (38° 30′ N., 121° 25′ W.), city, on Sacramento River, capital of California, U.S.A.; has R.C. and Prot. Cathedrals; public buildings include state capitol, county court, magnificent state library; several charitable institutions; has works of Southern Pacific Railway; manufactures flour, furniture, pottery, woollens. Pop. (1910) 44,696.

SACRED BEETLE, see CHAFERS.

SACRED HEART.—R.C. cult of Sacred Heart of Jesus existed centuries before formal authorisation; fixed as feast by Pius IX. in 1856.

SACRIFICE, 'the offering or destruction of anything as a religious rite' is a possible definition, but the idea, though in a measure familiar to every one, is a difficult one to focus, for the term is used ethically besides. Ritual s. is very important in nearly all religions,—Buddhism is an important exception,—but its original significance is disputed. It may have started in more than one way, and a given act of ritual s. may have different aspects. Thus (1) a s. is a gift to the deity; (2) *Totemism*, a feature of early religion and society, the importance of which was first brought out by Robertson Smith, explains s. A s. was a sacred meal shared by a god and his worshippers, or a rite in which the worshippers fed on their god himself, or of an expiatory s. of the totem animal. Dr. Frazer has suggested that the s. of a god is connected with the idea of the renewal of life, and this again with the s. of a king in the guise of a god. Human s., however, does not seem so ancient, though it has been practised at various times all over the world. Many religions have developed elaborate sacrificial rituals, *e.g.* the Jewish, in which various forms, sin-offering, peace-offering, etc., were distinguished. Hindu s. has likewise a complicated ritual. Christianity has no place for animal s., though it has still lingered in the Armenian Church. The *Epistle to the Hebrews* represented Christ as culminating Jewish s., which typified Him. In Catholic theology the Mass is a s. in which Christ participates as priest and victim. That the Eucharist is a s. is denied by extreme Protestants, but of course is admitted by Anglo-Catholics and the Eastern Churches. 'S.' in the Communion service is applied also to that of 'praise and thanksgiving.' Whether the Eucharist be itself a s. or not, it certainly is in memory of the self-s. of Christ. This leads on to the ethical: thus, it has been said, 'Christianity teaches self-realisation through self-sacrifice,' or 'self-realisation is self-s.'

See Frazer, *Golden Bough*; Robertson Smith, *Religion of the Semites.*

SACRILEGE, the crime of injuring sacred things has been accounted serious in most religions. In primitive religion it is connected with the idea of *taboo* (*q.v.*). It was accounted very serious among the Jews. In Catholicism all things connected with the Church were sacred, and the severest ecclesiastical penalties pronounced against those who robbed or injured them. The worst s. of all was the defiling of the Sacred Host. In various civil codes it was severely punished.

SACRUM, see SKELETON.

SACY, SILVESTRE DE, see SILVESTRE DE SACY.

SADDLERY AND HARNESS, an important branch of leather trade, established as separate craft in XIII. cent. by foundation of London Saddlers' Company; main parts — bridle, martingale, bit, reins, and saddle proper. The bit may be *snaffle* or *curb*, or both combined. The saddle comprises *tree* or skeleton (pommel, ribs, and side-bars), usually of beechwood, canvas, and steel; *stirrup-bars*; leather covering of seat, skirt, and hanging flaps. Continental and American saddles have high pommels; Eastern saddles, concave seats; ladies' side-saddles have two pommels or one pommel and a *leaping-head.*

SADDLEWORTH (53° 35′ N., 1° 59′ W.), town, Yorkshire, England; woollens. Pop. (1911) 12,605.

SADDUCEES, Jewish party, frequently mentioned in New Testament. They were aristocratic and had considerable political power; disbelieved in a future life and in the existence of spirits and angels, etc.; rationalists, tainted by materialism and continually opposing Christ, *e.g.* trying to entangle Him about

giving tribute to Cæsar and about marriage after resurrection.

SADE, MARQUIS DE, DONATIEN ALPHONSE FRANÇOIS (1740–1814), Fr. writer of prurient romances, e.g. *Justine, Juliette, Les Crimes de l'Amour.*

SA'DI, SHEIKH MUSLIH ADDIN (c. 1184–1292), most famous of Persian poets; b. Shiraz. The latter half of his life was spent in retirement—a period fruitful in literary work. His most famous book is the *Gulistan,* a medley in prose and verse. His 'Bostan' or Tree Garden ranks next—a poem religious in sentiment. The *Pend-Nameh* is a didactic work, exquisite in finish.

SADIYA (27° 50′ N., 95° 41′ E.), frontier outpost, on Brahmaputra, Lakhimpur district, Assam, India. Pop. 4500.

SADLER, SIR RALPH, SADLIER (1507–87), Eng. statesman; agent of Thomas Cromwell and Henry VIII.; P.C., 1547, 1558; frequent envoy to Scotland under Elizabeth; keeper of Queen of Scots, 1584–85.

SADO (38° N., 138° 30′ E.), island, Japan; area, 335 sq. miles. Pop. 122,000.

SADOLIN, JÖRGEN (1499 ?–1559), Dan. bp.; promulgated Dan. version of Luther's catechism, 1532, and trans. of Confession of Augsburg, 1533; became reforming bp. of Fyen, 1537.

SADOWA (50° 20′ N., 15° 40′ E.), village, Bohemia; scene of Prussian victory over Austrians, 1866.

SÆPINUM (41° 25′ N., 14° 35′ E.), modern Altilia, ancient city, Etruria; taken by Romans, 293 B.C.

SAETERSDAL (59° N., 7° 30′ E.), valley, S.W. of Norway.

SAFED KOH (34° 40′ N., 64° E.), range of mt's, Eastern Afghanistan; highest peak, Sikaram, 15,600 ft.

SAFES.—To be of real service s. must be both burglar- and fire-proof. The door and body of modern s. are made of such thickness that it is impossible to cut a hole large enough to give access to the contents, and of such strength that the locks and attachments of the door cannot be destroyed by drilling. Safety from fire is attained by the constructional strength of the safe and by placing between the outer and inner shells a steam-generating mixture which will keep the interior in a moist condition even during the prolonged heat of a serious fire. STRONG ROOMS are similar to s., except that they are larger and built into position instead of being portable. They are built on various plans, specially prepared steel plates and reinforced concrete being largely employed. SAFE DEPOSIT VAULTS are like strong rooms, but are fitted with other smaller s. which are rented by different people. The locks of these s. are so arranged that each hirer requires the assistance of the vault attendant in order to open his safe.

SAFETY LAMP (or DAVY LAMP, from its inventor, Sir Humphry Davy) is used in coal mines as illuminant and indicator of explosive gases. It consists of an oil lamp, the flame being completely enveloped with wire gauze, which so rapidly conducts the heat away on the large surface exposed that the flame cannot pass through at a sufficiently high temperature to ignite explosive gases. These it can be made to detect by turning down the flame to a blue point, when a light flame cap appears if over 2 or 3 % of gas is present.

SAFFI, ASFI (32° 18′ N., 9° W.), seaport, Morocco, on Atlantic. Pop. 14,500.

SAFFLOWER (*Carthamus tinctorius*), composite plant, native to India; its large red flowers yield the dye *carthamine,* used in preparation of rouge.

SAFFRON, an orange-yellow dye extracted from the dried stigmas of *Crocus sativus*; formerly used commercially, but now only employed as a colouring and flavouring ingredient in cookery.

SAFFRON WALDEN (52° 2′ N., 0° 15′ E.), market town, Essex, England; ruined castle; agricultural centre. Pop. (1911) 6311.

SAGA, prose epic of Iceland; originally an oral account of heroic deeds of hist. persons recited by professional minstrel (cf. the Teutonic *Beowulf*). The first s. *writer* was Ari Frothi (d. 1148). *Njala* is perhaps the greatest s.; it deals with law and belongs to the Islendinga s's. In XIV. cent. Sturla Thordsson, assisted by his brother Olaf Hritaskald, made his *Sturlungasaga* collection. See ICELAND (LITERATURE).

William Morris and E. Magnússon, *Saga Library* (6 vols.).

SAGAING (21° 54′ N., 96° 2′ E.), district and division, on Irrawadi, Upper Burma. Pop. (dist.) 288,000; (div.) 1,000,000. Capital, SAGAING. Pop. 10,500.

SAGALLO (11° 40′ N., 43° E.), small seaport, on Gulf of Tajura, Fr. Somaliland.

SAGAN (51° 37′ N., 15° 19′ E.), town, on Bober, Silesia, Prussia; cottons, woollens. Pop. (1910) 15,077.

SAGAR, SAUGOR (21° 40′ N., 88° 20′ E.), island, at mouth of Hugli, Bengal, India; place of pilgrimage.

SAGASTA, PRAXEDES MATEO (1827–1903), Span. Liberal statesman; assisted revolution, 1868; led opposition to restored Bourbons, 1875–81; premier, 1881, and again, 1885; introduced trial by jury and male suffrage; later administrations marked by excessive caution at home and disastrous foreign policy.

SAGE (*Salvia*), genus of plants, order Labiatæ; Common S. (*S. officinalis*) is used as a tonic and gargle; Meadow S. (*S. pratensis*) has blue flowers.

SAGHALIEN, see SAKHALIN.

SAGINAW (43° 50′ N., 83° 40′ W.), city, on S. River, Michigan, U.S.A.; sawmills; iron manufactures. Pop. (1910) 50,510.

SAGO, edible substance obtained from pith of certain palms. See PALM.

SAGUENAY (49° 25′ N., 74° W.), river, Quebec, Canada; enters St. Lawrence at Tadousac.

SAGUNTUM (39° 45′ N., 0° 15′ W.), ancient city, eastern Spain; taken by Hannibal, 219 B.C.; modern MURVIEDRO.

SAHARA (c. 15° to 33° N., 10° W. to 30° E.), the great belt of desert stretching eastward from Atlantic to Nile and southward towards the Niger and Lake Chad. Practically the whole region (over 1,500,000 sq. miles) is in the Fr. sphere of influence. Its northern edge is the hinterland of Morocco, Algeria, Tunis, and Tripoli. S. of Algeria and Morocco and in the centre are important mountain ranges, seamed with valleys in which water is to be found below the surface; mts. of the central plateau—Ahaggar—are covered with snow three months of the year, and reach a height of over 8000 ft. The S. is crossed by many caravan routes, which follow the oases; routes from Mirzuk in Tripoli to Lake Chad and from Morocco to Cairo *via* Tafilat are of particular importance.

A process of desiccation or drying is in progress over whole area of S.; extreme heat by day and excessive cold by night, combined with the great evaporation that takes place, tend to break up the rock and thus to produce fragments which the wind reduces to sand. Vegetation is scarce except in the oases, in some of which it attains great luxuriance, fig trees and date palms being the principal trees. The camel is principal animal used by the nomads of the desert, owing to its powers of going for a long period without water; but horses, cattle, and sheep are raised in many of the valleys.

The inhabitants are chiefly Berbers and Arabs, all of whom profess Muhammadanism. It is a mistake to suppose that the S. as a whole lies below sea-level, although lagoons exist in N. Algeria, which have been surveyed with a view to forming them into an inland sea by connecting them with Mediterranean. A trans-Saharan railway has been proposed. Pop. (estimated) 2¾ millions.

Visoher, *Across the Sahara* (1910).

SAHARANPUR (29° 58′ N., 77° 35′ E.), district,

Meerut division, United Provinces, India. Pop. 1,050,000. Capital, SAHARANPUR. Pop. (1911) 66,254.

SAHIB, title meaning 'Sir' or 'Mr.' used by Ind. natives addressing Europeans.

SAHYADRI (15° N., 74° 20′ E.), mountain range, Bombay, India (Western Ghats).

SAIDAPET (13° 1′ N., 80° 15′ E.), town, Chingleput district, Madras, India. Pop. 15,000.

SAIGA (*Saiga tartarica*), an antelope found on the steppes of Europe and Asia, with large inflated nose, and yellow, lyre-shaped horns; a prehistoric inhabitant of Britain.

SAIGON (10° 50′ N., 106° 48′ E.), capital, French Indo-China, on Saigon; commercial centre; exports rice. Pop. 64,845.

SAILCLOTH is made from flax, cotton, or hemp; yarn is washed and boiled to purity, 10 % weight lost in process, then spun, generally with double warp; pieces are usually 24 in. wide by 40 yds. in length; sixteen qualities made; more popularly known as 'canvas.'

SAINFOIN, SAINTFOIN (*Onobrychis sativa*), plant, order Leguminosæ; pink flowers; one-seeded pods; excellent fodder.

SAINT (Latin *sanctus*, 'holy'), title given to great Christians, especially martyrs; in New Testament means sanctified ones rather than (in our sense) saintly; from about VI. cent. specially applied as now to the dead. Honour paid to s's is an important side of Catholic piety, but is generally rejected as superstitious by Protestants. In R.C. Church the dead are *canonised*, i.e. officially entitled saints.

ST. AFFRIQUE (43° 57′ N., 2° 53′ E.), town, on Sorgues, Aveyron, France; woollen cloths. Pop. 6500.

ST. ALBANS (51° 46′ N., 0° 21′ W.), Rom. *Verulamium*, city, Hertfordshire, England; seat of a bp. since 1077; the cathedral, formerly abbey church, is a famous specimen of Norman architecture, and contains some notable monuments and brasses; in St. Michael's church is the tomb of Lord Chancellor Bacon; silk and straw-plait manufactures; scene of two battles in the Wars of the Roses (1455 and 1461). Pop. (1911) 18,132.

ST. ALBANS (44° 47′ N., 73° 5′ W.), city, summer resort, Vermont, U.S.A.; exports dairy produce. Pop. (1910) 6381.

ST. ALDEGONDE, PHILIPS VAN MARNIX VAN (1538–98), Dutch Protestant; fled from Flanders, 1567; joined republicans, 1570; blamed for surrender of Antwerp, 1585; writings (theology and sacred verse) important in vernacular lit.

ST. ALDWYN, 1ST VISCOUNT, MICHAEL EDWARD HICKS BEACH (1837–), Brit. statesman (Conservative Free Trader); pres. of Board of Trade, 1888–92; Chancellor of Exchequer, 1895–1902; reduced charge for National Debt and increased taxation for war; raised to peerage, 1905.

ST. AMAND-LES-EAUX (50° 27′ N., 3° 24′ E.), town, at junction of Scarpe and Elnou, Nord, France; mineral springs. Pop. (commune) 14,600.

ST. AMAND-MONT-ROND (46° 43′ N., 2° 31′ E.), town, on Cher, France. Pop. 8600.

ST. ANDREWS (56° 20′ N., 2° 48′ W.), royal burgh, E. coast of Fife, Scotland; the 'Mecca' of golfers. Univ. is oldest in Scotland (founded, 1411; St. Salvator's Coll., 1455; St. Leonard's, 1512; St. Mary's, 1537). There is a ruined cathedral dating from XII. cent., and remains exist of the old church of St. Regulus, generally ascribed to X. cent. The castle, or Bishop's Palace, is also in ruins, and traces of an old monastery remain. Madras College was founded by Dr. Andrew Bell (*q.v.*). St. A. figures prominently in Scot. history, especially in religious troubles; long the Scot. ecclesiastical metropolis. Pop. (1911) 7851.

Lang, *St. Andrews* (1893).

ST. ARNAUD (36° 37′ S., 143° 16′ E.), town, Victoria, Australia; gold-mining and agricultural district. Pop. 3850.

ST. ASAPH (53° 16′ N., 3° 26′ W.), cathedral city, Flintshire, Wales; bp.'s see.

ST. AUGUSTINE (29° 51′ N., 81° 30′ W.), city, on peninsula of Matanzas and San Sebastian Rivers; seaport, winter resort; capital, St. John's County, Florida, U.S.A.; chief building is old Span. fort of San Marco, now Fort Marion; settled by Spaniards, 1565. Pop. (1910) 5494.

ST. AUSTELL (50° 21′ N., 4° 48′ W.), market town, near Eng. Channel, Cornwall, England; china-clay works. Pop. (1911) 3365.

ST. BARTHOLOMEW, ST. BARTHÉLEMY (17° 50′ N., 62° 45′ W.), small island, Lesser Antilles, Fr. W. Indies. Pop. 3000. Capital, Gustavia.

ST. BENOÎT-SUR-LOIRE (47° 48′ N., 2° 17′ E.), village, on Loire, Loiret, France; fine abbey church.

ST. BERNARD, GREAT (45° 51′ N., 7° 11′ E.), Alpine pass (8130 ft.), leading from Martigny, Valais, Switzerland, to Aosta, Italy; its hospice was founded by St. Bernard de Menthon in 962.

ST. BERNARD, LITTLE (45° 40′ N., 6° 51′ E.), Alpine pass (7178 ft.), leading from Bourg St. Maurice, in Isère valley, France, to Aosta, Italy.

ST. BERTRAND-DE-COMMINGES (43° 1′ N., 0° 34′ E.), village, Haute-Garonne, France; Rom. *Lugdunum Covenarum*; cathedral.

ST. BRICE'S DAY, MASSACRE OF, Nov. 13, 1002; device of Ethelred the Unready to get rid of Danes, whom it merely rendered ferocious; the massacre fell on day of **St. Brice** (fl. V. cent.), bp. of Tours.

ST. BRIEUC (48° 33′ N., 2° 45′ W.), town, on Eng. Channel, Côtes-du-Nord, France; bp.'s see; iron and steel works Pop. 23,500.

ST. CATHARINES (43° 11′ N., 79° 17′ W.), city, Ontario, Canada; iron manufactures; mineral springs. Pop. (1911) 12,484.

ST. CHAMOND (45° 30′ N., 4° 33′ E.), town, on Gier, Loire, France; coal mines; silk manufactures. Pop. 14,600.

ST. CHARLES (38° 50′ N., 90° 40′ W.), city, on Missouri, Missouri, U.S.A.; boots and shoes; carriages. Pop. (1910) 9437.

ST. CHRISTOPHER, see ST. KITTS.

ST. CLAIR.—(1) (42° 28′ N., 82° 50′ W.) lake, between Michigan, U.S.A., and Ontario, Canada; discharges by Detroit into Lake Erie. (2) (42° 45′ N., 82° 37′ W.) river, Canada, flows from Lake Huron; enters Lake St. Clair. (3) (40° 45′ N., 76° 12′ W.) town, on Mill Creek, Pennsylvania, U.S.A.; coal mines. Pop. (1910) 6455.

ST. CLAUDE (46° 25′ N., 5° 52′ E.), town, on Bienne, Jura, France; cathedral; manufactures toys. Pop. 11,100.

ST. CLOUD.—(1) (48° 50′ N., 2° 18′ E.) town, Seine-et-Oise, France, 1 mile W. of Paris; favourite residence of kings of France; Sèvres porcelain. Pop. 8600. (2) (45° 35′ N., 94° 20′ W.) city, on Mississippi, Minnesota, U.S.A.; flour-mills; granite quarries. Pop. (1910) 10,600.

ST. CROIX, SANTA CRUZ (17° 44′ N., 64° 41′ W.), island, Dan. W. Indies; capital, Christianstad; chief product, sugar. Pop. 18,000.

ST. CYR-L'ÉCOLE (48° 46′ N., 2° 3′ E.), town, Seine-et-Oise, France; seat of military school. Pop. 3800.

ST. DAVIDS (51° 53′ N., 5° 16′ W.), town, Pembrokeshire, Wales; has large cathedral (dating from XII. cent., but several times added to and restored in different architectural styles). Ruins of the bp.'s palace and of St. Mary's Coll. remain. The bishopric was held by Laud in 1621–27. Pop. (reg. sub-dist.) (1911) 5398.

ST. DENIS (48° 56′ N., 2° 21′ E.), town, on Seine, Seine, France; its abbey church, founded by Dagobert I., in VII. cent., became burial-place of kings of France; manufactures chemicals; scene of victory of Fr. Catholics over Huguenots, 1567. Pop. (1911) 71,759.

ST. DIÉ (48° 17′ N., 6° 57′ E.), town, on Meurthe, Vosges, France; bp.'s see; textiles. Pop. 22,000.

ST. DIZIER (48° 38′ N., 4° 58′ E.), town, on Marne, Haute-Marne, France; iron manufactures. Pop. 14,800.

ST. DOMINGO, see HAITI, SANTO DOMINGO.

ST. ELMO'S FIRE, see CASTOR AND POLLUX.

ST. ÉMILION (44° 55′ N., 0° 10′ W.), town, Gironde, France; wines. Pop. 3500.

ST. ÉTIENNE (45° 26′ N., 4° 23′ E.), town, capital, Loire, France; industrial centre; coalfields; manufactures fire-arms, ribbons; has school of mines and palace of arts. Pop (1911) 148,656.

ST. EUSTATIUS (17° 29′ N., 62° 55′ W.), volcanic island, Dutch W. Indies; capital, Orangetown.

ST. FLORENTIN, Roman *Castrodunum* (48° N., 3° 45′ E.), town, on Armance, Yonne, France.

ST. FLOUR (45° 2′ N., 3° 6′ E.), town, Cantal, France; cathedral; woollens. Pop. 5100.

ST. GALL.—(1) (47° 25′ N., 9° 23′ E.) canton, Switzerland, bordering Rhine and Lake of Constance; hilly and mountainous; chief industries, cattle-rearing and cotton-spinning; prevailing language, German. Pop. (1910) 301,141. (2) (47° 25′ N., 9° 23′ E.) capital of above; manufactures embroidery and cotton goods; bp.'s see; cathedral and large library; famous VII.-cent. Benedictine abbey, suppressed, 1805, was for long a centre of learning; joined the Swiss Confederacy, 1454. Pop. (1910) 37,657.

ST. GAUDENS (43° 6′ N., 0° 43′ E.), town, Haute-Garonne, France. Pop. (commune) 7100.

ST. GAUDENS, AUGUSTUS (1848–1907), the greatest of Amer. sculptors; officer of the Legion of Honour.

ST. GEORGE (d. 303), tutelary saint of England, Portugal, and Aragon, and patron saint of chivalry in Europe in mediæval times. Reputed native of Cappadocia; rebuked Diocletian for his persecution of Christians; was arrested, tortured, and killed at Nicomedia. Dragon tradition dates from VI. cent.

ST. GERMAIN-EN-LAYE (48° 54′ N., 2° 4′ E.), town, on Seine, near Paris, France; favourite summer resort; fine forest; historic castle. Here James II. died (1701) in exile. Treaty of St. G., 1570, made peace between Catholics and Huguenots. Pop. 17,300.

ST. GERMANS (50° 24′ N., 4° 19′ W.), small town, Cornwall, England. Pop. (rural dist.) (1911) 12,274.

ST. GILLES (43° 42′ N., 4° 27′ E.), town, ancient *Vallis Flaviana*, Gard, France; noted abbey church. Pop. 6300.

ST. GIRONS (42° 59′ N., 1° 9′ E.), town, Ariège, France. Pop. (commune) 6000.

ST. GOAR (50° 15′ N., 7° 35′ E.), town, Rhine prov., Prussia, on Rhine.

ST. GOTHARD PASS, see ALPS.

ST. HELENA (15° 56′ S., 5° 42′ W.), Brit. island, S. Atlantic, 1200 miles off W. coast of Africa; area, 47 sq. miles; of volcanic origin; mountainous and rocky; highest point, 2700 ft.; healthy climate; capital and port, Jamestown (*q.v.*); coaling and cable station; cattle, fruit, vegetables, flax, lace; dwindling trade since Suez Canal opened. St. H. was discovered by Portuguese, May 21, 1502; held temporarily by Dutch, XVII. cent.; finally acquired by Brit. East India Co., 1673; rendered famous as scene of Napoleon's exile, at Longwood, 1816–21; Crown Colony, 1834; Boer prisoners sent here, 1900, during South African War; garrison (island's chief support) withdrawn, 1905–6; administered by gov. Pop. (1911) 3520.

Jackson, *St. Helena, the Historic Island* (1903).

ST. HELENS (53° 27′ N., 2° 44′ W.), town, Lancashire; glass-works. Pop. (1911) 96,566.

ST. HELIER (49° 11′ N., 2° 6′ W.), seaport, resort; capital of Jersey, Channel Islands. Pop. 31,000.

SAINT HILAIRE, see BARTHÉLEMY.

ST. HUBERT (50° 1′ N., 5° 3′ E.), town, Luxemburg, Belgium; noted abbey church. Pop. 3500.

ST. HYACINTHE (45° 37′ N., 72° 58′ W.), city, on Yamaska, capital, St. Hyacinthe County, Quebec, Canada; woollens. Pop. (1911) 9797.

ST. IGNATIUS (*c.* 110), see APOSTOLIC FATHERS.

ST. IGNATIUS'S BEANS, see IGNATIUS'S BEANS.

ST. INGBERT (49° 18′ N., 7° 5′ E.), town, Bavaria, Germany; collieries; iron- and steel-works. Pop. (1910) 17,278.

ST. IVES (50° 12′ N., 5° 30′ W.), seaport, watering-place, on St. Ives Bay, Cornwall, England; winter resort; pilchard and herring fisheries. Pop. (1911) 7179.

ST. IVES (52° 19′ N., 0° 5′ W.), market town, on Ouse, Huntingdonshire, England; agricultural trade. Pop. (1911) 3015.

ST. JEAN-D'ANGÉLY (45° 57′ N., 0° 29′ W.), town, capital, Charente-Inférieure, France; remains of Benedictine abbey; trade in wine. Pop. 7100.

ST. JEAN-DE-LUZ (42° 23′ N., 1° 39′ W.), town, sea-bathing resort, Basses-Pyrénées, France; fisheries. Pop. 3200.

ST. JOHN.—(1) (18° 20′ N., 64° 45′ W.) island of Virgin group, Danish W. Indies. Pop. 6500. (2) (45° 17′ N., 66° 2′ W.) seaport city, capital St. John County, at mouth of St. John, New Brunswick, Canada; fishing centre; shipbuilding; cotton manufactures. Pop. (1911) 42,511.

ST. JOHN (45° 20′ N., 66° 10′ W.), river, New Brunswick, Canada; flows E.; enters Bay of Fundy.

ST. JOHN, HENRY, see BOLINGBROKE.

ST. JOHN, KNIGHTS OF, see HOSPITALLERS.

ST. JOHN, OLIVER (1598–1673), Eng. statesman and lawyer; defended Hampden, 1638; solicitor-gen., 1641; supported parliamentarians as member of Short and Long Parliaments.

ST. JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF THE HOSPITAL OF, see HOSPITALLERS.

ST. JOHN'S (47° 36′ N., 52° 54′ W.), fortified city, seaport, capital, Newfoundland; exports fish; manufactures seal-oil. Pop. (1911) 32,292.

ST. JOHN'S (45° 19′ N., 73° 19′ W.), town, port entry, capital St. John's County, Quebec, Canada, on Richelieu; trade in lumber. Pop. 6500.

ST. JOHN'S WORT (*Hypericum*), genus of plants, order Hypericineæ; flowers yellow; easily distinguished by lemon-like smell when leaves are crushed; formerly worn as charm against evil and used medicinally.

SAINT JOHNSBURY (44° 24′ N., 72° W.), town, on Passumpsic, Vermont, U.S.A.; large scale factory. Pop. (1910) 6695.

ST. JOHNSTOUN, old name for PERTH (*q.v.*).

SAINT JOSEPH (42° 5′ N., 86° 30′ W.), city, summer resort, on Lake Michigan, Michigan, U.S.A.; fruit-growing centre. Pop. (1910) 5936.

SAINT JOSEPH (39° 49′ N., 94° 52′ W.), city, on Missouri, port of entry, capital, Buchanan County, Missouri, U.S.A.; important railway centre; slaughtering and meat-packing industries; iron manufactures. Pop. (1910) 77,403.

ST. JUNIEN (45° 54′ N., 0° 54′ E.), town, on Vienne, Haute-Vienne, France; gloves. Pop. (commune) 11,600.

ST. JUST (50° 8′ N., 5° 42′ W.), town, Cornwall, England; tin and copper mines. Pop. (1911) 5753.

ST. KILDA.—(1) (57° 49′ N., 8° 34′ W.) rocky island, Outer Hebrides, Scotland; circumference, 7 miles. (2) (37° 53′ S., 145° 2′ E.) watering-place, southern suburb of Melbourne, Australia. Pop. 21,500.

ST. KITTS, ST. CHRISTOPHER (17° 18′ N., 62° 43′ W.), island, Lesser Antilles, Brit. W. Indies; area, 65 sq. miles; mountainous; chief product, sugar. Pop. (1911) 26,283. Capital, Basseterre.

ST. LAWRENCE (48° N., 69° W.), great river of Canada, carrying off surplus waters of great lakes; length from Lake Ontario to opening into Gulf of St. L., *c.* 750 miles; gives access to navigation of some 2200 miles to head of the Lakes. Chief tributaries from N. are Ottawa, St. Maurice, Saguenay, Portneuf, Betsiamites, Bustard, and Manicouagan; and from S., Richelieu and Chaudière. Eight important canals

have been constructed to avoid the falls and rapids, and of these the Welland Canal, which avoids Niagara Falls, is most famous.

Browne, *The St. L. River* (1905); Dawson, *St. L. Basin and its Borderlands* (1905).

ST. LEGER, SIR ANTHONY (1496–1559), Brit. statesman; as Lord Deputy of Ireland, 1540–51, 1553–56, he continued introduction of Eng. land tenure; author of Act by which Henry VIII. was declared king of Ireland.

ST. LEONARDS, see HASTINGS.

ST. LIZIER-DE-COUSERANS (43° 1′ N., 1° 9′ E.), village, ancient *Lugdunum Consoronorum*, Ariège, France; contains cathedral and episcopal palace.

ST. LÔ (49° 6′ N., 1° 5′ W.), town, on Vire, capital Manche, France; manufactures cloth. Pop. 12,300.

ST. LOUIS (38° 36′ N., 90° 18′ W.), city, Missouri, U.S.A. Founded by Fr. traders in 1764; was included in the territories ceded to Spain in 1762, retransferred to France in 1800, and sold to U.S. in 1804 (see LOUISIANA PURCHASE); was Federal stronghold during Civil War; damaged by storms and fire in 1896; site of great international exhibition held during spring and summer of 1904 to commemorate Louisiana Purchase.

St. L. is principal city of Mississippi valley, and stands on right bank of river a few miles below its junction with Missouri; has frontage of 19 miles along river, which is here crossed by two magnificent bridges of 800 yds. in length. Town is regularly laid out, with fine streets and beautiful parks; public buildings include the Four Courts, Court-House, Cotton Exchange, Merchants' Exchange, fine art museum, public library, and various charitable institutions; seat of Washington Univ., St. Louis R.C. Univ., and Christian Brothers' R.C. Coll. St. L. is great trading centre both by railway and river, and is leading tobacco market of the world; important grain and cotton market; has meat-packing establishments, printing works; manufactures machinery, beer, flour, boots, etc. Pop. (1910) 687,029.

ST. LOUIS (16° N., 16° 30′ W.), town, on Senegal, capital, French Senegal, W. Africa; active commerce; contains cathedral and governor's palace. Pop. 25,000.

ST. LUCIA (13° 50′ N., 60° 53′ W.), largest and northernmost of Brit. Windward Islands, W. Indies; several times changed hands between French and English, finally coming to English in 1814; area, 233 sq. miles; surface hilly and forested; famed for beautiful scenery; capital, Castries; produces sugar, cocoa, tobacco, spices. Pop. (1911) 48,637.

ST. MACAIRE (44° 34′ N., 0° 12′ W.) (ancient *Ligena*), small town, on Garonne, Gironde, France; interesting church.

ST. MAIXENT (46° 23′ N., 0° 11′ W.), town, Deux-Sèvres, France; woollen hosiery. Pop. 5500.

ST. MALO (48° 39′ N., 2° 1′ W.), strongly fortified seaport, Ille-et-Vilaine, France; built on rocky islet communicating with mainland by causeway, at mouth of Rance, Brittany; episcopal see, has cathedral dating in part from XII. cent.; exports cereals, vegetables, fruit, eggs, wine, meat. Pop. 10,600.

ST. MARTIN (18° N., 63° W.), island, Lesser Antilles, W. Indies, divided between France and Netherlands; exports salt. Pop. 7000.

ST. MARYS (40° 33′ N., 84° 20′ W.), city, on St. Marys, Ohio, U.S.A.; woollen and lumber manufactures. Pop. (1910) 5732.

ST. MARY'S LOCH (55° 29′ N., 3° 12′ W.), lake, Selkirkshire, Scotland; length, 3 miles.

ST. MAUR-DES-FOSSÉS, ancient *Castra Bagandurum*, S.E. suburb of Paris. Pop. (1911) 33,852.

ST. MAUR-SUR-LOIRE (47° 7′ N., 0° 37′ W.), village, Maine-et-Loire, France.

ST. MAWES (50° 10′ N., 5° W.), fishing town, Cornwall, England.

ST. MICHAEL'S, SÃO MIGUEL (37° 40′ N., 25° 30′ W.), largest island of the Azores; volcanic; contains several hot springs; exports wine, fruit. Pop. *c.* 130,000. Capital, Ponta Delgada.

ST. MICHAEL'S MOUNT, ancient *Ictis* (50° 8′ N., 5° 29′ W.), rock, in Mounts Bay, Cornwall, England.

ST. MIHIEL (48° 53′ N., 5° 34′ E.), town, on Meuse, Meuse, France. Pop. 5600.

ST. MORITZ (46° 30′ N., 9° 30′ E.), village, Grisons, Switzerland; mineral springs; centre for winter sports.

ST. NAZAIRE (47° 16′ N., 2° 12′ W.), seaport, on Loire, Loire-Inférieure, France; shipbuilding yards. Pop. (1911) 38,267.

ST. NEOTS (52° 14′ N., 0° 16′ W.), town, on Ouse, Huntingdonshire, England. Pop. (1911) 4171.

ST. NICOLAS (51° 10′ N., 4° 7′ E.), town, E. Flanders, Belgium; cottons, woollens; capital, ancient district of Waes. Pop. (1910) 34,774.

ST. NICOLAS (48° 38′ N., 6° 16′ E.), town, on Meurthe, Meurthe-et-Moselle, France; salt-works. Pop. 5600.

ST. OMER (50° 45′ N., 2° 15′ E.), town, on Aa; capital, Pas de Calais, France; fine Gothic cathedral; manufactures textiles; taken by Louis XIV. in 1677. Pop. 21,500.

ST. OUEN, town on Seine department, Seine, France; suburb of Paris; river-port. Pop. (1911) 41,904.

ST. PANCRAS, parliamentary and metropolitan borough, in N. of London, England. Pop. (1911) 218,453.

ST. PATRICK, see PATRICK, ST.

ST. PAUL (38° 42′ S., 77° 34′ E.), volcanic island in Indian Ocean, belonging to France.

ST. PAUL (44° 55′ N., 93° W.), capital, Minnesota, U.S.A., on Mississippi near its junction with Minnesota R.; founded by Fr. priest, 1840; capital, 1849; damaged by terrible hurricane, 1904. Important railway and transit centre for upper Mississippi basin and Red R. Valley; trades in furs, clothing, boots; meat-packing and butter-making carried on. St. P. is seat of Macalister Coll. and Hamline Univ.; has great number of educational institutions. There is a R.C. cathedral. Public buildings include State Capitol and city hall. Pop. (1910) 214,744.

ST. PAUL DE LOANDA, see LOANDA.

ST. PAUL'S CATHEDRAL, centre of life of mediæval London; invocation given at time of its foundation, perhaps on site of Rom. temple of Diana, by Ethelbert of Kent between 601 and 624; new building constructed after Conquest; finished early XIV. cent., and showed Norman, Early Eng., and Decorated work; Perpendicular additions; spire fell, 1561; destroyed in Great Fire, 1666. Rebuilt by Christopher Wren. For present cathedral, see ARCHITECTURE.

ST. PAUL'S ROCKS (0° 55′ N., 29° 20′ W.), group of islets, in Atlantic, E. of S. America.

ST. PETER (44° 20′ N., 93° 55′ W.), city, on Minnesota, capital, Nicollet County, Minnesota, U.S.A.; trade in lumber and grain. Pop. (1910) 4176.

ST. PETER PORT (49° 32′ N., 2° 38′ W.), seaport, watering-place, capital, Guernsey, Channel Islands. Pop. 18,600.

ST. PETERS, suburb of SYDNEY (*q.v.*).

ST. PETERSBURG (59° N., 30° E.), government, Russia, at head of Gulf of Finland; country generally flat; much covered by marshes and forests; has some dairy-farming, fishing, and cotton-weaving; chief export, timber. Pop. (1910) 2,882,900.

ST. PETERSBURG, PETERSBURG (59° 56′ N., 30° 26′ E.), capital of Russia, at junction of Neva and Gulf of Finland; a modern city with broad streets, beautiful parks, and striking edifices, built on a peninsula and several islands, formed by division of Nova into numerous branches before flowing into Gulf of Finland. Greater part of St. P. stands on mainland; innumerable stone, wooden, and floating bridges connect the different parts of the city; chief features—cathedrals of St. Isaac and Kazan; Winter, Marble, and Anitchkoff palaces; Hermitage (rich art collection), Admiralty House, monument of Peter the Great,

Royal Theatre, museums, univ., imperial public library, fortress of St Peter and St. Paul (now state prison), Nevsky Prospect (principal street), and fine surroundings with several imperial palaces; great sledge traffic during winter; seat of government and Duma, also revolutionary centre.

Leading industries are cotton textiles, machinery, metals, leather, shipbuilding, chemicals, printing, soap, sugar refineries, breweries, tobacco, etc. St. P. was founded by Peter the Great, 1703; Peace of St. P. between Russia and Prussia, 1762. Great fires, 1736, 1780. Pop. (1910) 1,907,708. See RUSSIA.

ST. PIERRE, see RÉUNION.

ST. PIERRE (46° 46′ N., 56° 14′ W.), rocky island, in Atlantic, S. of Newfoundland, forming with Miquelon Islands the Fr. colony of St. Pierre and Miquelon; fisheries; connected by cable with France and U.S.A. Pop. (resident) 6700.

ST. POL-DE-LÉON (48° 41′ N., 3° 59′ W.), town, Finistère, France; fine XIII.-cent. cathedral. Pop. (commune) 8300.

SAINT PRIVAT (49° 12′ N., 6° E.), village, Lorraine, Germany.

ST. QUENTIN (49° 50′ N., 3° 17′ E.), town, Aisne, France; here French were defeated by Spaniards in 1557, and here in 1871 the Germans under Goeben defeated French under Faidherbe. St. Q. has fine Gothic church dating from XII. cent., and town hall dating from XIV. cent.; manufactures cottons, woollens, and other textiles, paper, leather. Pop. (1911) 55,571.

ST. REMY (43° 47′ N., 4° 50′ E.), town, Bouches-du-Rhône, France; stone-quarries. Pop. 6300.

ST. RIQUIER (50° 10′ N., 1° 46′ E.), town, Somme, France; noted abbey church.

ST. SERVAN (48° 38′ N., 2° W.), seaport, watering-place, on Rance, Ille-et-Vilaine, France. Pop. 10,000.

ST. SEVER (43° 40′ N., 0° 25′ W.), town, on Ardour, Landes, France. Pop. (commune) 4700.

ST. STEPHENS, see WESTMINSTER.

ST. SWITHIN, see SWITHUN, ST.

ST. THOMAS (0° 20′ N., 6° 40′ E.), volcanic island belonging to Portugal, in Gulf of Guinea; first settled by Portuguese, *c.* 1485; occupied by Dutch, 1641–44, when restored to Portugal. Area, *c.* 380 sq. miles; surface mountainous; capital, St. T.; produces cacao, coffee, rubber, cinchona. Pop., with San Principe, with which it forms province of Portugal, 68,221.

ST. THOMAS (18° 20′ N., 65° W.), island, Virgin group, Danish W. Indies; surface hilly. Pop. (1911) 10,684. Capital, Charlotte Amalie, is fine harbour and coaling station.

ST. THOMAS (42° 49′ N., 81° 16′ W.), city, capital Elgin County, Ontario, Canada; railway centre; railway workshops; car-works. Pop. (1911) 14,054.

ST. TROND (50° 48′ N., 5° 13′ E.), town, Limburg, Belgium; breweries, distilleries. Pop. 16,500.

ST. VINCENT (13° 25′ N., 61° 11′ W.), island, Windward group, Brit. W. Indies; mountainous; chief export, sugar. Capital, Kingstown; ceded by France to Britain in 1763. Pop. (1911) 41,877.

ST. VINCENT, BATTLE OF, naval battle between England and Spain, 1797. Sir John Jervis, Eng. admiral, attacked Span. fleet of nearly twice as many, but ill-manned, ships; victory due to Nelson boldly taking initiative; first great success against Napoleonic party.

ST. VINCENT, JOHN JERVIS, EARL OF (1735–1823), Eng. admiral; commander-in-chief of West Indies fleet, 1793–95, assisting in conquest of Martinique, etc.; commander-in-chief in Mediterranean, 1795–99; won great victory off Cape St. Vincent, 1797, largely owing to Nelson's independent action, prevented Fr. and Span. invasion of England; cr. admiral of the fleet, 1821.

Tucker, *Memoirs* (1844).

ST. VITUS'S DANCE, see under CHOREA.

ST. YRIEIX (45° 31′ N., 1° 12′ E.), town, Haute-Vienne, France; kaolin quarries. Pop. (commune) 8000.

STE ANNE DE BEAUPRÉ (47° 5′ N., 70° 55′ W.), pilgrimage resort, on St. Lawrence, Quebec, Canada.

SAINTE-BEUVE, CHARLES AUGUSTIN (1804–69), Fr. critic and guide to the Romantic movement; b. Boulogne-sur-Mer; started new school of criticism based on study of history and all sources of information bearing on his subject; produced some 300 *portraits* of literary people under various titles. His works include mediocre poetry, a novel, *Volupté* (1834); *Tableau de la Poésie française au XVI. siècle* (1828); *Histoire de Port-Royal* (1840); *Portraits Littéraires* (1844); *Causeries du Lundi* and *Nouveaux Lundis* (1849–69); *Chateaubriand et Son Groupe* (1860). These afford delightful reading, though later generations think that in them gossip overpowers criticism. S. was Hugo's friend and Ronsard's champion; admitted to *Académie,* 1845; prof. at Collège de France, 1854; Senator, 1865; perhaps greatest modern literary critic.

Harper, *Sainte-Beuve* (1909).

SAINTE-CLAIRE DEVILLE, ÉTIENNE HENRI (1818–81), Fr. chemist; discovered toluene, nitric anhydride, sodium method for aluminium; authority on 'thermal dissociation.'

SAINTE-PALAYE, JEAN BAPTISTE LA CURNE DE (1697–1781), Fr. antiquary; member of the *Académie des Inscriptions* at twenty-seven; compiled more than 4000 notices of MSS. concerning Fr. language and institutions.

SAINTES (45° 44′ N., 0° 38′ W.), ancient *Mediolanum,* town, on Charente, Charente-Inférieure, France; cathedral; iron foundries; noted Rom. remains; was capital of the Santones and later of the old province Saintonge. Pop. 19,500.

SAINT-ÉVREMOND, SEIGNEUR DE, CHARLES MARGUETEL DE SAINT-DENIS (1613–1703), Fr. author; served in Thirty Years War, etc., till age of forty-eight; wrote *La Comédie des Académistes* (1644), a clever satire on the forthcoming dictionary of the Fr. Academy.

SAINT-HILAIRE, AUGUSTE DE (1799–1853), Fr. botanist, anthropologist, and Brazilian explorer.

SAINT-JUST, ANTOINE-LOUIS-LÉON DE RICHEBOURG DE (1767–94), Fr. revolutionary leader, saintly, brave, fanatic; despite his youth, perhaps chiefly responsible for Reign of Terror; pres. of Convention, 1793; guillotined with Robespierre: powerful orator; author of *Esprit de la Revolution.*

SAINT-MARTIN, LOUIS CLAUDE DE (1743–1803), Fr. philosopher and mystic; held that materialism is overcome by deeper insight into the human mind.

SAINTONGE (45° 30′ N., 0° 35′ W.), ancient province, France; capital, Saintes; now forms greater part of department Charente-Inférieure.

SAINT-PIERRE, JACQUES HENRI BERNARDIN DE (1737–1814), Fr. writer; in navy and army, and finally director of the Jardin des Plantes, Paris; Rousseau's last friend and follower; best-known work, novel, *Paul et Virginie,* 1787.

SAINT-PRIEST, COMTE DE, FRANÇOIS EMMANUEL GUIGNARD (1735–1821), Fr. royalist *émigré*; distinguished as soldier and ambassador; member of Necker's administration, 1788; Sec. of Household and Minister of Interior, 1789; bitterly opposed democrats.

SAINTS, BATTLE OF THE, BATTLE OF DOMINICA, April 12, 1782; named from Saints' Islands between Dominica and Guadaloupe. Fr. fleet, in aid of Amer. rebels, was sailing to attack Jamaica when it was intercepted by Eng. admiral, Rodney, who won important victory.

SAINT-SAËNS, CHARLES CAMILLE (1835–), Fr. composer, organist, and pianist. He early made a name by his symphonic poems and his *Danse Macabre,* which he has followed by notable works in several departments. Of his operas, *Samson and Delilah* has received chief attention.

SAINTSBURY, GEORGE EDWARD BATEMAN (1845–), Eng. critic and literary historian; prof. of Eng. Lit. and Rhetoric, Edinburgh Univ. (1895–); authority on prosody and prose rhythm.

SAINT-SIMON, COMTE DE, CLAUDE HENRI DE ROUVROY (1760–1825), founder of social creed of St. Simonism; served in America against England, showing energy and valour; as *philosophe* greeted outbreak of Fr. Revolution with enthusiasm; during brief imprisonment soul of ancestor Charlemagne appeared and predicted for him as great a career as philosopher as his own as conqueror; fell into bitter poverty; mutilated himself by attempt at suicide, 1823; last work, *Nouveau Christianisme*, was foundation of XIX.-cent. socialism.

Booth, *Saint-Simon and Saint-Simonism* (1871).

SAINT-SIMON, DUC DE, LOUIS DE ROUVROY (1675–1755), Fr. author; lived for twenty-five years at courts of Louis XIV. and Louis XV., but belongs to the end of reign of Louis XIV.; famous *Mémoires*, from notes gathered day by day, are marked by some partiality and jealousy, but he knows how to use words graphically.

SAINT-WANDRILLE, village, Seine-Inférieure, France, 30 m. N.W. of Rouen; ruins of Benedictine Abbey.

SAIS (30° 57′ N., 30° 47′ E.), ancient city, in delta, on Rosetta arm of Nile, Egypt.

SAISSET, BERNARD (d. *c.* 1314), Fr. ecclesiastic, abbot, then bp. of Pamiers; defender of Languedoc feeling against Fr. domination; quarrelled with Philip IV.

SAITH, name for COAL FISH (*q.v.*).

SAJO, TOBA (1053–1140), Jap. artist; noted for pictures of animals in violent action.

SAKAI, aboriginal tribes of the Malay peninsula. They are intelligent and receptive of civilisation; sharp-featured, with long wavy hair and light brown skins.

SAKHALIN, SAGHALIEN (50° N., 143° E.), long, narrow island in N. Pacific, E. of Siberia, the N. half belonging to Russia and the S. to Japan; traversed N. to S. by forest-clad mountain ranges; climate severe; about one-half of inhabitants are Russian convicts; natives consist of Gilyaks, Orochons, and Ainus; coal-mines; some fishing and hunting. Pop. (1910) 13,800.

SAKI MONKEYS (*Pithecia*), a genus of New World Monkeys of family *Cebidæ* (q.v. under PRIMATES), with non-prehensile tails, and projecting incisor teeth; occur especially in Amazon Valley.

SAKURA-JIMA (31° 40′ N., 130° 40′ E.), island of Japan, in Gulf of Kagoshima; hot springs.

SAL AMMONIAC, AMMONIUM CHLORIDE (NH_4Cl), prepared by neutralising ammonia (from gasworks) with hydrochloric acid, $NH_3+HCl=NH_4Cl$. A fibrous mass, or white, crystalline powder; sharp, saline taste; solubility at 10° C.=32·8 : 100 water; sublimes when heated, and vapour dissociates. Used in medicine, dyeing, soldering, and in the laboratory.

SAL PRUNELLA, fused nitrate.

SAL VOLATILE, see AMMONIA.

SALA, GEORGE AUGUSTUS (1828–95), Brit. journalist and novelist; long connected with the *Daily Telegraph* as special correspondent and leader-writer.

SALADIN, SALAH-ED-DIN-YUSSUF-IBN-AYUB (1138–93), sultan of Egypt and Syria; founder of Ayubite house; aided Noureddin in attacks on Fatimites of Egypt; as grand-vizier defeated crusaders of Syria and Palestine; after Noureddin's death, 1174, became sultan of Egypt and Syria; won great victory over Christians at Tiberias, captured Jerusalem, etc., 1187; defeated by Richard I. of England, 1191–92; praised by western invaders as possessor of every quality of mediæval knight-errant.

Reinaud, *Life of S.* (in French, 1874); Sir Walter Scott, *The Talisman.*

SALAMANCA,—(1) (40° 45′ N., 6° W.) province, in ancient Leon, Spain; mountainous in S. Pop. (1910) 330,633. (2) (40° 59′ N., 5° 39′ W.) old walled town, capital of above; captured from Moors, 1055; occupied by French in Peninsular War, 1811–12; in neighbourhood French were defeated by Wellington, 1812. S. has two cathedrals, of which one is late Romanesque and dates from XII. cent., while the other is Gothic and was begun in XVI. cent.; there are Augustinian and Dominican religious houses. Seat of one of oldest univ's of Europe, founded *c.* 1240; now comparatively unimportant, having only 1200 students in 1910; fine library. Pop. (1910) 29,830.

SALAMANCA (42° 10′ N., 78° 43′ W.), village, on Allegheny, Cattaraugus County, New York, U.S.A.; railway repair-shops. Pop. (1901) 5792.

SALAMANDERS, small Amphibians, with rounded, plump, commonly spotted bodies, without dorsal crest; widely distributed in Europe, rare in U.S., and absent from the Brit. Islands.

SALAMIS.—(1) (37° 57′ N., 23° 30′ E.) mountainous island, in Saronic Gulf, ancient Greece (modern *Kollouri*); scene of great naval victory of Greeks over Persians, 480 B.C. (2) (37° 57′ N., 23° 30′ E.) ancient city, E. coast of Cyprus; scene of victory of Demetrius Poliorcetes over Ptolemy I., 306 B.C.

SALARIA, VIA (42° N., 12° 35′ E.), ancient high-road, Italy, leading from Rome to Adriatic coast.

SALAS (43° 25′ N., 6° 25′ W.), town, Oviedo, Spain. Pop. (commune) 18,000.

SALAYER, SALEIJER (6° 30′ S., 120° 30′ E.), group of islands, Dutch East Indies. Pop. 85,000.

SALDANHA BAY (33° S., 17° 33′ E.), inlet of Atlantic, in Cape Province, S. Africa.

SALE (53° 26′ N., 2° 18′ W.), town, Cheshire, England. Pop. (1911) 15,046.

SALE (38° 6′ S., 147° 5′ E.), town, on Thomson River, Tanjil County, Victoria, Australia. Pop. 4000.

SALE, a contract acting as conveyance of the property from the seller to the buyer. Where goods have been sold, and the buyer does not pay up, the seller may sue for the price; but where an agreement to sell is broken, by the buyer refusing to take the goods, the seller cannot sue for the price; all that he can obtain is damages for breach of contract. If an agreement to sell is broken by the seller, the only remedy for the buyer is to sue for damages. He cannot claim the goods, for they still belong to the seller. But if there has been an actual sale, and the seller fails to deliver the goods, not only can the buyer obtain damages from him for breach of contract, but in some cases he can claim the goods. All contracts for the sale of goods of the value of £10 or upwards must be in writing, unless part of the goods have already been accepted.

SALE, GEORGE (*c.* 1697–1736), Eng. Orientalist; translator of the *Koran.*

SALE, SIR ROBERT HENRY (1782–1845), Brit. general; hero of Afghan Wars, storming Ghazni, 1839, defending Jalalabad, and driving off investing force, 1841–42; d. from wound at Mudki; his wife, captured at Kabul, was released.

SALEIJER, see SALAYER.

SALEM.—(1) (11° 39′ N., 78° 12′ E.) town, on Tirumanimuttar; capital, district **Salem,** Madras, British India; textiles, cutlery. Pop. (1911) 59,153; district, 2,215,000. (2) (44° 59′ N., 122° 47′ W.) city, on Willamette; capital, Oregon, U.S.A.; manufactures flour, woollens. Pop. (1910) 14,094. (3) (40° 54′ N., 80° 53′ W.) city, Columbiana County, Ohio, U.S.A.; flour-mills; canneries. Pop. (1910) 8943. (4) (39° 33′ N., 75° 27′ W.) city, on Salem Creek; capital, Salem County, New Jersey, U.S.A.; fruit-canneries. Pop. (1910) 6614. (5) (37° 17′ N., 80° 4′ W.) town, summer resort; capital, Roanoke County, Virginia, U.S.A.; seat of Roanoke College. Pop. (1910) 3849.

SALEM (42° 28′ N., 70° 59′ W.), town, Massachusetts, U.S.A., founded 1626; scene of witchcraft agitation in 1692, when great numbers of people were tried and nineteen put to death. S. is situated on Massachusetts Bay, and has good harbour, but the

trade, which was formerly very extensive, has now declined. Public buildings include city hall, courthouses, armoury; and there are many institutions, including Athenæum, Peabody Academy and Marine Soc., Essex Institute. Birthplace of Prescott and Hawthorne. Pop. (1910) 43,697.

SALEMI (37° 48′ N., 12° 44′ E.), town, Trapani, Sicily. Pop. 17,200.

SALERNO (40° 41′ N., 14° 47′ E.), ancient *Salernum*, seaport, on Gulf of Salerno, capital, **Salerno** province, Italy; abp.'s see; cathedral; manufactures textiles; in mediæval times famous for its medical school. Pop. (1911) 43,426; (province) 554,030.

SALERNO, SCHOOL OF, see MEDICINE.

SALERS (45° 7′ N., 2° 30′ E.), village, Cantal, France.

SALES, FRANCIS DE, see FRANCIS OF SALES.

SALFORD (53° 29′ N., 2° 16′ W.), town, on Irwell, Lancashire, England; suburb of Manchester; cotton and iron industries. Pop. (1911) 231,380.

SALIC LAW, the law that excluded women from the throne of France. Probably derived from the code of Sabian Franks among whom women were debarred from inheriting certain lands known as *Salic lands*. One of its first applications to the crown was in opposition to the claim of Edward III. of England to the crown of France. The law remained in force from that time to the end of the Fr. monarchy. It prevailed in other continental countries, but has never been recognised in England.

SALICIN ($C_6H_{11}O_5.OC_6H_4.CH_2OH$), colourless, bitter, odourless, crystalline substance obtained from the bark of several species of trees of the classes *salix* and *populus*, employed in med. for the same purposes as salicylic acid (*q.v.*) and salicylates, and believed to have a less depressant action than they have on the heart.

SALICYLIC ACID ($C_6H_4.OH.COOH$), an aromatic acid obtained by treating with hydrochloric acid the salt obtained by the action of carbon dioxide on sodium carbolate; a colourless, inodorous, light, prismatic crystalline substance, tasting at first sweetish and then acid, used in med. externally as an antiseptic and for removing corns and warts, and internally as a specific remedy for rheumatic fever, and also for chronic rheumatism and for sciatica. *Sodium salicylate*, obtained by action of salicylic acid on caustic soda, is used internally for same purposes.

SALII, Rom. priests, traditionally founded by Numa; there were two coll's each of 12 priests; ceremonies were observed in March.

SALINA (38° 50′ N., 97° 40′ W.), city, on Smoky Hill River; capital, Saline County, Kansas, U.S.A.; flour-mills. Pop. (1910) 9688.

SALINA CRUZ (16° 10′ N., 95° 15′ W.), seaport, Oaxaca, Mexico. Pop. (1910) 6138.

SALINS (46° 57′ N., 5° 53′ E.), town, Jura, France; salt-springs. Pop. 5300.

SALISBURY.—(1) (35° 41′ N., 80° 20′ W.) city, capital, Rowan County, N. Carolina, U.S.A.; railway repair-shops; foundries. Pop. (1910) 7153. (2) (38° 23′ N., 75° 35′ E.) town, on Wicomico, Wicomico County, Maryland, U.S.A.; manufactures lumber, flour. Pop. (1910) 6690. (3) (41° 58′ N., 73° 25′ W.) town, Litchfield County, Connecticut, U.S.A.; iron-works. Pop. (1910) 3522. (4) (18° 51′ S., 30° 55′ W.), capital of S. Rhodesia.

SALISBURY (51° 4′ N., 1° 48′ W.), town, Wiltshire, England; famous for beautiful Early Eng. cathedral, founded 1220, and dedicated to St. Mary, 1260; spire, a XIV.-cent. addition, is highest in England; close also contains bp.'s palace, dating from 1220, cloisters and chapter house dating from 1270, library and deanery. Town has several old churches and other interesting buildings; and in neighbourhood are remains of early Brit. stronghold of Old Sarum and Druidical monument of Stonehenge. Pop. (1911) 21,217.

SALISBURY, EARLDOM OF.—Patrick de S. was cr. Earl of S. or Wiltshire in or before 1149; Cokayne writes, 'Doubtless at this early period the earldom was that of the *county*, tho' called by the name of the residence of its possessors'; held by (1) first earl's line till 1226; (2) Montacutes, Nevills, and Plantagenets, 1337–1539; (3) Cecils, 1605 to present time.

SALISBURY, JOHN OF, see JOHN OF SALISBURY.

SALISBURY, 3RD MARQUESS OF, ROBERT ARTHUR TALBOT GASCOYNE-CECIL (1830–1903), Viscount Cranbourne on death of his bro., 1865; Eng. Prime Minister; Conservative M.P. for Stamford, 1853–68; opposed extension of franchise and attacks on Established Church; Sec. of State for India in Derby ministry, 1866–67; resigned on question of Parliamentary Reform Bill, 1867, and bitterly attacked it when introduced; severely criticised Gladstone's resolutions on Irish Disestablishment, 1868, but dropped opposition after an appeal to country returned Liberals to power, 1868; chancellor of Oxford Univ., 1869. Conservatives returned to power, 1874, and S. became Sec. for India in Disraeli ministry; Public Worship Regulation Bill, 1874, was occasion of Disraeli's characterisation of S. as 'a great master of gibes and flouts and jeers'; Salisbury's fame as speaker rested on great powers of attack and oratory never adorned with 'flowers of speech.'

When Gladstone roused Europe against Bulgarian 'atrocities,' 1876, S. was sent to Constantinople to conference of the Powers; England resolved not to weaken Turkey as against Russia, but S. by small concessions avoided offence to Russia; Minister of Foreign Affairs, 1878; represented England with Beaconsfield at Congress of Berlin; succeeded Beaconsfield as leader of Conservative party in Lords, 1881; Prime Minister, 1885–86; short Home Rule Parliament followed by return to power, 1886–92; last ministry, 1895–1902, in which Chamberlain was Sec. for Colonies; kept Foreign Office till 1900; strong imperialist; successful in Egypt; chief event, Boer War, after termination of which he resigned. Sons: (1) JAMES EDWARD HUBERT, present marquess (1861–), Privy Seal, 1903–5; pres. of Board of Trade, 1905; (2) WILLIAM (1863–), chaplain to the king; (3) ROBERT (1864–), K.C. and politician; (4) EDWARD (1867–), Under-Secretary for Finance, Egypt; (5) HUGH (1869–), prominent Conservative politician.

Life, by Traill (1891), Aitken (1901), How (1902).

SALISBURY, ROBERT CECIL (1563–1612), **1ST EARL OF** (cr. 1563), baron (cr. 1603), Viscount Cranbourne (1604), Eng. Lord Treasurer; younger s. of great Lord Burghley, and became his father's adjutant and statesman of same cautious school; great opponent of Essex and war party. One of Sec's of State, 1590–96; Privy Councillor, 1591; secured succession of James I.; principal Sec. of State, 1596–1612; Privy Seal, 1597–612; Lord Treasurer, 1608–12. Great statesman of Elizabethan pattern, but showed inability under James I. to cope with new independence of Parliament and no sympathy with democratic claim to control taxation; small, deformed body, but good head; exchanged estate of Theobalds, Herts, with king in 1607 for Hatfield Chase; designed Hatfield House.

SALISBURY, THOMAS DE MONTACUTE (1388–1428), **EARL OF** (1409), distinguished in Fr. wars, 1414; lieut.-gen. of Normandy, 1419; captain-gen. of Eng. army in France, 1428; mortally wounded at siege of Orleans; peerless soldier.

SALIVA, see DIGESTION.

SALLI (34° 3′ N., 11° 26′ W.), seaport, on Atlantic, Morocco. Pop. 11,000.

SALLOW, tree of Willow family (*q.v.*); Common S. (*Salix cinerea*), abundant in copses, is used in manufacture of gunpowder charcoal.

SALLUST, CAIUS SALLUSTIUS CRISPUS (86–34 B.C.), Rom. historian; quæstor, c. 59; tribune, 52, and led popular attack on Milo; expelled from Senate, 50; joined Cæsar; prætor-elect, 47; gov. of Numidia, 46; removed for misgovernment; authentic works, *Bellum Catilinarium*, *Bellum Jugurthinum*, written on Gk. model, polished and graphic.

SALMASIUS, CLAUDIUS (1588–1653), Latin name of CLAUDE DE SAUMAISE, Fr. scholar; his *Defensio Regia pro Carolo I.* evoked Milton's *Pro Populo Anglicano Defensio.*

SALMO, see under SALMON FAMILY.

SALMON FAMILY (Salmon, Trout, etc.—*Salmonidæ*), a family of bony fishes, interesting and valuable on account of the sport and food afforded by its members. The body is long and covered with scales, but the head is naked and has no barbel. Most characteristic is the second dorsal fin, which is small, fleshy, and without rays. Apart from a few Antarctic and New Zealand forms, all are found in the rivers and seas of north temperate and Arctic regions. Of about 80 species, about 11 or 12 occur in Britain. The most important of these is the hook-jawed, pink-fleshed Salmon (*Salmo salar*), weighing sometimes 60 lb., which dwells and grows in the sea, but regularly visits rivers for spawning. There are many local names for its various stages: a young salmon is a 'parr' or 'smolt'; one newly entered fresh water, a 'grilse'; and a spawned or spent fish a 'kelt,' or a 'kipper' if male. The familiar brown Trout (*Salmo fario*) is common in most Brit. rivers, and much smaller than, though in colour resembling, the Salmon. Its weight seldom exceeds 5 lb. There are many varieties, such as the Sea Trout and the Bull-Trout, Sewin or Peal, sometimes regarded as distinct species. The gregarious Powan (*Coregonus clupeoides*) lives in some British lakes, and weighs up to 4 lb.; the Pollan (*C. pollan*) is found in the Shannon and some Irish loughs, only 6 inches long; and their relative the 9-inch Vendace (*C. vandesius*) is confined to Scottish lochs. The pale-green and silvery Smelt or Sparling (*Osmerus eperlanus*) lives, like the Salmon, in the sea, ascending rivers only to spawn. It reaches a length of 12 inches and is closely related to the Capelin (*Mallotus villosus*) and the Candle-Fish or Eulachon (*Thaleichthys pacificus*), two of the most important food fishes on the coasts of Arctic America. Other well-known Brit. Salmonoids are the Char and the Grayling (*q.v.*). Fraser River (*q.v.*) is the great centre of salmon-canning industry.

SALMONIDÆ, see SALMON FAMILY.

SALOL ($C_6H_4OH.COO.C_6H_5$), colourless, almost tasteless, slightly aromatic crystalline substance, obtained by the action of phenol on salicylic acid: employed in med. externally as an antiseptic, and internally as a mouth wash, and as an intestinal and urinary disinfectant.

SALOMON-IBN-GABIROL, see IBN GABIROL.

SALON (43° 38′ N., 5° 10′ E.), town, Bouches-du-Rhône, France; olive oil, soap. Pop. (commune) 14,100.

SALONICA.—(1) (40° 38′ N., 22° 56′ E.) vilayet, European Turkey; area, 13,510 sq. miles. Pop. about 1,130,800. (2) capital of vilayet of S.; an important seaport on Gulf of S.; was the ancient Thessalonica, the importance of which was due to its position on Rom. road to Byzantium; has interesting Gk., Rom., and Byzantine antiquities; visited by St. Paul, 53; captured by Saracens, 904; after various vicissitudes, came into possession of Turks in 1430; since great fire of 1890 business quarter has been modernised. Gk. archiepiscopal see; several old churches, including Mosque of St. Sophia. Trading centre; manufactures cotton, flour, carpets, silk, leather, etc. Besieged by Balkan Allies and captured, Nov. 1912. Pop. *c.* 174,000.

SALOP, Shropshire (*q.v.*).

SALPA, a genus of TUNICATA (*q.v.*).

SALSETTE (19° 15′ N., 72° 49′ E.), island, N. of Bombay Island, Brit. India; noted for its cave temples.

SALSIFY, SALSAFY (*Tragopogon*), genus of plants, order Compositæ; cultivated in Britain as vegetable—Purple Goat's-beard and Yellow Goat's-beard; root, which resembles carrot, is cooked.

SALSOMAGGIORE, village, watering-place, Emilia, Italy.

SALT.—Chemically, a salt is a compound formed by the interaction of a base and an acid, with elimination of water, thus: B.OH + H.A = B.A + HOH.
Base. Acid. Salt. Water.

B and A are the basic and acidic radicals, respectively, and BA is a normal salt. 'Acid' or hydrogen salts contain H; basic salts contain OH (see CHEMISTRY).

Common salt is sodium chloride, NaCl. It occurs as rock salt in Cheshire, Lancashire, etc., and exists in solution in sea-water and in brine springs. Rock salt is sometimes mined solid, but more often converted into brine, which is pumped up and evaporated, sometimes first by 'graduation,' *i.e.* atmospheric evaporation promoted by trickling over walls of faggots, and then by boiling. 'Bay salt' is obtained from sea-water by solar evaporation.

Salt usually crystallises in cubes, of S.G. 2·16; it is diathermous; M.P. 815° C.; solubility at 20° C. = 35·94, scarcely more soluble in hot than in cold water. Common salt contains small quantities of sodium sulphate, calcium sulphate, and magnesium chloride; the latter causes dampness in moist air. Besides its dietic use, salt is employed in manufacturing hydrochloric acid, chlorine, washing soda, caustic soda, etc.

SALT LAKE CITY (40° 50′ N., 112° 2′ W.), capital, Utah, and centre of Mormonism; stands at foot of Wasatch Mts., *c.* 4000 ft. above sea-level, and was founded by Brigham Young, 1847. Seat of Univ. of Utah; contains Mormon Temple, completed 1893, Tabernacle, Prot. and R.C. cathedrals, and various educational and philanthropic establishments; commercial centre; manufactures glass, woollens, paper, cutlery, pottery, etc. Pop. (1910) 92,777.

SALT OF SATURN, lead acetate or sugar of lead. See LEAD.

SALT OF SORREL, binoxalate of potash, a salt of oxalic acid (*q.v.*).

SALT OF TARTAR, potassium carbonate in its crude state. See POTASSIUM.

SALT RANGE (32° 54′ N., 71° E.), mountain range, Punjab, India; salt mines.

SALT, SPIRITS OF, common name for hydrochloric acid.

SALTA (24° 32′ S., 66° 14′ W.), province, Argentina, bordering on Bolivia; generally mountainous; rich in minerals; chief occupation, agriculture; pop. 150,000. Capital, **Salta**; pop. 17,000.

SALTA (24° 32′ S., 66° 14′ W.), city, Salta, Argentina; bp.'s see. Pop. 17,000; (prov.) 150,000.

SALTASH (50° 24′ N., 4° 13′ W.), seaport town, on estuary of Tamar, Cornwall, England. Pop. (1911) 4130.

SALTBURN-BY-THE-SEA (54° 35′ N., 0° 58′ W.), watering-place, N. Riding, Yorkshire, England. Pop. (1911) 3324.

SALTIER, SALTIRE, see HERALDRY.

SALTILLO (25° 28′ N., 101° 2′ W.), city, capital of Coahuila, Mexico; commercial centre; cottons, woollens. Pop. (1910) 35,063.

SALTIRE, see HERALDRY.

SALTO (31° 23′ S., 57° 27′ W.), town, port, department of Salto, Uruguay, S. America, on Uruguay; trade in salted meats. Pop. 17,656; (dep.) 54,159.

SALTPETRE, NITRE, POTASSIUM NITRATE (KNO_3), white crystals, dimorphous, M.P. 339°; solubility, 20·9 : 100 water at 10° C., 246 : 100 at 100° C.; bitter, saline taste. Generally obtained from 'Chili saltpetre' by reaction with potassium chloride: $NaNO_3 + KCl = KNO_3 + NaCl$. *Uses*: gunpowder, as an oxidising agent, for pickling meat, and medicine.

SALTWORT (*Salsola*), genus of plants, order Chenopodiaceæ; Prickly S. (*S. kali*), a Brit. seaside plant, yields soda when burnt.

SALUTATION of persons meeting each other is almost universal, and is accompanied by various kissing, and embracing. Many Orientals 'rub noses,' or at any rate sniff each other. The kiss is properly a gesture of tasting; from New Testament times it appears as a salutation

among Christians; its use among men has gradually declined, but is still common in France and among monarchs when meeting ceremonially. Orientals bow profoundly or even prostrate themselves before superiors. The modern custom of shaking hands is mediæval, but not ancient. Various formulas of greeting are used which tend in time to become meaningless.

SALUZZO (44° 38′ N., 7° 28′ E.), city, Cuneo, Italy; castle and cathedral; birthplace of Silvio Pellico. Pop. 11,000.

SALVADOR (13° 40′ N., 89° W.), smallest but most densely populated state of Central America; area, 7225 sq. miles; surface generally high tableland, with hills rising above it to 7900 ft.; mean temperature, 80° Fahr.; earthquakes frequent. S. belonged to Spain, 1526–1822, and from 1823–39 was member of Central Amer. Federation, after dissolution of which it became independent republic. Executive power held by Pres., legislative authority by Congress of 42 members. Capital, San S.; chief port, Acatjutlo; produces coffee, sugar, rubber, tobacco, indigo, timber; minerals include gold, silver, antimony. Education free and compulsory; chief religion, R.C. Pop. (1912) 1,161,426.

SALVAGE, money paid in case of shipwreck by the ship owner, or the cargo owners, or both. The salvor is only entitled to this reward when his work has been done voluntarily, and he has been under no obligation to do it. It must be shown that but for his services the ship or goods would probably have been lost, and that some skill was shown or danger faced in the performance of these services. The salvor has a maritime lien on the property salved, and this claim ranks before all others. Disputes as to the amount of salvage are decided in the Admiralty Division of the High Court. In the case of fire in London a SALVAGE CORPS is a body of men engaged to assist the Fire Brigade in the preservation of insured property. London Salvage Corps was established 1865, and now acts from five stations.

SALVATION ARMY, see BOOTH, 'GENERAL.'

SALVATOR ROSA, see ROSA, SALVATOR.

SALVIAN (fl. IV. cent.), Christian author of good family and probably of Christian birth; m. dau. of heathen parents and went with his wife to monastery at Lerins; wrote *De Gubernatione*, in which he vigorously attacks vices of his time, and *Ad Ecclesiam*, sometimes called *Contra Avaritiam*, about almsgiving.

SALVINI, TOMMASO (1829–), famous Ital. tragedian.

SALVINIA, genus of floating plants of order Heterosporous Ferns; spores, on under side of leaf, drop to the pond bed in winter. See PTERIDOPHYTA.

SALWEEN, SALWIN (20° N., 98° E.), river, Burma; rises in Chin. province of Yunnan; flows into Gulf of Martaban; estimated length, 1750 miles.

SALWIN, SALWEEN (18° N., 97° E.), district, Tenasserim, Lower Burma, India; area, 2666 sq. miles. Pop. 40,000.

SALYANY (39° 35′ N., 49° E.), town, Baku, Russ. Transcaucasia; fishing centre. Pop. 12,000.

SALZBRUNN (50° 50′ N., 16° 16′ E.), watering-place, Silesia, Prussia; manufactures porcelain. Pop. (1910), Ober-S., Neu S., and Kieder S., 12,585.

SALZBURG, duchy and crown-land of Austria; surrounded by Upper Austria, Bavaria, Tyrol, Carinthia, and Styria; area, 2767 sq. miles; surface mountainous; highest peaks in Hoher Tauern, over 12,000 ft.; forests and pastureland; numerous lakes; watered by Salzach; rich in minerals, especially salt. Pop. (1910) 214,737. Capital, **Salzburg**; beautifully situated on Salzach, with fine castle of Hohen-Salzburg on Mönchsberg; cathedral (begun 1614), Benedictine and Capuchin monasteries, Franciscan church, town-house (1407), Duke of Tuscany's palace museum, etc.; S. stands on site of ancient *Juvavum*; destroyed, 448; ceded to Austria, 1797; birthplace of Mozart; manufactures of musical instruments and marble ornaments. Pop. (1910) 36,188.

SALZKAMMERGUT (47° 40′ N., 13° 40′ E.), Alpine district, Upper Austria; watered by the Traun; salt mines. Pop. 18,500.

SALZWEDEL (52° 51′ N., 11° 9′ E.), town, Saxony, Prussia, on Jeetze; damask cloth. Pop. (1910) 14,426.

SAMANA RANGE (*c.* 33° 30′ N., 70° 50′ E.), mountain range, N.W. Frontier Prov., India.

SĀMĀNIDS, Persian house descended from Samani; won most of Persia and Transoxiana from Caliph and ruled as independent princes, 874–1005.

SAMANUD, town, EGYPT (*q.v.*).

SAMARA.—(1) (*c.* 52° 30′ N., 51° E.) government, S.E. Russia, in basin of Volga, which has course of over 500 miles along W. border; area, 58,320 sq. miles; surface consists chiefly of forest land and fertile prairie; produces cereals, vegetables, tobacco, honey; poultry and live stock raised; manufactures leather, soap, tobacco, flour, spirits, beer. Occasionally suffers from famine. Pop. (1910) 3,544,500. (2) (53° 10′ N., 50° 9′ E.) town, capital of above, at junction of Samara and Volga; bp.'s see; trade in grain; flour-mills. Pop. (1910) 120,980.

SAMARIA (32° 15′ N., 35° 15′ E.), ancient city, Palestine; founded by Omri *c.* 925 B.C. (*I. Kings* 16[24]); taken by Assyrians, 721 B.C.; by Alexander the Great, 331 B.C.; destroyed by John Hyrcanus *c.* 110 B.C.; rebuilt by Herod the Great, who renamed it Sebaste (Augusta) in honour of Emperor Augustus.

SAMARITANS, a religious sect and fragment of a people, living at Shechem (now called Nablus); they are supposed to be descended from the ten tribes, but are separate from orthodox Judaism. Their sacred book is the Pentateuch, but as this was not in its present form till the time of Ezra, they must have received it from Jewish sources. According to Nehemiah their assistance in rebuilding the Jewish temple was refused; there was probably foreign admixture in their blood. Bitter hostility grew up between the Jews and Samaritans, to which the Gospels are witness. They have a little other religious but hardly any secular lit. Though suffering many vicissitudes they have continued in the same place, and a remnant still exists. Their language was a form of Aramaic; now Hebrew is their sacred and Arabic their ordinary tongue.

Montgomery, *The Samaritans*; Cowley, *The Samaritan Liturgy*.

SAMARKAND.—(1) (*c.* 39° 49′ N., 67° 18′ E.) province, Russ. Turkestan. Formerly included in dominions of Jenghiz Khan and Timur; transferred from Bokhara to Russia in 1868. S. has area of 26,627 sq. miles; surface mountainous in S. and E., steppe and desert in N.; watered by Zarafshan and other streams; considerable area forested; soil fertile, producing large crops of grain, besides wines and cotton; manufactures cottons, silk, leather. Pop. (1910) 1,169,900. Chief town, Samarkand. (2) (39° 49′ N., 67° 18′ E.) town, capital of above; connected by railway with Caspian; many beautiful architectural remains, including finest mosque in Central Asia and tomb of Timur. Was conquered by Alexander of Macedon, and in later times by Jenghiz Khan and Timur; captured by Russians, 1868. Manufactures cloth, leather. Pop. (1910) 79,530.

SAMAS, see BABYLONIA (Religion).

SAMBALPUR (21° 27′ N., 84° 1′ E.), town, on Mahanadi, Sambalpur, Brit. India. Pop. 13,000; (dist.) 646,000.

SAMBHAR LAKE (26° 52′ N., 74° 57′ E.), salt lake, Rajputana, India, in states of Jaipur and Jodhpur.

SAMBUCA, a mediæval stringed instrument of the harp kind; term also applied to a wooden pipe.

SAMLAND (54° 53′ N., 20° 20′ E.), district, E. Prussia, between Frisches Haff and Kurisches Haff; produces amber.

SAMNAN, SEMNAN (35° 30′ N., 53° 20′ E.), town, Persia. Pop. 16,500.

SAMNITES, Ital. race inhabiting Samnium (or Sabinum), the mountainous region of middle and S.

Italy, offshoot of Sabini. Waged war against Rome for over fifty years, 343–290 B.C., and their final defeat left Rome the conqueror of Italy.

SAMOA, NAVIGATORS' ISLANDS (*c.* 12° S., 170° W.), group of fourteen volcanic islands surrounded by coral reefs in S. Pacific; area, *c.* 1080 sq. miles; generally mountainous and fertile. In 1899 Britain relinquished claim to the islands, and consented to arrangement whereby Germany took two largest and U.S. the remainder. The chief ports are Apia in Upolu, Pago Pago in Tutuila. R. L. Stevenson is buried on top of mountain near his home of Vailima. Exports copra, cocoa beans. Pop. *c.* 40,000.

SAMOS (37° 45′ N., 26° 50′ E.), island, Ægean; area, 180 sq. miles; surface mountainous, with fertile valleys; was independent in VI. cent. B.C.; subsequently passed under control of Persia and then of Athens; was included in Rom. dominions, and in XII. cent. was captured by Venice; conquered by Turkey, 1459; ruled by Gk. prince, but tributary to Turkey. Declared for Greece, 1912. Produces wine, oil, tobacco. Pop. 53,400.

SAMOSATA (37° 30′ N., 38° 35′ E.), mod. *Samsat*; chief town, ancient Commagene, Syria, on Euphrates; birthplace of Lucian.

SAMOTHRACE, SAMOTHRAKI (40° 27′ N., 25° 35′ E.), small mountainous island, in Ægean Sea, belonging to Turkey; sponge fisheries; in ancient times seat of the worship of Cabiri.

SAMOYEDES, Mongolian race, Finno-Ugrian stock, inhabiting tundras of N.E. Europe and Siberia; nomadic, dwelling in tents or huts; fishers and hunters; strongly Mongoloid in appearance; estimated at 17,000, of whom one-third are in European Russia.

SAMPHIRE (*Crithmum*), genus of plants, order Umbelliferæ; Common S. (*C. maritimum*), a rock-plant, makes an excellent pickle.

SAMPIERDARENA, SAN PIER D'ARENA, western suburb of Genoa, Italy; shipbuilding yard. Pop. 35,000.

SAMSON, Bible character; performs various deeds of strength; his name (Hebrew for *sun*) and points in the story suggest that he is partially mythical, originally perhaps a Danite hero.

SAMSUN (41° 18′ N., 36° 21′ E.), town, ancient *Amisus*, seaport, vilayet Trebizond, Asiatic Turkey; exports cereals, tobacco. Pop. 14,900.

SAMUEL, Biblical character; devoted as a child to the service of God, under charge of Eli. Two different accounts of his life seem to be interwoven in I. Samuel; according to one, the leader of his people, according to the other, a local prophet.

SAMUEL, BOOKS OF, at first formed one book together with the two books of Kings, so that in the Septuagint and Vulgate they were numbered instead of, as with us, I. and II. Samuel and I. and II. Kings, I., II., III., IV. Kings, comprising in all a history of Judah and Israel.

I. Samuel starts with the birth of Samuel and gives an account of his work as judge (chaps. 1–7). Chaps. 8–14 describe the reign of Saul, in which two different narratives are combined, one representing Samuel as willing, the other as unwilling, that there should be a king in Israel. Chaps. 15–31 trace the struggle between Saul and David, whose again in parts two narratives are combined, ending with the death of Saul and Jonathan and the establishment of David as king.

II. Samuel 1–8 narrates the main events of David's reign, including the establishment of the capital at Jerusalem, and his various wars; 9–20 describe the family life of the king and his troubles with his sons; 21–24 have been described as an 'appendix,' giving miscellaneous information about his reign, a famine in Israel, wars against the Philistines, and a census of the kingdom.

Like other Old Testament books I. and II. Samuel are composite and not all of one date. The later parts have been pub. about 700 B.C., but the main body of the narrative is early, and perhaps in parts only written a short time after the events it describes. Most of it is fine classical Hebrew.

Driver, *Introduction to Lit. of O.T.*; Commentaries by Kennedy (*Century Bible*), Kirkpatrick (*Cambridge Bible*).

SAN ANTONIO (29° 28′ N., 98° 28′ W.), town, on S. A. River, Texas, U.S.A.; originally a Span. town; attacked and occupied on various occasions by Mexicans; XIX.-cent. episcopal see of R.C. and Prot. Episcopal churches; has R.C. cathedral; public buildings include Federal Government building, arsenal, various educational and philanthropic establishments; several beautiful parks; manufactures flour, beer, etc. Pop. (1910) 96,614.

SAN ANTONIO DE LOS BAÑOS (21° 50′ N., 85° W.), city, Havana, Cuba; mineral baths. Pop. 8300.

SAN BERNARDINO (34° 9′ N., 116° 50′ W.), city, resort, capital, San Bernardino County, California, U.S.A.; important fruit-growing centre. Pop. (1910) 12,779.

SAN CATALDO (37° 27′ N., 14° 2′ E.), town, Caltanissetta, Sicily; sulphur mines. Pop. *c.* 18,000.

SAN CRISTOBAL (16° 25′ N., 92° 42′ W.), town, Chiapas, Mexico; bp.'s see. Pop. (1910) 16,523.

SAN DIEGO (32° 47′ N., 117° 8′ W.), city, health-resort, on Pacific, capital, San Diego County, California, U.S.A.; good harbour; exports fruit. Pop. (1910) 39,578.

SAN FERNANDO (36° 27′ N., 6° 13′ W.), seaport, Cadiz, Spain, on Isla de Leon, in Bay of Cadiz; exports salt. Pop. (1910) 25,371.

SAN FRANCISCO (37° 47′ N., 122° 25′ W.), largest city in California, and greatest commercial town on W. coast of America; founded by Franciscan monks in 1776; its prosperity dates from discovery of gold in California, *c.* 1849, after which there was a great influx of miners and other settlers, while the city rapidly increased in size and importance. Several great fires in 1850 and 1851 destroyed most of the wooden buildings of which it was originally composed, and the business part was subsequently rebuilt in stone, although wood was still used for residences; damaged by earthquakes in 1868 and 1872. In 1906 there occurred a terrible earthquake and fire, which caused great loss of life and destruction of property, and left about 300,000 people homeless; has since been rebuilt.

S. F. stands at point of a peninsula separating S. F. Bay from Pacific, with San Pablo Bay stretching to the N., and with the opening of Golden Gate giving access to Pacific; now built chiefly of brick, stone, iron and steel, and concrete; public buildings include town hall, post-office, and merchants' exchange, but there are few examples of fine architecture; numerous hotels, several museums, and libraries; seat of several departments of California Univ. and of various educational establishments; fine system of parks. S. F. is terminus of two lines of railway crossing continent to Atlantic, and is connected with China, Japan, Australia, and Hawaiian Islands by regular lines of steamers; value of imports in 1909–10 amounted to over 10½ million sterling, exports to nearly 7½ million; exports treasure, wheat, flour, tinned fruits and vegetables, timber, wine, etc. Pop. (1910) 416,912.

SAN GERMAN (18° 8′ N., 67° 1′ W.), city, Mayaguez, Porto Rico; exports sugar, coffee. Pop. 4100.

SAN GIMIGNANO (43° 28′ N., 11° 2′ E.), town, Siena, Italy. Pop. 10,000.

SAN JOSÉ (9° 56′ N., 83° 52′ W.), capital, Costa Rica; bp.'s see; trade in coffee. Pop. (1911) 121,162.

SAN JOSÉ (37° 16′ N., 121° 50′ W.), city, health-resort, capital of Santa Clara County, California; fruit centre; canneries. Pop. (1910) 28,946.

SAN JUAN (31° S., 69° W.), mountainous province, Argentina; rich in gold, silver, copper; chief industry, agriculture. Pop. 117,000. Capital, San Juan (31° 2′ S., 68° 57′ W.), exports wine and dried fruit. Pop. 11,000.

SAN JUAN (18° 25′ N., 66° 7′ W.), fortified city, capital, Porto Rico, on N. coast; excellent harbour; chief port of the island. Pop. (1910) 48,716.

SAN JUAN ISLANDS (48° 30′ N., 123° W.), group of islands, in Strait of Georgia, belonging to U.S.A.

SAN LUIS (33° 32′ S., 66° 3′ W.), province, Argentina; rich in minerals. Pop. (estimated) 199,500. Capital, San Luis. Pop. 14,500.

SAN LUIS POTOSÍ (22° 5′ N., 100° 48′ W.), city, capital of San Luis Potosí, Mexico; railway centre; cotton and woollen goods; active trade. Pop. (1910) 82,946; (state) 624,728.

SAN MARINO (43° 57′ N., 12° 27′ E.), republic, N. Italy; area, 38 sq. miles; capital, San Marino; its independence, dating from Middle Ages, was confirmed by the Pope in 1631. Pop. (1910) 10,489.

SAN MARTIN, JOSÉ DE (1778–1850), S. Amer. patriot; commander of forces against Spain, 1814; won great victories and set up Chilian republic, 1817–18; drove Spaniards from Peru, 1820–21; became protector of Peru, but, being mistrusted, retired to France, 1822.

SAN MIGUEL (13° 35′ N., 88° 10′ W.), town, capital, San Miguel department, Salvador; trade in rubber, indigo. Pop. 22,000; (department) 60,000.

SAN MIGUEL DE MAYUMO (15° 14′ N., 121° E.), town, Luzon, Philippine Islands; produces iron, cotton. Pop. 20,500.

SAN MINIATO (43° 41′ N., 10° 51′ E.), town, Florence, Italy; cathedral; manufactures glass. Pop. (commune) 21,000.

SAN NICOLAS DE LOS ARROYOS (33° 14′ S., 60° 35′ W.), town, river port, on Paraná, Buenos Aires, Argentina; exports wheat, frozen mutton. Pop. 12,550.

SAN PABLO (14° 10′ N., 121° 20′ E.), town, Laguna, Philippine Islands. Pop. 22,000.

SAN REMO (43° 50′ N., 7° 46′ E.), seaport, health-resort, Porto Maurizio, Italy. Pop. 25,000.

SAN SALVADOR (13° 45′ N., 89° 10′ W.), capital of Salvador Republic; contains univ. and cathedral; manufactures silk and cotton goods. Pop. (1912) 59,136.

SAN SEBASTIAN (43° 19′ N., 1° 56′ W.), seaport, watering-place, capital of Guipuzcoa, Spain, on Bay of Biscay; bp.'s see; contains bull-ring and casino; breweries, flour-mills. Pop. (1910) 49,008.

SAN SEPOLCRO (43° 33′ N., 12° 10′ E.), cathedral town, Arezzo, Italy; birthplace of Piero della Francesca. Pop. (commune) 10,000.

SAN SEVERINO (43° 15′ N., 13° 10′ E.), town, ancient *Septempeda*, on Potenza, Macerata, Italy. Pop. 3500.

SAN SEVERO (41° 42′ N., 15° 23′ E.), town, Foggia, Italy; bp.'s see. Pop. (commune) 32,000.

SAN SHUI (23° 10′ N., 112° 45′ E.), town, treaty port, Kwangtung, China. Pop. (1910) 6000.

SAN VICENTE (13° 42′ N., 88° 43′ W.), town (and department), Salvador; manufactures cloths, cigars. Pop. (1912) 20,400.

SANA (15° 22′ N., 44° 12′ E.), town, capital, Yemen, Arabia; surrounded by wall 5½ miles in circuit; trade in coffee, dried fruit; devastated by famine. Pop. *c.* 19,000.

SANCERRE (47° 20′ N., 2° 49′ E.), town, Cher, France.

SANCHI (23° 28′ N., 77° 46′ E.), village, India; remarkable Buddhist remains.

SANCROFT, WILLIAM (1616–93), abp. of Canterbury, 1677–91; one of the 'Seven Bishops' (*q.v.*).

SANCTI SPIRITUS (21° 40′ N., 79° 30′ W.), city, on Yayabo, Santa Clara, Cuba. Pop. 13,500.

SANCTUARY was the protection afforded to an offender against the law who took refuge in a church or other consecrated place. It dates back in England and on the Continent to very early times, and was recognised throughout the Middle Ages. From XIV. cent. complaints are frequent against debtors taking sanctuary, and the privilege was more and more limited. The rule was that the offender, having made confession of guilt to the coroner, must flee the country within 40 days. If he remained in sanctuary after that time he would be starved into surrender. Westminster Abbey and Durham Cathedral were famous s's. All statutes affecting sanctuary were repealed in James I.'s reign, but certain notorious quarters of London were treated as sanctuaries as late as the XVIII. cent.

SAND, fine particles of stone, not so fine as dust and not larger than grit; mostly grains of quartz. It differs in colour, according to the rock from which it originates; it is spread by wind—as in deserts—or washed up by sea. S. due to volcanic action is generally grey or blackish. Pure white s. is used in glass manufacture.

SAND, GEORGE, Lucile Aurore Dupin, afterwards Madame Dudevant (1804–76), Fr. novelist. Dau. of Lieutenant Dupin; spent part of childhood with her father, who was in the army of Murat; her father, who had made a *mésalliance*, finally gave his daughter into charge of his mother, who kept her at Nohant in Berry at her country house; there the child imbibed great love for the country, with her tutor, Deschâtre, also her grandmother's overseer, a disciple of Rousseau, who believed in the education of nature, but taught her Latin, music, and natural history; played much with the village children, and stored up rustic tales and ghost stories which she inserted so skilfully in her pastoral novels; sent at thirteen to convent of Eng. Augustinians at Paris, where she remained three years; so great was her power of adaptation that she settled down and even thought of taking veil; dissuaded, and at eighteen married Dudevant, retired officer turned farmer. After nine years, in which s. and dau. were born, they separated, Dudevant keeping Nohant while wife went to Paris with her daughter and small allowance; after struggles in garret, often without a fire, she tried literature; discouraged by Balzac and other well-known literary people, but editor of *Figaro*, Delatouche, took pity on her, and gave her work at low rate; Jules Sandeau, an old acquaintance, collaborated in publication of works under name Jules Sand; when *Indiana*, which she wrote alone, appeared (1832), it was under name of **George Sand**, which she kept. She adopted dress and life of student, travelled with Alfred de Musset, Chopin, and others, imposing, as she said, no constancy upon herself, and publishing a vast number of novels, some of which came out in the *Revue des Deux Mondes*. At revolution of 1848 she mixed in politics for a short time, wrote speeches, and started a newspaper.

For over twenty-five years, at end of life, lived at Nohant with her children and grandchildren, where a great number of friends came to visit her as well as many celebrities of the time (amongst them Matthew Arnold).

Her pastoral novels (the best of her production), *La Mare au Diable* (1846), *La Petite Fadette* (1848), *François le Champi* (1850), *Le Meunier d'Angibault*, *Marion*, are idylls written in easy felicitous prose; her style was stronger than her psychology, but the emotion, which in her work, as in that of most members of early Romantic school, swamped analysis, has truth and restraint and retains its charm.

Life, by Revon (1896), Karénine (1901); Gribble, *G. S. and her Lovers* (1907).

SAND STORM, Simoon, see Wind.

SANDAL, see Boot.

SANDALWOOD, wood of trees, order Santalaceæ; pale and fragrant; native to India and E. Indies.

SANDBACH (53° 9′ N., 2° 22′ W.), town, Cheshire, England; manufactures boots and shoes. Pop. (1911) 5723.

SAND-EELS, Launces (*Ammodytidæ*), small, long-bodied fishes related to the Cod family; found burrowing in sand on the coasts of the N. hemisphere; favourite fishing-bait.

SANDEFJORD (59° 34′ N., 10° 17′ E.), seaport, watering-place, Norway; mineral springs. Pop. 4800.

SANDEMANIANS, see GLASITES.

SANDERS, NICHOLAS (*c.* 1530–81), Eng. historian and rebel; prof. of Theology at Louvain; pub. *De Visibili Monarchia Ecclesiæ*, 1571; one of chief R.C. plotters against Queen Elizabeth.

SANDFORD, FULK, abp. of Dublin, 1256–71.

SANDFORD, JOHN DE, abp. of Dublin, 1284–90; d. 1294.

SANDGATE (51° 4′ N., 1° 9′ E.), watering-place, Kent, on English Channel.

SAND-GLASS, see CLOCK.

SAND-GROUSE (*Pteroclididæ*), inhabits desert regions. One variety, **Pallas's Sand-grouse**, known by its long tail-feathers and feathered legs, is an occasional migrant to Britain.

SAND-HOPPER, see MALACOSTRACA.

SANDHURST (51° 22′ N., 0° 49′ W.), village, Berkshire, England; Royal Military Coll.

SAND-LAUNCE, see SAND-EELS.

SANDOMIR, SANDOMIERZ (50° 44′ N., 21° 47′ E.), town, on Vistula, Radom, Russ. Poland; bp.'s see. Pop. 6500.

SANDOWAY (18° 27′ N., 94° 24′ E.), town, Sandoway, Arakan, Lower Burma. Pop. 13,500; (district) 96,000.

SANDOWN (50° 48′ N., 1° 8′ W.), watering-place, Isle of Wight, England. Pop. (1911) 5551.

SANDPIPERS, see under PLOVER FAMILY.

SANDRINGHAM (52° 52′ N., 0° 32′ E.), village and royal estate, Norfolk, England.

SANDROCOTTUS, see CHANDRAGUPTA MAURYA.

SANDSTONE, a rock generally formed of grains of quartz; colours—white, yellow, brown, red, or green; varieties—coarse and fine grained. Sometimes the grains of former are as large as eggs,—these are then called conglomerates,—while grains of the latter may be so pure as to be invisible to naked eye; used for building and monumental purposes. **Old Red Sandstone** is name given to series of strata lying between Silurian and Devonian, although they are at times thought to be the same as the latter. In either case they fall below the Carboniferous, and the name 'Old' was given to distinguish them from the red sandstone ('New') included in the Permian and therefore resting upon the Carboniferous. Old Red Sandstones probably stretch across the whole of central Scotland, and they occur in Tweed, Usk, and Wye valleys.

SANDUR, SANDOOR (15° N., 76° E.), native state, Bellary, Madras, India. Pop. 12,600.

SANDUSKY (41° 23′ N., 82° 43′ W.), city, port entry, on Sandusky Bay, Ohio, U.S.A.; large trade in fish, coal, wine. Pop. (1910) 19,989.

SANDWICH (51° 17′ N., 1° 20′ E.), seaport, on Stour, Kent, England; one of the Cinque ports; important in Middle Ages. Pop. (1911) 3040.

SANDWICH, EDWARD MONTAGU (1625–72), **1ST EARL OF** (1660), Eng. admiral; member of Cromwell's 'House of Lords,' 1657; with Monk took fleet over to Charles II., 1660; defeated Dutch, 1665; slain in Dutch War.

SANDWICH ISLANDS, see HAWAIIAN ISLANDS.

SANDWORT (*Arenaria*), genus of plants, order Caryophyllaceæ; small white flowers.

SANGERHAUSEN (51° 29′ N., 11° 38′ E.), town, on Gonna, Saxony, Prussia; manufactures sugar; agricultural machinery. Pop. (1910) 12,032.

SANGLI (17° 28′ N., 75° 30′ E.), native state, Bombay, India. Pop. 230,000. Capital, SANGLI. Pop. 16,800.

SANGUINARIA, genus of plants, order Papaveraceæ; Blood-Root (*S. canadensis*) is used by Amer. Indians as 'red paint.'

SANHEDRIM, see JEWS.

SANHITA, SAMHITÂ, see SANSKRIT.

SANITATION, see HOUSE AND HOUSING.

SANJAK, see TURKEY (GOVERNMENT).

SANKARA ACHARYA (789–820), Hindu philosopher.

SANKEY, IRA DAVID (1840–1908), Amer. evangelist; sang his famous hymns at meetings when touring with D. L. Moody (*q.v.*).

SANKT JOHANN (49° 15′ N., 7° E.), town, on Saar, Rhine province, Prussia; machinery. Incorporated with Saarbrücken, 1909.

SANKT PÖLTEN (48° 12′ N., 15° 38′ E.), town, on Traisen, Lower Austria; bp.'s see; iron manufactures. Pop. (1911) 21,661.

SANLÚCAR DE BARRAMEDA (36° 47′ N., 6° 22′ W.), fortified seaport, watering-place, on Guadalquivir, Cadiz, Spain; trade in wine. Pop. (1910) 22,645.

SANPO (31° 30′ N., 82° 5′ E.), head-stream of Brahmaputra, in Tibet.

SANQUHAR (55° 23′ N., 3° 54′ W.), town, Dumfriesshire, Scotland; coal mines; birthplace of The Admirable Crichton (*q.v.*).

SANRAKU, KANO (1559–1635), Jap. artist; founder of the Kyo-Kano school, the style of which was largely influenced by the old Chin. manner. See JAPAN: *Japanese Art.*

SANS-CULOTTES (Fr., without breeches), name which the Fr. aristocrats applied contemptuously to the revolutionaries who, in 1789, adopted pantaloons and trousers in place of the knee-breeches of society.

SANSETSU (1599–1651), Jap. artist; pupil of Sanraku (*q.v.*); regarded as one of the greatest exponents of the Kyo-Kano style; his 'Rainstorm' is in the Brit. Museum.

SANSKRIT, the name given to the ancient sacred tongue of the Hindus, derived from two words—*sam*=together (Greek *syn*), and *krita*=done, is the nearest to the original parent tongue and is the only one of the original offshoots which has a surviving literature. The whole word signifies something which is thoroughly done. Sanskrit belongs to the family of Indo-European, or Indo-Germanic, or Aryan languages, which includes the Indian, Medo-Persian, Græco-Latin, Germanic, Lithuanian, Slavonian, and the Gallo-Celtic families. Another mode of classification is to place Sanskrit amongst the Asiatic or East Aryan group of the Aryan languages, which comprises, besides Zend, Persian and Armenian.

The purest form of the language has been spoken for more than 3000 years by the learned and priestly families among the Hindus, while various dialects have at different times been adopted by the masses, revealing various deviations from the parent tongue.

Yet, in spite of its antiquity, it is only in comparatively recent times that modern scholarship has thrown light upon this section of the East. Charles Wilkins, a pioneer of the time of Warren Hastings's rule in India, compiled the first Sanskrit grammar. Students of Sanskrit were struck by the resemblance of that tongue to many of the Eastern languages and even to the classical languages.

There was a time when it was believed that Sanskrit was the mother tongue to which all languages could be traced. It is almost certain that Sanskrit was introduced into India when the Brahminical races settled there, and that it largely took the place of the languages of the aboriginal inhabitants, which are now only spoken in the South.

Mention may be made of other dialects—Hindi, Hindustani, Bengali, Punjabi, Mahratti, and Gujeratti.

Sanskrit has come down to us in a well-preserved and developed state, which, at least, can compare very favourably with other languages of that branch. Hence it has been of great assistance to ethnologists and philologists in solving the many problems which beset the study of the formation of languages.

It is difficult to ascertain what is the precise relationship of the Aryan to the Semitic languages—whether, for example, Sanskrit has any close ties with Hebrew or Arabic. There is, at least, a connection in the prevalence of guttural and other sounds which are found in Semitic tongues.

The characters in which Sanskrit is written vary according to the dialects, but the alphabet is known as Nágari or Devanágari, and consists of the following sounds: (*a*) fourteen vowels—ten simple and four diphthongs; (*b*) thirty-three consonants—*k, h, kh, g, gh, ṅ, c, ch, j, jh, ñ, ṭ, ṭh, ḍ, ḍh, ṇ, t, th, d, dh, n, p, ph, b, bh, m*, three '*s*' sounds, and four semi-vowels—*y, r, l, v*. In addition there are three derivatives from these original sounds.

Sanskrit Literature.—Very little is definitely known as to the actual dates of the literature which has survived, but from the language of *The Vedas*, a collection of hymns setting forth the religion of the Brahmins, it would seem that this is the earliest extant work.

The full name is Rig-Veda-Samhitâ. The last word means 'collection.' It is contended that this is the oldest book of the Aryan family of nations, and probably the latest of these hymns dates from a time before 1000 B.C., and a study of the contents and language of the hymns suggests that these do not represent the earliest form of the language.

They contain many obsolete words and forms. There are 1028 songs, divided into ten separate collections (*mandalas*), and again subdivided into smaller collections, with the authorship attributed to some well-known saint or priest. It is, of course, impossible to say whether these personages are historical or mythical, though it is possible that the names commemorate successive generations of priestly families.

The oldest known manuscripts of the Rig-Veda do not date back from before 1500 A.D. Yet it is well known that as early as 600 B.C. the art of memorising was so far advanced that every verse, word, and syllable were counted to ensure an accurate text. It is clear that there could be much room for alterations and corruptions of the text. The care which has been expended is responsible for the remarkable condition of the text. This careful guarding of the text demanded skilful interpretation of the contents, and this led to the writing of commentaries. The Rig-Veda was translated into English by R. H. T. Griffith (1896-97), and also by Professors H. H. Wilson and E. B. Cowell.

The numerous theological works comprised under the heading *Brahmanas*, which were written by Brahmans for the use of Brahmans, formed the literature of the Hindus for many centuries. This literature marks a sort of transition stage.

The *Vedas* were divided into four books, each one of which had several Brahmanas attached to it. There were many different schools, each with its own method of interpretation. All the Brahmanas are not extant, many have been lost. To each Brahmana there is an appendix, called Âranyaka, *i.e.* 'belonging to the forest,' for the use of those members of the community who had betaken themselves to the forest to spend the last years of their lives as hermits. Of these Âranyakas, at least four are known.

It must be borne in mind that a distinction is drawn between *Shruti*, i.e. what was heard, and *Smriti*, i.e. what was remembered. All the law-books, including the Code of Manu, are *Smriti*, as are also the Itihâsas and the Purânas.

Smriti, which is almost synonymous with tradition, includes a great variety of subjects. There is one special class which must be mentioned.

It is one that comprises manuals which contain certain principal subject-matters which come under the following headings: (1) Phonetics (pronunciation and accentuation)—*i.e.* Siksha; (2) Metre—Chhandas; (3) Grammar—Vyâkarana; (4) Explanation of words (etymology, homonyms, and the like)—*i.e.* Nirukta; (5) Astronomy—Jyotisha; (6) Ceremonial—Kalpa. If one wishes to have a thorough understanding of the Veda, a knowledge of these six branches of learning is essential.

In this necessarily brief outline, full reference cannot be made to the various branches of Sanskrit literature. Yet it has its epic poems—the *Mahâbhârata* and the *Râmâyana*, the former being attributed to Vyâsa. It consists of more than 100,000 couplets and is divided into 18 books. The latter is ascribed to Valeniki; it is divided into 7 books consisting of about 48,000 lines.

Another work of importance is *The Purânas*, i.e. old or prehistoric documents—a sort of scripture of the Brahmans. This work is of comparatively modern origin, dating probably from about the X. cent. A.D., though some of the Purânas may go back to a very early time, even before the Christian era.

There are also many romances and a vast dramatic literature. Of poetry proper there are many lyrics, didactic poems including moral maxims, fables and narratives, and popular stories. In addition there is a large literature of scientific and technical subjects, including, of course, law and theology, and philosophy, and there are also treatises on music and kindred subjects. Medicine, astronomy, and mathematics are well represented.

Roughly speaking, Sanskrit literature comprises two distinct periods, Vedic and Post-Vedic, the former comprising works written in an ancient form of Sanskrit which is to the later form much the same as the language of Chaucer is to the English of to-day.

The range of subjects covered is remarkable, and to this is added the difficulty of the almost inordinate length of some of the books. Curiously enough, sciences like Grammar were cultivated by the Hindus long before serious attention was given them by the most ancient nations of Europe. Yet in spite of this enormous stretch of literature most of the works worthy of consideration have been edited and translated and are accessible to students.

English scholars have been prominent in the work, and there are both grammars and lexicons in English.

SANSOVINO, JACOPO (1477–1570), Ital. sculptor and architect; pupil of Andrea Sansovino, the Florentine sculptor, and adopted his surname.

SANTA ANA.—(1) (33° 27′ N., 117° 50′ W.) city, California, U.S.A.; fruit-producing district. Pop. (1910) 8429. (2) (13° 58′ N., 89° 36′ W.) town, capital of Santa Ana department, Salvador; exports coffee. Pop. (1912) 50,500.

SANTA BARBARA.—(1) (34° 27′ N., 119° 50′ W.) city, watering-place, California, U.S.A., on Pacific; fruit-growing centre. Pop. (1910) 11,659. (2) (10° 50′ N., 122° 40′ E.) town, Panay, Philippine Islands. Pop. 16,000.

SANTA CATHARINA (27° S., 50° W.), maritime state, Brazil; mountainous, forest-covered; watered by numerous streams; coal and iron found; capital, Florianopolis (Desterro). Pop. 353,000.

SANTA CLARA (22° 24′ N., 80° 2′ W.), town, Cuba. Pop. 15,000.

SANTA CLAUS, see NICOLAS, ST.

SANTA CRUZ.—(1) (36° 58′ N., 122° 1′ W.) city, seaside resort, California, U.S.A., on Bay of Monterey. Pop. (1910) 11,146. (2) (14° 20′ N., 121° 30′ E.) town, La Laguna, Philippine Islands; palm-wine. Pop. 13,000. (3) (10° S., 167° E.) group of Brit. islands, Melanesia, S. Pacific. Pop. 5500. (4) (17° 22′ S., 62° 23′ W.) department, Bolivia; surface is mostly level or undulating; watered by Rio Grande and San Miguel; chief product, sugar. Pop. 240,000. Capital, Santa Cruz de la Sierra. Pop. 21,000.

SANTA CRUZ, ALVARO DE BAZAN, 1ST MARQUIS OF (1526–88), Span. admiral; defeated Portugal off Terceira, 1583; planned Armada against England and might have averted Span. disasters, but could not win king's confidence.

SANTA CRUZ DE TENERIFFE (28° 32′ N., 16° 28′ W.), capital and leading port of Canary Islands; situated on N.E. coast; good coaling station; here Nelson lost his arm in unsuccessful attack, 1797. Pop. (1910) 65,615.

SANTA FÉ.—(1) (31° 40′ S., 61° W.) province, Argentina, S. America; flat; drained by Paraná; chief

industries, agriculture and stock-raising. Pop. 841,700. (2) (31° 45′ S., 60° 38′ W.) city, capital of above, on Salado; cathedral; seat of Jesuit Coll.; exports wheat. Pop. (1912) 48,928. (3) (35° 39′ N., 106° 2′ W.) capital, New Mexico, U.S.A.; one of oldest towns of N. America; has old Span. buildings; R.C. archiepiscopal see; has cathedral and episcopal palace; public buildings include state capitol and armoury; important railway and trading centre; exports wheat, linseed, quebracho. Pop. (1910) 5072.

SANTA MARIA (29° 30′ S., 54° 18′ W.), town, Brazil, in Rio Grande do Sul. Pop. 14,600.

SANTA MARIA (37° 0′ N., 25° W.), island, Azores, belonging to Portugal.

SANTA MARIA DI LICODIA, town, Catania, Sicily, 10 miles N.W. of Catania. Pop. 4300.

SANTA MARTA (11° 12′ N., 74° 16′ W.), seaport, capital of Magdalena, Colombia, on Caribbean Sea; bp.'s see. Pop. 8200.

SANTA MAURA (38° 50′ N., 20° 42′ E.) (anc. *Leucadia*), one of the Ionian Islands, Greece; traversed N. to S. by a chain of mountains terminating in the promontory famous as 'Sappho's Leap'; produces currants, wine. Pop. 33,000. Chief town, Santa Maura. Pop. 5500.

SANTA ROSA (38° 29′ N., 122° 42′ W.), city, California, U.S.A.; wine-growing centre. Pop. (1910) 78 7.

SANTA TECLA, see NUEVA SAN SALVADOR.

SANTA-ANNA, ANTONIO LOPEZ DE (1795–1876), Mexican governor; several times dictator of Mexican republic, 1822–53; led gallant opposition to French and U.S. invasions.

SANTAL PARGANAS, THE (24° 30′ N., 87° E.), district, Bhagalpur division, Bihar and Orissa, Brit. India. Pop. 1,815,000. Capital, Naya Dumka.

SANTALS, aboriginal tribe of Bengal, India; little is known of their history; nomadic in character, but amicable in disposition; they approach the negroid type.

SANTANDER.—(1) (43° N., 4° W.) maritime province, in Old Castile, N. Spain; mountainous. Pop. (1910) 303,152. (2) (43° 27′ N., 3° 48′ W.) seaport, ancient *Portus Blendium*, watering-place, capital of above, on Bay of Biscay; abp.'s see; exports iron ore. Pop. (1910) 65,209.

SANTAREM.—(1) (2° 43′ S., 55° 33′ W.) city, on Tapajos, Para, Brazil; trade in rubber. Pop. 5000. (2) (39° 14′ N., 8° 40′ W.) town, ancient *Scalabis*, or *Præsidium Julium*, on Tagus, Estremadura, Portugal; trade in olive oil, wine. Pop. 9200.

SANTAROSA, ANNIBALE SANTORRE DI ROSSI DE POMAROLO, COUNT OF (1783–1825), Ital. patriot; organised Piedmontese rising, 1821; afterwards lived in Paris, Belgium, and London; slain in Greece.

SANTERRE, ANTOINE JOSEPH (1752–1809), Fr. revolutionary general; his brewery was meeting-place of Jacobins; headed attack on Assembly, 1792; defeated by army of Vendée, 1793, and fell into obscurity.

SANTIAGO DE CHILE (33° 30′ S., 70° 30′ W.), city, on Mapocho; capital Chile and of province Santiago; public buildings include cathedral, university, national library, art, agricultural, military, and medical schools; abp.'s see; commercial centre; founded by Valdivia in 1541. Pop. 335,000.

SANTIAGO DE COMPOSTELLA (42° 50′ N., 8° 30′ W.), town, Galicia, Spain; archiepiscopal see, has Romanesque cathedral, dating from 1078 and still visited by pilgrims as shrine of St. James; seat of Univ.; has ruins of many religious houses. Headquarters of the Knights of S. of the Sword, a Span. military order. Pop. 25,500.

SANTIAGO DE CUBA (20° N., 75° 48′ W.), seaport, S.E. coast, Cuba; originally a Span. town; figured prominently in SPANISH-AMERICAN WAR (*q.v.*); archiepiscopal see, has cathedral. Harbour is fortified; carries on considerable trade with Europe and America; chief exports are sugar, tobacco, timber, fruit, cacao, coffee, rum, iron ore. Pop. 45,800.

SANTIAGO DE LAS VEGAS (22° 40′ N., 82° 15′ W.), city, Havana, Cuba; manufactures tobacco. Pop. 9000.

SANTIAGO DEL ESTERO (27° 43′ S., 64° 23′ W.), province, Argentina, S. America; flat; chief crops, sugar-cane and wheat. Pop. 216,500. Capital, Santiago del Estero. Pop. 10,500.

SANTLEY, SIR CHARLES (1834–), Eng. baritone; wrote *Reminiscences* (1909).

SANTO DOMINGO (19° N., 71° W.), republic, eastern portion of island of Haiti, W. Indies; area, 18,050 sq. miles; surface generally mountainous, with fertile valleys between ranges; chief town, **Santo Domingo**, on south coast. Climate is hot in low districts, cooler in higher lands. Exports are coffee, cocoa, logwood, mahogany, cotton, hides, copper; inhabitants are of mixed European and African descent; religion, R.C.; education free and obligatory. Country formerly belonged to Spain, became independent republic, 1821. Pop. 677,000.

SANTO DOMINGO (18° 30′ N., 69° 50′ W.), city, at mouth of Ozama; capital, Dominican Republic, W. Indies; abp.'s see; exports tobacco, sugar. Pop. *c.* 19,000.

SANTONIN, drug, consisting of yellowish flat prisms, obtained from the unexpanded flowers of the plant *Artemisia maritima*; used medicinally to kill parasitic round-worm (*Ascaris lumbricoides*), being administered on an empty stomach and followed by a purgative.

SANTORIN (36° 22′ N., 25° 28′ E.), one of Sporades Islands (Greek), Ægean Sea; of volcanic formation; frequently suffers from earthquakes; shores outlined by precipitous rocks; chief town, Thera; has prehistoric remains and some ruined Gk. temples; produces wine; water very scarce. Pop. 20,000.

SANTOS (24° S., 46° 21′ W.), city, on Santos Bay; seaport, state of São Paulo, Brazil; exports coffee. Pop. 78,000.

SANUTO, MARINO, THE ELDER (1260–1338), Venetian statesman, traveller, and author; travelled over Scandinavia, Asia Minor, Palestine, etc.; wrote three books of *Historia Hierosolymitana*, completed 1321, accompanied with maps and intended as military guide for crusaders; MS. versions exist under various names; maps probably from Pietro Vesconte.

SANUTO, MARINO, THE YOUNGER (1466–1533), Venetian historian, archæologist, and statesman; collections of MSS. copies of inscriptions and histories of contemporary events invaluable; chief work, *Diarii*, which extend from 1496–1533.

SÃO FRANCISCO (10° S., 42° W.), river, E. Brazil, rises in Minas Geraes; flows generally N.E., enters Atlantic; length, 1800 miles; navigable to falls of Paulo Affonso, and for about 1000 miles above them.

SÃO LEOPOLDO (29° 50′ S., 51° 10′ W.), city, on Sinos, Rio Grande do Sul, Brazil; seat of Jesuit Coll.; various manufactures. Pop. 8500.

SÃO LUIZ DE MARANHÃO, MARANHÃO, MARANHAM (2° 30′ S., 44° 10′ W.), seaport, on island of São Luiz; capital, state Maranhão, Brazil; bp.'s see; exports cotton, sugar. Pop. 32,000.

SÃO PAULO.—(1) (*c.* 21° S., 50° W.) state, S. Brazil; has coast-line of 300 miles, whence it extends inland to Paraná R.; area, 112,307 sq. miles. Surface consists of plateau in interior, crossed by several ranges, and low-lying coastal strip; much of surface forested; drained by Grande and other affluents of Paraná; produces coal, iron, gold, silver, marble. Chiefly an agricultural state; large cultivation of coffee, considerable crops of sugar-cane, cotton, tobacco, cereals, grapes. Manufactures cottons, wine, tobacco. Pop. 3,397,000. (2) (23° 30′ S., 46° 33′ W.) city, capital of above; among principal edifices are the cathedral, several monasteries, convents, governor's and bishop's palace, schools of law and theology; military hospital; bp.'s

see; coffee centre; founded by Jesuits, 1554. Pop. 400,000.

SAÔNE (46° 2′ N., 4° 45′ E.), river, France; rises in Faucilles Mountains, passes Auxonne, Chalon, Mâcon, and joins Rhône at Lyons; length, 301 miles; navigable.

SAÔNE-ET-LOIRE (46° 40′ N., 4° 30′ E.), department, France, formed of part of old Burgundy; mountainous; watered by the Saône, Loire, and Arroux; produces wine, coal, cattle; flourishing manufactures. Pop. (1911) 604,446. Capital, Mâcon.

SAPAJOU MONKEYS, see CAPUCHIN.

SAPINDACEÆ, natural order of trees, mostly tropical; genera include Soapberry (*Sapindus*).

SAPONIN, glucosides contained in certain plants, *e.g.* Soapwort, Horse Chestnut, Soapbark; forms lather with water; used in cleaning kid gloves, wool, etc.

SAPOTACEÆ, natural order of trees and shrubs; includes gutta-percha tree, and Sapota.

SAPPERS, see ROYAL SAPPERS AND MINERS.

SAPPHIC METRE, form of verse employed, and, according to tradition, evolved by Sappho (*q.v.*); developed by Horace; attempted in English, notably by Campion, Cowper, and Swinburne. Sapphics consist of four lines, the first three of five feet and the last of two. In the first three lines, the first and fourth feet were always trochees, the second and fifth, spondees or trochees, the third a dactyl; in the last line there is a dactyl and trochee (or spondee). The Eng. sapphic is metrically more elastic than the classical.

SAPPHIRE, blue precious stone, second in value and hardness to the diamond, is a variety of corundum; sometimes found in gneiss, but generally in alluvial soils in Burma, Ceylon, and Asia.

SAPPHO (fl. *c.* 620 B.C.), Gk. lyric poetess. A native of Zesbos, she established at Mytilene a lyric school for maidens, among whom was Erinna of Telos. Round her character many legends have been woven, and it is impossible to give any proved historical details, except that she was intimate with Alcæus. S. was absolute mistress of her art, and the greatest lyricist of ancient Greece. The bulk of her works has perished, but the extant fragments (especially the incomparable *Ode to Aphrodite*) show a marvellous combination of sound and sense, a perfect knowledge of technique, and an extraordinary power of passionate description.

SAPPORO (43° N., 141° 20′ E.), town, capital of Yezo, Japan; flour- and saw-mills. Pop. 70,084.

SAPROLEGNIA, see under FUNGI.

SAPROPHYTIC, see FUNGI.

SARACENS, mediæval term for Muslims. See CRUSADE, ARABS, MOORS.

SARAGOSSA, ZARAGOZA.—(1) (41° 35′ N., 0° 53′ W.) province, in Aragon, Spain; mountainous in N. and W. Pop. (1910) 448,995. (2) (41° 40′ N., 0° 58′ W.) town, capital of above; famous for gallant defence against French during Peninsular War, though eventually forced to capitulate, 1809. Archiepiscopal see, has two cathedrals built in XIV. and XVII. cent's; seat of Univ.; public buildings include the old citadel, exchange, various charitable institutions; manufactures beer, spirits, woollens, leather, iron goods. Pop. (1910) 113,729. See SPAIN (*History*).

SARAJEVO, SERAYEVO (Turkish *Bosna-Serai*) (43° 54′ N., 18° 30′ E.), fortified town, on Miljacka, capital, Bosnia; has a college, numerous mosques; seat of a R.C. bp. and of an Orthodox metropolitan; manufactures metal-wares. Pop. (1910) 51,919.

SARAN (26° 10′ N., 84° 30′ E.), district, Tirhut division, Bihar and Orissa, India; capital, Chapra. Pop. (1911) 2,409,509.

SARANSK (54° 12′ N., 45° 10′ E.), town, Penza, Russia; leather, soap. Pop. 14,000.

SARAPUL (56° 30′ N., 53° 30′ E.), town, on Kama, Vyatka, Russia; tanneries; leather manufactures. Pop. 23,000.

SARASATE, PABLO MARTIN MELITON (1844–1908), Span. violinist of genius; composed Span. dances.

SARATOGA SPRINGS (43° 4′ N., 73° 43′ W.), village, health-resort, Saratoga County, New York, U.S.A.; mineral springs; destroyed by French and Indians, 1745; near scene of surrender of English to Americans, 1777. Pop. (1910) 12,693.

SARATOV.—(1) (*c.* 52° N., 45° E.) government, S.E. Russia; area, 32,624 sq. miles; steppe lands in S., hilly in N.; drained by affluents of Don and Volga; soil fertile, producing cereals, flax, linseed, sunflowers, mustard; manufactures flour, leather, oil; has fish-curing works, sawmills, distilleries. Pop. (1910) 3,094,700. (2) (51° 31′ N., 46° E.) town, capital of above, on Volga; commercial centre; distilleries; trade in corn. Pop. (1910) 193,600.

SARAVIA (10° 55′ N., 123° E.) town, Negros, Philippine Islands. Pop. 14,000.

SARAVIA, ADRIAN (1531–1613), Anglican divine.

SARAWAK (*c.* 3° 30′ N., 110° 8′ E.), state, Brit. N. Borneo, ceded to Sir James Brooke by Sultan of Brunei in 1842; territory extended at various dates; under Brit. protection since 1888; area *c.* 42,000 sq. miles; surface generally mountainous; produces timber, rubber, sago, pepper; minerals include coal, gold, silver, mercury; diamonds and sapphires found. Chief towns, Kuching and Sibu. Governed by rajah, Sir Charles Brooke. Pop. *c.* 500,000. See BORNEO.

SARCOCYSTIS, a genus of SPOROZOA (*q.v.*).

SARCODE, name for protoplasm (*q.v.*).

SARCODINA, GYMNOMYXA, one of the four classes of Protozoa, containing individuals characterised by the presence of blunt, mobile extensions of protoplasm (*pseudopodia*). Many, such as the *Foraminifera* and *Radiolaria*, are protected by shells of limy or siliceous material. The class includes the sub-classes RHIZOPODA and ACTINOPODA.

SARCOMA, see TUMOUR.

SARCOPHAGUS (Gk. 'flesh-eater'), stone coffin; originally of stone from Assos in Troas supposed to consume body within 40 days; oldest are Egyptian, square or oblong.

SARCOPSYLLA, see FLEAS.

SARCOPTES, see under MITES AND TICKS.

SARCOSPORIDIA, a group of SPOROZOA (*q.v.*).

SARDANAPALUS (classical myth.), last Assyrian king; effeminate; besieged in Nineveh by Medes, he burned himself, his wives, and treasure on a pyre.

SARDES, see SARDIS.

SARDHANA (29° 9′ N., 77° 39′ E.), town, United Provinces, Brit. India. Pop. 12,700.

SARDICA, COUNCIL OF, held at Sofia, Bulgaria, 343, to settle Arian controversy. Eastern bp's declined to act, and Western pronounced for Athanasius.

SARDINE, see HERRING FAMILY.

SARDINIA (38° 53′ to 41° 15′ N., 8° 7′ to 9° 52′ E.), large island in E. Mediterranean, belonging to Italy; lies about 120 miles distant from mainland of Italy and immediately S. of Corsica, from which it is separated by Strait of Bonifacio; area, 9308 sq. miles; surface almost entirely mountainous plateau, reaching height on E. side of 4200–6200 ft.; almost equally divided between forest, arable land, and pasture; drained by Tirso, Samassi, Flumendosa, and other short streams. There are one or two islands off coast. Chief towns are Cagliari, Sassari, Iglesias. Climate is unhealthy in lower districts.

Sardinia was subdued by Carthaginians towards close of VI. cent. B.C., and remained in their possession until the III. cent. B.C., when it passed under Rom. control. After the break-up of the Rom. empire it was captured by the Vandals and subsequently by the Ostrogoths; but in VI. cent. A.D. it was reconquered by the Byzantines, in whose hands it remained for about four cent's, although frequently overrun by Saracens. The latter were ultimately expelled early in XI. cent. by the Pisans and Genoese, who for some time continued to struggle for possession of the island. Conquered by Aragonese, *c.* 1326, S. remained in hands of Aragon and afterwards of Spain till 1713, when it

was transferred to Austria by Treaty of Utrecht. In 1720 it was given to Victor Amadeus, Duke of Savoy, in exchange for Sicily, and formed kingdom of S. with Piedmont and Savoy. In 1848 a constitution was granted by King Charles Albert, and in 1861 Victor Emmanuel II. of S. became king of Italy, with history of which the further history of S. is coincident.

Island is divided for local administrative purposes into the two provinces of Cagliari and Sassari. The religion is R.C., and the island has three archbishoprics and eight bishoprics. Education is in a backward state, but Cagliari and Sassari are univ. towns. The island has prehistoric and Rom. remains.

Sardinia produces lead, zinc, silver, lignite, and blende. Forest products—apart from oak, olive, and other timber—are cork, tanning bark, charcoal. Principal industry is agriculture; wheat, barley, and other crops are grown, and fruit is largely cultivated; horses are bred in considerable numbers, and cattle, sheep, and goats are reared for food and export. Wine is largely produced, and there are tunny, sardine, anchovy, and coral fisheries. Manufactures sea-salt, tobacco, gunpowder, wooden pipes, matches, macaroni. Inhabitants are Italians with admixture of Span. blood; various Ital. and Span. dialects are used. Pop. (1911) 852,934.

Edwardes, *Sardinia and the Sardes* (1889).

SARDIS, SARDES (38° 30′ N., 28° E.) (modern SART), ancient city, on Pactolus, capital, Lydia, Asia Minor; famous wool-dyeing centre; after its capture by Cyrus, 546 B.C., became residence of the satrap of Persia; later a Rom. city; in the Middle Ages it was several times destroyed.

SARDOU, VICTORIEN (1831–1908), Fr. dramatist; great success due to vogue of somewhat heavy problem play with melodramatic issue; succeeded best in comedies of manners, though he attempted all kinds; fortunate in way his plays were staged; wrote *Fédora* (1882) and other plays for Sarah Bernhardt; others are *Nos Intimes* (1862), *La Famille Benoîton* (1865), *Rabagas* (1872), *Daniel Rochat* (1880), *Divorçons* (1880), *Robespierre* (1899), *La Piste* (1900).

SARGASSO SEA (25° N., 30° W.), tract, N. Atlantic; covered with floating seaweed (*Sargassum bacciferum*).

SARGENT, JOHN SINGER (1856–), Amer. artist; settled in England, 1883; R.A., 1897; a brilliant portrait painter.

SARI (36° 33′ N., 53° 6′ E.), town, capital of Mazandaran, Persia. Pop. c. 9000.

SARIPUL (36° 2′ N., 65° 58′ E.), town, Afghan Turkestan. Pop. 19,000.

SARIPUTTA (d. 480 B.C.), one of chief followers of Buddha; attained Arahatship; his teaching is contained in *The Perfect Way*.

SARK (49° 27′ N., 2° 22′ W.), smallest of Channel Islands (*q.v.*), consists of Great and Little S., connected by isthmus; 3 mls. long, 1½ broad; area, *c.* 2 sq. mls.

SARLAT (44° 53′ N., 1° 13′ E.), town, Dordogne, France; distilleries; coal and iron mines. Pop. 6300.

SARMATIANS, SARMATÆ, quondam nomad race of S.E. Europe; spoke Scythian; women were warriors; conquered Scythians, IV. cent. B.C.; crushed by Goths, IV. cent. A.D.

SARNEN (46° 49′ N., 8° 14′ E.), town, Unterwalden, Switzerland, on Lake of Sarnen. Pop. (1910) 4640.

SARNIA (42° 59′ N., 82° 33′ W.), town, port, on St. Clair, Ontario, Canada; oil refineries. Pop. 10,100.

SARNO (40° 48′ N., 14° 38′ E.), town, ancient *Sarnus*, Salerno, Italy; manufactures paper, textiles. Pop. 18,700.

SARONNO (45° 37′ N., 9° 5′ E.), town, Milan, Italy. Pop. 10,500.

SARPI, PAOLO (1552–1623), Venetian churchman, scientist, and historian; entered Servite order, 1562, and became renowned for learning and skill in disputation; app. ecclesiastical adviser to Venetian Council on outbreak of dispute with pope, 1606, and made famous report suggesting that the Senate should either forbid publication of papal decrees or postpone action to appeal to general council; led able attack on pope's secular jurisdiction, and sought to separate Venetian from Rom. Church; papalists attempted to assassinate him, 1607; hist. works not always reliable; as scientist welcomed discoveries of Galileo.

SARPSBORG (59° 30′ N., 11° 20′ E.), seaport town, on Glommen, Smaalenene amt, Norway; manufactures calcium carbide. Pop. 7300.

SARREGUEMINES, see SAARGEMÜND.

SARSAPARILLA, drug prepared from the dried roots of several plants of the genus *Smilax* (e.g. *S. officinalis* and *S. medica*), which grow in Mexico, Central and South America, the extract being used medicinally as a mild tonic; regarded by profession as of little therapeutic value.

SARSFIELD, PATRICK (d. 1693), Irish Jacobite; major-general of forces of James II. in Ireland, 1689, showed desperate valour; Fr. field-marshal, 1692–93.

SARSINA, see SASSINA.

SARTHE (48° N., 0° 15′ E.), department, France, formed of old Maine and portions of Anjou and Perche; hilly; generally fertile; traversed by Sarthe; minerals include coal, iron, marble. Pop. (1911) 419,370. Capital, Le Mans.

SARTI, GIUSEPPE (1729–1802), Ital. composer; trained by Padre Martini, Bologna; Cherubini's teacher; operas—*Le Gelosie Villane*, *Giulio Sabino*, etc.

SARTO, ANDREA DEL, ANDREA D'AGNOLO (1486–1531), Florentine artist, known as 'the faultless painter'; s. of a tailor (*sarto*); pupil for many years of Piero di Cosimo, though he was more influenced by the work of Leonardo da Vinci and Michelangelo; won fame early in life by his facile touch, breadth of handling, and mellow colouring. Judged by his portraits, he stands beside Giorgione and Titian. His *Portrait of a Sculptor*, now in the National Gallery, long supposed to be a portrait of himself, is one of the supreme portraits of the Ital. Renaissance. Another famous work is the *Portrait of a Lady*, supposed to have been his wife; while the known portraits of himself, no less than his *Last Supper*, are recognised masterpieces. S.'s artistic life and personal happiness were both wrecked by his marriage with Lucretia del Fede, a hatter's widow—a beautiful, extravagant, and entirely heartless woman. His infatuation for his wife dragged him into manifold dishonours, and to supply her extravagance he neglected the more spiritual side of his art, and merely concerned himself with money-getting. Last of all, he flung up his lucrative employment under the Fr. king, Francis I., whose confidence he is accused of betraying by embezzling large sums entrusted to him by the king for his own purposes. Lucretia sat for the face of most of his Madonnas, and in the Holy Family (Borghese Gallery). S.'s relations with his wife form the subject of one of Browning's best-known poems.

SARUM, OLD, see SALISBURY.

SARZANA (44° 6′ N., 9° 57′ E.), town, Genoa, Italy; bp.'s see; exports wine. Pop. 12,200.

SASKATCHEWAN (*c.* 55° N., 106° W.), western province, Canada, containing greater part of old districts of S. and Assiniboia, and half the former territory of Athabasca; formed, 1905; area, 250,650 sq. miles. In S. the province is crossed by S. River, and a considerable area is under wood; many lakes; several Indian reserves; capital, Regina; produces wheat, oats, barley, flax in great quantities, and has excellent fisheries; live stock raised; trades in furs. Saskatchewan is developing with extraordinary rapidity; railway communications are being greatly improved; enormous quantities of wheat exported annually. S. has a Lieut.-Gov. and Legislative Assembly. Pop. (1911) 492,432.

SASKATCHEWAN (54° N., 104° W.), river, Canada; rises in two branches in Rocky Mountains; joining near Prince Albert, flows E. into Lake Winnipeg.

SASSARI (40° 43′ N., 8° 34′ E.), town, capital, province Sassari, Sardinia; cathedral and university; trade in oil, grain. Pop. (1911) 43,240; (province) 331,778.

SASSERAM (24° 57′ N., 84′ 3° E.), town, Shahabad, Bihar and Orissa, India. Pop. 24,000.

SASSINA (43° 50′ N., 12° 10′ E.) (modern **Sarsina**), ancient town, on Sapis, Umbria, Italy; birthplace of Plautus (*q.v.*).

SATAN, see DEVIL.

SATARA (17° 41′ N., 74° 2′ E.), town, capital, Satara district, Bombay, Brit. India. Pop. 27,000; (district) 1,145,000.

SATELLITES, see ASTRONOMY.

SATI, SUTTEE (*q.v.*).

SATIN SPAR, see ARAGONITE.

SATINWOOD, a light-coloured furniture wood; obtained from *Chloroxylon swietenia* of India and Ceylon, and from W. Indies.

SATIRE (Lat. *satura*, a mixed dish), a form of literary composition (prose or verse) that exposes, ridicules, and censures particular or general vices and follies. S. may be fierce or kindly, but it must always be humorous. The 'father of s.' was Archilochos of Paros (VII. cent. B.C.); the inventor of Rom. s. was Gaius Lucilius (116 B.C.); famous Rom. satirists were Horace, Juvenal, and Perseus. Many great dramatists, novelists, etc., have strong satiric vein (*e.g.* Aristophanes, Molière, Cervantes, Thackeray). Among greatest modern satire writers are Butler, Dryden, Pope, Swift, Byron; Rabelais, Régnier, Pascal, Boileau, Voltaire, and Heine. The *Satire Ménippée* (1594) is a good example of political s.; written by several hands against the League.

SATPURA (21° 50′ N., 74° 30′ E.), range of hills, India, between valleys of Nerbudda and Tapti.

SATRAP, Persian provincial governor of ancient times. Darius I. (d. *c.* 485) organised empire into twenty satrapies.

SATRICUM, modern CONCA (41° 35′ N., 12° 50′ E.), ancient town, Latium, Italy.

SATSUMA ISLANDS (31° 40′ N., 129° 40′ E.), group of islands, W. of Kiushiu, Japan.

SATURN, second largest planet; remarkable for system of rings which surround its globe, but do not touch it. The diameter of the planet, according to Prof. Barnard, is 76,470 miles, while that of the rings is 172,000 miles, but they are only 13 miles thick. S. is the sixth planet in order of distance (some 886 million miles) from the sun. Its revolution period around the sun is 29 years 6 months. S. has ten satellites, named Mimas, Enceladus, Tethys, Dione, Rhea, Titan, Hyperion, Japetus, Phœbe, and Themis.

SATURN, a god of ancient Italy associated with agriculture; supposed to have reigned in Latium, taught civilisation, and established the Golden Age. The legend of S. was confused with the Gk. myth of Cronus, hence S. was said to have been deposed by Zeus, and came as an outcast to the Saturnian hill, where he was received and welcomed by Janus. In ancient art he is represented with a pruning-knife or sickle.

SATURNIA (42° 40′ N., 11° 30′ E.), ancient town, Etruria, Italy.

SATURNIAN VERSE, ancient Rom. verse loose in scansion, depending largely upon accent; some fragments are extant; was entirely superseded by classical metres.

SATURNINUS, LUCIUS APPULEIUS, Rom. demagogue, supporter of Marius; twice tribune, and brought forward an agrarian law, a corn law (reducing the price), and a law for founding new colonies; won popular favour. During his 3rd tribunate he had Memmius murdered to prevent his election to the consulship, but this action proved his ruin. The mob turned against him and eventually stoned him to death.

SATYRS (classical myth.), goat-like, half-human creatures attendant on Dionysus (Bacchus); dreaded by men.

SAU, see SAVE.

SAUCHIEBURN, see JAMES III.

SAUERLAND (51° 17′ N., 8° E.), mountainous region, Westphalia, Prussia.

SAUGOR (23° 50′ N., 78° 48′ E.), town, cantonment, capital, Saugor district, Central Provs., Brit. India. Pop. 43,000; (district) 475,000.

SAUJBULAGH, SUJBULAH (36° 45′ N., 45° 30′ E.), town, Azorbaijan, Persia; dried fruit. Pop. 6510.

SAUL, Old Testament character, king of Israel. The narratives contain divergent traditions about him. In one he is informed by Samuel, a local prophet, that he is divinely appointed to lead Israel against the Philistines; in the other he is chosen by lot when the Israelites desire a king. His dynasty was supplanted by David, friend of Saul's son Jonathan.

SAULT SAINTE-MARIE (46° 25′ N., 84° 16′ W.), city, on St. Mary's, capital, Chippewa County, Michigan, U.S.A.; manufactures flour, lumber. Pop. (1910) 12,615.

SAUMAREZ, JAMES SAUMAREZ, BARON DE (1757–1836), Brit. admiral; second in command at Battle of Nile; won great victory over Franco-Span. fleet near Cadiz, 1801.

SAUMUR (47° 15′ N., 0° 4′ W.), town, on Loire, Maine-et-Loire, France; seat of cavalry school; XI.-cent. castle; manufactures rosaries; trade in wine. Pop. 16,500.

SAUROPSIDA, a group erected by Huxley to include the vertebrate classes of Reptiles and Birds, and thus emphasise their many resemblances. Some of these are the presence of epidermic scales or feathers; of a lower jaw composed of one cartilage and four or five membranes, bones articulating with the skull through the quadrate; of a cloacal vent; of oval, nucleated, red blood corpuscles; and of large eggs, with much yolk, protected by a limy shell.

SAUROPTERYGIA, extinct REPTILE (*q.v.*).

SAUSSURE, HORACE BÉNÉDICT DE (1740–99), Swiss physicist and geologist; b. Conches, near Geneva; prof. of Physics and Philosophy, Geneva, 1762; made brilliant physical, botanical, geological, and meteorological observations in the Alps; invented and improved number of scientific instruments.

SAUSSURE, NICHOLAS THÉODORE DE (1767–1845), Swiss botanical physiologist.

SAVAGE ISLAND, NIUE (*q.v.*).
